AN important point relating to the rights of artistic property has recently been tried in France. M. Clesinger, a well-known sculptor, in 1873 gave up to the Society Marynhac the sole right of reproducing his works, and the question now arises as to how far an artist is justified in selling to different purchasers works similar in design and composition, though not absolutely identical. The society has seized two new sculptures by M. Clesinger—a Phryne and a Roman Bull—under pretext that they are only reproductions of previous works over which they have exclusive right. Several sculptors were called in, and after careful comparison of the alleged reproductions they gave it as their opinion that, though the external resemblance was undoubtedly great, different ideas were expressed in the several works, and that therefore this could be no case of simple reproduction. The tribunal accordingly decided in favour of M. Clesinger, condemning the Society Marynhac to pay the costs.

Apropos of the opening of the new Town Hall at Manchester on Thursday, the *Preston Herald* eulogises the concentration of arrangement displayed in its planning, adding:—“We have a handsome building in Preston, with a very beautiful interior, and with a fine assembly-room, but its defects in the matter of accommodation are of the most glaring character. If Mr. Gilbert Scott had been specially instructed to design an edifice wherein all the space should be devoted to staircases, corridors, and lobbies, and from which the light should be carefully excluded, we do not think he could have produced a better building than our Town Hall. We know to our cost that our municipal

offices are widely distributed, and many are the aspirations that it were otherwise.”

A NEW street-sweeper, invented by Mr. Warren, of Cheltenham, was tested before the members of the Clerkenwell Vestry on Wednesday week in Corporation-row and Goswell road. In the latter thoroughfare a section 200 yards in length, traversed by tram rails, was saturated with water from the vestry carts, and speedily cleansed by the machine, no surface water being visible after it had been used. The machine consists of a rotary band of brushes feeding a shallow on wheels. The shallow fills itself in two minutes, and contains the same quantity as an ordinary slop-cart. It can be detached when full, and a fresh one substituted without deranging the sweeping power.

THE art classes in connection with the Royal Architectural Museum will recommence their studies on Monday, October 1st, on which date the newly-formed sketching club will be inaugurated. The classes are held under the auspices of the Science and Art Department and the students receive instruction from a fully certificated master, while they enjoy the advantage of using the large collection of casts and examples in the museum. A life class for men is also held, besides the art workmen and ladies' classes and the sketching club we have already noticed on a previous occasion but it may be here pointed out that prizes are offered by the Council of the Museum, and an annual exhibition of the sketches will be held. A selection of drawings by members of the club will be made for publication, and we have undertaken to help forward the work of the club by making room for some of these sketches in the BUILDING NEWS. Particulars of the club and classes may be obtained of the Curator, at the Museum, 18, Tufton-street Westminster, S.W.

At the last meeting of the Hackney District Board of Works a correspondence was read originating in a complaint addressed to the Local Government Board respecting some streets of new houses of the speculative class (locally known as “jerry buildings”) in Hackney Wick. The clerk informed the Board that he had written to the Local Government Board informing them that the matter was not within the jurisdiction of the Local Board but that the complaint had been forwarded to the Metropolitan Board. To this a reply was received from the Metropolitan Board, enclosing a copy of the district surveyor's report. This was to the effect that most of the houses were of such a character as to require the close attention, and a portion of the brickwork had been ordered to be taken down, course by course; and a pledge had now been given that “not less than half the bricks in the wall should be whole bricks.” This, with the other remedial steps, would, it was believed, adequately meet the case. Mr. G. B. Holmes, member of the Board, said he had visited the locality, and could fully corroborate the statements of the complainants. The mortar used was composed of cinder siftings, and did not contain a particle of sand, and the sewers were very inadequate, there being only a 12in. pipe in a long street—laid, moreover, among dust and refuse which had been freely shot there. The course taken by the clerk was approved.

A NEW dock, which will be known henceforth as the Queen's Dock, was opened on Tuesday by the Clyde Navigation Trustees. The work which are situated at the western extremity of Glasgow Harbour, cover 61 acres. Of these are water. The extent of quays provided is 3,344 yards, or about one-half the quay space which at present exists on the river. The total cost of the undertaking when completed will amount to £1,600,000. The Lord Provost of the city performed the opening ceremony, and in the course of some remarks in connection therewith he rapidly sketched the history of the Clyde since 1769, when there were only two feet of water at Dumbarton and 14in. in the harbour of Glasgow. Now they had 14ft. of water at the lowest of low water, and were dredging away with the expectation that they would have 20ft. At the accession of his Majesty in 1837 the yearly revenue of the trust was £37,644, and now it was £208,752; the tonnage at that time outwards and inwards was 929,732 tons, and it was now 2,428,616 tons.

ONE of the most interesting visits to works yet made by the Society of Civil and Mechanical Engineers took place on Friday afternoon, the 7th instant, when, by the kind permission of the architect and contractors, the members made a detailed inspection of the new Courts of Law, now building at Temple Bar. The members were received by the clerk of the works, and after a brief inspection of the great quadrangle the members went to the architect's temporary office, and there the general scheme of the buildings was fully explained, and various questions as to the working of the different parts answered in detail. The members were then taken to the eastern block, facing Bell-alley, which is now rapidly approaching completion, and begins to give a very fair idea of what the completed buildings will be like. Great interest was shown as to the internal finishing of the walls, the construction of the floors, and the general arrangements for lighting and ventilation. From this point the visitors were taken to the main block of buildings, which will contain the great Central Hall, surrounded by the courts, retiring rooms for the witnesses, counsel, &c. This part of the works is at the present time but little above the main floor level of the Central Hall, but is quite far enough advanced to admit of the ultimate "working" of the buildings being fully explained and understood. The clerk of the works then led the way to the western part of the site, where is situated the machinery and sheds in which the stone is sawn, moulded, and worked in readiness for fixing, and from which tramways lead to all parts of the works. This part of the work, which was only of less interest than the finished buildings, having been thoroughly inspected, the visit came to an end, and the members and their friends left, loud in their admiration of the work, very much interested in all they had seen and heard, and feeling a great debt of obligation to the clerk of the works for the kind and painstaking way in which he had conducted his visitors over this most important addition to the public buildings of London.

CHIPS.

Mr. William Tuley, assistant borough surveyor, Kendal, was last week appointed to the office of borough surveyor of Chesterfield, at a salary of £150 per annum. There were 58 applicants.

The foundation stone of the new waterworks at Leamington was laid on Tuesday week. Mr. R. Davidson, C.E., is the engineer.

The foundation stone of a new Congregational chapel, at Barton, in Cheshire, was laid on Saturday week. Mr. Thomas Huxley is the architect and builder. The chapel will be a plain brick building, with stone facings, and will find accommodation for 200 people. The cost will be about £500.

The Local Board of Farnworth have applied to the Local Government Board for sanction to borrow £1,800, for carrying out a drainage scheme in connection with the workhouse at Fishpool, from plans by Mr. Lomax, surveyor to the board.

An experimental well is being sunk for the Frome Local Board at Egford, under the superintendence of Mr. Tomlinson, C.E., with the hope of obtaining a supply equal to the wants of the town.

In Breslau, a successful attempt has been made to erect a paper chimney, about 50ft. high. By a chemical preparation the paper was rendered impervious to the action of fire or water.

At the Court of Common Council, last week, Deputy Fry wished to know what was to be done with Temple Bar. The Chairman of the City Lands Committee said the committee had made certain suggestions to the Government, but no reply had yet been received. The committee, however, expected communications from the Government very shortly, and they would then be enabled to make a satisfactory report as to the removal of Temple Bar and other important improvements that were intended to be carried out.

The ceremony of laying the foundation stone of the University-buildings at Nottingham has been fixed for Thursday next. The cost of the buildings, including the land, will be £60,000. The architects are Messrs. Lockwood and Mawson, of London and Bradford.

The works of rebuilding the parish church of St. Nicholas and St. Runwald, in Colchester High-street, from Sir Gilbert Scott's designs, are rapidly approaching completion. Tessellated pavement has just been laid to the architect's designs by Messrs. Goodwin, of Hereford. That in the chancel is based on the 14th century pavement in Milton Abbey, Dorset. The contractor, Mr. G. Dobson, has completed the tower and lead-covered spire, which rise to a height of 150ft.

The Barton Regis Board of Guardians have requested Messrs. Foster and Wood to prepare plans for three new infirmary buildings for 205 patients, at their union house.

The Duke of Cleveland owns the racecourse in the centre of Wolverhampton, which the townspeople want for a public park. In a letter read out at a special meeting of the town council on Friday, the Duke offered 50 acres in the middle, on lease at a little over £3 a year for 63 years, with the option of purchase then at £100 an acre. The offer has been accepted with thanks.

The science and art prizes gained by students at the Mechanics' Institute, Accrington, were distributed on Wednesday week. It was stated that the competition for the prizes had been very keen.

It is proposed to rebuild the nave of Edgefield church, near Holt, Norfolk, at a cost of £2,000.

The foundation stone was laid last week of a new Congregational chapel, at Furthergate, Blackburn. When completed the building will seat 1,000 persons, at a cost of £4,000.

The sword-room in Norwich Guildhall has just been redecorated under the direction of Mr. Lake, city surveyor, and embellished with some of the portraits removed from the window spaces of St. Andrew's Hall, in order to give more light to that noble room.

Trade News.

WAGES MOVEMENT.

LONDON.—Within the last day or two the concession of the 10d. an hour demanded by the masons of the metropolis has been granted by two large West-end building firms—those of Messrs. Wheeler and Warren, of Lansdowne-road, Nottingham, and of Messrs. Hook and Aldred. Other employers are expected to accede to the men's demand in the course of the present week. The firms above referred to have taken on a number of men at the increased rate of wages, and hence the strike list is proportionately reduced. The masons held a private conference on Wednesday at Wilcox's Rooms, Westminster Bridge-road, when the prospects of a speedy termination to the strike were discussed, and a resolution passed as to the future conduct of the movement.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—[ADVT.]

Holloway's Pills are especially recommended to all annoyed by tender bowels—a source of constant weakness, if not indicative of danger. Diarrhoea, flatulency, nausea, spasms, and distension yield to the extraordinary power this purifying medicine exerts over digestion, and those subversive functions which extract the food's nutriment for the body's maintenance.

TENDERS.

Bow.—For proposed additions to the Old Ford Mission Hall, Tredegar-road, for Arthur Farnau, Esq., Messrs. Hills and Fletcher, architects; quantities supplied:—
Sheffield and Prebble £593
Selby 585

JOSEPH GILLOTT'S
STEEL PENS.
 Sold by all Dealers throughout the World.

BY HER MAJESTY'S ROYAL PATENT.

ESTABLISHED A.D. 1774.

AUSTIN'S NEW IMPERIAL PATENT FLAX SASH LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength and the large amount of wear in it, consequent on its peculiar manufacture. **AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES** (two prize medals awarded). The Manufacturers of the Trade above articles particularly wish to draw the attention of the Trade to their Imperial Patent Flax Sash Lines, of which they are now making five qualities, and they strongly recommend that, in all making cases, they should be purchased in preference to the Patent Lines made from Jute, which article has neither the strength nor the durability of Flax; consequently cannot give so much satisfaction to the consumer. They also invite the particular attention of the Trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered. They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors, and Wholesale Houses in Town or Country.

GAULT BRICKS, DRAIN PIPES, &c.

THE AYLESFORD POTTERY COMPANY. Manufacturers of Salt Glazed Stoneware Drain Pipes, Terra Cotta Chimney Pots, Agricultural Drain Pipes, and Gault Bricks for facings, &c., are now prepared to supply the above in trucks at the Aylesford Station (S. E. Railway), or in barges at the Works. For prices, &c., apply to THOMAS STANFIELD, Aylesford Pottery Company, 17, Belvedere-road, Lambeth; or to JOSEPH HAMLET, at the Works, Aylesford, near Maidstone, Kent.

THE ENGLISH MECHANIC AND WORLD OF SCIENCE.

PRICE TWOPENCE WEEKLY.

31, Tavistock-street, Covent-garden, W.C.

MICHAEL & WILL'S GAS AND WATER SUPPLY.

This day is published, Second Edition, 8vo., 25s. cloth. **THE LAW RELATING TO GAS AND WATER:** comprising the Rights and Duties, as well of Local Authorities as of Private Companies in regard thereto, and including all Legislation to the close of the last Session of Parliament. Second Edition. By W. H. MICHAEL and J. SHIBRES WILL, of the Middle Temple, Esquires, Barristers-at-Law. London: BUTTERWORTHS, 7, Fleet-street, Her Majesty's Law Publishers.

Now Ready, 8vo, price reduced to 3s., post-free. **IMPROVED SYSTEM of BOOK-KEEPING,** specially adapted for BUILDERS and CONTRACTORS. By the gainer of the Birkbeck Prize. This system secures accuracy by simplicity of arrangement, and contains within itself a perfect check against careless errors. London: H. C. BEVES, 97, Lambeth-road, London.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPT. 28, 1877.

THE TECHNICAL EDUCATION OF THE ARCHITECT AND ENGINEER.

THERE will always be a disagreement between the theorist and practician so long as the disjointed system of professional training exists. This feeling springs more from ignorance or prejudice than from any irreconcilable elements. The school or book-learned and the practical mechanic often entertain a deep-rooted jealousy for each other, springing usually from a misunderstanding of one another's methods. It is to be regretted that the training of the architect or engineer, and that of the building or mechanical operative are not more in harmony; but the fact is, one only learns just that part which the other rejects—one acquires a knowledge of abstract forms and theories, while the other learns to handle and to use his senses. Now, both these parts are, or should form, a complete knowledge, but there happens to be a good deal of manufacturing detail, or friction between theory and actual practice, and the empiric dexterity necessary to overcome this is sought to be made the most of by the practician. The estrangement, however, is one of those which our technical schools, treatises, and periodicals are doing a vast deal to lessen by that process of intercommunication which brings the wants and ideas of one class into the cognisance of the other. If each class would just consider that they are lacking what the other possesses, good feeling and understanding would be promoted.

In the discussions on Technical Education, at the Congress of the American Institute of Civil Mining Engineers, held at Philadelphia last year, the subject of education was thoroughly entered into; the questions raised being:—1. Should a course of instruction in works precede, accompany, or follow that in a technical school? 2. Is it practicable to organise practical schools under the direction and discipline of experts in engineering works? Mr. President A. L. Holley's address at Washington on this subject contains some very important recommendations. He shows the value of precedence in practical culture, and the remarks made apply with so much force to the teaching of those destined as architects or builders that we may refer to them. He defines three classes of engineering-learners; the original investigators, who come close to nature, "who search into first principles, and who follow that scientific, and, therefore, fruitful method by which the relations of matter and force are discovered, classified, and brought within the reach of practice. These men do not create the laws of nature as they almost seem to, but they go up into the trembling mountain, and the thick darkness, and bring down the tables upon which they are written." Another class are the schoolmen; they are learned in the researches and conclusions of others, and skilled in reasoning and speculating from these upon certain or probable results of physical combinations; and a third is the great army of practicians, from the common labourer to him who exhibits judgment and power. The author proceeds to illustrate his proposition by reference to the progress of metallurgy. Thus, while the metallurgists are still "disputing over the sequence of reactions in combustion and reduction, the iron-smelter has felt his way from the barbarous practice of a century ago to the economical production of to-day;" the improvements in the hot-blast, shape, and proportion of stack to different fuel and ores, have grown out

of "constant handling, not of books, but furnaces." Bessemer is mentioned as an instance of one who with a chemical knowledge only superior to that of an average schoolboy, developed a revolutionary process in iron manufacture. As Mr. Holley shows, it is the inadequate union of engineering, science, and art that is at the bottom of the present educational difficulty. The hiatus must be bridged over. The schoolman or graduate has the advantage of the practician, in that he can cast away the dross, and precipitate the rubbish, and proceed by surer and quicker methods. The practician, on the other hand, is jealous of the schoolman's interference, while the schoolman too often despises the manual skill of the mechanic. Well may the author say, "while the un-schooled practician wastes his energies in unscientific methods, and on impossible combinations, but generally carries into successful use his comparatively few well-founded attempts, the student, merely of principles and abstract facts, so usually originates the ideas upon which progress is founded, but rarely clothes them with practical bodies. In this chasm between science and art, how much effort and treasure, and even life, are swallowed up year by year." These observations apply with equal force to those engaged in the building art. Any one acquainted with building operations will often have remarked the almost intuitive mode in which the artificer skilled in his work will overcome a little difficulty, and yet how staggered he becomes if some unforeseen change of design, or something of which he is not familiar in his trade occurs. He is at once embarrassed—his practical methods fail him. On the other hand, one merely learned in principles and abstract facts can rarely apply them to the most practical advantage. The economics of the builder's workshop or the foundry, the forge or the machine shop, can only be learnt by an acquaintance made face to face with the materials, and by manipulation or a handling of them. Again, in bridge-building it is not so much to failure in calculating the strains we owe the disastrous accidents that have taken place, but the hundred other causes, such as vibrations, buckling, imperfect fitting, wear or corrosion of important parts, and various details that can only be learnt from a course of observations in the workshop, or by actual experience of the behaviour of such structures and their materials. Another hindrance to a complete union of science and art is unquestionably the combined ignorance of a class of "practical men" of the meaning of the term "theory." As Mr. Holley says, many of this class take it to be something discordant with fact. This incomprehension and ignorance of the results of science—we may call it bigotry—prevails largely among those whose knowledge is confined to their own practice, and to whom analysis and generalisation in their business affairs, as well as in morals and politics, are unknown.

Turning to the remedies suggested for this discordance between the theoretic and the practical, Mr. Holley proposes that practical culture should precede the science, and, in order that it should be efficient, it must instruct, not *men* of good general education, but *artisans* of good general education. He instances the greater rapidity in knowledge of capable and ambitious practical men derivable from books as compared with schoolmen. The advantage of a practical familiarity with tools and materials, for example, in the study of carpentry or ironwork is beyond dispute, and every learner from books would find immense aid if he could refer to or realise the subjects of his study. "Beginning with theoretical and abstract knowledge is no less an in-

verted process in the useful than in the fine arts, than it would be to take a course of Ruskin within brick walls as preparatory to opening a studio, and then climbing the mountains to square nature with the book." Mr. Holley proposes, not that mere school-boys shall go into works and then into technical schools, but that young men of more advanced general culture shall apply first to Nature, and to the schoolmaster afterwards. Mental training can be acquired quite as well in the works as in the school, and an objection urged to beginning with the technical school is that it cannot stop at logical methods which are abstract, and must come from the fountain-head. The second point affirmed is that the desultory study in works should be systematised for the benefit of the student, and that owners of works shall grant facilities and establish organised schools in the various engineering works. The students would be, of course, learning, not receiving pay like the other operatives, and there would, it is thought, be little difficulty in the management. Several of our science schools are attached to workshops, or have entered into an arrangement with contractors and owners of works for a similar object. Thus Mr. Holley's proposition consists in a practical knowledge acquired in works, not desultorily, but by an organised system, and afterwards the investigation of general facts and their relations. By this procedure, it is believed, a better class of experts would be produced in little more than half the time required by the reverse order. It would discourage none from finishing an engineering education, which would be complete in its parts if only time were allowed. Professor Egleston, in the discussion, dissented from the proposition that manual work is desirable in the engineer, and he contended the schoolman acquired experience in a much shorter time than the workman. Professor Thurston specified three courses, any of which may effect the generally-admitted combination of knowledge—first the usual method in which the student receives his education, and is then sent into business; second, that which gives a boy a common school education, and sends him into the office or the workshop, and finally places him in the technical school to obtain the professional education and scientific basis; and thirdly, a mixed course of study and practice, extending throughout the early life of the man up to his complete immersion in practice. The latter plan is preferred for economical reasons. The first plan is defective, inasmuch as the youth's habits have been formed, and he has become unfitted for the vastly different habits of the workshop. The second is far better, and Prof. Thurston seems to agree with Mr. Holley, that a simultaneous acquirement of both branches is desirable and necessary. Other speakers took the view that book knowledge should precede practice; among them Mr. Thomas C. Clarke, M.I.C.E., thought observing facts and acquiring data should be the first step; observing the relations of phenomena and of drawing conclusions therefrom the second; and the third, that of verifying conclusions by observation and experiment. In short, general culture seems to have been tacitly if not openly admitted as essential, but at what point the practice should be acquired the discussion has hardly settled. Whether technical education in works should precede or follow technical education in the school is a question, we think, that may be generally left to the individual capacities and proclivities of the student himself. In some cases it would be undesirable to place an uncultured youth among workmen at first; it would have the effect, probably, of deterring him from after reading or book knowledge. A general school education, combined during later years with the run

of the "works," or "shops," would be far more desirable. We cannot overlook the fact that the pupillage system adopted in this country for both architects and engineers is defective, and demands improvement. It does not take into account the education of the eye or the mind; while if the pupil were permitted to avail himself of works in progress, and then to enter a technical school, he would be virtually receiving the most valuable of all educations. Whatever course be adopted we wish to impress upon the minds of instructors as well as pupils that study of principles, together with facts, are necessary; that books and classes are as vital to the future architect or engineer, if he wishes to become something higher than a handicraftsman, as works or the "shop;" but that to get the greatest benefit a method is necessary, which may be summed in two words—observe and generalise. Let the student first grasp the great facts of his profession in the concrete, and then he will be better able to understand the value of the abstract as taught in schools and books—a portion of his curriculum without which he cannot be considered cultured or worthy of a liberal profession.

OPTICS AND PAINTING.

AMONG the charges delivered to the new Government Commission which is to inquire into the state of the Arts in France, is one concerning the relations of optics with painting. It might have been thought that a subject so delicate and abstruse might have been left to pure scientific examination, and, indeed, we should not have ventured to touch upon it, were it not that two most experienced Parisian critics have ventured to attempt applying this test to the Parisian *salon* of 1877. Their experiments and experiences, their suggestions and ideas, if not conducing to any full-formed ideas, are worth remembering, especially when it is kept in mind that a considerable degree of artistic art and knowledge is brought to bear in connection with them. They, in fact, regard a picture as a study in, or illustration of, Natural Science. Suppose we enter, at midnight, into an unknown country: its horizon is strange; the relative positions which it reveals are not easy to reconcile; the sun seems in the wrong place, and the colours are anywhere that, for the moment, the fancy may determine. But there is a science which studies and appreciates light, and assigns to all things, whether colours, proportions, or positions, their relative outlines on the map, and this is the knowledge that M. Jules Jamin, and his equally erudite colleague, claim to have interpreted. They put aside the general graces, such as were almost worshipped by the Greeks and the Romans; they object to the ancient calculations of the sciences, and they aver that, in fact, photography is the groundwork of all graphic art. It is an idea likely to meet with encouragement; yet it is one of which the justification may excite more controversy than the French Government Commission might desire to stimulate. Most people will be surprised to note the simple premises whence these Art reformers start. They say, like Persians, that the sun is the source of all light and warmth; it is the centre and pivot of mathematical science; it gives its tint to every uncovered earth-flower in bloom, and stone taken from the quarry; all whereof is confessed; but then, they go on to insist, pictures are pictures, bad or good, simply because the artists have had or good lights in their studios—lights which refract their reflectives; lights which intermingle with the mixed tints upon their palettes; lights which supply them with oriel radiances and cryptic shadows at pleasure. This is all, exclaims M. Jules Jamin, an affair of paint

and powder. Let us venture to differ from him. The question is—What relation can be established between the art and science of the optician, and the art and science of the painter; though the two professions are far from occupying a common ground. The business of the optician is to see with an unimaginative exactitude; the business of the painter is to reflect with such a glow as he can add from his imagination. Even the French Commissioners, in their preliminary report, hard though their restrictions be, admit so much. They repeat, "there may be nothing in common between an optician and a painter, yet the one cannot be perfect unless he understands the other." The two, no doubt, examine the same figures and scenes in different lights; the one may be looking for phenomena, and the other for effect; but the inspiration is the same, and the "Holy Family" of Raphael, the "Marriage of St. Catherine" of Corregio, and the "Virgins," bathed in mystic light, of Murillo, are sufficient to prove it. They drew their religion from Heaven, and they carried their genius to it. It has been the same with all great artists, imitators, and worshippers of Nature. They have wanted light, and they have been compelled to use shadow. But the former has been infinitely less easy to manage than the latter—a secret which the Dutch found out long before their monotonous school became famous—as, for example, the dreary cellarages of Granet, and the kitchens of Drolling, compared with the sunshines of Claude and Cuyp. Nevertheless, in optic or perspective illusion the Low Country masters may be accepted as perfect, no other painters having mastered with equal power, for instance, the candle-lights of Schendael. At the same time, notwithstanding the judgments of the French critical commission, whence can be produced the challenges, in sunrises or sun sets, or moonlight splendours of Turner? If, indeed, the comparisons are to be fairly carried out, no slight amount of national egotism, and not a less degree of critical prejudice, will have to be got rid of. The question now before the learned societies of France is, however, one which concerns science in its highest, rather than art, in its most obvious sense.

M. Jules Jamin now asks whether we are certain, after the travels of the sun's rays through a space more or less indefinite, our drawing-room artists—painters of blood in Moorish palaces—of children's dresses in Belgravian nurseries—of barbarous costumes in Montenegrin defiles—are not sure whether they see red instead of yellow, purple instead of blue, green instead of white, upon their easels. "Are they certain," he asks, "that they are not mixing up in one pot all the hues of the rainbow?" And may they not fall back upon the doctrine of Newton, that there is no such thing at all in nature as colour? We may go with M. Jamin so far, without agreeing to the least extent with his judgment that there is no such element as colour in art. In point of fact, he is not upon this topic, consistent with himself, because his preliminary reply to the queries of the French Fine Arts Commission exhibits a totally different view. "The knowledge of a combination of colours," he writes, though the remarks are not yet generally published, "once acquired, and the science of combining them once mastered, must lead to immense advances in art and industry." We look at a crimson cloth; let us look directly from it to the crimson rays of the sun. They may, for the moment, appear scarlet, amber, blue, green, or even white; but still they are the same rays, and every painted picture presented to our eyes is, in its way, discoloured—glorified or degraded by them—which may be news welcome to some artists, and indignantly repudiated by

others. We will not, however, pursue M. Jamin through his excessively minute discourse concerning the influence of a picture upon the human eye, or—which we had never heard of hitherto—the influence of Paul Potter's "Bull" upon an average ox; but he does seriously assert that, every season, in the Parisian *salon*, people—and even critics, armed with *lorgnettes* and magnifying glasses, do mistake red for blue, and green for yellow; and that optical illusions are rarely more active than when the qualities of pictures are involved. Every gallery is a *camera obscura*, a transit-chamber of shadows and lights; an illuminating and darkening of figures by turns. This appears, however, to be somewhat of an imaginative view, and we are rather anxious to range the facts before us. The optician, of course, like the artist, studies nature through the grand effects and contrasts of shadow and light; he finds them changing as the hours progress; he does not see at twilight a picture, or even a common wall, under the same aspect in which it was shown him in the morning. There was light, here is shadow; there was crimson, here is rose-blush. And yet, we are assured, there are certain celebrated pictures which never vary in expression or in tone, whatever the radiance, toned or brilliant, that may be thrown upon them. Murillo's "Ascension of the Virgin" is among them; so is the celebrated "Descent from the Cross" at Antwerp, though that hangs in a perpetual *chiaroscuro*. With critical nicety, M. Jules Jamin says: "I station myself before a wall, having a plain and uniform surface; I assume it to be painted all over in the same colour—yellow, if you will—and I watch at the same time the shadow of the next house falling upon it, at a moment when the wall is divided into—one-half bright, and the other half darkened. It is evident that there can be no actual differences of colour created between these two points of view;" and yet how different, and even distracting to the eye! The criticisms of the French Commissioner, however, do not stop at this point. He is evidently anticipating the great art rivalry at Paris of 1878. The artists of our day, he asserts, are timid; they are afraid to employ colours, and they have ceased to use light; "they paint as if the sun had ceased to shine;" they would rather photograph a yellow wall than sketch a living landscape; and as to evening or night illuminations, they are nowhere. Listen to the master again. "Certain artists are renowned for their *spécialité* in reproducing night-scenes, and they almost invariably employ a flaring lamp which, placed in the centre of the canvas, kindles up an interior wherein every object is made distinctly visible through a strong light, or left in shadow by a doubtful flicker." Is this right? we are asked; is it true to nature? The inexorable critic replies by a detail of his own experiments with wax, tallow, and oil. Surely such an analysis of canvas goes beyond criticism altogether. As well might we count the puckers on the countenance of the famous "Egg-Merchant," or the shrinking wrinkles on the back of the humiliated Ganymede at Amsterdam. This is not the study of art, it is the appraisal of an auctioneer. It reminds us of Granet, the miserable courtier of Louis XVIII., who said to his master, "Your majesty, I have seen the heavens through your windows, but found nothing outside equal to that within." But M. Jules Jamin keeps himself, upon the whole, far away from these extravagancies. He used his *photomètre* with conscientious exactitude; he endeavoured to compare the colours of nature, fleeting though they must inevitably be, with those of art, necessarily fixed, and therefore artificial, and he confessed himself vanquished. He denied the veracity of

the painter; but he could tell him nothing beyond that which he had been taught already. Darkness, he assures us, was scarcely less perplexing to him than light itself; and so, in despair, he gave himself up to general principles, convinced that not the glimmer of a star, or the shadow of a tree, or the gloom of a midnight could ever be represented, on canvas or paper, faithfully. In such a spirit of despair the latest treatise on light, as applicable to art, has been delivered to the students of France. There could be delivered to the art of the 19th century no more expansive lecture, no finer doctrine than that which is offered within the light of this optic treatise, which proves that, not only is humanity part of industry, and human strength at large as represented as it should be represented. The incentives, or at least the instincts of this new artificial art, as it may be termed, are fallacious. Within the experience and knowledge of the living generation a choice may be made out as viewed by the experienced eye, and art as looked at by tradition between the experiments of the present and the past.

COMPETITION DESIGNS FOR LODGE TO THE PROPOSED RECREATION GROUND, SYDENHAM.

A KEEPER'S COTTAGE, with a refreshment buffet attached, presents a somewhat fresh and inviting subject for the architect's pencil. The requirements are necessarily few, while the accessories gave an opportunity for the display of artistic handling. The conditions in the present instance were not restrictive. A lodge for the keeper of the recreation ground, consisting of a parlour, kitchen, washhouse, three bedrooms, and offices; together with a waiting or refreshment-room with counter, a caterer's-room, and retiring-room for ladies comprised the main features, the total cost being limited to £1,000. It is surprising to notice how these very simple requirements have been met. Some of the authors have gone out of the way to give us examples of the most far-fetched modes of solving the problem; we see almost burlesques of an arrangement that would have been very obvious to any of the old builders, of whom we entertain such unbounded admiration, or indeed any builder who looked upon the plan in a common-sense and really artist-like manner. To take a few of the prominent types, we find the lodge and waiting-room inextricably combined without any distinction apparent in the external design. In some cases, the refreshment room is made to occupy the flank of a long range; in others it is placed at one end, and in a few we lose sight of it altogether. The site selected by the Board, near the Mayow-road from Lower Sydenham to Perry Vale, does not confine the architect to any particular arrangement or disposition, and therefore each author was enabled to choose which disposition he liked. Looking at the points of the compass, it is clear the most westerly side was that best adapted for the refreshment-room, and the south-easterly for the lodge. Taking the selected design by Mr. Robert Walker, under the motto "Respice Finem," first, we find the author has carefully studied the requirements. The lodge is placed near the entrance, and the waiting-room on the inner side. A public waiting-room, 30ft. by 18ft., and 19ft. 6in. high, is placed transversely with the main frontage. At one end of this room is a females' retiring-room, with w.-c.'s well arranged for privacy. The doorways are placed on the long side of the waiting-room, under the shelter of a verandah, which encloses two sides of the building. The counter is placed centrally, on the longest side, facing the entrance. Examining the sections, we

observe that the waiting-room is carried up two stories, the upper range of windows being above the verandah, giving the appearance of a two-story dwelling. This is rather a demerit. The ceiling is coved and panelled. The lodge is well planned; there is a corner entrance between the parlour and kitchen, the walls of lobby cutting off the angles of those two rooms, and the parlour projects with a square bay, and is 13ft. x 14ft., the kitchen being of the same dimensions. Three bedrooms are provided above. Behind the counter is a door, leading into the caterer's room, and a good-sized yard fills up the angle between the two buildings, which are kept quite distinct. Mr. Walker has adopted a half-timbered brick style in a Gothic spirit, and has distinctly externalised the separation of the refreshment-room and lodge. The upper portions of the gables and the roofs are tiled, and a well drawn perspective accompanies the design. "Rusticus," by Mr. Henry Shaw, of New Broad-street, E.C., is another of the five designs the committee have been pleased to recommend. This plan is hardly so economical, the author making a feature of his waiting-room by giving it an apsidal or circular bay end, surmounted by a conical roof, and surrounded by a verandah. Instead of being placed crosswise, it occupies a longitudinal position, the lodge being placed on one side, partly overlapping the waiting-room. We observe a rather wasteful entrance-hall to the lodge. The caterer's and retiring-rooms are at the end of waiting-room, the entrance to the latter being on the opposite side to that of the lodge, so that the bay end would face the pathway. In treatment, the design is timbered in the upper portion, the basement being of red brick. There is considerable merit in the general conception, but the plan of lodge has not been studied with sufficient care. We see two designs bearing the motto "Pro Bono Publico." In one of these, shown by an admirably tinted perspective, and some good elevations, in which red brick and tile, slightly timbered, have been employed, we have a refreshment-room placed lengthways along the front 35ft. x 17ft., the retiring-rooms being at one end, and the lodge at the other. In general arrangement the design strongly resembles a village school, for which purpose it would be better suited. The treatment is quiet, unpretending, and picturesquely handled, with some good detail; but the plan is defective. The entrance of lodge directly opens into the living-room, and the stairs are between this and the kitchen. A lean-to roof forms a verandah along the waiting-room, over which is a square clock-turret. Another design, under the same motto, exhibits a waiting-room with octagon end, in one splay of which is the entrance, the lodge being at the other. The ladies' retiring-room has an outer yard intervening between it and the closets, and the men's are similarly arranged. The lodge plan appears economical. The waiting-room is 24ft. by 20ft. with the retiring and caterer's room at the end, and a counter in one corner. The bedroom arrangement is defective, and the skewed landing is inadmissible. Externally a low roof covers the verandah; the gable treatment is redundant in its woodwork, and the white stock and red brick courses are not happy. Taking the plan as a whole there is an approach to the right solution. An ink perspective, with darkly-tinted plans and elevations, under the motto, "Spes," indicates some character; the gables are timbered and filled with parquet work, and the style of a vernacular Old English is thoroughly suited for bricks. Of the plan we note the following faults:—A wasteful lodge and kitchen, the latter about 20ft. by 12ft.; caterer's room entered from kitchen of lodge; female retiring-room unnecessarily

large; washhouse ditto; stairs from kitchen; bedroom plans irremediably spoilt by a crooked passage to rooms. "XXX." is a piquant half-timber lodge, with buffet combined cleverly, and shown in a well-drawn pen-and-ink sketch. The latter, 26ft. by 19ft., forms one gabled front towards the pathway of a plan cruciform in shape, the lodge occupying two other arms, and the conveniences the fourth. The lodge is scarcely separated enough. Externally the author has covered his waiting-room with a span roof, which embraces the kitchen of lodge and the caterer's room, and the gable end has a mullioned window, which partly lights the buffet, the other windows being on the front and return sides below a deep-tiled roof or lean-to, which is supported on bold cut wooden brackets. The ceiling of buffet is plastered between ribs which form a cove. The details display taste, and the panelling of buffet is a sensible treatment, though perhaps the design as a whole is open to the stricture of being rather too rural. Of other designs we may notice "Pavilion," the principal feature in which is an octagonal refreshment-room, surmounted by a conical roof of tile, and surrounded by a verandah. At the other end is the lodge, certainly not economic in its arrangement. There is certainly a meritorious attempt to make the refreshment-room a public feature, and the elevations exhibit a skilful handling in the grouping and detail; but the limited means at the disposal of the committee preclude any elaborate or costly timbering, such as the timber pavilion roof would entail. Barring these objections, we believe the author of "Pavilion" has hit on a something far more suitable for recreation grounds than many of his co-competitors. Another design displaying merit is certainly "Minotaur," shown in some effectively-coloured elevations in red brick with tile roof, and gables, simple and broad in its masses. The plan, confused by a heavily-coloured tile paving, shows the waiting-room on one side placed crosswise, with centre entrance inside, the lodge being on the gate side. The two buildings are, however, mixed up, with a small yard intervening. The perspective sent is weak and ill-drawn, and rather detracts from the elevations. Cost is put at £980. "Spero" is a set of sketch drawings in colour, with some good points, but wanting in sufficient *prononcé*. "Lewis" is a fanciful gala sort of structure, with lodge and waiting-room in one range, more resembling a school. "Simplicity," another design in ink, certainly belies its motto; it is anything but simple in arrangement. A small waiting-room is placed at the end of a Gothic lodge, Jacobean in detail, but with fair grouping. "At the Eleventh Hour" is a rough though clever pen-and-ink sketch in brown ink, picturesquely conceived, but so rough that its author might have withheld it. In plan we have a waiting-room, 18ft. 6in. by 15ft. 6in., with bay window, porch on one side, and a shelter on the other, with settles in them. The lodge stairs break awkwardly into waiting-room, and the ladies' room is lighted by windows over lean-to of offices. We may just note also another, "Pro Bono Publico," in an enervated style of Gothic; Triangles in Circles, in which the waiting-room is placed side by side with the ladies' retiring-room; "Welcome," a confused plan; "Una," an economical arrangement, but savouring too much of the acrobatic in style; "Castissima," a design that might well be mistaken for a small church or suburban vestry-hall, with cupola; "May," and "Laboratur," both ill-considered and confused; "Intus si Recte ne Labora," a design displaying considerable labour, but wanting in a due subordination of the apartments, and with a refreshment-room 30ft. by 18ft. "Blenheim," "A. R.," "Plevna," "Lodge,"

"Vale," "Study," "Utile Dulci," are other studies failing in some essential, and many of them betraying either misconception of the requirements, confusion of the apartments, want of subordination or distinction, defective construction, ignorance of detail, or some architectural vulgarity. The plans and elevations of "Lodge" appear to be the work of two distinct hands, as the details are worthy of better plans. "Study," too, might have been more successful. The item of cost has not been taken into the consideration of many of the competitors, and we should not like to say that any one of the designs which the Lewisham Board have selected can be carried out for the expenditure named.

EARLY CHRISTIAN ARCHITECTURE. XII.

IN our last article we illustrated and gave a general description of Sau Lorenzo at Milan, a structure resembling in its main outlines the well-known church of St. Vitale, and once the cathedral of that city. We now proceed to give some particulars of other structures based on the octagon, the plans of which will be found illustrated in our impression of to-day. It will be noticed that the Early Christian architects were striving to convert the Roman circular baptistery, or sacramental temple, into a square form, an achievement which the Byzantines ultimately accomplished. In Isabelle's "Edifices Circulaires" may be found several examples of circular structures, which have been reproduced by Fergusson, the leading feature in all being a circular drum, carried by an inner and concentric row of columns, forming a circular aisle, the centre portion being covered by a flat conical roof, under which, as at the Baptistery at Nocera dei Pagani, there was sometimes a dome. These circular tomb-houses or baptisteries were the germs of those later developments which the Byzantine architects have left us. Sometimes there were two rows of columns, as we find in the ruined building of San Stephano Rotondo at Rome, forming two circular aisles, the centre being carried up and roofed. Generally, the columns supported arches, as shown by MM. Isabelle and Hübsch. The next stage of development seems to have been the octagon, or some modification of it, as we find at San Lorenzo Maggiore, Milan (see p. 97), and the ancient Cathedral of Florence, now called the Baptistery, plans of which we illustrate to-day. If our readers will turn to our photo-litho. illustrations of this structure—of which we give four plans with details of the same (see Figs. 1 to 6)—they will see what masters of constructive masonry designed and executed these buildings. In Fig. 1 we have the ground plan, showing an octagon of about 84ft. internal diameter, the thickness of the walls and counterforts making an external diameter of 108ft. The necessity of resisting the thrust of a cupola of this space has been ingeniously met by the arrangement of the recesses in the sides of the octagon and the gallery above. By reference to plan 2, it is seen the thickness of wall has been economised, and a gallery obtained in its thickness, approached by two spiral stairways. M. Hübsch, in describing the building, observes that it belongs to the Early Christian age, and that it is built entirely of stone, though so small a quantity of that material has been used that in appearance it is quite aerial. It is observed that the thrust exerted by the cupola 83ft. in diameter is entirely neutralised by eight counterforts only 12ft. in thickness, and each of these had to be pierced in two places to allow of communication between the various parts of the two galleries. Hübsch, describing the cupola, says, "The enormous vertical weight of this cupola is chiefly sup-

ported by two columns placed on the lower story at each side of the octagon. (See plan, Fig. 1). These columns, which are of ancient origin, are monoliths of oriental granite 2ft. 3in. in diameter. On the upper story there is a corresponding number of piers of masonry, which assist to support the dome, which by means of a well-known technical arrangement, is securely tied to the outer wall. Beside the eight counterforts, sixteen keys (*lanquettes*), corresponding with the sixteen pillars of the upper story, tie the eight faces of the octagon to the cupola. These keys, while serving for a support to the stone covering, assist to neutralise the thrust of the vault, the thickness of which is rather over 3ft." Fig. 4 in our plate shows these and the cellular construction at the springing of the dome.

M. Hübsch alludes to its extraordinary stability, and its resistance to the action of centuries. He says, "After a very careful examination we are convinced the edifice has not undergone any restoration. The walls and pilasters, from base to summit, are all of a piece, perfectly harmonised in all parts, and composed of the same kind of stone (*macigno*) squared." The stones, he says, too, are large at the base, and gradually diminish in bulk as they get towards the top. Referring to the decorations, external and internal, the same authority declares them to be of later date. "Giovanni Villani, writing in 1340, states that the external dressings of black and white marble, in the style of the first Renaissance, dates from 1293." It is also said that this monument was converted into a baptistery at the commencement of the twelfth century, after having been the cathedral church. Hübsch informs us that "it is probable the altar, which until that time stood in the centre of the octagon, was then transferred to the recess marked *a*, originally the main entrance." The interior refacing with slabs of marble of the second story is supposed to have been done at the same time as the exterior facing. Contemporaneously the lights of the first gallery, originally quite open, were supposed to be ornamented with small Doric columns, one in each opening, with half-columns against the piers, and surmounted by arches in the style of the first Renaissance. (See detail, Fig. 6.) Kugler attributes these details to the first half of the middle ages, but Hübsch shows that he is mistaken. The dome is lined with mosaics, and also the groined roof of entrance. The lower panels are said to be the work of some masters of the Florentine school, themselves pupils of the Byzantine school. Some doubt is expressed as to the architectural integrity of the panelling, and the upper mosaics are thought more recent. The opening at the summit of dome was not originally surmounted by a lantern, and, according to Villani, this opening lighted the interior far more effectually than the small piercings in the rotunda. The form of cupola is a pointed arch, and, as observed by Hübsch from a statical point of view, is the most advantageous when the roof has to rest directly on the vault. Numerous modern monuments, some very precious, cover the walls of the lower story between the columns. The pavement, formed of small pieces of marble of various colours, is noticed as bearing the date 1207.

Archæologists have widely differed as regards the date of the first construction. Kugler assigns the cupola to the middle ages, but Hübsch does not think his theory rests upon any researches made on the spot. Fergusson thinks it was erected as a cathedral in the time of Theodelinda, Queen of the Lombards; though, if this be so, he says it could not originally have had its present form, but that the columns now ranged round the walls stood in the centre as in the Roman examples. He also speaks of its

being remodelled when the new cathedral was built, by Arnolfo da Lapo, in both its form and decoration, and says, "It must be considered rather as a building of the thirteenth century than of the sixth, in which it seems originally to have been erected." It will be seen authorities differ materially as to the date of the first structure which Hübsch places before us from personal researches. At any rate there is evidence of its antiquity, and it was doubtless as he asserts, "the model from which the illustrious architects of Italy took their ideas." "Arnolfo da Lapo, who in 1296 began the new cathedral, would not," says Hübsch, "have dared to conceive so vast a cupola had he not daily contemplated that of St. John, which faces it. In the fourteenth century Bumelleschi undertook to carry out the desigus of Arnolfo, and when, two centuries later, Michael Angelo had the boldness to undertake the construction of the dome of St. Peter, it was surely due to the fact that from a child he had been accustomed to gaze on these two grand cupolas at Florence."

In Fig. 7 we give the plan of the ancient church of Neocesarea, in Asia Minor, erected by the father of St. Gregory Nazianzen, who died about A.D. 374. The church is no longer in existence. It was a remarkable example of the octagonal plan, and a detailed description was left by this father of the Church, which is given by Hübsch, but the leading features will be readily seen by examination of the plan and section (Fig. 8) which we give, and which will enable the reader to compare the plan and structure with the church of St. John at Florence. Fig. 9 is the plan of the early Christian church of Sta. Mariadelle-Cinquo-Torra, and presents us with an interesting instance of a square plan.

INDIVIDUALISM IN ART.

IT may be a profitable inquiry to what extent should the individual be impressed or reflected in his work; in other words, how far is individuality compatible with art? The question, we admit, is not easy to answer, and from a rather extended study of writers and authorities on art, it appears to us there is a decided conflict of opinion on the point, though a general consensus is evident if we carefully compare them. All ancient art decidedly negatives the idea that the peculiarity or mannerism of the individual artist should be paramount. Greek and mediæval architecture, if appealed to, alike refute the individualistic theory of art, and it has only been reserved to modern times and artists to propound the doctrine. We shall find, indeed, it to be quite a modern quality of art, and to have arisen when society shook off the thralldom of the middle ages. It was a kind of reaction from the previous national and communal character of art, and, within certain limit, it was beneficial. Like religion, art was thoroughly communal before the fifteenth century revival of literature, and we look at any epoch in vain to discover the peculiarities of individual workers who are lost in the general result. To use a very expressive phrase of a modern writer, we must admit, then, the "efflorescence" of individuality is a phenomenon that has arisen from our disconnected and individual study of art, and we are inclined to lay down the proposition that individuality has been exaggerated at the expense of art. But let us here examine a few opinions on the subject. Sir Joshua Reynolds in his admirable "Discourses" says:—"Peculiar marks I hold to be generally, if not always, defects, however difficult it may be wholly to escape them. . . . Peculiarities in the works of art are like those in the human figure—they are always so many blemishes." Again, he says:—"The works, whether of poets,

painters, moralists, or historians, which are built upon general nature, live for ever; while those which depend for their existence on particular customs and habits, a partial view of nature, or the fluctuation of fashion, can only be coeval with that which first raised them from obscurity." To imitate a favourite master is a practice held by the same great authority as a pernicious one. He takes to task the artists of his time who imitated peculiarities, and he impresses upon artists that, as Raphael took many models without their peculiarities, so if "they would equal Raphael they must do as he did, take many models, and not even him for your guide alone." Referring to another great art writer—Ruskin—we find him constantly upholding the unselfishness of art; he speaks, too, of comprehensiveness and moderation, and his "Lamps of Sacrifice and Truth" follow a similar strain. No less an authority than the late Slade professor, in one of his Cambridge lectures, alludes to the Socratic reply that "Man is the measure of all things. By descent deeper into his personality, you will find that underneath all varieties there is ground of steady truth. . . . Agreement is the region of truth." No writer on art ethics maintained so strongly as the late Digby Wyatt the necessity of a wide and comprehensive basis. He designates the classicist creed as "subjective," and the mediævalist as "objective." In the first, man's physical and intellectual condition were made the basis of the art creed; in the second or mediæval theory man was regarded as comparatively nothing, but each "variety of matter possessed properties and rights of its own." The Classical theory supposed man to do all; the Mediæval, a very little. Digby Wyatt, however, in adopting these terms, has not given them their full and philosophical significance, as taught us by the great minds of the age, and as employed by German metaphysicians. We apply the term "subjective" to art as meaning that art which is the result of thought, and has been evolved by a mental process going on in the mind; while the "objective" belongs to the "Non-Ego," or that in which imitation of nature, or some particular school or master, is concerned. It is the external, as the other is the internal product. Mr. E. L. Garbett, in his excellent treatise, also alludes to the value of a generalised art, which means a subjective one; and Mr. Fergusson, in his "Historical Inquiry into Beauty," and in his well-known Handbook has insisted upon the fact that architecture has never been the result of individual action, but a combination or concert of skill of the particular age in which it was produced.

Having shown the general opinion of writers, let us briefly make a distinction—a very necessary one—namely, that between art which is the outcome of individual thought, and that which simply expresses a mere whim or sentiment. We may call the first, for distinction's sake, originality; while the latter we must call mannerism or idiosyncrasy. In a settlement of this distinction, we believe, resides the solution of the question we are considering. The followers of "Queen Anne" architecture are certainly mannerists. Others like to individualise their work, to stamp it with something different to the general expression. Another coterie of architects take up the individual peculiarities of a particular master. In each case the generic qualities of good art are sacrificed to the personal whim of the artist. To take a work out of the common groove, to place it above the level of contemporary works, is a pardonable ambition; but to individualise it with a character that is essentially selfish and personal, is to degrade the art in which the artist works. We are quite

willing to admit that "genius can only breathe in an atmosphere of freedom." The late J. S. Mill says in his celebrated Essay: "Persons of genius are *ex vi termini* more individual than any other people; less capable of fitting themselves, without hurtful compression, into any of the small number of moulds which society provides in order to save its members the trouble of forming their own character." Now, this is perfectly true of social and political life, and it may even be argued that, as architecture is the expression of our wants, it is quite reasonable that every man's house should have a character of its own. We should allow the greatest range of variation; but, as a fine art, we are compelled to accept the general humanitarian ideal in preference to the individual. If we were dealing with domestic wants or political considerations we should allow the individual the greatest freedom compatible with the freedom of other people; so in a fine art certain limits are set. If it professes to appeal to the taste of the greater number, it must be unselfish, and reject all monopoly of pleasure. Again, Mr. Mill, it must be remembered, was speaking of persons of genius who could not fit themselves to the more contracted ideas or moulds of ordinary society. Now, the moulds or ideas of architecture—its types—it must be admitted, come under another category. They are the products of experience, science and social wants, and to supplant them we must justify putting our personal taste against these things. The only consistent individuality in art is that which, renouncing the monopolist or selfish pleasure, freely accepts those elements which have been sanctioned by experience, and have undergone the crucial test of the designer's own mind. It also appears to us that the quality of individuality in a work of architecture is more permissible in works of a private than of a public character. In domestic architecture the architect is unrestrained by considerations due to a public building, and we consider in proportion to the general or public character of a work should this element be subordinated. In the subordinate features of buildings and their ornamentation, there is obviously more scope for the individual artist to impress his personality, though the most successful and long-lived reputation may be said to depend on the predominance of a taste that does not militate against the common sense or ordinarily accepted taste. The Greeks, who were, of all people, the most free as individuals, amongst whom the individual life was estimated largely—in short, deified—produced an art that of all others was profoundly generic and abstract. It was an ideal form of art, and had nothing peculiar or particular about it. But there is another cause of individuality to which we may briefly refer. It is the lack of culture. Architects often assume a style simply because they have not studied all styles, in the same way as a man of one idea rides a particular hobby to death. This kind of egotism is painfully apparent. Some artists of low standard of education are the most egotistical; they like to impress their individuality on everybody, not considering that no two persons perceive any sensible property in precisely the same way. It has been shown by every writer on æsthetics who have regarded the only reasonable foundation of our perceptions, that the impressions one receive depend on the education or susceptibilities of our nervous organisation (see Grant Allen's "Physiological Æsthetics," recently published), and that, therefore, the general level of the cultivated taste of the age is something widely different to the taste of the uneducated artist. In every fine art we find the truth of this position illustrated. The eye, like the ear, perceives at every step in its

education something that gives it greater pleasure: it sees some new element, it corrects its imperfect taste, till at last what was once sensibly pleasing becomes positively distasteful. Hence it is evident the architecture of the future must become amenable to cultivated criticism, and that this must be its only test.

LIVERPOOL ENGINEERING SOCIETY.

ON Wednesday night (Sept. 26) this society held its usual fortnightly meeting at the Royal Institution, Colquhoun-street, Mr. H. D. Baldry, A.I.C.E., vice president, in the chair. A paper was read on "Some of the Advantages of the Metrical System," by Mr. E. T. Jones. After explaining the metrical system, and pointing out the value of a convenient standard of length used decimally, Mr. Jones proceeded to demonstrate the saving of time and labour in engineering calculations upon the metrical system over those on the English method. Sections of the same piece of railway, plotted on the two systems, were exhibited, showing that the metrical system reduced the number of figures required by at least one-fifth. In the metrical system one of the greatest advantages is the definite relation between the units of length, volume, and weight. The labour of calculations in hydraulics, for example, is reduced to a minimum. It was thought that the compulsory introduction of the metrical system into England would cause but temporary inconvenience, and, judging from the experience of other countries, no serious difficulty need be anticipated. From the discussion at the end of the paper it appeared that the opinion of the meeting was divided upon this latter question.

BOOKS RECEIVED.

Preventive Medicine in Relation to Public Health, by Dr. Alfred Carpenter (London: Simpkin Marshall and Co.), is a very useful re-arrangement of a series of lectures delivered by the author at St. Thomas's Hospital and elsewhere on hygiene. It would form a very good class-book for use in institutions devoted to the acquirement of useful knowledge. The facts are clothed in plain comprehensive language, and the style is attractive.—*Round About London*, by a F.S.A. (London: Edward Stanford), is a well-condensed, historical, archaeological, architectural, and picturesque note-book, suitable for the tourist within a circle of twelve miles around the metropolis, to which are added specimens of short walking excursions to Hatfield, Knole, St. Albans, and Windsor. There is a very good map and a copious index, and the information, so far as we have been able to test it, is reliable and accurate.—*The Timber Merchant and Builder's Vade Mecum*, by George Bousfield (London: E. and F. N. Spon) has reached a second edition, which has been revised and enlarged, and which we have again the pleasure of commending as a cheap and simple series of tables, and supplying a want previously felt by all in the trade.

The Galway Town Commissioners recently accepted the tender of Mr. Bagnell, amounting to £4,500, for carrying out drainage works for the town. At their meeting on Thursday week the other two tenderers, who had each offered to do the work for lower sums, wrote in complaint. The first, Mr. Henry Abbott, of Albano, whose tender was for £4,651 10s., objected to the proceedings as illegal, as Mr. Bagnell's tender was not received till Thursday, whereas the advertisement had named the previous Saturday noon as the latest day for sending them in to the secretary. Mr. James Swallow acknowledged his tender (£3,753) was not on the printed form, but said that the others were more informal, inasmuch as Mr. Abbott's was not handed in till 3 o'clock, and the chairman (Mr. O'Hara) then produced Mr. Bagnell's from his pocket. It was admitted that those statements were correct, but the chairman said no discussion must take place unless members were prepared with a motion, and as none was proposed, proceedings terminated. The transaction reflects no credit on the commissioners.

The Guildford Town Council having received a report as to the inadequacy of the present pumping apparatus at the waterworks to meet the requirements of the borough, have decided to call in Messrs. Easton and Amos, civil engineers, of London, to advise on the matter.

ILLUSTRATIONS.

DESIGN FOR NEW VESTRY HALL AT KENSINGTON—EARLY CHRISTIAN ARCHITECTURE—SHOPS IN BRIDGE-STREET, CHESTER—SECOND PREMIATED DESIGN FOR PROPOSED MORTUARY CHAPEL AT NOTTINGHAM.

OUR LITHOGRAPHIC ILLUSTRATIONS.

DESIGN FOR THE NEW VESTRY HALL AT KENSINGTON.

We have much pleasure in giving illustrations of the design by Mr. J. W. Bryden, of 98, Gower-street, submitted in the recent competition, which, under the motto of "Alpha," attracted so much attention when the drawings were on view in the old school-room at Kensington. It is designed in that phase of English Classic which the author considered most in harmony with the traditions and associations of the old Court suburb. The fronts were intended to be executed in red cut brick-work, with Portland stone for the mullions of the hall windows, the base, plinth, &c., and the roofs to be covered with dull red tiles. As we noticed at the time, the site is of rather an irregular shape, and hampered with old buildings and ancient lights, but it will be seen from the plan that the arrangements are exceedingly simple, the vestry-hall itself forming the *motif* of the design. The offices of the various departments were all on the ground floor, opening from a central hall and the grand staircase, while the hall and committee-rooms form a suite of apartments by themselves on the first floor. The vestry hall is 73ft. long by 43ft. wide by 40ft. high, has a gallery for the public at one end, and is covered with a vaulted ceiling in plaster. The walls are panelled in dark walnut up to a height of about 10ft. from the floor, and the space above to the springing of the vault ornamented with plaster panels of characteristic design, a large open fireplace being a marked feature on one side of the room.

SHOP AND HOUSE, BRIDGE-STREET, CHESTER.

In erecting this building an attempt has been made to preserve the general character of the old half-timber work so prevalent in the city, without losing sight of the modern conveniences and arrangements necessary to the business of the present day. The shop, which is on the street level, has a total depth of 85ft., the area of floor space therein being 2,667 superficial feet. Beside the front window lights there are skylights, which light the shop from an open court on the first floor, round which are placed warerooms accessible from the shop. In common with the other buildings in this street, the front portion of the first floor, to the depth of 18ft., is given up to the "Row" or public passage, which in this city forms a promenade over the shops on the street level. From this "Row" level access is obtained to the dwelling-house and to the court in the rear; the steps shown on the left side of shop afford means of access to the "Row" from the street. The drawing-room to house is over this "Row," and occupies the entire frontage, the central bay window making an important addition to this room, and affording an excellent view of the street. The dwelling-house consists of 2 large entertaining rooms, 6 bedrooms, kitchens, and the necessary offices;

the warehouse in rear is 4 stories in height. The total cost of buildings, exclusive of site, was £2,850; and has been carried out by Mr. Vernon, builder, under the direction of Mr. Thos. M. Lockwood, architect, Chester.

PROPOSED MORTUARY CHAPEL, NOTTINGHAM.

The design which we publish to-day was awarded the second place in the recent competition. The building is designed to serve as a public mortuary, as well as a chapel, and with this object two dead-houses have been provided, and also a large room for inquests, as well as a vestry for the chaplain. The materials proposed are local stone, with wrought stone dressings for walling, lined with red brick; the roofs to be covered with green slates, and the bell turret with oak shingles. The estimated cost is £2,000. The author of the design is Mr. Richard C. Page, of 18, Buckingham-street, Strand, W.C.

EARLY CHRISTIAN ARCHITECTURE.

A DESCRIPTION of these photo-lithographic illustrations of Early Christian Architecture will be found on p. 302.

THE GREAT BARN AT HARMONDSWORTH.

This famous barn, which we illustrated last week, is one mile from West Drayton station. It is supposed to have been built about the middle of the 14th century. The outside dimensions are as follows:—198ft. long, 41ft. wide, and 40ft. high to the ridge, the width of the bays inside being 15ft. The timber is of oak, axed to the required sizes, and is in an excellent state of preservation. The average scantlings of the timbers are as follows:—Principal uprights, 1ft. 2in. by 1ft. 2in.; tie-beams, 1ft. 8ft. by 1ft. 2in.; collars, 1ft. 2in. by 8in.; plates, 7in. by 6in.; cills to the trusses, 1ft. 2in. by 10in. It is worthy of notice that the trees were turned upside down for the principal uprights, the butt ends being placed at the top, so that the tie-beams might have a better bearing. The roof is covered with red tiles. The low side walls are of rubble work, chiefly of plum-pudding stone. The sills of the trusses stand upon roughly-tooled hard stones.—G. R. WEBSTER.

A QUESTION OF QUANTITIES.

A RATHER noisy discussion on a question that has lately occupied a large portion of our space took place last Thursday at a meeting of the Southampton Town Council. It appears that a member of that body, Mr. Parmenter, an architect and surveyor, has been busying himself in not a very friendly spirit towards the town surveyor, Mr. Lemon, and been asking for the returns of sums paid by contractors to surveyors; the question being whether the contractors who carried out works for the corporation should pay their own surveyors for taking out the bills of quantities, the percentage, of course, being charged to the ratepayers, or whether the borough surveyor should take them out, thereby saving the pockets of the ratepayers. This seems to be the main question involved, though the mover in asking for returns of board contracts during the past ten years, and the sums paid by the contractors to their surveyors, proceeded in a very roundabout manner, and defeated his own object by the feeling and animus displayed towards a brother professional. The plain facts are, that the Corporation of Southampton have for years followed the very independent and justifiable procedure of allowing every party tendering to take out his own quantities, or to employ some independent surveyor to do so for him. As the town clerk explained, it was pretty well understood among intending contractors that their least costly and most direct plan was to agree among themselves in selecting a surveyor to take the quantities out, the surveyor being paid a percentage of from 1½ to 2 per cent. as a commission. By this means the corporation had nothing to do, directly or indirectly, with the quantities of materials and labour, and was consequently not responsible for any inaccuracies, or, indeed, for any error in the tendering or contract price. As before observed, we think the rule the only justifiable course for corporations as well as for individuals, and it is somewhat remarkable that

a town council should be blamed for doing what they are bound, in justice to themselves and the ratepayers, to do. But another point to consider was the independence of the surveyor to the corporation. As the arbitrator between the contracting parties, he should always be free from any responsibility in respect of the quantities prepared. If he prepared them himself, the corporation would necessarily be held liable for any deficiency. It was said what check had the corporation as to the correctness of the quantities supplied, or the work actually performed, as the surveyor appointed looked after the interests of his employers. This was equivocal, as the town surveyor exercised his independent judgment free from any interest, and beyond this it is clear that the contractor's tender must be a reasonable one, and could not greatly exceed the surveyor's protecting estimates. If the corporation surveyor took the quantities out, the responsibility would fall upon him or the corporation, who would thereby compromise themselves. The weakness of the attack was that the mover failed to show how the ratepayers' pockets could be saved in any case. We have already expressed our unqualified opinion that the interests of the architect or adviser demand his entire independence in all work which he designs, and upon which he exercises his professional skill. To make him responsible to those who carry out his intentions, is to frustrate the very object of his appointment. Indeed, we cannot understand the object of a member of the Town Council placing himself in such a hostile position to the interests of his constituents. From the sequel of the proceedings we gather the motive which prompted the action, and it is too clear that a personal enmity is at the bottom. The borough surveyor is taunted with having time to devote to other extra official work at Winchester and Basingstoke, a matter quite distinct, and one which his employers are no doubt aware of. But it appears from one member's remark there was an ulterior aim which the said Mr. Parmenter had in view in asking for returns of the contracts and the sums paid to surveyors. One of the council asked whether the borough surveyor had been paid this money, meaning, of course, the percentage. Such a charge amounted to a personal attack upon the surveyor's integrity, and we are glad, for the sake of the town and their professional adviser, it was summarily dismissed.

But the discussion settles at once the opinion we have constantly expressed upon this matter. The special and general works committee reported that no less than 80 letters had been addressed to various authorities and corporations throughout the kingdom, and it was found from 73 replies that in 13 towns only the borough surveyors took out their own quantities; in 14 they were paid extra for taking them; and in 42 the contractors obtained their own. From these figures it will be seen that the general opinion is in favour of the quantities being taken out of the town surveyor's hands. But the very acrimonious feeling displayed is not creditable, and we should at least expect that an "architect" would have known the general feeling of the profession upon the subject if he had not been made acquainted with the recent by-law of the Institute of British Architects. We are further informed that the motion was lost by a large majority.

A new Congregational chapel was opened for worship at Preston, by Brighton, on Wednesday week. It seats 300 persons, and cost £3,000. Mr. Gibbins, of London and Brighton, was the architect, and Messrs. Cheesman and Co., of Brighton, the contractors.

At a meeting of the shareholders of the Sunderland Improved Dwellings Company, held on Friday last, a dividend of 6 per cent. was declared, after a sum had been carried to the reserve fund. The dwellings of this company consist of a row of houses two stories in height, built of concrete, each story or "flat" forming a separate dwelling of two rooms, after the fashion so common in the North. The advocates of concrete and others will, doubtless, continue to watch with interest the success of this experiment as a solution of the problem of how to erect dwellings for the working classes in the most satisfactory manner, with due regard to financial results.

THE SOCIAL SCIENCE CONGRESS AT ABERDEEN.

THE Social Science Congress commenced at Aberdeen on Wednesday week, under the Presidency of the Earl of Aberdeen, who, in his address, touched on the subjects of education, prison labour, the management of work-houses, and intemperance.

DWELLINGS FOR THE LABOURING CLASSES.

On Thursday the work of the Departments commenced. In the Health Department, presided over by Mr. Edwin Chadwick, C.B., the special question for consideration was "What is the best mode of providing suitable accommodation for the labouring classes, and of utilising open spaces in towns?"

Dr. WILLIAM HARDWICKE opened the discussion by reading a paper, in which he explained a model block system, which he inspected on the Continent, and which he hoped to see some day adopted in London. The most interesting part of the address dealt with the question of utilising open spaces in London. He was anxious for the multiplication of such spaces, but he pointed out that when they were closed against the public they were deprived of half their value. London squares and gardens presented good opportunities for recreative purposes, and he agreed with those who thought there should be legislation on the subject, believing that compulsion, with proper compensating clauses, would not fail to acquire these spaces for the public benefit. The speaker also pleaded for graveyards being used as ornamental recreation grounds.

Mr. WILLIAM BOTTLEY, London, recommended that drainage should be carried from the backs of houses and not under the floors, that dwellings should have a southern exposure as much as possible, that greater care should be taken in the construction of cisterns in the future than there had hitherto been. Mr. BALDWIN LATHAM, London, mentioned that the question of accommodation for working men in the metropolis had within recent years been settling itself by the railway companies providing means of transit to suburbs, fifteen and twenty miles distant. With regard to open spaces, he agreed with Dr. Hardwicke that they should be made public. Ex-Bailie ESSLEMONT, Aberdeen, said that the English spirit of independence revolted against a system of aggregation of populations in large blocks. Dr. FARQUHARSON approved of the co-operative principle adopted in connection with the block system. Dr. STEVENSON MACADAM, Edinburgh, and other gentlemen took part in the subsequent discussion. The other papers contributed to the section related to the health and climate of Aberdeen.

RESTORATION.

In the Art Section, which was presided over by Lord Ronald Leveson Gower, the first paper was read by Mr. G. AITCHISON, on "The Principles which should Govern the Restoration of Ancient Buildings, or their Preservation as Memorials." So far as the latter was concerned, he said they should preserve as many of them as they could, and where there was only a chance of preserving one, they should preserve the best. It was impossible to reproduce old art. The seething thoughts and stirring action of the 13th century were not those of the 19th. It was the very quintessence of folly to destroy the invaluable records we have to get a deplorable imitation of what has been. The monuments of real art which we possessed should above all things be kept from the hands of that worst Vandal that ever lived—the restorer.

Mr. E. M. WARD, R.A., read a paper on the same subject. As prevention was better than cure, he maintained that preservation was better than restoration. He instanced as specimens of the best style of restoration what had taken place in St. George's Chapel at Windsor, and of the neighbouring Eton College. The dilapidations had been made good, consistently with the general tone of the original design, while adding to the durability of the structure and preserving the venerable character of the buildings. With respect to the changes of our cathedrals, he mentioned some changes that were highly desirable in Westminster Abbey. He applauded the enlightened action of the present Dean and Chapter, who

had done a great deal, and stated that stained glass windows were about to be uniformly introduced. He hoped the artists employed would be guided by the still existing specimens of ancient art in this department. He thought a restorer of ancient buildings should be mainly directed by deep reverence for the work on which he is employed, and the associations connected with it. In no case should he take on himself to make any serious innovation on the character of the work, or imprint his own style on any part of it, as unfortunately was too often the case. He also referred to the colouring of ecclesiastical buildings.

Mr. J. F. White, Mr. John Forbes Robertson, Dr. Stevenson, Mr. Statham, Dr. Phené, and Mr. W. Brodie continued the discussion. Mr. G. Aitchison was then heard in reply.

HUMANISING EFFECTS OF ART.

Dr. PHENE, F.S.A., read a paper on "The Humanising and Refining Effects of Art."

TRADE UNIONS.

In the Economy and Trade Section, which met under the chairmanship of Mr. James Caird, the special question for discussion was, "What are the social effects of Trade Unions, Strikes, and Lock-outs?"—the first paper being by Dr. Watts, Manchester. In his absence, it was read by the secretary, Mr. Neison. Dr. Watts remarked that while trade societies no doubt tended towards the increase of capital, they did so indirectly, and not with a good spirit; while, on the other hand, they crippled the extension of technical knowledge. They also did a fair share of work among their own members in lessening pauperism and crime, but that was negated to a great extent by their exclusiveness, which condemned others to poverty. Adverting to the Clyde lock-out, and to the strikes in the coal and iron trades, the writer said that while no doubt unions did sometimes raise wages in prosperous times before the rise would otherwise take place, as employers would then rather suffer loss than stand a strike, yet when capital became unremunerative, no power of combination among workmen could long withstand a fall. He believed that while unions amongst working people for good objects, such as the support of the sick, were commendable, still, on the other hand, when the principal object was to raise the price of wages and shorten the hours of labour, they were very questionable. As to strikes as a *dernier ressort*, the demoralisation arising from them was wholesale, the employment of capital was dissipated, families became disorganised and driven into debt and penury, and an evident breakdown of all self-respect when obliged to seek parochial relief. The only practical way out of the difficulty seemed to rest in compulsory arbitration. Then strikes would be at once abolished, and workmen, giving up the restrictive rules which had not protected them, would ultimately rise to the level of employers.

Mr. JOHN GREY, Aberdeen, also read a paper on the same subject. He argued that trade unions were necessary to prevent unfair depression of wages by the combination of employers, and to obtain a ready rise of wages in times of prosperity. It was admitted that some of the practices of unionists were unjustifiable, but these had been mostly rejected by the better societies. Trade unions, he contended, conferred great benefits on workmen—(1) by preventing, in the case of large and well-organised unions, a frequent resort to strikes; (2) as benefit societies; (3) by fostering habits of discipline and self-government amongst workmen, and thus paving the way for the future adoption of co-operation.

In the discussions which followed the Rev. Dr. BROOKE LAMBERT expressed astonishment that Dr. Watts should have used such arguments as he had done at this time of day. All the mischief which had been done to trade of late years could not be attributed to trade unions; but the surplus of capital which flowed to particular trades in good times had also to bear a share of the blame. Mr. HOYLE, Nottingham, thought that working men in their combinations should have respect, not to their own particular interests, but to those of the general community. Mr. WATHERSTON, London, believed that combinations among masters had done nearly as much harm as those

of the workmen. The latter were, however, frequently conducted in defiance of the principles of political economy, as, for instance, when they tried to increase wages and decrease labour. He thought Fawcett's "Political Economy for Beginners" should be put into the hands of all working men. Mr. LINDSAY, barrister, London, was of opinion that, as trade unions were managed at present, it could not be said that they were productive of good to the community, though the principle on which they were based was sound. Mr. EDWIN CHADWICK said he was connected with establishments which employed over 50,000 men, and he believed that if the managers of those establishments had met their men in a fair, conciliatory way nine out of ten of the strikes would have been averted. Dr. McLEOD, Birkenhead, also spoke, and the chairman shortly summed up the discussion.

ART COMPETITIONS—THE MANCHESTER TOWN HALL.

On Friday the special question for discussion was, "Are Art Competitions Favourable or Unfavourable to Art Progress?" It was introduced by Mr. J. Forbes Robertson, the well-known art critic. In a paper of considerable length, Mr. Robertson pointed out that competition for Civil offices in the service of the State was a practice as old as civilisation itself. The Eisteddfodau of the Welsh and the gathering of the Clans on the Braes of Mar were doubtless a survival of competition. He admitted that art competition properly conducted, and entered upon in a proper spirit by those concerned, undoubtedly accelerated art progress. Excellence in any branch of art, however, presupposed a life's devotion; and a man to judge of such excellence must not only have been born with the art instinct, but his natural perceptions must have been quickened by travel and his knowledge extended by much study. If a public competition took place in a great commercial city for a building, or a statue, or a mural painting, there could not be many men in that city capable of pronouncing on the merits of the various works, and it might happen, and in fact did happen very often, that these men were out-voted by a parcel of well-meaning but unhappy busybodies, which spoiled all. Mr. Robertson continued—"We have something of this kind happening at the present moment in Manchester. The city magnates of that great centre of manufacture were fortunately successful in securing a fairly good design for their Town Hall, and now that that hall is finished, they naturally wish the walls decorated with appropriate paintings. Well, first we heard of one set of artists being engaged, and then another. At one time distinguished Englishmen were to be employed, at another distinguished foreigners; and so it has been going on for many months, and the Corporation seems as far from decision as ever. I have no doubt that the souls of the few righteous men of Manchester whose opinion is worth anything are being periodically vexed by the babble of a set of most unconscionable and irrepressible Philistines." He was far from saying that art competitions were prejudicial to art progress; but it was our duty to free from all unnecessary restrictions what was evidently a law of our nature. Set all art contests open and free; let the judges be the most cultured men within the city, whether they were poor or rich; and if an expert from afar was within reach, the circumstance that he was a stranger should prove no bar to the acceptance of his services. Above all, the interests of the citizens at large should be enlisted, and the general community should be educated up to feeling that they had a stake in what concerned the adornment of their cities, and the art success of their children. A brief discussion followed, in which Mr. E. M. WARD, R.A., took occasion to defend the Royal Academy from certain strictures passed upon them by Mr. Robertson, and to express the opinion that if well-known names were selected as judges of competitions the issue would be the same.

ART FURNITURE AND BRIC-A-BRAC.

Mr. STATHAM read a paper entitled, "Is the Prevalent Taste for Art Furniture and Bric-a-brac Indicative of a Sound and Æsthetic Culture?" The paper was an onslaught on the prevailing taste for crockery, fancy dresses, imitations of the Queen Anne style, &c.

Mr. T. S. MILLS said that art from one point of view was the endeavour after perfection of execution, and what was truly workmanlike was almost always artistic. Such a thing as art furniture, as a separate species of materials, did not exist. We might as well ask a boot-maker for a pair of art boots. Indolence of mind, combined with the love of show, was at the bottom of this. It was a common phrase that art was not confined to sculpture and painting, but should be shown in all the objects collected in a room, and aim at the totality of effect. This was to bring down painting and sculpture to the level of furniture, instead of looking on each work of fine art as a poem in itself. He deplored that style of painting in which all meaning was eliminated from a picture, which, in consequence, sank to a piece of decorative furniture. Mr. ARCHISON could not assent to the view that if we had a fine picture or statue it was no matter what the rest of the room was filled with. If our perceptions were so blunted that we could endure ugliness around us, was it likely we could appreciate the exquisite qualities of works of fine art? In the discussion which followed, and in which Mr. Ward, R.A., Mr. J. F. White, Mr. Robertson, and Mr. W. C. Dalrymple took part, the opinion was maintained that the practice of sticking china plates over the walls of rooms was a barbarism.

BEAUTY NOT INCOMPATIBLE WITH LABOUR.

Miss BURTON, of Edinburgh, read a paper on "Beauty not Incompatible with Labour." She contrasted the condition of the mining villages in Scotland and England with the picturesque mining districts of the Hartz Mountains, and pointed to the difference in the dress of the miners as proving the title of her address. She was afraid that the secret of our want of feeling in this matter was due to the fact that we were ashamed of work.

Miss LYDIA BECKER said she did not attribute the ugliness which characterised the dressing of our working classes to any shame of work. She added: There was something in the fact that when important work was to be done a uniform dress increased the spirit of the workers. Probably the army would not be so attractive as it was but for the uniform. It was a matter for regret that the characteristic uniforms of the country were dying out and being substituted by the present very common dress which both for men and women was undesirable. For women it was highly inconvenient, unwholesome, and unbecoming; but men had secured a certain amount of conscience at the sacrifice of a great deal that was becoming. In the manufacturing districts great obstacles to beauty were coal smoke and chemical vapours. She thought ascetic and gloomy opinions on religious matters had something to do with our want of the sense of beauty, and that the love of dress in women itself was to be regarded as evidencing a sense of beauty, and should not meet with denunciation at the hands of men as it did. Of course a sense of fitness should guide women in this matter; but if they took the men at their word, and made frights and guys of themselves, she thought men would soon be glad to have all the finery back again, with all its evils.

ART IN THE HOUSE.

On Monday, in the Art Section, Mr. John Forbes White read a paper entitled, "How can Art be best introduced into the Houses of Persons of Limited Income?" Mr. WHITE commenced by observing that art cannot be introduced into houses like water and gas. In one and the highest sense, it must be already in the house, seeking only how it can best manifest itself and clothe itself in visible form. He would attempt to show that there was not a room of the humblest mechanic that might not be made a beautiful home. How was this to be attained? By using their eyes. They must learn to enjoy the beautiful things around them in everyday life, to note the beauty of the passing cloud and of the world of colour at their feet. By noticing the relation of the component parts, of the landscape, the harmony of form and colour, and the distribution of light and shadow, all uniting to make up one whole, they could come to understand what the greatest artists had put before them in their representations of the breadth and simplicity

of nature, as well as of its variety, subtlety, and mystery. As Mr. Ruskin had well said, "all judgment of art finally finds itself on knowledge of nature." If to this careful study of nature they added, as they had opportunity, an equally careful study of the best of the old masters and of the best workers in every material, they would gradually arrive at some knowledge of whatever was best in art. His first suggestion was as to the colour of the walls—which should be in tertiary hues. Here science confirmed all we had learned in our study of nature, which was so sparing in her employment of bright colours, using them only as enrichments. We should be shocked if we saw a gaudy background in a picture, and yet we were content to live in rooms so hideously painted or papered that even our ladies' complexions were robbed of their beauty by the background against which they were set. As this was demonstrated by science, our ladies should look to it, and prefer a colour that will enhance rather than destroy their good looks. The ceiling should receive special attention. If it could not be decorated it should at least be toned to a pleasant colour. The use of gold should be sparing. When used in masses it became vulgar. Here, as in many other parts of domestic arrangement, economy and good taste went together. In furniture, he insisted on simplicity and suitability. Regarding the floor, they should remember that it was a plane surface, and we should not in our carpets go in for elaborate effects of light and shade. There should be no representation of objects in relief, to make us feel as if we might trip over a bunch of roses or a heap of ferns. Curtains might be plain enough if the materials and colours were well chosen, and they could be best and most cheaply hung from a brass rod, as in the old times, to modify the light and exclude drafts. The gilt valances that were so common were both ugly and costly, and a mere make-believe. As to introducing things of beauty into such a household, everything must depend on the amount that could be prudently expended; but whether that was much or little one principle should guide them—that what was selected should be best of its sort, avoiding everything that was an imitation of what it was not, or which did not in its own department reach a high degree of excellence. Plaster casts, coloured wood-cuts and autotypes were strongly commended. Etchings were rapidly taking the place of line engraving. To the matchless and incomparable Bewick we owed the revival of the art of engraving on wood. He referred to the illustrations of the *Illustrated London News*, *Once a Week*, *Punch*, the *Graphic*, the *Cornhill Gallery*, and even the *Band of Hope*, which often contained wonderful productions. He also called attention to the revival of the art of pottery, and the establishment of Messrs. Doulton, at Lambeth, as affording means for the acquirement at a cheap rate of many articles of domestic use of a highly artistic character.

Mr. WARD, R.A., expressed his obligations to Mr. White for his very admirable paper, and congratulated the people of Aberdeen upon possessing among them so able an expositor on art subjects. There was one point which had struck him, and that was the importance that artists of eminence in this country should aid in forwarding the general object by doing practically what Flaxman undoubtedly did in assisting Wedgwood to make his admirable designs for his ware. Raphael and Michael Angelo did not disdain to assist decorative art, and he did not see any reason why our modern painters should refuse to do so. He was glad to say that there was a very good opportunity of restoring the art of tapestry in this country, and he trusted that it might be the nucleus of a great movement in the right direction. A gentleman—a very skilful artist in his way—of the name of Henry—a Frenchman by birth, but, from long residence in England, with a strong feeling for his adopted country, had brought over a number of skilled artists from France, with a very able director at their head, and they were now engaged in a small studio in executing tapestries after designs of an English artist for the ensuing great Exhibition in Paris. There were also executed, after designs of the same artist, several pieces for the Queen and other mem-

bers of the Royal Family, and her Majesty felt so strong an interest in the matter that she had bestowed a valuable piece of ground belonging to the Royal domain on which was to be erected the future manufactory. It was the intention of Mr. Henry to select English boys who showed any art talent, and have them educated under the French director, so that the fabric should ultimately become strictly English, as was formerly the case at Mortlake, the only instance in this country where any effort had been made in the manufacture of tapestry. He felt so strongly on this matter that he had determined to execute designs for three pieces of tapestry himself, in the hope that some well-known artists might be induced follow his example. He was glad to be able to mention among the supporters of this scheme the names of Prince Leopold, the Duke of Westminster, and Sir Richard Wallace, and their noble chairman had consented to act as honorary secretary. Mr. Ward concluded his remarks by referring to the colouring of the walls in which they were now assembled as one of the worst specimens in that way he had ever seen. At the same time, he congratulated the college on the many fine pictures which he had had the happiness of seeing in one of their rooms, and which merited better treatment and a better position than they had hitherto met with. He was glad to say that the walls required no other restoration than that most simple and harmless one—soap and water.

HOUSE ACCOMMODATION IN RURAL DISTRICTS.

In the Health Department the question set down for discussion was—"The present state of house accommodation in rural districts. Can its evils be remedied?"

Dr. HAVILAND introduced the subject. He stated that he was an officer of health in Northamptonshire, the area over which he had charge extending to about 1,000 square miles, and having 365 towns and villages within it. Great misery was to be witnessed in consequence of the wretched dwellings, for which he thought the landlords were to blame. He would have the houses improved by the proprietors, and was in favour of Government loans being given for the purpose. He would abolish piggeries, as they generally existed at present in connection with country cottages, and would allow no pig to be kept without a licence being obtained from some proper authority.

Principal BROWN, of the Aberdeen Free Church College, pointed out that Dr. Haviland's statements chiefly referred to England, and suggested that before the discussion was begun they should hear something about the circumstances of Scotland in regard to this matter.

The Earl of ABERDEEN, who entered the room while the Principal was speaking, was briefly informed by the President of the position of the discussion. His lordship once remarked upon one point as to which there was great diversity of opinion—namely, whether country cottages should be of one or two stories. In Scotland the custom of the people was against an attic story, which they usually converted into a loft for storing purposes. He believed there was no intrinsic objection to having all the rooms upon the ground floor if sufficient accommodation could be provided. He had generally adopted ground-floor cottages.

AIR SPACE IN COTTAGES.

Dr. STEVENSON MACADAM, Edinburgh, then read a paper, in which he dealt mainly with air space that should be provided in cottages, and with the water supply and drainage that should be provided for them. To give 500 cubic feet of air for a family of six persons it was necessary to have a house 24ft. long, 16ft. broad, and 8ft. high interiorly. No cottage should have less than that. Then the air should be constantly replenished from the outside, so that there should not be stagnation or starvation of air, and the people should be instructed upon these points. At night room-doors should be left open, and the curtains should be drawn back from beds. He did not care for artificial systems of ventilation, which were sure to go wrong. As to drainage, a gravelly site should be selected for the house, and slop water should not be thrown upon the ground to sink near a

well. To prevent damp walls, there should be a layer of pitch at or immediately above the surface of the ground. The rooms should be lathed and plastered, and whitewashing should be adopted in preference to covering the interior walls with paper. Pure water should be obtained from a running stream, and if there was a closet it should be on the dry system. In the rural districts, to allow of the sick being properly cared for, there should be cottage hospitals.

Mr. CHADWICK, the President, mentioned that in two-story cottages it was often found that the lower flat was let, or that the upper one was unoccupied. His father-in-law had built good cottages in a Scotch glen for some of the families, but he found on coming back that the upper story was occupied as a roost for the poultry, and the goodwife said, "Jock couldna be fashed gaun up the stairs after he was tired." He said the walls should be dry and washable.—Dr. HAVILAND submitted a resolution as to some legislative action to enable, if not to compel, landlords to build cottages.—Rev. Dr. McLEOD, Birkenhead, while agreeing with this suggestion, and admitting its necessity, as he had seen his people in houses unfit to live in, remarked that landlords could not be expected to build houses that would not yield a fair return for the capital invested, and therefore it was really desirable to see if they could suggest some way by which the rural population could earn higher wages so as to be able to pay better rents.—The EARL of ABERDEEN said the rev. gentleman had hit the real point. It was certainly difficult to get proper cottages erected, as after they came to be occupied defects were found in the building or its surroundings, and much money was wasted. He had tried wooden cottages—the cost not being quite two-thirds of that of stone and lime—and the experiment promised to be successful, especially where there were changing circumstances connected with the land. A lining of 6in. of sawdust in the walls made the interiors dry and warm. He did not think a landlord should be compelled to erect cottages, but he should be enabled to do so by borrowed money.—The discussion was continued by Principal BROWN, Aberdeen Free Church College, and Mr. W. PAUL, advocate, Aberdeen, the latter maintaining that the suggestions made about legislation were impracticable.—After the adjournment for luncheon the Earl of Aberdeen presided, and the following resolution was adopted:—"That this meeting is of opinion that the Standing Committee of this department should take into consideration what further legislative measures are necessary for the extension and improvement of the house accommodation for the rural population, and report to next annual meeting." It was understood that this would include inquiry as to accommodation for unmarried ploughmen.

THE TAY BRIDGE.

ONE of the most notable triumphs of modern engineering is achieved in the completion of the construction of the Tay Bridge, which carries the North British Railway across the Frith of Forth. The project has repeatedly been brought forward during the past thirty years, but it was not till 1871 that the work was commenced. The history of its execution, which we take from the *Scotsman*, is interesting as a record of engineering difficulties overcome by persistent perseverance and high professional attainments. The plans were originally prepared by Mr. Bouch, C.E.

What with the novel and extensive character of the undertaking, and the arduous conditions under which it had to be carried out, the bridge has taken longer to build than was at first anticipated. In the outset the operations were necessarily to a certain extent of a tentative character. When one difficulty after another had been overcome, steady and rapid progress began to be made; but still the ever-varying contingencies of wind and weather remained to be dealt with; and we believe that a detailed account of the practical problems which arose at various stages, and the manner in which, under the superintendence of Mr. A. Grothe, the resident engineer, professional skill was brought to bear on their solution,

would form a most interesting chapter in the history of modern engineering. At the point selected, about a mile and a-half above Newport, the river has a breadth of nearly two miles, its depth at high water of spring tides attaining a maximum of 45ft., and the velocity of its current ranging up to 5 knots an hour. To bridge this formidable stretch of water the engineer had planned a structure of 85 spans, which, as now realised in brick and iron, presents a noteworthy example of the purpose-like adaptation of means to ends. The spans vary in width from 67ft. to 245ft., those of the largest size, to the number of thirteen, being placed over the navigable part of the river. In this central section, where it is necessary to provide for the passage of such shipping as frequents the ports of Newburgh and Perth, the bridge has a clear height of 88ft. above high-water mark, from which it slopes down to the Fife side with a gradient of 1 in 356, and towards the Dundee end, where it takes a curve to the eastward, in order the more conveniently to join the land line, with a gradient of 1 in 73. The spans are formed of wrought-iron lattice girders, and the supporting piers in some cases entirely of brickwork, in others of a combination of brick with iron columns.

It was, of course, mainly in the construction of the piers that the special difficulties of the enterprise were encountered. The system adopted was no less remarkable for effectiveness than for its extreme simplicity. Without any elaborate apparatus of coffer-dams or wooden staging, workmen were enabled to operate under water, or at great heights above it, the work itself being ingeniously turned to account as a means of facilitating its own progress. Commencing from the south end of the bridge, it was found that for a considerable distance a foundation of rock could be reached at the depth of from 10 to 15 feet below the river bottom. Here, accordingly, it was decided that a sufficient substructure would be provided for each pier by sinking to the rock two cylinders of iron and brick work, with a diameter of 9 feet 6 inches. These cylinders were built on shore in such lengths as would reach from the rock on which they were intended to rest to a point above low-water level. Each consisted of a cast-iron shell, with a lining of brickwork set in Portland cement, leaving inside a central shaft, 3 feet 6 inches in diameter, through which workmen might pass up and down. The absence of brickwork from several feet at the bottom left that portion in the form of a round chamber with iron walls; while above the brick lining the iron casing was continued, so as to constitute an air-tight compartment of considerable size. Two cylinders thus constructed were connected by means of a wall of brickwork about 3 feet wide, thus placing a space of 12 feet between their centres. The whole being then made fast to a system of strong iron girders, barges were introduced at low water underneath the girders, so that when the tide rose, the ponderous mass, weighing, it might be, as much as 120 tons, was lifted bodily and quietly floated out into the river. Having been towed out to the site of the intended pier, the cylinders were lowered by hydraulic apparatus till they rested on the river bottom. The top of each having been closed, air was blown in by means of a steam pump the result being to force out all water which had entered below, and leave the interior dry. This pumping in of air was continued while workmen, descending the internal shafts, excavated the material from beneath the cylinders, and so caused them gradually to sink till they reached the rock, in which a level bed was cut for their permanent resting-place. The upper iron chambers were then removed, and the interior of the cylinders filled with concrete to the top of the brick lining—being just above low-water mark. From this point the work was continued, by bringing men and material in barges alongside, till it reached, in the form of a solid brick pier, the level of high-water, where it received a course of Carnylie stone, showing externally on the cylindrical columns as slightly projecting rings. Meanwhile, the double girder intended to form the span had been getting built on shore, to be, when completed, floated off by the same simple device as was adopted in the case of the cylinders. A couple of piers having, in the manner described, been brought

up to the high-water level, the girder was floated over them, allowed to sink on the receding tide till its ends rested on the masonry. When this had been accomplished, nothing remained but to raise the girder by hydraulic appliances in short lifts of 2 feet at a time; while the brickwork of the pier was carried on *pari passu*, so to speak, by men planted on light scaffolding suspended from the girder.

At the fourteenth span it was found that the rock suddenly shelved away to a great depth under beds of clay, gravel, and sand. To continue sinking the piers to that foundation consequently became impracticable, and a method had to be resorted to which would give equally secure foothold in one of the overlying beds. On the one hand, the weight of the pier had to be lightened, and this was done by the substitution, in the upper works, of iron columns for masses of solid brick; while, on the other hand, the adoption for each pier of a single oval cylinder, measuring 23ft. 6in. by 13ft. 6in., ensured a larger bearing surface than had been obtained by the use of two smaller ones. The cylinders were, as formerly, constructed on shore, and on the same system as those above mentioned, with the exception that the outer casing was of malleable instead of cast iron. These large masses were then duly floated, towed out, and lowered to the river bottom; and when they had been got into position the sand underneath was removed by means of a sand pump contrived for this special purpose by Mr. Reeves, one of the assistant engineers. This apparatus consists of iron tanks connected with ordinary air-pumps, and having flexible pipes running down to the river bottom, where the ends have to be manipulated by divers. When, by working of the air-pumps, a vacuum has been created in the tanks, a current of water and sand rushes up through the pipes, the sand sometimes being in the proportion of one-third of the total quantity raised. By this process a large cavity was speedily formed under the cylinder into which the mass sank by its own weight; and the operation being continued till it reached the gravel at the depth of about 18ft. below the river bottom, any remaining sand was carefully cleared out, and the interior of the cylinder filled to the top with concrete, while a mound of rough stone was deposited around its base to give protection from the scour of the current. The upper part, so far as it stood above the bottom of the river, was next removed, thus leaving an ample platform of artificial rock for the reception of the superstructure, which consisted, to begin with, of a mass of brickwork, in the form of an elongated hexagon, measuring 20ft. by 10ft., and placed with its greater length in the direction of the current. This part of the pier was likewise put together on shore and floated out between barges in a length of about 20ft., being sufficient, when placed upon the cylinder, to reach above low-water mark. In order to keep down the weight to be lifted, these masses were, in the first instance, built hollow. When placed in the river the interior was filled with concrete so as to confirm the solidity of walls whose brick and cement, without any assistance from iron bracing, had been found to hold together with perfect tenacity.

From the low-water level the pier was formed of solid brickwork, built in the ordinary way by workmen brought alongside as the state of the tide would permit; and at high-water mark four courses of Carnylie stone, of an aggregate thickness of 4ft. or 5ft., finished off this portion of the work. The piers of 14 spans were founded in this way, their upper works being formed of iron columns of 15in. and 12in. diameter, arranged on the hexagonal basement in the same manner as those of the great central section of the bridge, now to be described. In dealing with the navigable channel, it was necessary to increase the length of the spans, and, this involving an increase in the weight of the girders, the foundations of the piers had to be correspondingly enlarged. For the oval cylinder a round one, 31ft. in diameter, was here substituted, the hexagonal mass of brickwork rising to high-water mark having its dimensions increased to 27ft. by 16ft. The piers having been brought to that level, the girders, measuring for this section 245ft. in length, and weighing 190 tons for each span, were towed out and deposited upon them in

the manner already indicated. The hoisting of these girders to their ultimate height was, however, a much more serious operation than in the case of the smaller spans; for, not to speak of the greater weight to be raised, the process had to be performed in much longer lifts. The cast-iron columns forming the upper part of the pier were, in the first instance, built up to their full height. These columns are for each pier six in number, corresponding to the angles of the hexagonal basement, those placed at the ends which look up and down the river measuring 18in. and the other four 15in. in diameter. Cast in lengths of 10ft. they were securely bolted together and made fast to each other by strong vertical and diagonal braces, forming for each pier a sort of composite column with a bearing power such as would hardly be imagined from its comparatively light appearance. When the piers had been completed the raising of the girders was commenced, and carried on, in lifts of 20ft. at a time, by hydraulic apparatus placed upon stages bolted between the columns. To the north of the deep-water channel the foundations for the piers had still to be laid on gravel; but the spans here being shorter, and the upper works consequently lighter, it was deemed expedient to revert to the double-cylinder system pursued on the south side, with this difference, that the cylinders were made of the considerably greater diameter of 15ft. The work was continued to high-water mark in much the same manner as in the central section, and the upper part of the pier formed, as for the large spans, of six coupled columns, the diameter of these, however, being again reduced to 12in. and 15in., so as to preserve a due relation to the weight to be carried. In the curved portion of the bridge, where it nears the north shore, a different arrangement of columns was resorted to, and a series of stays put down on the west side to resist the outward thrust of trains going round the curve.

The girders forming the upper part of the bridge, of which two, connected by transverse braces, go to each span, have been made of various depths, according to the width of the space to be crossed. In the case of the thirteen large central spans the depth is 27ft., and here, in order to secure the greatest possible amount of clear space underneath, the railway has been carried along the lower member of the girders, which accordingly stand, by their entire depth, above the other sections, where the line runs on the top of the girder, and present, when seen in perspective, something of the appearance of a tubular bridge. On either side of the navigable channel, where the length of the spans diminishes towards the north and south sides of the river, the depth of the girders is correspondingly decreased, reaching at the shore ends a minimum of 12ft. At one point, near the north shore, where provision had to be made for the extension of the Esplanade, a span of 160ft. is crossed by a bowstring girder. In order to provide for expansion by heat, which, it is calculated, will amount to something like 7ft. in the whole length of the bridge, the girders have had to be so adjusted to the piers as to allow a certain amount of free play. They are accordingly arranged in sets of four, the girders composing each set being connected together, but the outer ones standing clear of the set next in order at either end, so as to admit of self-adjustment at twenty-one different places over the length of the bridge. To the pier which comes in the centre of a set the ends of the girders meeting there are bolted down; but at the other piers the girders merely lie upon rollers over which they can slide longitudinally when expansion or contraction takes place, lateral motion being provided against not only by the weight of the girder, but by projecting flanges on the rollers fitting close to both sides of the bed plates on which they rest. The open lattice-work of the girders offering comparatively little resistance to wind, there is no such tendency to sway sideways as might perhaps have been expected. The Tay valley is well known to be exposed, not only to severe easterly gales, but to heavy blasts from the western mountains; and during two years remarkable for the frequent recurrence of boisterous weather, it has been impossible to observe the slightest movement produced by wind in any of the girders which had been

deposited on the top of the piers, even when only resting on the temporary blockings which afterwards gave place to the more secure rollers. In regard to its bearing capacity, again, the bridge has been calculated for a rolling load of $1\frac{1}{2}$ ton to the foot run. Under such a burden, which is more than could be brought upon any span by filling its whole length with loaded goods waggons, no part of the structure would have to undergo a strain of more than 4 tons to the square inch; and when it is borne in mind that the iron is actually capable of sustaining a strain of 21 tons to the square inch, it will be seen that there is an ample margin of surplus strength to come and go upon. For the railway the girders afford a surface 15ft. wide, being ample space for the single line to which it has been deemed expedient to restrict the undertaking. In forming the road the first step was to lay down cross sleepers of creosoted timber, measuring 12in. by 9in. in the section. Over these were placed longitudinal sleepers to receive the rails, the remainder of the flooring being laid with substantial planking covered with asphalt, to prevent the wood catching fire from the ashes of passing engines. In order to obviate the possibility of trains getting off the metals, each rail is furnished with a guard, the two being laid in substantial double chairs; while, for behoof of those who may have occasion to walk along the track, each side is furnished with a handrail, which at the same time answers the purpose of a gas main.

During the six years that have been occupied in its construction, the bridge, as above hinted, has had a somewhat eventful history. The work having been contracted for by Messrs. De Bergue and Co., London, in May, 1871, the foundation-stone was laid, in the land abutment at the Fife end, on 22nd July of the same year. On 20th October following, the first cylinder was floated out; but it was not till August, 1872, that the works on the north side were commenced. Slowly but steadily pier after pier and girder after girder were got into their places in the face of difficulties and dangers significantly illustrated by an accident which occurred in August, 1873. A pier was then in process of being sunk to the rock, and six men were at work in its bottom chamber digging out the sand and gravel of the river-bottom, when, through some unexplained mishap, the upper part of the cylinder burst, and the water rushing in, drowned all the poor fellows where they stood. Considering the character of the work, the wonder is not, perhaps, that such a disaster should have occurred, but that, by care and foresight, operations of such magnitude, and extending over such a length of time, should have been carried through with, comparatively, so little loss of life or personal injury. In May, 1874, the death of the principal partner of De Bergue and Co. led to the transference of the contract from that firm to Messrs. Hopkins, Gilkes, and Co., Middlesboro', by whom it has since been prosecuted with characteristic energy. Thanks to the experience gained in the earlier stages of the work, it has, during the last three or four years, been possible to make more rapid progress. As many as 600 men have latterly been employed upon the bridge; and, while in the summer twenty hours out of the twenty-four were turned to account by working two shifts of ten hours each, the electric light was taken advantage of during the long nights of last winter to push forward the operations on shore. The last of the great 31ft. cylinders was floated out on 26th December, 1876, and at that time it was confidently anticipated that the ensuing summer would witness the completion of the work. With February of the present year, however, came another serious accident, which necessarily occasioned considerable delay. During an exceptionally heavy gale, two of the large girders, which had been raised to the top of the piers, but were still hanging in the lifting gear, were blown down, carrying with them a portion of one of the piers. While entailing serious loss, both of time and money, this disaster had, on the other hand, a reassuring effect in calling attention, so pointedly as it did, to the perfect stability of that portion of the bridge to which the finishing touches had been given.

Of the subsidiary works necessary to render the bridge practically available, the south connection consists of five miles of railway, form-

ing a junction with the North British line at Leuchars station. This part of the undertaking does not seem to have involved any special difficulties, the cuttings and embankment being mostly of moderate dimensions, and none of the fifteen or sixteen bridges exceeding a single span. Laid with two sets of rails, the line is now so far completed as to admit of waggons being run from Leuchars on to the bridge, though a good deal has still to be done, more particularly towards the north end, in the way of ballasting and trimming. From the south end of the bridge another railway is to be carried to Tayport; but with this line, which runs along the hillside overlooking the Frith, and passes through the south part of Newport, only a beginning has yet been made. Passing to the north side of the Frith, we find that the bridge joins up to a land viaduct, which, after crossing the carriageway of the Esplanade with a bowstring girder, runs on with a falling gradient, through a series of over thirty brick arches, to the embankment which the company has reclaimed from the foreshore, and which carries the railway into its Dundee station, a little to the west of the Ferry Pier. By the time it reaches the station the line has sunk considerably below the general level of the ground thereabouts, and immediately to the eastward it plunges into a tunnel in which it is carried alongside of the docks for a distance of 700 yards, when it emerges to form a junction at the East Station with the Dundee and Arbroath Railway. In glancing over these works we noted that all along the viaduct and embankment the permanent way is still rather rough—a gang of workmen being, however, employed in getting one line of rails down, to be ready against the opening. The passenger station—a substantial brick building with iron-roofed sheds, has made considerable progress, but some months must evidently elapse before it and the goods station, another brick structure immediately to the southward, can be got ready for occupation. The scale of the latter building, it should be added, is commensurate with the extent of siding accommodation which the company will here command when they have reclaimed the whole area that has been acquired for the purpose—an area which looks sufficient to receive the whole rolling stock of the North British Railway. The tunnel, which forms the connection with the Dundee and Arbroath line, has been formed as an open cutting, and afterward covered in. The walls are of substantial brick work, and the roof presents a series of transverse iron girders, placed at regular intervals and having the interspaces filled in with brick arching. The work seems complete, except that the permanent way has yet to be laid down, and some excavation and building to be done at either end. On the bridge itself workmen were last week engaged in placing the last of the rails and completing the woodwork. A portion of the planking remained to be laid and there were still some gaps in the handrail, but all was got into good form in time for the preliminary inspection with which the directors have anticipated the public inauguration of the bridge.

On Monday the foundation stone of a new Presbyterian church and school was laid at Houghton-le-Spring. The church will be a Gothic building of the fourteenth-century style, with a tower 100ft. high. The plans have been prepared by Mr. W. Lister Newcombe, architect, of Newcastle. The contractor are Messrs. Robinson and Tremble, of Hutton-le-Hole, with Mr. L. Wilford as clerk of the works.

The workmen—about 100 in number—employed on the construction of the new barracks at Richmond, North Riding, were on Friday evening entertained at supper at the Talbot Hotel. Mr. Truman, the engineer, presided, and after other toasts gave "The Workmen." Mr. Etherington, in responding, congratulated those present on the fact that no serious accident had occurred during the construction of the barracks, which would be a favourable comparison with any in the kingdom for workmanship.

The foundation stone of the Episcopal Church of St. Modoc, in course of erection near Woodside, Doune, N.B., was laid on Saturday. Mr. James Brooks, of Wellington-street, London, W.C., is the architect, and Mr. William Jones, of Doune, the builder. We gave a perspective view, plan, and description of the church on June 30th, 1876 (Vol. XXX., page 685).

COMPETITIONS.

BOLTON.—To-morrow (Saturday) designs will be received by the Town Clerk of Bolton for a new museum. Premiums of £50 and £35 are to be awarded.

CLIFTONVILLE, BRIGHTON.—The newly-formed School Board for Hove are about to erect their first school, and have selected a site for this purpose in Ellen-street, Cliftonville. Designs will be sent in under motto on Monday next. The chief requirement is to provide for a large number of infants besides the boys' and girls' schools, and this has to be done with one-story buildings chiefly, and on a rather limited site for the purpose. The buildings are to be of brick.

COVENTRY.—A new hotel is to be built at Coventry, at a cost of £5,000, and those who have responded to the offer of the projectors—viz., £30 for the accepted design—are to forward their drawings on Monday, Oct. 1st.

KENSINGTON.—The vestry-hall competition is so far settled that the premiums have been paid within the last few days to the authors of the designs selected by the vestry. The premiated designs have, however, been referred to a committee to consider as to what further steps should be taken with a view to obtaining designs that will meet all their requirements both as to accommodation and cost. The other designs it was determined to return "carriage paid." All we can say is, that if the vestry and their committee were unable to select a design out of all the 65 sets which they received in competition, some of which were of exceptional merit, they can scarcely be equal to the task which, with all the expenses already incurred, is still before them.

MANCHESTER.—An important competition is now in progress at Manchester. Designs were sent in on Wednesday last for new baths and wash-houses on a rather extensive scale, to be built by the corporation. Premiums of £200, £100, and £50 are offered, and several well-known architects in London have sent in designs.

NEWCASTLE.—Ten competitive designs for the new Byker School have been received by the Newcastle-on-Tyne School Board. The estimates of cost ranged from £5,485 for materials in brick, or £7,025 for stone, to £9,500 for brick and £10,000 for stone. The committee recommended that the three premiums of 30, 30, and 10 guineas be respectively awarded to the plans marked "Epsilon," "Labor omnia vincit," and "Common Sense." The report has been adopted; and the author of the first-mentioned design was appointed architect for the school. The estimates of the three competitors were as follows:—The first, the lowest already quoted; the second, £7,500 for brick or stone; the third, £7,600 for external walls of stone and internal of brick. The successful design is by Messrs. Austin, Johnson, and Hicks; the second, by Mr. Thomas Oliver; and the third, by Messrs. Oswald and Sons.

READING.—A new town hall and free library, with museum and school of art, are about to be erected at Reading. Designs will be received on November 1st, and the premiums offered are £150, £100, and £50 for the three best designs.

The plans of Mr. Angell were accepted by the Southend-on-Sea Local Board, on the 18th inst., for the pier extension and new tram pier, so far as they relate to that portion south of the offices, and Mr. Angell was instructed to furnish detailed plans with regard to the offices themselves. At the same meeting Mr. Storey, surveyor to the board, was requested to furnish the members with specifications and estimates of the cost of a new landing pier eastward of the present one (plans for which were shown), in wood, iron, and concrete.

Messrs. Beanland, of Bradford, have entered into a contract with the Engineers' Department, War Office, for the erection of new infantry barracks near Fulford, York, at an estimated expenditure of nearly £150,000.

An appeal is being made for aid in the restoration of St. Mary Coslany, Norwich, one of the handsomest parish churches in the diocese, the roofs and walls of which are in such a state of dilapidation that unless repairs be speedily effected the fabric will become a wreck. It was recently said that half the seats had been destroyed by dry rot, and these have been replaced. Why have the churchwardens allowed the church to fall into such a condition of neglect?

Building Intelligence.

BROCKLEY.—The new Wesleyan chapel was opened on Tuesday, the 18th instant, by the Rev. Dr. Pope, the new president of that body. The chapel is in the Brockley-road, at the corner of Harefield-road. The building is in the Gothic style, built of Kentish rag, with Bath stone dressings, and comprises chapel, capable of sitting 1,016 persons, 2 vestries, lobbies, &c., organ gallery and practising room for singing, large vestry in mezzanine, lofty schoolroom with two large class-rooms, kitchen, with coppers, heating chamber, &c. The architect is Mr. Banister Fletcher; the builder, Mr. Bishop, of Reading, Berks.

CARDIFF.—Plans have been submitted to, and approved by Lord Bute, for the development and improvement of the whole of the land belonging to him on the west side of the river Taff. Park-street will be widened 20 feet by throwing land from the park into it. An iron girder bridge of similar width (60ft.) will be thrown over the river Taff, and a street on a line with Park-street will be carried along on the other side of the river. A promenade, planted with trees and shrubs on each side, will extend from Coldstream-terrace to the Great Western Railway bridge, and the houses to the south of Brook-street are to be built on three sides of the square only, the space between being laid out as an ornamental flower garden. The desire of Lord Bute is to make the new district one of the handsomest in design and architecture in the town.

EDINBURGH.—It is proposed to convert the Edinburgh Theatre, in Castle-terrace, into a new Synod Hall and Theological College for the United Presbyterian Church. According to Mr. Dick Peddie's plans, which are as yet only in a provisional form, and liable to alteration, the central portion of the block is to be appropriated for the Synod Hall. While it is proposed to take out a great many of the internal partitions, as well as the flooring and galleries of the theatre, the architect is of opinion that the external walls and almost the whole of the thick internal walls should be retained, as in this way space can be found for a hall of ample dimensions. Whereas the whole area of the Free Church Assembly Hall is 8,648 square feet, and of the part thereof devoted to the Court 3,120 square feet, the Synod Hall shown on the sketch plan presents an area of 7,230 square feet, or adding 3,014 for gallery, a total floor space of 10,244 square feet, of which the portion proposed to be allocated to the Court measures 3,672 square feet. The whole floor space attainable is thus 1,596ft. more than that of the Free Assembly Hall, while the area available for the Court is 552ft. larger. The cost of the proposed alterations and additions is estimated at £10,000.

LINCOLN'S INN.—The work of reconstructing the buildings comprised in Lincoln's Inn, from the designs of Sir Gilbert Scott, R.A., is being carried forward. At the present time the operations in progress are the rebuilding of the block of chambers of Queen Anne date adjoining Chancery-lane, next the Law Institution. These buildings are generally to resemble the other new work of Early Tudor style, with projecting bays and oriels, and like them to be in red brick, with bands of black bricks and freestone dressings. At present they have scarcely reached the first-floor stage, having been nearly at a standstill during the past six weeks, owing to the masons' strike. Mr. Shaw, of Westminster, is the builder. The great hall, built 30 years since, from Mr. Philip Hardwick's designs, is undergoing repairs and renovation, the work being entrusted to Messrs. Patman and Fotheringham, of Theobald's-road. The scaffolding has just been removed from the central lantern, which has been regilded, painted, and varnished, &c. Mr. Kaberry is clerk of works for all the works now in progress.

LINGDALE.—New Board schools were opened in the mining village of Lingdale, near Guisborough, on Saturday last. They will accommodate 660 children, equally divided into three departments, and include two large school-rooms, four class-rooms, lavatories, offices, and large playgrounds, a portion of each being

covered in for use in wet weather. The premises are enclosed with ornamental iron fencing. The work has been carried out at a cost of £5,200, by Mr. Ellmer, builder, of Saltburn, from the plans and designs of Mr. Bewick, architect, of Lingdale.—Building operations are being carried out with rapidity in the village, about 500 houses having been built during this year and last.

LONDON SCHOOL BOARD.—On Wednesday the meetings of the board were resumed after the recess, when a return was presented, showing cost of the sites of schools purchased by the board up to March 24, 1877. This shows that upon that date the purchase of 112 sites had been completed, involving an expenditure of £433,575 5s. 7d. for purchase and redemption of land-tax, and a further sum of £60,562 10s. 8d. for surveyors' and solicitors' fees and scheduling. Upon these 112 sites (of which 7 are situated in the division of Chelsea, 10 in Finsbury, 10 in Greenwich, 17 in Hackney, 23 in Lambeth, 8 in Marylebone, 18 in Southwark, and 19 in the Tower Hamlets), school buildings have been erected or are in course of completion, accommodating 101,365 scholars. A second table shows the approximate cost of sites, for which the purchase accounts are not completed. They are 96 in number, distributed thus: In City 1, Chelsea 6, Finsbury 17, Greenwich 12, Hackney 13, Lambeth 19, Marylebone 4, Southwark 7, Tower Hamlets 13, and Westminster 4. The buildings upon them will house 71,549 children, and the expense has been thus far—for purchase and redemption of land-tax, £403,193 18s. 2d.; surveyors' and solicitors' fees on both sides and for scheduling, £117,182 5s. 7d. It thus appears that the 208 schools in the metropolis have on an average 831 scholars, and that the sites have cost, before the buildings were placed upon them, about £4,591 2s. 3d. each. At the same meeting of the Board, Mr. T. Boyce, of Eagle Works, Hackney, was authorised to enlarge the school in Stepney-street, Lisson-grove, by 346 places, bringing the total accommodation to 1,046 school places, at the contract schedule of prices. Playground extensions and teachers' rooms, &c., were ordered to be added to schools in High-street, Shadwell; Wolverley-street, Bethnal-green; and James-street, Camberwell.

MARSTON MONTGOMERY.—St. Giles's Church, Marston Montgomery, which has been restored at a cost of upwards of £2,000, was re-opened on Tuesday week. The church has been almost entirely rebuilt, and enlarged by the reconstruction of the aisle, which was taken down 200 years ago, and the addition of an organ chamber and vestry. Accommodation is now provided for a congregation of 200 persons. The chancel arch is notable as being the oldest piece of ecclesiastical architecture in Derbyshire. The work of restoration has been carried out from the designs of Mr. J. P. St. Aubyn, of London.

NEWMARKET.—All Saints' Church has been rebuilt as a memorial to the late Lord George Manners, the aspect being changed from N.E. to S.E. The style of architecture is English Decorated. It now seats 600 persons—double the former accommodation—and has cost £5,148. Mr. W. O. Chambers, of Lowestoft, is the architect (selected by a competition), and Mr. Tooley, of Bury St. Edmunds, the builder. The windows in the chancel and the centre light of the west window have been fitted with stained glass as memorials, and were designed and executed by Mr. W. H. Constable, of Cambridge. The subjects illustrated are the six principal events in the Life of Our Lord, and they are drawn and coloured in harmony with the style of the church—14th century.

SUNDERLAND.—On Monday the foundation stone was laid of the Museum and Library at Sunderland. The buildings will be erected in freestone, and will be nearly 200 feet in length, and 40 feet wide. The style is Classic. The principal entrance will be from the Borough-road front into a spacious entrance hall forty-eight feet long, and twenty-five feet wide. On the right and left of this hall are the museum and curator's room, library, librarian's room, reading room, and room for science and art classes. The committee-room is directly above the entrance hall. There are three rooms provided for the hall-keeper on the second

floor. It is intended to erect a winter garden on the south side of these buildings. The contract for the works has been let to Messrs. Allison, of Whitburn, and the building will be carried out under the superintendence of Messrs. J. and T. Tillman, architects.

WESTMINSTER.—A block of residential chambers to be hereafter known as Members-buildings, is being erected at the corner of Victoria and Chapel-streets. The angle yet remains to be built over, but the structure just roofed in consists of nine stories and a basement, each floor containing twelve rooms and offices. The architect, Mr. Butler, of Bedford-square, has given the buildings façades of Late Tudor character, with projecting bays on either side of central entrances. The windows are square-headed, with large transoms. The whole of the street frontages are executed in Tisbury stone. Carving is but sparingly applied, except in the cornices and pinnacles above the projecting bays. Features of the building are that all the ornamental cresting and pipes are executed in leadwork, no iron being used for decorative purposes, and that the internal fittings are all in polished sequoia wood, scarcely any paint or plastering being introduced into the structure. Five lifts, two for passengers and three for porters, are provided. Mr. W. Holt is acting as clerk of works.—The premises of the Army and Navy Co-operative Company, on the opposite side of Victoria-street, are being extended in Artillery-row, with a new frontage, similar to the older portion. A tower is being added at the angle, to give unity and emphasis to the building. Mr. J. T. Knowles is the architect, and Messrs. MacLachlan, of Clapham, are the contractors. Mr. William Knight is clerk of works.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published September 28 contains articles on Condensed Meat in the City of London, Disease and Damp Soils, The Social Science Congress, Domestic Plagues, The Parkes Museum of Hygiene, Public Health Reports, Sanitary Novelties, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Gleetings, &c. Price Twopence. Annual Subscription, Post-free, Eleven Shillings. 31, Tavistock-st, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C. Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 32f. 60c.). To India (via Southampton), £1 6s. 6d., To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

"BUILDING NEWS" DESIGNING CLUB.—Drawings received: Discreo Volo.—St. Lucy.—Triangle in Circle.—Unicorn.—L. S. D.—Hampton.—"Sketches by Boz."—Finem Respicere.—Susan.—Capio Lumen. Received:—George Udell, A. L. B. (The drawings of list No. 13, which were selected, will appear in due course.)—MEHLIN. (The drawings to which you refer shall be returned with your next.)—JOHN T. GROVES, J. HARRIS, EGBERT.

RECEIVED.—F. E. and Co.—H. P.—E. W.—J. H. M.—J. J. F. B.—G. R. L. S.—R. T.—T. R.—J. W.

F. R. TALLIS, GOTHICUS D. (The semi-circle arch is not in accordance with the principles of Gothic architecture, though instances of the employment of circular arches are met with.)—J. C. R. D., A. B. C. (The usual term of articleship to architects is from 3 to 5 years.)

GALLO-ROMAN REMAINS AT CARNAC (Throughout our review of Mr. Miln's book, pp. 275-6, last week, the name of the site of the excavations was printed "Carnac," instead of "Carnac.")

Correspondence.

PRESSURE OF WIND ON OBLIQUE SURFACES.

To the Editor of the BUILDING NEWS.

SIR,—While admitting the accuracy of the experiments conducted by the Aëronautical Society to determine the pressure of wind on differently inclined surfaces, and also admitting the truth, under certain circumstances, of the formulæ deduced by Professor Unwin from such experiments, I think the formulæ will require a little modification before it can be safely applied in the calculations of the strains on roofs with sloping sides; as I consider the action of the wind on the experimental discs, and that on the side of a roof to be slightly different, the same formulæ not being applicable to both.

As the reason of the apparent anomaly may not be apparent to all, I venture to offer the following explanation of it, which may not be the correct one, but it appears to me as the most probable one. If we take a thin disc

(A B, in Fig. 1), say 3in. diameter, and hold another disc, E F, equal in size to A B, to the face of A B, we know that, by blowing down the tube, C D, the disc, E F, remains against the disc, A B, and the harder we blow the harder it sticks. Now, the reason of this is, that the current of air passing down the tube coming in contact with the disc, E F, radiates in the direction of the dotted lines, and in the same way as the jet of steam in the Giffard's injector draws up the feed-water, the radiating currents of air draw up the air at the back of the disc, E F, thus producing a partial vacuum, the atmospheric pressure exceeding the pressure of the current of air in the tube, and so presses the discs together. A similar action takes place when a disc is held to the action of the wind, only instead of the currents radiating, they pass directly over the edge of the disc, but still cause the partial vacuum on the back side, which is, perhaps, better illustrated by the simple experiment of dropping a penny, face downwards, with a flat piece of paper on the back, when the partial vacuum formed in the descent, presses the paper to the penny, and both fall together.

Thus, we see that the pressure on a disc exposed with the face at right angles to the direction of the current, is equal to the pressure formed by the current, minus the pressure caused by the vacuum at the back. Now, if we incline the disc, the action is not the same, and we obtain different results on account of the negative pressure decreasing as the angle of the disc increases, and that this is the case will be seen by examining the direction of the currents, as shown by the dotted

lines in Fig. 2. The currents of air, instead of radiating as before, are reflected upon one side only, and consequently draw the air from one side of the back, which air is replaced by air from the bottom, thus preventing, to a certain extent, the formation of a partial vacuum at the back. Of course, the greater the angle of inclination of the disc, the more easily is the air supplied at the back.

No doubt, as Professor Unwin states, the actions of the currents of air on the side of a roof are very complex, and there are many other disturbing influences besides those have just mentioned, but if what I have stated be the true explanation of the apparent anomaly, it is very evident that formulæ deduced from experiments on discs, are not applicable to roofs, as the partial vacuum (if it be formed) could not possibly act on the side of the roof on which the wind was blowing, but would only cause a slight pressure on the opposite side.—I am, &c.,

JOHN J. WEBSTER.

Dock Office, Hull, Sept. 25, 1877.

MORTAR.

SIR,—If you will allow me the space in your paper I will endeavour to show to "Mortar" how and when it is best to use that very common substance known as mortar. Lime, the principal ingredient in mortar, is never found in the earth as pure lime, but always in union with other metals or gases. Carbonate of lime is semi-crystalline, close-grained, and cold to the touch, but submit it to the action of a strong fire for 20 or 30 hours, and it becomes non-crystalline, very porous, and warm to the touch and the reason of this is the fire has driven off the carbonic acid gas, and it is now lime ready for the builder. When water is thrown on lime while it is fresh from the kiln, it will unite with the lime in certain proportions, and form a hydrate of lime, and the latent heat of water will be set at liberty, and thus causing the great heat of newly-slaked lime, which does not (as is commonly supposed) proceed from the lime itself. Another very remarkable result of putting water on lime is that the particles of lime lose all power of cohesion, and it becomes a fine powder. No sooner has the heat evaporated from a newly-slaked heap of lime than it begins to absorb carbonic acid gas from the atmosphere, and in a short time it is reconverted into a carbonate of lime, and in this state it is said to be dead. As far as my experience goes I find that mortar is easier to use and makes cleaner work, if it is allowed to lie for two or three days after it is made up before using it, but there is no doubt that it will set better if used as soon as made up. How it is that set harder than it would without it I am not able to say. With a soft or earthy sand good mortar cannot be made, and in no case should the proportion of sand to lime exceed 3 to 1, and if really good mortar is required the proportion should be 2 of lime to 1 of clean sharp sand. With lime fresh from the kiln, 2 parts of lime to 1 of sand and clean water (a most essential thing in making good mortar), mortar will be made that will set harder and stand the weather longer than the stone or brick it binds together.—I am, &c.,

H. G. Cox.

12, Wharnclyfe-street, Rotherham,
September 26.

TECHNICAL BUILDING TERMS IN THE PROVINCES.

SIR,—It would be of great use and interest if some of your numerous readers residing in the north-west, and other remote districts, would send you a list of the technical terms adopted in their several localities, so that the same might be published with the ordinarily accepted London terms. There are several terms that are comparatively unknown except in the immediate districts. Provincial building terms would be at least a very useful addition to our vocabulary. The thing could soon be accomplished if some of your enterprising readers would forward any peculiar local nomenclature.—I am, &c.,

G. H. G.

RESTORATION.

SIR,—As public attention has been so much drawn of late to the subject of "Restoration," through the "Society for the Protection of Ancient Buildings," by the paper read by Mr. Stevenson, at the Royal Institute of Architects, on the 28th of May last, and the discussion thereon; and by the articles in *Macmillan's Magazine* for June and July, entitled, "Thorough Restoration," by the Rev. W. J. Loftie, and "Thorough Anti-Restoration," by Sir G. Gilbert Scott, I venture to hope that the accompanying remarks on "restoration" abroad, and the amusing, and but very slightly exaggerated, description of the arrangements of a modern Catholic church may be allowed a place in the *BUILDING NEWS*, and so draw others in to the fray, and keep the hurly-burly going merrily. The extracts are from the letters of a friend, and I have his permission to make what use I please of them.—I am, &c.,

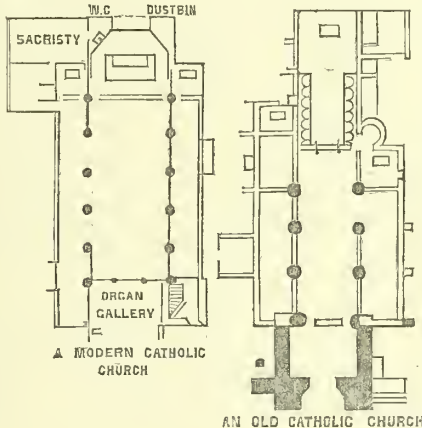

THOROUGH PRESERVATION.

"I fear that the acensation which you bring against Catholics is only too true.* The horrors being now perpetrated in France, Germany, and Belgium, under the name of 'Restoration,' are terrible; in fact, I say, without hesitation; that more harm is being now done to ancient churches than either at the Reformation, the Huguenot rising, or even the French Revolution. The French or Belgian restorer is like some disgusting animal—what he leaves undestroyed he covers with his filthy slime. Notre Dame, Paris; Cologne Cathedral, and Bruges Cathedral are the three greatest libels upon mediæval architecture existing. To come nearer home—what can be worse than the plan of church generally adopted by English Catholics? It has just enough antiquarianism about it to render it a libel upon ancient architecture, and just enough of modern arrangement to challenge criticism from a utilitarian point of view; but when we come to examine this plan we find that it has all the defects (from a utilitarian point of view) possessed by the ancient churches, together with others which are peculiarly its own. The Church, for instance, requires a large space for the divine offices, and insists that every provision shall be made for these before the congregation is even thought of. The Church demands that after the clergy and their assistants have been considered, the choir, which ought to take an important part in her services, shall be placed near to the altar and officiating clergy. Now, what do our Catholic architects do to meet these wants? Well, they generally begin by designing a very pretentious west front. Then, of course, the congregation must be considered, because, as they give the money, they must have comfortable seats, especially those who are well off. As to the poor, the aisles offer a capital place to tuck them out of sight; in fact, this is the only use of columns and arches; and then it is so thoroughly in keeping with the traditions of the Catholic Church to have a regular structural division between the rich and poor. Are not the high roof and clerestory of the nave emblematical of the loftiness and high position which the rich hold in the presence of God, and are not the low aisles emblematical of the degradation of poverty in God's sight? Really, we can get far more meaning out of a nave and aisles than they could in the middle ages when the charming separation of the rich and poor in the presence of God was unknown! Well, having accommodated the congregation, the rich in good comfortable seats, and the poor as much out of sight as possible, he thinks about a chancel and sanctuary. As the space left is very small indeed, he cuts off the angles, and makes an apse, one angle-space of which forms an excellent space for a w.c., in connection with the sacristy, and the other offers great facilities for a dust-bin or muck-heap. Of course, the sanctuary is far too small for High Mass, but really the clergy must do the best they can with it—the congregation must really not be put to any inconvenience for mere sentimental notions of this kind, so the sub-deacon can stand just outside the altar rails. He will just move a little on one side, to allow the great Mrs. Pipkins to enter the front bench when that lady comes into church during the Preface! Now, then, for the choir. What is to be done with it? Of course it can't be in or near the chancel, and must be kept well out of sight, because the great Mr. O'Howlagan can't possibly sing his solo in the 'Credo' without a quart of stout before he begins, and the chief bass singer, Mr. Abimelechson, is a member of the Jewish persuasion, and would rather not be seen in a Christian place of worship. Then, although the bishop has strictly forbidden it, we must occasionally

smuggle in a lady or two for the treble solos, and so on. Now this is really hardly an exaggeration of the way in which Catholic churches are often arranged and designed. Oh! for a good honest barn!

"If you can make any use of my letter pray do so, but I fear the evils against which we wish to protest cannot be met by a simple letter, but will require volumes of argument before they can be exposed in all their deformity. I fear much harm has been done by our reviving Gothic architecture before we had got hold of the spirit which directed our mediæval forefathers, and I am inclined to think that, with the present position which the Catholic Church holds in England, we ought not to go in for architecture at all. Ecclesiastical architecture has always been the expression of the Church when she has been in a condition of triumph, and not when she is struggling on in a missionary state, and this is probably what lies at the root of the whole business. We are trying, by our architecture, to sing 'Alleluia' when we ought to be singing 'Miserere,' and so our buildings all have a false ring about them. We should do far better if we were to build large, solid unpretentious barns or chapels, and content ourselves with having good altars and fittings, and true ritual arrangements, however devoid they may be of ornament, and however humble.

"The first thing should be the ritualistic requirements of the building and style—detail and ornamentation should be afterthoughts. Now we put up buildings which are in every way unfit for Catholic worship, and cover them with elaborate and often pretentious detail.

"This is a jolly old English village. The church is quite unrestored, and I have persuaded the rector to keep it as it is, galleries, three-decker, and all. This is the plan. Nave and aisles, Decorated; chancel, Perpendicular; aisle, Late Perpendicular, with a good roof; tower, time of William III., with curious pinnacles, two sedilia, piscina, and Easter sepulchre in the chancel, tall pews, galleries, and high pulpit. There are several interesting churches in the neighbourhood, but ruined by restoration. — has been at work in this locality, and has left a mark upon the old buildings that nothing will ever remove."

The vestry of Paddington have authorised Messrs. Knipple and Morris to prepare drawings and estimates for the reconstruction of Westbourne-terrace-road-bridge, the Grand Junction Canal and Regent's Canal Companies having consented to the proposed improvement, including the giving up of additional land.

The committee of management of the Glasgow School of Art have resolved to open a branch in the East-end, at which special attention is to be paid to design in connection with manufactures. The free use has been granted the school of a large hall in the Buchanan Institution, and the trustees of Haldane's Academy have given pecuniary assistance in starting the extension.

A new Welsh Wesleyan chapel is shortly to be commenced in Aberystwith, from plans, &c., now in course of preparation by Mr. Walter W. Thomas, architect, Liverpool. The chapel is to hold about 800 persons, and will be built upon one of the most commanding sites in the town. The style of architecture suggested by the committee is Classic.

Four large London firms have been invited to tender for the supply of corrugated iron for huts to contain a hundred thousand Russian soldiers. The huts are to be of four sizes, for twenty-five, fifty, a hundred, and five hundred men. They are to be delivered at Antwerp, and sent direct to Bucharest across the Continent by rail. Orders have also been issued for eight railway stations for a strategic railway. These are to be complete in every way, and are to be provided with heating apparatus.

The new nave of Bristol Cathedral, which has been completed at a cost of upwards of £40,000, will, according to present arrangements, be opened on the 23rd prox.

Intercommunication.

QUESTIONS.

[5135].—Old Barn, Harmondsworth.—Can any of your readers favour us with particulars of this building? I think some allusion, if not a description, has appeared in the *BUILDING NEWS*, in a paper on "Timber Buildings," but cannot find it.—E. C.

[5136].—Measurement of Chimney Breast.—Will any kind reader explain the Yorkshire method of ascertaining the quantity of chimney breasts? And also say which are the best and most durable materials to adopt for tuck pointing?—W. A. K.

[5137].—Lowest Tenders.—I was solicited, with three or four others, to give a price for certain works for which specifications, plans, and quantities were supplied. Some time after the tenders were sent in, we received a letter stating "that all the prices so far exceeded the architect's estimate that none were accepted." About a month after that notice a paragraph appeared in the local papers announcing that the tender of Mr. — was accepted. Now, it appears the architect materially altered the plans, ignored all those who first had the trouble of tendering, and asked an entire stranger without competition for a price on the revised plans. Can any of your correspondents inform me if the lowest of the first tenders can claim compensation for such treatment, although the usual clause—"the lowest or any tender not necessarily accepted"—was in the conditions?—G. E. H.

[5138].—Quantities.—Will any of your numerous readers kindly advise me how to act under the following? My tender for the erection of some shops and warehouses was accepted, and the contract signed in February, 1876. The work was commenced, and shortly afterwards stopped, for reasons unknown to me. The work executed by me was valued and paid for; but the architect's fee for taking out the quantities, which I paid on signing the contract, was not included in that valuation. The architect refuses me any explanation, and won't grant me even an interview on the matter.—PROVINCIAL CONTRACTOR.

[5139].—Joiner's Work.—Excuse my again broaching this subject, as I am not satisfied with "G. H. G.'s" answer. While thanking him very much for his reply, I think he has quite missed the point of my inquiry. Apart altogether from the "untruthfulness" of the decoration, which has nothing whatever to do with the question, what I wish to know is merely—1st. Can the treatment of veneer in the way I indicated be satisfactorily executed? 2nd. If so, would it not be much cheaper or at least sufficiently so to warrant its adoption in preference to inlaying? And 3rd. If my idea is not good, as "G. H. G." appears to think, will he or some other reader please point out its practical defects? I think "G. H. G." attached too much importance to my using the expression "yellow pine"—I added "or other light wood." This, obviously, showed that the term I used was a general one, and might include the most valuable woods in the market. Further, I fail altogether to see in what sense of the word a well-designed ornament in maple or satin wood, or even yellow pine, relieved by a "rich rosewood veneer," would be "untruthful decoration."—VENEERING.

REPLIES.

[5132].—Compensation for Deficient Quantities.—In the trial *Coker v. Young* it was held that the builder could not recover as for extras, nor obtain compensation for an excess of work performed in consequence of an error in the quantities.—NICHOLI FILIUS.

[5132].—Compensation for Deficient Quantities.—If the quantities were calculated by the surveyor for, or in expectation of fee or reward from the builder, the surveyor is bound to bring to his work ordinary care and skill, and if by not doing so he causes loss and damage to the builder, he is bound in law to make good the loss. It does not follow, however, that because the actual work has consumed more material and labour than the surveyor estimated that he is therefore responsible for the difference. The builder may, as he sometimes does, cause himself greater expense by mismanagement and erroneous setting out. The inquiry must be limited to whether the surveyor exercised due ordinary care and skill in estimating the quantities from the plans, specifications, and other information provided him. Sometimes the causes of deficiencies are want of sufficient plans and general meagreness of particulars; but if this is so, it is no doubt the surveyor's duty either to obtain further information before committing himself to statements of quantity, or to refuse to go on. Probably it would be held that errors arising from these causes showed that the surveyor was negligent and unskillful in proceeding without the proper documents to enable him to understand the exact nature of the contract according to the usual custom of the trade.—L.

[5132].—Compensation for Deficient Quantities.—"A Builder" does not clearly state his case. It is impossible to know whether the quantities were paid for by him in the ordinary way or

* The accusation here referred to was, that if our ancient churches were now in the possession of the Catholic Church they would meet with even more ruthless destruction than they have met with during the last fifty years at the hands of the Protestant clergy and architects—that a large proportion of the Catholic clergy in England at the present time would, for certain reasons not necessary to explain, be less likely to love and reverence our ancient buildings as historical monuments of past ages than the majority of the Anglican clergy, and be even more "dead to the claims of poetry and history in the highest sense of the words."

paid by the employer direct. Errors in quantities are very unusual, and any small matter is generally arranged in settling up the accounts. I would not advise "A Builder" to proceed against a surveyor unless he could show a very good case.—SURVEYOR.

[5133.]—**Rolled and Built Girders.**—The formula is the same for rolled and built-up girders, but the constant varies between 6 for plate, 6.5 for box-girders, and 7 for rolled girders. "A Young Surveyor" should study the subject in any of the many books treating of it.—H. L.

[5134.]—**Charge for Taking out Quantities.**—"A Young Surveyor" must be very young indeed if he does not know something about the usual professional charges. Surely he must have seen bills of quantities in the office in which he learnt his business. The charge varies from 1½ per cent. for large and simple work, to 2½ per cent. on more elaborate. If a small house—say, under £1,000, 2½ per cent. might be charged. It is difficult to give an opinion without seeing the drawings. One word of advice to a beginner. Do not hand over the draft for another to get lithographed, but carefully examine the lithographed copies yourself.—H. L.

CHIPS.

Mr. Joseph Hamblet, of the Piercy Blue Brick, Tile, and Pipe Works, West Bromwich, Staffordshire, has just been favoured with a large order for blue bricks for the Great Eastern Railway Company, Liverpool-street Station.

A great gathering will take place at Chesterfield on the 17th of next month, when the Marquis of Hartington will lay the foundation stone of a hall to be erected in that town to the memory of George Stephenson. The hall, which is from the designs of Messrs. Smith and Woodhouse, of Manchester, will cost about £12,000. It will be used for purposes of higher education.

A stained-glass window has just been erected in the south aisle of the parish church, Chagford. The subject is Christ blessing little children. The artist is Mr. W. H. O'Connor.

An Exhibition of Fine Art is to be opened on the 16th of October, at Bideford, in connection with the local school of art.

A general meeting of the St. Albans Architectural and Archaeological Society will be held in the Court House, St. Albans, on Tuesday, October 11th, at three p.m., when the Earl of Verulam, president of the society, has consented to preside. A second meeting will be held at eight p.m. on the same day. Papers will be read at both meetings.

Cheltenham Town Council are about to expend £20,000 on street improvements.

The nave of Exeter Cathedral is to be reopened early in October after restoration from Sir Gilbert Scott's designs and plans.

At Tullamore Sessions, on Friday, William Ives Smith was committed for trial on a charge of having embezzled money and falsified account sheets belonging to his employer, Alfred Peter Sharpe, building contractor.

The Bridgewater rural sanitary authority have accepted plans for the drainage of Cossington, prepared by their surveyor, Mr. Down. They are to be carried out at once at a probable cost of £300.

A "rest" is being built at Porthcawl, near Bridgend, from plans by Mr. John Prichard, architect.

A gridiron dock is being constructed beside the new ballast wharf at Portmadoc, by Messrs. Lewis and Davies.

The foundation-stone of a new church in connection with the Establishment was laid at Sinclairtown, near Kirkcaldy, on Saturday. The new church is to be in the Old English style. Mr. Anderson, Dundee, is the architect.

Our Office Table.

AN exhibition of Industrial Art has just been held at Ghent. Among the objects connected with construction some inscriptions and ornaments in relief were shown by F. de Smet, Laacken. No indication is given of the method by which the letters are produced, but the ground is sunk about $\frac{1}{32}$ of an inch, so that the presumption is a process is like the sand-blast, or eating-in by acid, is employed. Some double doors, both for a *porte-cochère* and also for a saloon, are shown by Brunneau Frères, Ghent, and some balustrades, turned in oak by J. B. Dogny, Brussels. Many examples of ornamental wrought iron work, executed entirely by hand, were exhibited, amongst them a balcony in the style of the Flemish Renaissance, ornamented with leaves and flowers. The first prize in the competition was carried off by M. Wanters-Koeck, of Brussels, for an artistic grille, three metres square, with roses each of forty-four leaves, lilies, and ferns—a complicated piece of work executed with the hammer alone. There were several panels, painted to represent various woods and marbles, by P. A. Cluytens-Muls, the Institut des Beaux Arts, Mechlin, and others. The first prize for the design and execution of stove and chimney-piece combined, was awarded to M. Verhengen, of Ghent, and the second to M. de Lorge, of the same town. The prizes for the design of the decoration of a vestibule, with the execution of the principal details, were not awarded; but the first and second prizes for the design of a floor for the same, the cost price which was not to exceed 8 francs per square metre (6s. 6d. a square yard), were awarded respectively to M. Desmet, of Ghent, and M. Delvigne, of Liege. The first prize for a double door for a dining-room, executed in natural wood for subsequent painting, polishing, or varnishing, was granted to M. Spilthoorn, of Ghent, but the second was not awarded.

MR. E. B. ELLICE CLARK, C.E., as borough surveyor of Hove, near Brighton, has recently furnished a report to the council as to the lighting of the district, which will give many suggestions to other local bodies than the one to which it is addressed. He is of opinion that a considerable saving in cost can be effected without prejudicially affecting proper and sufficient lighting. The lamps are at shorter intervals than usual, are unequally distributed, and the gas is burnt a greater number of hours than in 30 other towns from which Mr. Ellice Clark has obtained returns. He recommends that the number of hours the lamps are burning should be reduced from 4020° 10' to 3776° 44', and that the consumption should be regulated at four cubic feet per hour for each lamp; the effect of this will be a reduction in consumption equal to about 7s. per lamp. The regulators should be regularly tested at the rate of 8 per cent. each month, and the meters, which are on the old dry system, should be tested by an inspector under the Sales of Gas Act at least once in each year, and if then are found to work incorrectly, wet meters, one to every 12 lamps, should be sub-

stituted. Into the question of reflectors the report goes at considerable length, it being shown that in nearly every kind the reflecting surface soon becomes blackened. Parabolic reflectors, back to back, answer best, but as two flames are needed in each lamp, are too expensive for adoption. He considers Skelton's catoptric reflector the only successful attempt to utilise the light now wasted. It is formed on the principle of reflecting the rays of light above the flame by placing strips of silvered glass at such angles as to disperse the light over the darker intervals between the lamps. Mr. Clark adds that at Ramsgate these became useless after a few months from the condensation of water and consequent peeling off and blurring of the silver, but that in some new patterns air is admitted by two holes at the bottom of the frame, and if they are made sufficiently large, will, no doubt, prevent condensation, the only point against this being that dust may be admitted which will obscure the silver. The amount of saving is estimated by Mr. Skelton at 50 per cent., but by Mr. Clark at 4 per cent., after deducting additional cost originally and for repairs, and he suggests that a trial of them be made on the Shoreham road and in Brunswick-terrace. In closing, it is urged that the old-fashioned ladder and hand-lantern mode of lighting be given up in favour of the more expeditious and less laborious pole-torch system, and that the town be divided into two districts, for the purpose of ascertaining the consumption in the east by average meter indication, and in the west by positive meter indication.

THE ninth course of forty lectures on the "Historical Development of Art," with general reference to Architecture, Sculpture, Painting, and the principles of Æsthetics, by Dr. G. G. Zerffi, F. R. Hist. S., will be commenced on Tuesday, October 9th, at eight o'clock, in the Lecture Theatre of the Science and Art Department, South Kensington. Students in training and national scholars are admitted free, whilst the public may attend on payment of nominal fees. The lectures will be richly illustrated by photographs, diagrams, maps, plans, and sketches, and are of general interest, directed more to a correct appreciation of the History of Art than to the technicalities of ornamentation. The syllabus issued by the Department is comprehensive, and the lectures promise to treat in sharp outlines the gradual development of Art from the period of savage down to that of our own times.

THE Congress of the Sanitary Institute at Leamington, will be opened on October 3rd, by Dr. Richardson, F.R.S. The Exhibition in connection with the Congress will be opened on the same day by the Worshipful, the Mayor of Leamington, when Councillor Lawson Tait, F.R.C.S., will give an account of the work of the Interception Sub-committee of the Birmingham Corporation, illustrated by working models of plan. The chairman and medical officer of the health committee, Manchester, and a large number of representatives of boroughs and local boards have sent in their names as intending to be present and to take part in the Congress.

CHAPPUIS' PATENTS

THE BUILDING NEWS.

LONDON, FRIDAY, OCT. 5, 1877.

NEW BUILDINGS IN THE CITY.

HOLBORN is destined to become the finest and most architectural of the main arteries of the metropolis. Since the completion of the Viaduct, and the clearance of old buildings whose associations and picturesque squalor were their chief recommendations, frontages of palatial magnitude, if not architectural magnificence, have been erected. The new Holborn Viaduct Station and Railway Hotel, illustrated by us recently (see page 594, Vol. XXXI.), is, perhaps, the chief structure in size and architectural pretensions, and if it is wanting in some of the characteristics of interesting detail, we are compelled to admire the grand effect of its lengthened façade, and the majestic order of its pilasters, which dwarf by their comparative magnitude the diminutive and almost puny-like features of the adjoining buildings. Nothing can present a more remarkable contrast than the uninterrupted vertical lines of the fenestration of this great façade, as seen in perspective against the adjacent building on its eastern side, whose treatment is as bewilderingly confused and cut up as it is possible to be. Any one studying the two buildings may take a good lesson of the value of largeness and subordination of parts, and the littleness and distraction created by a multiplicity and diversity of features, devoid of a leading principle of design. But further westwards we note a new building in progress. It is at the corner of Brooke-street, presenting extensive frontages towards that street and Holborn. It is the Imperial Life Assurance Offices, from the design of Mr. Alfred Waterhouse. As far as it has gone, we notice a ground story of red terra-cotta, with three light windows, with pointed enriched arches of the same material. Red granite coupled shafts, with moulded terra-cotta caps, divide the windows, and the arch-mouldings are enriched by a cast ornament, while between the arches the courses of terra-cotta are relieved by a series of stamped patterns, at intervals. We observe that the terra-cotta is a thin facing in slabs varying from three to four courses of bricks in height, and presenting the appearance of a rich red sandstone. On the Brooke-street side we find a variation in the windows; some of these have square heads, formed by joggled bricks of the same material, with the angles simply moulded. The point we particularly notice is that the ornamentation is confined to flat or simple under-cut patterns of a conventional character, and free from naturalesque or very elaborate treatment. Messrs. Holland and Hannen are the contractors. Nearly opposite the Viaduct Hotel another building is being erected, in which red brick and stone are the materials employed. This building forms the superstructure over the the Snow-hill Station, and is intended, we believe, for shops and offices. The design, as far as we can yet discern the intention, will be of Queen Anne character, rather freely treated. Mr. Witherington, of Leadenhall-street, is the architect. At the end of the Poultry, nearly opposite the Mansion House, Mr. J. J. Cole, of Finsbury-circus, is engaged in the erection of extensive offices for the Gresham Life Assurance Company, St. Mildred's House. The structure is at present quite obscured by scaffolding, but from its position and proximity to many of the greatest buildings of this busy centre of City life, we may reasonably anticipate a work of some architectural pretension

Perhaps the greatest and most original work recently completed in the City is the City Liberal Club, by Mr. G. E. Grayson, of Liverpool. We scarcely remember seeing a building that has pleased us more by the freshness of its architecture. Most of our City buildings have been suffering from a stereotyped poverty, notwithstanding the importation of Queen Anne ideas. There is an *empressement* and *verve* in Mr. Grayson's new front that is refreshing. The three flat curves of the upper bays take off the monotonous effect of a straight façade, and give variety in the perspective. These bays do not meet each other, but a bold and projecting pier well marks the separation between them, and the bays spring from a square recess, without forming an angle. The three stories are well varied; the ground story has a Grecian solidity. The three-light windows, which are large, are of red moulded granite, set within the stone-work, and the door-way has similarly and boldly moulded antepagmentæ. A decided Greek feeling is displayed in the ornament which enriches the cymatium and other members, all of the flat Grecian sort. The anthemion and other Greek enrichments are freely used, and the pilasters between the bays are relieved on the face with lines of incised patterns in a similar spirit. Above the ground story the three bays, with their triple windows divided by shafts of red granite, with carved capitals, form a pleasing range of fenestration, the square form of the intervening pilasters contrasting happily with the curved lines of the entablature. Above, the third story has its three-light windows broken back in rectangular lines, the centre light of each standing out upon the lower carved bays, and following their outline. This variation of the square upon the circular lines is highly agreeable, and the mouldings and horizontal members are all of slight projection and flatly treated. The interior ceilings display a correct feeling for plaster, the surfaces being divided by moulded ribs of small section into panels of rectilinear forms. Altogether, the composition is very refined; the front reminds us of that free Greek feeling, without its literalness, which some of the works of the French revivalists and of Klenze and Schinkel afford, and a Classical elegance is stamped upon it, showing how readily even Greek forms may be applied to modern buildings of a certain kind. To the late Mr. Thompson, of Glasgow, we are perhaps indebted for indicating the mode of adapting the principle upon which the Greeks worked to modern purposes; and it appears to us Mr. Grayson has in some degree been working in the same spirit. The City Club is being built by Messrs. Trollope and Son.

In Cannon-street, near Bow-lane, and just opposite the Mansion-house Station of District Railway, some warehouses have been erected, the stone facade of which is designed in a Palladian style, having superposed orders of pilasters in four stories over shops. The columnar ordinances are effective, and the pediments pleasing, though we think the carver has overdone them, and the heavy festoons in the cornice have not added to the architectural dignity. Messrs. Taylor and Loeke, of Basinghall-street, are the architects. Close to it, Griffith and Co., the well-known safe manufacturers, are building new premises, the frontage of which will be narrow. We observe red granite is being used in the piers of the front, and the opportunity is a good one. By the way, we observe St. Mary's, Aldermary, has been entirely recased in its old Gothic dress, the detail of which appears to have been closely followed. We must not omit to notice some new shops and offices for Messrs. Tangye, Bros., and Co., on the site of Wren's interesting tower of St. Antholin's, ruthlessly taken down

lately. We cannot say the public have benefited by the change. There is a flat cast look about the windows and arches. The latter are stilted, and shafts adorn the openings. Mr. Ebenezer Saunders, we believe, of Finsbury-circus, is the architect. Returning to Cheapside we find that in Bread-street the old church of All Hallows, in which John Milton was baptised, has been completely demolished, its square tower only remaining. This church, relic of Wren's time, however, is already dismantled; its fine bell we saw had been lowered to the ground, and in a few days the site of All Hallows will know it no more. We have lately illustrated this interesting example of seventeenth-century Classic (see page 100); its pinnacled-carved festoons below the belfry, three-light windows, and circular lights are all characteristic details, and, we hope, may be spared destruction. In Bishopsgate-street-within, the Royal Bank of Scotland are erecting extensive premises, from the designs of Mr. Chatfield Clark, the elevation of which we may probably give. A bold Ionic arcade, surmounted by one order, and a bold cornice are the main features. We have already commented upon the design when it was exhibited at the Royal Academy, and we have no doubt that it will be a conspicuous structure.

Messrs. Maw, Son, and Thompson's new premises close to St. Martin's-le Grand is a double-gabled structure with Elizabethan features. The front is mainly composed of mullioned windows in each bay of the front, and the two bays are divided by red-brick piers, which are prominent. The carved circular tympana over the first-floor windows are cleverly introduced, and give freshness to an otherwise ordinary treatment. For the display of china the open fenestration adopted is well suited, though the horizontal members are particularly flat, and unnecessarily deep. The ornamental gables, their terminals, and the red brick and stonework form, on the whole, a pleasing ensemble. We cannot omit to note in this brief sketch of new buildings, a new picturesque building in Devonshire-street, Bishopsgate-street, known as "Ye Bull," with the sign made a feature in the front (illustrated by us, page 618). The structure is a very substantial and pleasing attempt at Queen Anne, though without its grotesque elements.

ENGLISH AND FOREIGN WORKMEN AND THEIR WORK.

A VERY noteworthy paper, printed in full on the outer sheet of the *Times*, by Mr. Thomas Brassey, on "Trades' Unions," was a paper, as we think, well deserving the attention of all working-men readers of this journal, not for its immediate interest alone, though that is not a little important, but for its lasting and ever-abiding interest. But very few workmen, at least, are likely to have read from first to last this important paper, for it is full of dry statistics, and of difficult and unexciting details. We cannot, therefore, but think, considering the real importance of the subject-matter of the paper, that some account of it, and a comment or two here and there, may be of interest, and most certainly it ought to be so. The subject of "strikes" alone is one which ought to engage the earnest attention of our working men, for, generally speaking, they would seem to come off but poorly, even after what may be termed a successful one, judging from what we hear of the results finally, and when all returns to its original quietness, to say nought of the then position of the men themselves, and what they have had to bear with while the strike lasted. And even now—for these necessities and differences never rest, and are, indeed, always present—the competition of

German workmen (masons) on a public building must needs exercise no small influence. It is in an artistic point of view that we here would look at the matter, for were but our workmen English artists as well as workmen, how difficult would it be to fill their places?

We will first give a few of Mr. Brassey's statistics and figures, both somewhat hard and dry, but very convincing, and impossible of refutation. Every head, he says, of our population produces and manufactures to the value of £6 3s. 2d., while France exports to the value of but £2 18s. 8d., and Italy only to that of £1 4s. 8d.—a not little remarkable statement when we come to think of it. Mr. Leoni Levi, from whom Mr. Brassey gets these interesting figures, explains that what gives so open a market to British merchandise all the world over is its universal adaptation to the wants of the populations of every climate. "Luxuries" are, he says, useless to the great mass of mankind, but "calico, iron, and hardwares" are necessities, even to the most uncivilised of peoples. And it is in such that we mainly work and deal. The French, it would seem, go a little further than the bare material, and "taste" enters more or less into the account, and so it must do with the Italians. Hence, to some extent, at least, the difference. France has but one-half, speaking roughly—and it is useful to remember this—the "producing," or trading, or exporting power of England, while Italy has but about one-fifth this power of supplying the rest of the world with what are called manufactured goods and simply useful things. But surely it will not be said that the "taste" of the French workman, or the classic "feeling" of the Italian, hinders their work, or destroys its value in the world's market? There must needs be a something else to account for it all other than those causes which Mr. Brassey has given.

It is useful to note here, by way of making the matter as clear as may be, that, as Mr. Brassey tells us, in those cases wherein the raw material is the largest factor in the total cost—as, for example, in the timber in a wooden ship—it may be readily understood that we, who have no primeval forests to draw upon for timber, should have been unable to compete with the United States, or Canada, or New England, who have them. But here there is another element in the account which is not a little startling, and well worth the notice of the English workman. It is that men with much higher wages, and while using materials as costly as they are here, and with this extra cost of production it is actually, as Mr. Brassey told his audience, neutralised by "superior organisation, by superior industry in the worker, and by the substitution of mechanical for manual labour." A very remarkable statement this, and might well afford a text for almost any amount of talk by those who, like Mr. Gladstone and Mr. Ruskin, profess to guide public opinion, and to explain all puzzling things. Mr. Brassey, in his able paper, gives no details, so that we do not know how it is that the Englishman of America is able to beat the Englishman of old England so thoroughly as here indicated. Is it indeed the impetus which high wages produces? for we have in this paper a comparative statement of the wages of the two sets of workmen, or mechanics. In the Eastern States, and in the large cities of America generally, it has been calculated that the wages of mechanics are not less than 100 per cent. higher than in England. Thus, in the principal trades in the United States the following table of daily wages is the result of many and careful inquiries in 1874:—

	United States.			North of England.	
	Highest.	Lowest.	Average.	Good men.	
	s. d.	s. d.	s. d.	s. d.	s. d.
Carpenters ...	12 3	5 7	9 0	5 0	5 0
Smiths ...	13 2	6 2	9 5	6 0	6 0
Bricklayers ...	18 10	7 6	12 3	5 6	5 6
Mechanists ...	11 3	7 6	8 3	5 10	5 10
Enginemen ...	—	—	6 6	5 6	5 6

In America, as in England, the "building trades" are, it is affirmed, disproportionately paid, and the reason, it is urged, is the same in both cases. The demand is essentially local, and wages are given which could not be sustained if the balance of supply and demand were distributed over a wider area. But we may well ask, will this altogether explain it? We think not, for Mr. Brassey goes on to say that he does not shrink from telling the representatives of English labour that any rules and regulations whereby the native vigour of British workmen is "restrained" must in the end prove fatal in their consequences, and that, consequent on the influence of foreign competition, the American workmen are conscious of the necessity of working "hard and well," in order to keep up the high wages which they are now earning. No doubt of it, but who can possibly go into an English workshop or factory of any kind without noting the activity and untiring energy of work displayed in it? Surely there must be a something else than want of "hard work" in the account.

And now we would call but a moment's attention to a somewhat startling fact in this difficult inquiry, which Mr. Brassey has so opportunely offered for the consideration of the Social Science Congress. It may interest a reader here and there. We never had the happiness, or privilege, of a personal talk with the late Mr. Cobden, to whom the world, and certainly Englishmen, owe so much; but we had a short correspondence with him on a somewhat difficult problem in modern political economy. It was this. We asked the great free-trader whether he thought it an unmixed advantage for such a small island as this to employ so many thousands and thousands of its population in "manufacturing"—even with the aid of the most effective machinery—goods, especially calicoes and printed stuffs, for the whole of the continent of India? We cited India merely for example. And whether even the "miserable Hindoo," with but a hand-loom to work with, must not lose a something by it, looking to the fact of our workmen, or manufacturers, or draughtsmen, or whoever is responsible, importing the very pattern, as worked by the native weaver, from which to impress a pattern at all on the stuff he is about to export, and without the knowledge of the native workman of what such pattern means and is, and which is so special to himself and to the country he is a native of? We sent him at the same time a piece of printed calico, a professed copy of the Hindoo work, and a bit of the genuine stuff as well. Mr. Cobden's reply was as might have been expected. He said that he did consider it an infinite advantage to the world at large everywhere that any one country which could do it should make and supply to all others what they could not do as cheaply and effectively for themselves, but that he had never considered the subject at all in an artistic point of view. But most surely this must be, and certainly ought to be, an important, not to say a vital, element in such work as involves form; and we might well ask whether any considerations on it are at all complete without taking "art" into the account. It is all but a new subject, for is it not a curious fact, when we come to think of it, that it should be indeed necessary for us, with all our infinite means and high civilisation, to go to such a country as India at all for a pattern, or a design, for

a printed cotton stuff, and that not for India alone, but for our own use and eye? It is not a little curious to look at the patterns and designs on the cottons and silks as seen in the shop windows, and to note where, in some cases, they indeed do come from. The Classic Greek no one needs to be more than reminded of—from the ornamentation to be found on the vases of Etruria to the scrolls cut in the marble of the Athenian temples. Old Egypt has not been forgotten, as all know, and we shall not be surprised to see the hieroglyphics on the obelisk now on its way here copied on a necktie or a handkerchief. The flowers on the stately robes of the King of Assyria, and the ornaments from the walls of his palace, were liberally drawn upon at one time for patterns and ideas in our schools of design, and thus became familiar to the public in the shop windows. Of China who needs to be informed, for what would or could have been done without the willow pattern? We might go further, and all round the world, and back to all dates in the world's history for the origin of the art we see all about us.

Most truly, indeed, may it be said that there is in this "labour question" a good deal yet to account for and to make plainer than it now is; and the artistic and designing phases of it, and the true vocation of the workman himself in it, are not the least puzzling of its many difficulties. But what a very singular fact it is that in these modern and advanced days—in this country at least there cannot be said to exist in reality any truly and individualised modern art at all; nothing, indeed, that can be considered for a moment as peculiar to the generation itself—unless, indeed, we may call modern engineering art a fine art. The modern English workman of to-day must surely be as good a man as he of the thirteenth, or fourteenth, or fifteenth centuries; and why, then, should not the work done in it be as good and as original and individualised as theirs? We can but hope that Mr. Brassey will glance at the matter artistically, and try to solve some of these complicated and very difficult problems. What, we may ask in conclusion, does he think of the fact of our sending all the way to Germany for masons and stone-carvers to work on an English Gothic building touching Temple Bar? This would have startled even Mr. Cobden had he been asked about it. But it is in these things, which happen every now and then so strangely and unexpectedly, that the power of any theory to explain phenomena is truly to be tested.

A new Wesleyan chapel is being erected at Bladon, Oxfordshire, from plans by Mr. Ranger, of Pinsbury-pavement, and will be opened on Tuesday, the 30th Oct. The cost will be about £500.

The quickest example of railroad-building on record is said to have taken place in the construction of the Philadelphia and Atlantic City (New Jersey) line. The distance is 55 miles, the gauge 3½ft. Among the excavations there is one of 40,000 cubic yards, among the embankments one of 1,800ft. long, requiring 23,000 cubic yards of earth, which was built in a week. Of bridges and culverts there are more than 100. The whole road was constructed in sixty-seven days, and in time for a large summer travel.

With a view to promote intercourse amongst the artists of Liverpool, a club is in formation to consist of painters in oil and water colours, sculptors and architects, and to include, as far as possible, all the artists of this town and neighbourhood. One of the objects of the club will be a conversazione, immediately before the exhibitions with which the Liverpool artists are most concerned, for the exhibition for one evening of works which members intend to send.

The death is announced of Mr. William Gue, an alderman for Andover, and one of the largest builders in North Hampshire. Mr. Gue was a generous supporter of the local school of art and other educational institutions, and had energetically promoted public improvements in the town of Andover.

BUILDING NEWS DESIGNING CLUB.

REVIEW OF DESIGNS.—NO. XIV.

A Village School.

THIS subject has elicited a large number of designs from our correspondents. The instructions proposed a mixed school to accommodate 100 children, with a master's house attached, the cost not to exceed £1,000. In looking over the designs, which we have arranged in three classes, we meet with many displaying ingenuity and artistic skill, though economy has not been studied with that care we should have liked to have seen. The design which appears to us to meet the requirements in the simplest and most efficient manner is "B." in a circle. The author shows a mixed school 36ft. × 18ft., with an infants' room 16ft. × 15ft., opening by folding doors into it, and placed as a projection. The girls' and infants' entrance forms a porch with space for hats and cloaks, placed at the angle between school and class-rooms, while the boys' entrance is at the other end, and forms a through passage 7ft. wide between the school and master's house. The desks, arranged in two groups for 18 each, with a gallery for 36 in a slight recess, are well placed on one side, the entrances not interfering; the windows are mainly behind the groups of desks; there is also an end window, and the class-room has a gallery lighted at both sides. Working out the area we find a superficial of over 8ft. provided for each child. The stoves of school-room and class-room are back to back, and the folding doors between enable both rooms to be brought into use. The master's house adjoins the end of school, with its entrance at extreme side; a parlour 15ft. × 12ft., kitchen 10ft. 6in. × 10ft. 6in., scullery and pantry, and three bedrooms being provided. Externally the treatment is simple but effective; the windows are placed high, and the gables are timbered. The section shows a double-collar roof, ceiled above an upper collar. We do not like the curve-braced principals. "B." in two circles, comes next in merit. The mixed school is placed crosswise, between the house and class-room, and is lighted chiefly at the ends. The school-room is about 37ft. × 18ft., and has the seats well massed against a blank wall, in three groups, for 76 children, while one end of it is canted, and forms a bay window, which is made a pleasing external feature. The class-room (for 24) is of good size, and well lighted, and the stoves are placed together. The entrances for boys and girls are placed on either side of class-room, and are provided with lavatories and cloak-rooms. The house is compact, with parlour, kitchen, scullery, and two bedrooms; but we think the entrance lobby expensive; the skewed lobby between parlour and scullery is wasteful, and there is a crowded look about the scullery. This design is by far the most artistic work we have received, and the drawings are clear and feelingly executed; but the canted work of gable, the bay end of house, and the timbering and roofing would be expensive, and the estimate of 6d. per cube foot (26,984ft.) allowed by the author inadequate; his total is £924. The windows are casements pivoted in the upper part. We object to the heavy timbering of principals. Why the tie-beam, and collar, and such heavy-curved brackets? It is positively wasteful. "Crowquill" shows a school-room 41ft. × 18ft., to hold 64 boys and girls, with an infant school or class-room, 18ft. square, projecting at one end, allowing for 36 at 9ft. superficial to each child. There are four groups of desks in school, the windows being chiefly behind the children. We rather object to the girls' and boys' entrances being at the same end, and the cloak and lavatory-rooms would have been better provided in the respective lobbies. The house is cramped in the entrance, and the breaks in the gable of parlour expensive. The plan of school, however, is less expensive than the last. A Queen Anne style has been adopted, and the gables are pleasing features, though we do not like the circular tops to the school windows, which are rather low. Cubic contents are worked out at 40,676ft. at 6d. = £1,000—a figure rather low for the style chosen, in which there is a great deal of moulded brickwork. "Ilampton" has not been fortunate in his planning. The class-room is,

for a not very apparent reason, placed end on to the school, the dimensions of the latter being 38ft. × 18ft., and the former 18ft. × 16ft. The boys' and girls' lobbies are at either end, and the house is quite detached from school, except by a passage leading from the girls' lobby. The author has four large windows behind the four groups of desks, and four smaller windows in front—an excess of light that is not desirable. Two stoves are provided—not too many for a school-room with so much glass. The house is tolerably planned, and the treatment is of brick, in a sensible style, and village-like, though the grouping is not very successful. The estimate is £975 14s., the school being worked out 4½d., and the house at 5½d., prices much too low. "Sketches by Boz" fail from providing only one entrance, which is made a lean-to, abutting against a projecting class-room. The school-room has desk accommodation for 72 children, and is 39ft. 6in. × 18ft., divided into four groups. The lighting is entirely from the gable windows, and the class-room is lighted from an end window, but on the wrong side. Iron casements are shown. On one side of the school is the master's house, made to occupy with its outbuildings the whole length of school; the planning is necessarily scattered, and uneconomical for the household of a schoolmaster. Cube contents equal 39,685ft. at 6d. = £992. In the elevations there is too much diversity of forms. Why put a square-headed window to the cloak-room, and a pointed triplet to the class-room? "A." in a circle, has arranged his buildings in a line—a plan that is not the most desirable in our opinion. The school, 35ft. × 18ft., shows four groups of desks, with a curtain dividing the boys from girls in the centre; the windows are in front facing the desks—a plan not recommended, as the light is admitted directly into the eyes of the pupils. The entrances are separated, with porch and lavatory behind, leading from which are the respective yards. The class-room is also lighted on the wrong side. A warm air-chamber with air-flues is provided behind the fireplace of school-room. The house is compact. In the elevations, which are rather commonplace, we may observe that it would have been better to have framed the doors and fanlights in one, to have omitted the second arch over each of the windows in class-room and master's house, and to have kept the gables plain. The cubing amounts to 47,040ft., and is worked out at 4½d. Similar in plan is "Triangle in Circle," the girls' entrance being placed behind class-room. The school is 45ft. × 20ft., lighted on both sides, the boys' and girls' yards being behind. The master's house is very like that of the last described, though the passage to kitchen is undesirable. The section shows a weak collar and brace-roof, with foul-air trunk in the ceiled space above collar. Of the elevations we cannot say much—they present a style of Gothic of a mild type, at least free from whimsicalities, though we do not approve of the springing pieces at the eaves. Cubical contents, 24,000ft. at 5d. equal £1,000. In a second order of merit we place "Toxophilite," a design in a more highly-flavoured style, but too domestic in appearance. The school-room, 27ft. × 17ft. 6in., is too small, and there is only one lobby entrance. The class-room is deficient in size. The small lobby for boys and girls would be a fruitful cause of conflicts between the two sexes and the rougher boys and infants. We cannot understand the drop-down of the master's house; why should it be placed on a lower level ground? "Discipulus" is not without merit in the plan. The school and class-room are at right angles, and open into each other, a curtain being placed to divide the rooms; the windows and desks are well placed, and the entrances are separated. On one side of girls' entrance is a small infants' school. We cannot say much for the master's house, which is awkward in the arrangement of entrance passage, and uneconomical in disposition. The elevation is in a species of Gothic, the house half-timbered, suitable, but heavy in detail. The school is put at £500, at £5 a child, the house being worked out at £133 15s., at 5d. per foot. "Nil Desperandum" shows a school-room, 43ft. 6in. × 25ft., with three groups of desks, with curtain between, the class-room

opening from it at the end, and divided by curtain. We find the general arrangements fairly worked out, but the entrances, with lavatories, are rather awkward. The windows are well placed, and pivot-hung at top, and the walls are 16in. hollow. The master's house is compact. The school is cubed out at 5d. = £737, and the house at 5d., £283 6s. 8d.; total, £1,020. Externally the author proposes to execute the work in white brick, with red-brick dressings, not a pleasing mixture; the treatment of gables is too fanciful. The drawings are, if anything, too neatly lined, and the plan should have been blacked or etched in; it is confusing to look at. We commend, however, the details and dimensions shown and described. The design of "Sirius" shows a school-room, only 30ft. × 18ft., with class-rooms, 14ft. × 13ft., at the extreme corners, but the benches are not shown, and the boys' and girls' entrances sacrifice the space of the school. We prefer the front elevation to the plan. "Unicorn" has the school and class-room planned so that the latter and the two side entrances form a triple arrangement of gables, which abut against the school-room. No desks are shown, and the house does not combine well with the school building. The cubing is worked out as 35,320ft. at 7d. = £956 11s. 8d. The sketch of bell-cote, forming a notch in the class-room gable, is far-fetched, and wanting in simplicity. "Capio Lumen" is the motto of a design in which the author shows a school-room 41ft. 6in. × 22ft., with only one entrance, and the desks arranged on the dual system, with a central and two narrower gangways, but no room for forming classes. There is no class-room, and the arrangement of master's house is faulty. Externally, the west elevation is not objectionable, but the pointed three-lights at end are out of keeping. The cubing is put at 7½d. In another design—"Senlac"—the fault is that the lobbies of entrance are placed together, and the infants' school or class-room is placed at the end without any apparent advantage. In both the latter designs there is a doorway from the master's house into the schoolroom. The exterior design of "Senlac" is a mixture of Gothic and Queen Anne, and the gable treatment is curious and excessively heavy. We cannot understand the singular diversity in the school dormers, nor their object. The heavy tie-beam queen truss is also unnecessary for a village school. "Student" displays some good points in the planning; the school and class-room are well disposed, and the area given to each child is 10ft., but they are over-lighted and the elevations are expensively treated. The external buttresses are unnecessary and objectionable features. In a third class we place in something like their order of merit, "En Avant," not economical in the master's house, and school ill-lighted; "Slingsby," too scattered in plan and expensive in treatment; "Felix" (economical, and with a little more care might have been better; author plans the infants a separate entrance); "Addisco," imperfect; "Trefoil," extravagant, and displaying vulgarity of style; "Discere Volo," desks imperfectly arranged; Finem Respice," desks on the Lancastrian plan, porches small, and elevations coarse; "Tuscan," wanting in study; "Egbert," plan not without merit, but elevations displaying ignorance of detail.

Design for Staircase.

In this competition, the conditions of which were simple, "B." in circle, has sent what appears to be the most judicious design for a wooden staircase. The detail may be denominated Old English or Stuart. The stairs are in three flights, with square carved newels, the balustrade being of turned pillars, supporting pierced tracery of step-like form below the hand-rail. The details of string or notch-board, handrail, and pendants are in keeping and thoroughly domestic. Second in merit we place "Another for Hector," a very sensible though plainer treatment in three flights, with two quarter spaces, the balusters being alternately turned and square, the lower part above string being filled in with perforated boarding. The detail of newels, balusters, &c., is correct, though the panelling under stairs and the door to cupboard are in questionable harmony. "Fleur-de-lis" sends a highly florid design, with a centre and two side

flights—a far too crowded arrangement for a hall of 15ft. 6in. x 14ft. 8in. The drawing is cleverly done, but the design is too like one we have recently given. "St. Lucy" sends a sketch in a Jacobean taste—a trifle too fresh for English taste, but with a thorough wooden, almost Japanese, feeling about the detail. "Quatrefoil," in circle, shows the stairs in two flights. The newel and details have an unmeaning character, unsuited for a rectory staircase. "Torpedo," with a little more study of detail and care in drawing, might have been better. "Tempus Fugit" is an extraordinary attempt. We cannot see the motive for the three first steps being placed angularly in the corner. The peculiarity of the arcading below stairs, and the singular treatment of the string-board, is unmeaningly strange, and the acorn-headed newels and mouldings are indicative of a want of purpose. "L. S. D." is more common-sense, but the detail is of a poor order.

An Escritoire.

For this subject we have received only two designs. The first in merit is that of "Début," a cleverly-designed piece of furniture, of a cottage piano type, with flap working on brass segments, which opens and forms a writing-desk, with pigeon-holes, shelves below, and cupboard above. The wood is ground in green, thin enough to show the grain, the side turned and carved pillars and panels are gilt with bright colour decorations. There is an elegance in the details. The next, with motto "Bee," in circle, shows an escritoire in pitch pine, the ground to be the natural wood, the mouldings picked out in colour and gold, and the whole varnished. A folding flap, with brass suspenders, enclosing a nest of drawers, cupboard below, and shelves above the desk comprise the main features of a piece of furniture resembling the old-fashioned writing-desk. The upper portion, containing the shelves, is enclosed by sliding doors with stained-glass panels set in silvered lead; but the ornament is rather mixed in character.

LIST OF SUBJECTS.—XVI.

A. A street front, four stories high, 18ft. frontage, including a mezzanine. The ground floor to be occupied as a shop suitable for a wine merchant's business. A private entrance to be provided. Material, brick and terra cotta. Plan of frontage wall of each floor, section and details. Scale $\frac{1}{4}$ in., and details $\frac{1}{2}$ full size.

B. A lych gate to a country church-yard. Material, oak, having a rest for coffins. Plan, section, and elevation, $\frac{1}{2}$ in. scale; details $\frac{1}{2}$ full size.

C. Two designs for bedroom wall paper, scale $\frac{1}{2}$ full size.

RECEIVED.—Wrapper to hand bearing post-mark, "Dublin," stamped—"Found in w.c. without contents."

DRAWINGS RECEIVED.—Leizlad (too late), Practical (too late), J'espere.

THE NEW COVERED MARKET FOR SOUTHPORT.

TWENTY-FIVE sets of designs have been sent in in response to the invitation of the Corporation of Southport for plans for a new covered market. At the beginning of July the Town Council offered premiums of £100, £50, and £25, for the best, second best, and third best sets of plans respectively. The conditions of the competition provided that the cost of the building should not be above £15,000, and also laid down certain requisites in the new market which the committee thought necessary. In other respects, as to style of architecture, mode of internal arrangement, &c., the competitors were left entirely free to put forward their own ideas. It is stated that six designs have been already selected, and that the final choice of three will shortly be made. The *Southport News* criticises some of the principal designs as follows:—

"In the Market" is a very good specimen of the group that covers the whole area with one large room. The hall in this case is 153ft. square, and is surrounded on three sides with enclosed shops, which have frontages both to the streets and to the interior of the market

hall. The centre of the hall is represented as occupied with flat stalls, arranged in the usual manner. The style of architecture is the Pointed, and a small clock-tower at the corner of Eastbank-street and Upper King-street is a prominent feature in the building as seen from Lord-street. The cost is put down at £15,026. The plans bearing the motto 'Haut et Bon' present a building of an imposing appearance, though the style of architecture is rather heavy. In this instance the several departments of trade are separated from each other by broad avenues 13ft. wide. The cost is estimated at £20,770. In 'Practical's' building, again, we have a massive-looking structure in the free Classic style. In this case, too, shops to the streets are provided. The main entrance in Eastbank-street is a fine feature in the architectural treatment of that front. The cost is put down at £14,970. 'Tenez' presents a very fine external elevation in the Classic style; the internal arrangement provides for enclosed stalls round three sides, with ordinary stalls in the centre; cost, £14,500. The building depicted under the motto 'Victorian' proceeds to greater lengths than any other in dividing the market into departments, as it makes the hall contain no less than five separate markets—butter, eggs, and cheese; retail meat; wholesale meat; retail fish, and wholesale fish. The frontages to Eastbank-street and Upper King-street in this design are rather peculiar, and the one to Eastbank-street especially is of a striking character. It consists of a series of eight arches, each constituting a shop front, and over each pair of arches rises a gable, while over the centre rises a clock-tower. The cost is said to be within the £15,000, exclusive of the statuary. 'Bona Fides' presents a building in the Italian style, and treated rather more elaborately than many of the others. This competitor furnishes an estimate as to the probable rental that would be yielded by his proposed building, the total being £3,760 yearly—a tolerably good return on the £15,000 which he says the building will cost. The peculiar feature of the plans marked 'Hope' is the mode of treatment of the frontage to Eastbank-street. The body of the building is set back 30ft. from the street, but the main entrance is formed of a large semicircular pavilion which comes forward to the street line, while two other entrances, one at each end of the front, are formed in a similar manner, only on a smaller scale. The space between these pavilions seems to be railed off as a sort of area, but it would be questionable whether so much ground could be wasted for such a purpose. This design has the recommendation of cheapness, the total cost being estimated at £12,855 7s. 10d. The author of the designs marked with the motto 'Palmam qui Meruit ferat' has adopted the plan of dividing his interior into four departments—general, butchers, fish, and wholesale. Another feature of this design which will recommend itself to many people is that in the basement provision is made for dining-rooms, with cooking kitchens, &c. The exterior elevation is treated in the modified Classic style, the details being in good proportion but plain, except in the case of the three entrances in the main front to Eastbank-street, which are richly ornamented, and which make that frontage a very effective one. The large entrance from Upper King-street is also a fine feature of the architectural treatment. At the corner of these two frontages is a real octagon, with a small bell turret rising from it. The cost of this design is estimated at £14,853, which, considering the fine appearance of the building as exhibited in the elevation, is certainly moderate as compared with some of the others. The design of 'Regardez Moi' is also a rather pretentious one, so far as regards the main front to Eastbank-street. The chief entrance is elaborately treated, being surmounted by a gable supported by Corinthian pillars, while the rest of the frontage has a neat entablature upheld by pilasters in harmony with the entrance. The author of the design with the motto 'Mark-it' has presented a building in the Palazzo-Italian style, freely treated. The architecture seems well suited for a market building, and it would certainly be a novelty in this part of the country. The one marked 'Début' may have a very commodious interior, but the exterior, as presented in the eleva-

tion, strikes an observer as positively ugly. The author may well say that the limit of cost will not allow of much elaboration of external treatment. Another striking design is that with the motto, 'Rouge et Noir,' which presents a very picturesque building in the Queen Anne style, the numerous gables of different sizes and shapes, for which this style of architecture is known, being well grouped, especially in the principal front to Eastbank-street. At the first glance the picturesque effect produced by this front is somewhat marred by a tower, suspiciously like a factory chimney, with an ornamental top, which rises a considerable height above the roof of the building. It appears, however, that this tower is useful as well as ornamental, as by an ingenious arrangement the architect conducts the smoke from all the fireplaces of the building into this one shaft. The cost of this design is put down at £14,800."

IMPROVEMENT IN MANUFACTURE OF BETON.*

IN the method now employed of making béton or concrete, cement and sand are used without previously preparing the cement. In the Coignet methods sufficient water only is added to make a plastic pulverulent paste. This does not contain sufficient water to form hydrates, unless lime enters largely into the composition, in which case the moisture held by the lime is taken up by the cement during its crystallisation, the lime absorbing its moisture from the air; but lime in a large quantity weakens the béton, from having but a low adhesive power in comparison with cement. Neither is it able to withstand the action of water or fit for underground work, as it does not become hard when kept constantly damp nor does it become hard in the interior of large monoliths when it is removed from the effects caused by the atmosphere. In the other and ordinary methods a larger quantity of water is used, sufficient to make a semi-liquid mass that will flow. This excess of water is forced out of the concrete by the contraction of the cement during its crystallisation, and leaves the stone porous. It also prevents the proper ramming of the béton, and gives rise to the difficulty known as "laitance," hereinafter described. On the other hand, a béton containing too little water becomes friable.

My process is as follows: When, in the construction of large monoliths or structures, largely underground, the checks and efflorescence which usually appear are not a serious objection, sand and cement may be mixed in the proportion of from three to six parts of sand to one of cement. This may be done by means of machinery or by hoes, shovels, and rakes. During this process water is added by means of a hose or watering-pot having a rose jet. The water is added gradually until the sand and cement contains so much that a handful of béton will, if tightly squeezed, allow a little water to exude, but will, when laid down, still retain the impression of the hand. The béton so mixed will have about the consistency of melting snow. It can be compacted in the same way, and pressure will force the moisture out of it. This condition, though difficult to describe, is learned at sight by the workmen, and the correct amount of water is more accurately gauged by trying the béton from time to time in the hand during its mixture (as it varies in different cements), than can be done by any rule of measurement. The béton is then placed in position and rammed, as described below.

The quantity of water thus gauged will be enough to form hydrates, in combination with the components of the cement, leaving no excess to be forced out during crystallisation, and does not prevent the proper ramming of the béton, while there is not sufficient to cause "laitance." But to obtain a perfect result where a finished surface is requisite, and to make a béton free from the deleterious ingredients that are found in all cements, and to insure the use of a proper quantity of water, I proceed as follows: Having obtained the heaviest slow-setting cement, the first step in this process is to separate from it the light

* By JOHN C. GOODRICH, JUN., of New York, in the *Scientific American*.

earthy impurities—the uncombined lime and clay and the soluble salts. This can be done to a considerable extent by a regulated current of air being driven against the cement while falling from a height, and in a proper inclosure; or it can be done by revolving screens, or by means of a centrifugal mill; and I claim these methods to be equivalents of the following. But the method which I prefer, and recommend as much more perfect, is to allow the cement to fall slowly into a box filled and constantly fed by a stream of water, the entrance of which is preferably near the bottom of the box. One side of the box is lower than the others, for the overflow of the water. Where a constant stream of water cannot be had the result may be obtained by agitating the cement with water in a swinging box or other convenient way, pouring off the water and supplying its place with fresh water from time to time. A box may be placed in and on the bottom of the larger box, to collect the cement as it settles. The portion thus preserved consists of the heavy, gritty, and inactive part of the cement, which is without adhesive power, and which acts simply as so much sand. This equals about ten per cent. of the whole mass of cement. Cements containing a larger amount than usual of this gritty portion may, when mixed pure, stand a high test, but will not bear a large admixture of sand. With this gritty part settles the true cement, which we call the "matrix." This is that portion which is capable of crystallisation or hydro-silicatisation called "setting." This portion of the cement is the only one of value, and is about 80 per cent. of it.

The third or lighter portion, which is washed away with the overflowing water, consists of impurities, light earthy matter, uncombined lime and clay, and soluble salts. This portion of the cement is entirely without adhesive power, and, when separated from the other portions of the cement, acts in all respects like the impure and dirty clays. When dry it shrivels and contracts, and when wet expands and becomes slippery. This portion of the cement is the cause of the unsightly checks, and what appear to be cracks, but which are simply projections of this earthy portion, which, by its own action in contracting and expanding, and the crystallisation of the cement, has become separated from it. With this earthy portion the alkaline salts, consisting mainly of soda and potash, escape. This is the portion that causes the efflorescence or white appearance on the stone as heretofore made, and also what is known as "laitance" on concrete laid in water. The light, earthy, and soluble portions having been removed from the cement, the supply of water is turned off, and it is allowed to escape from the wash-box. The cement, freed from its deleterious portions, and being thus saturated or supplied with the proper amount of water, is thoroughly mixed by machinery, or by means of shovels, hoes, or rakes, with clean, dry, sharp sand, in the proportions of from three to six parts of sand to one of cement, according to the strength desired. The *béton* thus mixed is rammed into position, layer by layer, with a pounder, having knobs or projections to make an irregular face. The irregularities made by the pounder on the top of the layer leave it much the better bonding of the succeeding layers. During the process of ramming and compacting, large stones of suitable shape to form a good bond may be put into the mould or mass, and the *béton* rammed around and between them, the stones not being allowed to come in direct contact with each other. This gives stronger work, and allows more thorough ramming and the use of larger stones than where in the usual way broken stone is mixed with the sand and cement before being put into the mold or mass.

The phenomenon of "laitance" is one of the gravest difficulties besetting the laying of concrete under water. It is caused by the impurities hereinbefore set forth. When the concrete is mixed in the ordinary manner, so as to form a semi-liquid mass, these impurities rise to the top of the layer in position, gradually subside, and deposit an unctuous stratum. Thus between each layer of the concrete is interposed a slippery layer, utterly preventing any union or bond between the layers of concrete, and very seriously impairing the solidity and strength of the structure. The former of my processes

prevents this, since the *béton* is sufficiently dry to prohibit any movement of its component parts. The second modification of the process prevents it for the same reason, and because the impurities forming the "laitance" are themselves eliminated.

STALLS FOR COSTERMONGERS, COLUMBIA MARKET.

ANOTHER of those acts of magnificence with which the name of Baroness Burdett Coutts is best associated is the erection of stalls for the accommodation of costermongers in the densely-crowded and poverty-stricken neighbourhood of Bethnal-green. Perhaps this last exercise of that lady's reputed generosity has as much to commend itself in our eyes as the costlier gift she presented in 1863. Columbia Market has been a costly failure. Commercially as well as architecturally the scheme was ill-advised. Established with the laudable object of supplying the poor of the neighbourhood with food at a reasonable price, this market has, from all accounts, failed to realise the expectations formed of it, and we understand the business done has degenerated considerably, and foreign meat is now chiefly sold. Its original object was to bring together that large class of traders who hawk their wares in the streets, and to afford them less costly facilities of plying their trade, by enabling them to sell their goods in the market, and of hiring their barrows and carts upon reasonable terms. Those of our readers who do not know Columbia Market will find a visit interesting. The plan consists of a quadrangle comprised of four blocks enclosing an area or market space of 14,000 square feet, and surrounded by a Gothic arcade of pointed arches of the kind best known at the infancy of the Gothic revival. These arcades are, to our mind, of that bizarre kind which was so much in fashion during the earlier days of Gothic art. We almost imagine that we are looking at some model—the parts are so toy-like, and the detail so elaborate. The florid Gothic hall at the back reminds one of a church with its triple-gabled ends, traceried windows, and superfluous carving in pinnacles and ornament, while the tower, with its profusely-carved termination, is the finish of a structure that recalls some Italian palace or Belgian hotel-de-ville rather than a market amid such surroundings as Bethnal-green. The detail and crowded effect of the wings and arcaded shops appear ludicrously out of place and keeping with the squalor of the surrounding tenements, and we are obliged to confess a sum of money has been expended that might have been far better spent in providing for the social wants of a large and exceedingly poor population. But this lavish and almost wasteful expenditure of money has been somewhat redeemed by the erection of a range of costermongers' stalls for the use of hawkers in the neighbourhood, which may be said to be as appropriate in their character as the market is out of place. The experiment of providing such accommodation on a sufficiently extensive scale in this locality is one of importance enough to call for a general description. One of the greatest wants in the poor districts of London and in large towns generally is the provision of cheap stabling, stores, and sheds for those who are too poor to rent such places in crowded districts. The consequence of this want of storage is that costermongers store their fish, vegetables, and other produce where they can in their own small and squalid rooms, under their beds and tables, to the manifest detriment of their own comfort, cleanliness, and sanitary rules. We have visited the new erections at Bethnal-green, and may give our readers some particulars of a species of construction as yet little known. The new stalls occupy a site opposite the Columbia Market, facing the dwellings known as Angela-gardens, flanking the shops of the market. We here find an area of about a quarter of an acre has been laid out. The ground is oblong, about 51ft. wide, and the sides and end are surrounded by open sheds, stalls, and other conveniences. The stalls, which occupy one side and a portion of the ends of the enclosure, are constructed of galvanised corrugated iron on the south sides, with boarded partitions. Each donkey stall is

9ft. by 4ft., on one side of which is a loose box for vegetables, &c., that have not been sold during the day, the division between the stall and box being a wooden partition not carried up to the roof, but kept low, the top being intended as a hayloft. These boxes have no doors. A corner iron rack is provided, and also a wooden manger in each stall. Externally these stalls form a lean-to of corrugated sheet iron, the roof being of the same material, and sloped inwards towards the enclosure, the pitch being slight. In front the doors are made to slide on an iron bar at the top, running along the entire range, and about a foot below the eaves, so that an open space above the doors is allowed to each stall for ventilation. Half the sliding front to each stall is hung to open as a door, and the other half attached to it slides. By this arrangement the donkey can be taken in or out of the stall without inconvenience, and the half that slides enables the costermonger to open which part he likes without trouble, to get either his donkey or his barrow out. There are 17 of these stalls, and they are all very simply constructed, the frames of the doors being of angle iron, upon which the corrugated sheets are riveted. Each door is cross-braced with flat bar iron, while the plates at the back, the partitions, and roof are fixed in a similar manner upon upright, horizontal, and inclined angle iron. On the other side of the space is an open shed, framed with T-iron standards in front, supporting the slanting roof, and this shed will be used for carts. The quadrangular enclosure in the centre is occupied by a double row of barrow stalls, each 9ft. deep by 4ft. wide, placed back to back, so that the roofs form together a span roof. These stalls are divided by rough board partitions. On one side there are 25 and the other 24 of these stalls: A copper for hot water, a few pony stalls, a dung-pit, and other conveniences occupy the ends, so that between the outer row of stalls and sheds and the inner double range of barrow stalls there is a wide path, which is paved. We understand that Mr. Hutchinson, of Westminster, prepared the plans; Messrs. Whitford and Co., of Limehouse, executed the iron work; and Mr. Andrew Mitchel has been the foreman. These structures are constructed thus in the simplest manner possible, so as to be easily taken down or re-erected should it be required. One drawback in the employment of corrugated iron is the noise created by idle and mischievous boys on the outside striking or stoning the corrugated iron at the back of the stalls, thereby frightening the animals, and for this reason we should have placed the barrows on the outside, and reserved the centre block for the stalls.

A *reredo* erected as a memorial to the late rector was unveiled in St. John's Church, Ballinasloe, on Sunday. The base is of grey Moate marble, surmounted by Caen stone. It is divided by columns of red cork and green Connemara marble into seven compartments, the central panel being carved with a vine and wheat intertwined with a ribbon. The *reredo* has been erected by Messrs. Sibthorpe, of Cork-hill, Dublin, under the supervision of Mr. John Kempster.

Mr. R. P. de Redder, M.A.A., architect, of 16, Saville-street, South Shields, has been unanimously appointed architect by the committee of management of East-street Presbyterian Church, South Shields, for the new church which they intend erecting early in the spring at a cost of about £4,000. It is intended to accommodate over 600 persons, and will probably be in the Decorated style of Gothic architecture.

A dinner took place at the Green Man, St. Martin's-lane, on Friday, September 28th, to celebrate the fifth anniversary of the establishment of the Stone Carvers' Society. This society, established in September, 1872, has met with continued success from its formation.

The Poplar Board of Works has accepted the tender of the Patent Victoria Stone Company for surfacing and paving Guerin-street and Trellis-street.

On Wednesday week Dartford parish church was re-opened, after having undergone extensive alterations. These consist mainly in the removal of the flat roof, and the substitution of an angular one, both over the nave and north aisle; the removal of the galleries, and the abolition of the old high pews. The work has been executed by Mr. J. G. Naylor, of Rochester, from the plans of Mr. Blomfield, and have occupied about four months in accomplishment, at a cost of £3,000.

OUR LITHOGRAPHIC ILLUSTRATIONS.

OCKHOLT MANOR-HOUSE, BERKSHIRE.

The ancient manor-house of Ockholt—now more usually called Ockwells—is situated in the parish of Bray, about one mile from Maidenhead. It was built about the year 1455 by Lord Norreys, of Ockwells and Yattendon, master of the wardrobe of Henry VI., and Lord Warden of Windsor Forest, and was originally of great extent, but only a portion of the ancient building now remains. The house appears to have formed three sides of a quadrangle, the buildings on the west side being the only ones now left, those which stood on the north having been taken down, and the chapel, which was situated on the south side, having been destroyed by fire about thirty years ago. The outside wood-work is very beautiful, but is in a deplorable state of decay. The proportions of the great hall—which is now used as a carpenter's shop—are very good, but the effect of the whole is marred by a modern flat plaster ceiling, obscuring the once beautiful open roof. The walls are covered with dado panelling to the height of 11ft., and the mouldings of the wood-work are rich and good. At one end of the hall—over the corridor leading from the porch—is an elevated gallery, probably used as an orchestra. The large bay window was formerly filled with beautiful painted glass panels, amongst which were the arms of Henry VI., with antelopes as supporters—he being the only English monarch who had them. This glass, which was falling to pieces in consequence of the lead being very rotten, was removed some years ago, and is preserved at Taplow Court. At the back of the hall is a small quadrangle, which formerly had an open corridor on three sides, but the proportions were greatly reduced about the time of James I., the grand staircase which leads to the principal rooms being built into it.—G. R. WEBSTER.

BISHOP'S CHAIR, FONT, AND TOMBS IN HEREFORD CATHEDRAL.

Our illustrations are taken (by permission) from a volume of considerable local interest, "Frasti Herefordenses, and other Antiquarian Memorials," 4to., published in 1869, by the Rev. F. T. Havergal, Minor Canon, with illustrations by Mr. G. Haddon, architect. I. The episcopal chair is preserved in the sacarium of the cathedral; it is used by the bishop at his visitations and ordinations, &c. A very great antiquity is claimed for this chair. No exact date can be assigned to it, as chairs of this character were made from the Anglo-Saxon period to the 15th century. It is of oak, in a fairly sound state, with slight traces of ancient colour—vermilion and gold. Full particulars are given of this and other ancient examples in the above-mentioned volume. II. The font consists of a solid block of stone, 32in. in diameter, curiously carved with figures of the Twelve Apostles, which, with one exception, have all been mutilated. Considerable variety has been displayed in the treatment of

the spandrels and pilasters. Beneath are four demi-griffins, with bold features and tusks. There are many fonts in the diocese of Hereford remarkable for extreme antiquity, those in the churches of Castle Frome, Erdisbury, and Old Radnor being specially remarkable. III. In this illustration three tombs are shown of the highest architectural merit, and the base of the shrine of Bishop Thomas de Cantilupe, ob. 1282. This is a very rich and remarkable specimen of early art, in an excellent state of preservation, although it has been moved three or four times. For full particulars see "Frasti Heref." p. 175, also BUILDING NEWS, pp. 138 and 146, and Proceedings of the late visit of the Royal Archaeological Institute. 2. Recumbent effigy of Dean Aquablanca, ob. 1320. 3. Tomb and rich canopy of Bishop Aquablanca, ob. 1268. This beautiful monument is one of the largest and most interesting in the cathedral. The whole of its details are most refined and delicate; with the exception of a few pieces of tracery, it is in an excellent state of preservation. The effigy of this bishop is perfect, and must have been originally gorgeous, as there are traces of minute patterns on the rich vestments. Slender Purbeck shafts support a rich and sharply-pointed canopy in three divisions.

HOUSE, NOTTINGHAM-PARK, FOR ALFRED CLEAVER, ESQ.

The house, which is now in course of erection, is situated in a pleasant part of the park belonging to the Duke of Newcastle, and which is being now let upon building leases. The house is built of the very excellent red dressed bricks which are made to such a large extent in the neighbourhood of Nottingham. The dressings of doors and windows are of fine Hollington stone. Red terra cotta, manufactured by the Whitwick Colliery Company, of Coalville, near Leicester, is used freely in various parts of the frontages, especially in the hexagon bay window, and in the ornamental panels above the windows. The principal woodwork of the interior is of pitch pine, lightly stained and varnished. The designs have been prepared by Mr. S. Dutton Walker, F.S.A., of Albert-chambers, Nottingham, architect, and Mr. D. E. Lynam is the contractor for the whole of the works. The following are the references to plans given:—

SECOND FLOOR.

Three bedrooms for servants.

BASEMENT.

Larder, dairy, beer cellar, wine cellar, potato and other stores, and rain cistern.

HURSTMONCEAUX CASTLE.

HURSTMONCEAUX CASTLE, in Sussex, was built of brick and stone, by Sir Roger de Fienes, about the year 1440, and, as bricks did not come into general use until 1500, it is probably one of the earliest brick buildings of importance, and one of the latest castles erected, as in the fifteenth century manor-houses became more suited to the customs of the time. It was in the possession of the descendants of Monceau of the Wood until 1708, when it changed hands, and shortly afterwards was again sold, and was partly dismantled, the best materials being used in the erection of a neighbouring mansion. Its style is Perpendicular or Tudor, and but little remains except the principal gateway and the outer walls, still there is enough to attest feudal magnificence. It is situated in a finely-wooded district, as the name implies, about 5 miles from Pevsey Castle. Our illustration is taken from a pen-and-ink drawing, which was exhibited in this year's Academy by Mr. F. W. Richardson.

CHAPEL, PEMBROKE TERRACE, CARDIFF.

This building is being erected for the Welsh Calvinistic Methodist connection at Cardiff, in lieu of an older building in another part of the town, about to be removed by the corporation in execution of their street improvement scheme. The chapel, which will cost about £5,000, is designed to seat 500, but will have in addition on a lower floor a large schoolroom, with two class-rooms capable of accommodating 300 children. There are galleries in each of the transepts, and one at the end facing the pulpit; these are approached by broad circular stone staircases with spacious landings, affording free communication between the front and transept galleries. The interior is lined with brickwork in bands, and diaper work with moulded brick cornices and stone strings. The large piers, with the four surmounting arches at the crossing, are to be built wholly of stone, the caps of the piers being carved. Both the transepts are ceiled with boarding in the form of a barrel vault, and the nave with a flat-panelled ceiling of wood, with the beams moulded on under-side. The contractors for the works are Messrs. W. and I. Webb, of Birmingham; and the architect Mr. Henry C. Harris, A.I.B.A., 76, St. Mary-street, Cardiff.

CHURCH OF ST. MODOC, DOUNE, SCOTLAND.

We give to-day an illustration of the interior of the chancel of this church, which is now in course of erection from the designs of Mr. Jas. Brooks. A plain style has necessarily been adopted, both on account of the hardness of the stone, which is from the Polmaise quarries, near Stirling, and also as being more in accordance with the requirements of a small country church than more elaborate work. A pleasing variety is, however, obtained by the contrast of the two kinds of stone in use—viz., red and white rock. The foundation stone was laid on the 22nd of September last by Lady Anne Moray. A general view of this church appeared in the BUILDING NEWS of the 30th June, 1876, when in the accompanying description a few mistakes were made.

COMPETITIONS.

GLASGOW.—The building committee of the Glasgow Trades House having solicited three of the city architects to prepare plans for a new trades' house, it was stated at a meeting of that body last week that the plans were then ready for inspection. The chairman said the highest estimate for the proposed new building was £42,000.

PROPOSED LODGE, SYDENHAM RECREATION GROUND.—At the meeting of Lewisham Board of Works on Wednesday week a report was received from a committee who had revised the thirty-four designs sent in, and had selected those marked, "Respice Finem," "Spes," "XXX," "Rusticus," and one of the two designs bearing motto, "Pro Bono Publico," as the best five. The members struck out "XXX," as disqualified, not being accompanied by specifications. The Board considered the other four selected, and chose that of "Respice Finem," which proved to be by Mr. Robert Walker, of Moorgate-street, E.C.

PROPOSED NEW HOTEL, COVENTRY.—Seventeen architects have submitted designs for this competition. One hundred and twenty-two applications for instructions were received.

The second anniversary of the re-opening of St. Nicholas' parish church, Skerbeck, Lincolnshire, has been marked by the presentation of a carved oak lectern and altar rails, both made from the designs of the architect (Sir Gilbert Scott), the former being the work of Mr. Robinson, carver, of London, and the latter that of Mr. Kenington, of Boston.

On Monday a new Congregational chapel was opened at Leigh. The chapel is of Gothic design, by Mr. Geo. Woodhouse, architect, Bolton. The estimated cost is £4,500, and sittings are provided for 550 persons.

The foundation stone of Pollokshields Free Church was laid on Saturday. The edifice is being built from the designs of Messrs. M'Kissock and Rowan, of Glasgow. It is Greek in style, will seat 1,000 worshippers, and cost £12,550; but that sum includes the provision of a hall, committee room, and other accommodation on the ground floor of the church proper.

PROPOSED PUBLIC OFFICES, SOUTHAMPTON.

IT is strange with what perversity Town Councils manage their local affairs. It would, indeed, appear that some outside and independent authority is often required to make a corporation do that which would be the real interest of a town. Southampton has one or two excellent sites for a town-hall and public offices in the centre of the town, which the corporation may easily acquire, and upon either of which a united structure could be raised in every way worthy of the town and its public convenience. Yet, in spite of these facilities, the Town Council have been carping over the expenditure of a few hundred pounds, and have at last come to the decision to throw away their opportunities, to squander their resources, and spend in an objectless manner a sum estimated by their own surveyor at from £4,000 to £5,000 in patching up, and making an old and totally different building answer their present purpose. That there has been a great deal of personal and local interests involved we are obliged to admit before we can seriously think of a Town Council spending £5,000 in a makeshift while the great need of a town-hall and offices still remains, and is becoming daily more necessary—at least, if the town desires to keep pace with much smaller boroughs. From the report of the public offices committee it appears a most eligible and suitable site can be obtained in Bar-street—now the skating-rink site—for about £6,000, but that this proposition was outvoted by some members for the adoption of the audit house or fish market site, now used for public offices, though thoroughly inadequate, and quite out of the centre of the town. This idea has been acted upon, and Mr. Lemon, the borough surveyor, was instructed to prepare plans for two schemes—one showing an entirely new building, and the other an arrangement retaining the present council-chamber. Plans have been prepared. The first scheme is estimated at £15,000, the latter at £14,000, and last Wednesday week these plans and Mr. Lemon's report were laid before the Town Council, with the committee's recommendation to adopt the first plan. After a lengthened discussion an amendment was proposed by Mr. Rolles Driver to carry out a temporary alteration of the present old building, at a cost of about £3,000. This was ultimately carried by a majority of the council. While we congratulate the town that the committee's report was not adopted, and the blunder committed of laying out £15,000 on a site that the public could never approve of, we cannot but express our surprise that an imperfect patchwork of the old building is contemplated, and we hope public opinion will be taken before such a frittering-away of the ratepayers' money is carried into effect. Mr. Lemon's report proposes the following offices on the old site:—On the ground-floor, office of health's, sanitary inspector's, borough surveyor's, and pay offices, with a hack entrance, rooms for the waterworks engineer, inspector of weights and measures, gas-meter, and other offices; on the first-floor a reception-room, 54ft. x 24ft., occupying the whole front, mayor's parlour, committee-room, 31ft. x 17ft., arranged so that they may be used *en suite*; a grand staircase in the centre of building, 31ft. 6in. x 19ft. 3in., lighted by a domical lantern; a council-chamber, 44ft. 6in. x 30ft., lighted from the roof partly, and also from the north end above a gallery, the present fittings being utilised. On the second floor the harbour board, school board, borough treasurer, and accountant will be provided for. The alternative scheme is to retain the present council-chamber in the front, which measures 38ft. 6in. x 24ft. 9in., and is lighted by four windows towards the High-street, and to make the other offices conform thereto, though the surveyor points out the error of this arrangement, and the architectural defect of preserving the old council-room, which will not be symmetrically placed. Besides this, the old façade will have to be remodelled. We certainly consider a council-chamber should be arranged, if possible, with top light, and be placed centrally, to avoid the glare of window light and street noise. These are the main features of the plan, but we

think, with Mr. Alderman Passenger, that as the post-office authorities require a new building, and as the audit-house would be well adapted for that purpose, the town would do wisely to sell their old building and purchase the upper site. At any rate, it would be better to postpone a scheme that would be but a temporary solution of the difficulty, till the council can purchase a central situation and combine the public offices with a town-hall, which is an important adjunct in any municipal structure. Let the corporation pause before committing another blunder, obtain one of those sites either as suggested, or in the public grounds, and then, if need be, invite the architectural profession to compete upon a basis laid down by their surveyor—a plan that has been found successful at Nottingham, Wakefield, and Leeds.

THE SANITARY CONGRESS AT LEAMINGTON.

THE Congress promoted by the Sanitary Institute of Great Britain opened on Wednesday under favourable auspices. For days before exhibitors and inventors of sanitary and domestic appliances had been hard at work in preparing an exhibition at Drill-hall, to be opened by his worship the mayor on Wednesday afternoon. It was somewhat incomplete when the time had arrived for the opening, but this fact did not materially detract from the interest of the whole collection. The Drill-hall, where the exhibition is held, is situated on the banks of the river Leam, and it has been necessary to supplement the capacity of the hall by adding a large marquee. The whole available space is occupied by manufacturers of labour-saving machinery, water, gas, and other purifying appliances, exhibitors of model hospitals, model cremators, model sewer works and processes, and most of the exhibits suggest the shortcomings of many dwellings and other buildings in the essentials of healthful living places. Messrs. Shillito and Shorland, the Sanitary Engineering and Ventilation Company, and others present working models of their inventions in the shape of cistern filters, gas meters and gas purifiers, and house ventilators. Mr. James Howorth, of Farnworth, Lancashire, exhibits appliances for securing effective ventilation in mills and work-places where the generation of impure air is very rapid; and Dr. Hinckes Bird, of Lytham, Lancashire, demonstrates by models his well-known means of securing ventilation in dwelling-houses. Messrs. Doulton, of Lambeth, exhibit some of their "Faience Ware," some sanitary pottery, and also present in tiles on the wall a handsome picture in pottery of the Pilgrim Fathers starting for America. These tiles form a permanent decoration for the insides or the outsides of buildings. The loan collection includes several models of systems of cremation and of the Burdett Pavilion Cottage Hospital. In all there are 300 stands.

The evening meeting was held in the Pump-room of the famous Leamington Spa. Dr. Richardson delivered an address, entitled "A Theory as to the Natural or Glandular Origin of the Contagious Diseases," a report of which will be found in *Public Health*.

AN ART FAN EXHIBITION, LIVERPOOL.

AN exhibition of fans is at least a novelty in these utilitarian days, but our art brethren at Liverpool have actually formed a loan collection of this graceful appendage to the lady's toilet, and we understand there is soon to be one in London. A catalogue before us of an exhibition of fans at the Liverpool Art Club House describes a collection of over 200 fans, beginning with ancient Egyptian and Oriental to the latest French and English examples of this elegant article of attire. The list of contributors to this interesting and unique exhibition includes a number of names well known in art circles, and we find Mr. G. Ashdown Audsley and Mrs. Audsley, Mr. James L. Bowes, Mr. Julius Franks, Mr. Frederick Holder, Mr. J. A. Pieton, Mr. and Miss Phené Spiers, large exhibitors. A succinctly-written historical sketch is given as

an introduction from the pen of Mr. G. A. Audsley, which furnishes the reader with a general idea of the history of the fan. Its patent and expressive movements in the hands of the fair adept are well known, and we quite believe, with the French poet quoted, that the fan has played a no unimportant part in the art of coquetry. The different and expressive movements and flutterings of the fan is a language akin to that of flowers, and Mr. Mason mentions the well-known dexterity of Spanish ladies in what he terms "fan-flirtation" or "fan-telegraphy." A Spanish maiden with dark eyes is seldom ever depicted without the accompaniment of this magic sceptre, and that it has in every age become a powerful auxiliary in the hands of the belle few will doubt. Like other articles of dress the fan seems to have been an object of great antiquity, especially among the people of tropical climates. Upon ancient Egyptian tombs painted representations of it are often seen, and the bas-reliefs of the hall of the Rhamesion contain the figures of the twenty-three sons of Rhameses the Great, each holding a fan in the shape of a long ostrich plume fixed to a handle, and the title "Fan-bearer of the King" is written over each. In Egyptian iconography the fan symbolised happiness. One of these ancient feather fans is described in the catalogue No. 1 as an "ancient Egyptian fan handle," the feather of which is missing. This form appears to have been the nucleus or earliest form of the fan. In Assyrian sculptures fans, composed of these palm leaves, are to be met with; and in India leaves of the palm, feathers, and reeds were employed. Various exhibits of Indian fans of these kinds are to be seen in the collection, and we may mention No. 5, sent by Mr. Fred. Holder, formed of fibre, radiating from a centre disc, in the circumference of which is a loop-handle. This fan was used by dipping it into perfumed water before setting it in motion. The handle and disc are ornamented with floral patterns in colour and gold. Another Indian fan is called the "tchaounry." Nos. 7 and 8 are examples. The former of these is formed of the tail of the yak or ox, of Thibet, mounted on a silver handle, and the latter is composed of delicate filaments of wood, mounted on a sandal-wood handle, elaborately carved. It is this kind of fan that is used over the heads of Indian princes to disperse insects. Various specimens of Japanese and Chinese fans are exhibited; some of these are fabricated in leaves, feathers, stout paper painted on one side, textile fabrics, &c. Mr. James L. Bowes exhibits several; one (9), of paper, has painted on one side a red orb on a gold ground, and on the other side a gold orb on a scarlet ground. The brins and panaches are of plain lacquered wood in this case, though in several they are of bamboo and pierced ivory. In China the fan is regarded as an attribute of rank, and the invitation to fan oneself is considered an act of politeness. It has been asserted that the folding fan is a Japanese invention, and was introduced into China by them; and, perhaps, no country has devoted so much artistic skill and taste to this article as Japan. It is certain those imported into this country are chiefly Japanese; and, in 1875, it is stated by Consul Annesley that three millions of fans were exported, and Mr. Audsley mentions that a million fans were ordered for the Philadelphia Exhibition. Paper leaves, decorated by block or hand-painted designs, are usually employed; the brins, or radiating pieces, and the panaches, or outside parts, being generally of bamboo. Mr. Audsley describes the folding and pressing of the leaf after it has been radially divided. We must not forget to note a series of war and ceremonial fans, contributed by M. Ph. Burty, of Paris, with metal panaches inlaid with silver. Passing various exquisite examples of Japanese and Chinese manufacture, some of tortoise-shell and ivory, pierced or carved, filagree and enamel brins, with variously painted and perforated leaves, many of the latter composed of radiants of ivory, sandal-wood, or metal filagree, perforated in a fashion that contravenes the intention of air wafters, some interesting specimens of English and French manufacture, Mr. Audsley tells us the fan became a fashionable article of costume in France during the reign of Henry VII., and in England during that of

Henry VIII. Mr. Redgrave describes various fans of this and a later period, and artists of celebrity, like Paul Ruhens, devoted themselves to fan-painting. The fans of the reigns of Louis XIV. and XV. were exquisite examples of the most consummate art. Many of these have panaches and brins pierced, inlaid with pearl, decorated with jewels, relieved with colour and gold. In works of the latter epoch the Liverpool collection is rich. No. 59, with a vellum-painted leaf with Arcadian subject, from a design by Watteau, the brins being of pearl, decorated in the Louis Quatorze style, may be noticed; also No. 60, of paper, beautifully painted in fine tempora—subject, betrothal of Louis XV. with Marie Leczinska, the work of Boucher. The brins, &c., are of white pearl, with carved medallions, and figures, and scrollwork in coloured gold foils, and the fan belonged to the Queen of Louis XV.; exhibited by Mr. Julius Franks. Nos. 68 and 69 are of silk tissue, painted with classical subjects; No. 73 is a work of Boucher, with harmonious colouring—all lent by Dr. Pioget. No. 79 is another finely-painted fan, by Boucher, lent by Mr. Julius Franks. 75, on painted vellum, with allegorical design, and refined colouring, and spangled with coloured metals—period, Louis XV.—is a rich specimen of art workmanship. We note other exquisite works of the Parisian artists. The paper fans of the 18th century are exceedingly suggestive, and, as Mr. Audsley says, they have been used as a vehicle for conveying political events, caricatures of great personages, and other information. Artists in metal, ivory, and wood, jewellers and enamellers, are engaged in this manufacture, and our French neighbours still take the lead in fan manufacture. We must not omit to mention No. 147—a Chinese fan with paper leaf, and with 14 brins composed of ivory pierced and carved, silver filagree and enamel, scarlet ivory, tortoise-shells, white pearl, &c., placed alternately, exhibited by Mr. R.W. Edis, F.S.A.; and especially the fine series of fans of the period of the French Revolution, lent by M. A. de Liesville, of Paris, variously representing the taking of the Bastille, the Fête of the Federation, portraits of Louis XVI. and La Fayette, Robespierre burning Atheism and Fanaticism, and unveiling Truth, and portraits of La Pelletier and Murat.

DRYING PLASTERING IN DENMARK.

ACCORDING to the *Grossherzoglich Hessisches Gewerbeblatt*, a Danish architect, Mr. Kruse, of Copenhagen, has recently erected a building, and prepared it for occupancy, in forty days; the walls being dried in three days. A calculation showed that from each story there was a minimum of four thousand gallons of water to be evaporated. To do this, a great increase of temperature was necessary, and coke-stoves were placed in the cellar at the base of every chimney. One flue, probably, served for all stories. The chimneys were then closed above the roof, and a passage allowed the dense smoke by cutting openings into the flues six inches underneath the ceiling of the first story. An escape was then allowed on the level of the floor; and the rooms thus filled with currents of smoke and gases were quickly dried. This process was repeated floor by floor, the openings being successively broken out and walled up. The temperature varied from ninety-five to one hundred and twenty degrees Fahrenheit, and was, of course, lowest at the floor-level. The ventilation was so great that the air, or rather the smoke, in the rooms, was totally changed from five to six times an hour. Something less than nineteen tons of coke were needed for a story, though we are not informed for how many rooms. A single workman was alone employed to attend the firing. It is also stated that the wood-work remained unharmed, there being no shrinkage noticeable in the doors, windows, etc. When dry, it appeared that the wall-plaster had attained an exceptional hardness, owing, no doubt, to the great quantity of carbonic-acid gas, produced by the imperfect combustion, which had changed the caustic lime into carbonate of lime. So says the report. It is quite customary to burn charcoal in newly-plastered houses for the sake of the gas; but there are few attempts of so great a magnitude as this on record. It seems strange,

remarks the *American Architect*, that three days of such heat, and the evaporation of such quantities of water, should not have caused the wood-work to shrink or check, as it might reasonably have been expected to crack the walls. Plaster thus rapidly dried, and capable of absorbing little or no water, must have increased the labour of the kalsominer, paper-hanger, or frescoer: the carbonic-acid gas which filled the house naturally rendered superintendence impossible; and it is to be supposed that walls, ceilings, and floors were blackened by the smoke. But these are minor considerations; the great objection is, that the plaster was probably only hardened on the surface. It is a well-known fact that mortar in any form does not reach its usual firmness when dried in the heat of summer even. It seems as though the presence of water were necessary to aid the combination of lime and carbon. One of the best authorities on the subject, Vicat (*Recherches sur la Chaux*) goes so far as to assert that mortars lose four-fifths of their strength if dried too rapidly. He commends the custom of the masons of Northern Italy, who, in constructions of importance, water the masonry during the summer months to guard against this danger. It is an old saying, that lime at a hundred years is but a child; and such precocious forcing at birth does not appear conducive to long life.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.—On Saturday morning the members of the Yorkshire branch of this association met at Sheffield, and visited Messrs. Cammell's works and the new tramways, under the guidance of Mr. P. B. Coghlan, borough surveyor of Sheffield. In the afternoon a meeting was held in the mayor's parlour, Mr. Ashmead, borough engineer of Bristol, in the chair, when a paper was read by Mr. J. H. Smedhurst, surveyor, of Sowerby Bridge, on "The sinking of cylinders for bridge piers at Sowerby Bridge, across the river Calder." The method adopted was, instead of exhausting the air from the cylinders, to compress the air within them. As they were closed at the top and open at the bottom, this plan forced the foul air through the interior, which not only allowed the men to work inside and excavate the soil, but the condensation of the air infused so much energy into the men that they did more work in the cylinders in a given time than above ground under similar circumstances. The paper was followed by a discussion, and in the evening the members dined together.

DURHAM AND NORTHUMBERLAND ARCHÆOLOGICAL SOCIETY.—The members of this society visited Thirsk Church—re-opened next day after restoration from Mr. Street's designs—on Monday, and afterwards descended to the crypt, where an address was delivered by Mr. Longstaffe, of Yateshead, who spoke of the church as a very fine Perpendicular work, depending entirely for its beauty upon its proportions. Canon Greenwell said that the ancient glass removed during the restoration ought to be restored, because, however good the repository, the church was the most fitting place for it. The last of the series of charters of Thirsk, which belonged to the vicar's choral at York, had disappeared, and he wished to know how it was that that body had been so careless of documents of the greatest interest. In the afternoon the members left for Multon, and visited the Priory there. On Tuesday a carriage excursion was made from Multon to Castle Howard and Sheriff Hutton Castle, and in the afternoon they left Flaxton Station for York.

GLASGOW ARCHÆOLOGICAL SOCIETY.—On Thursday the members of this society took their annual excursion, visiting the ruins of Inchmurrin Castle, on an island in Loch Lomond. After an examination of the ruins of the principal buildings and tracing the subsidiary structures, a paper was read in the Earl's Hall, by Mr. Galloway, on the castle and its owners, who, from 1170 to 1470, were of the old Lennox line; Mr. Irving described, with the aid of maps, photographs, and drawings,

the principal ancient and modern castles round the Loch; and Mr. Kirksop showed a collection of seals and cameos. After ascending the hill in the centre of the island, the members sailed across the Loch to Auchindennan, the seat of Mr. Martin, and from thence proceeded in boats to Balloch, where they dined together before returning to Glasgow.

CHIPS.

A new Board School at Somers Town was opened on Friday last. It is a single block, three stories high, in the usual Queen Anne style. The area of the site is 13,320 square feet. The total cost has been £9,570 8s. 6d., equal to £11 5s. 5d. per head. The school is to accommodate 349 children. The building has been carried out from designs by the architect of the London School Board by Messrs. Wall Brothers, builders, of Kentish Town.

Some of the vacant niches in Winchester Cathedral are about to be filled with statues of the Apostles to replace others which have been removed.

The erection of the new Middle Class College at Hereford is to be commenced forthwith from the designs of Mr. F. R. Kempson, of that city. The cost will be £11,000.

A new Primitive Methodist chapel at Halesworth was opened on Thursday week. It has been erected by Mr. Woodyard, of Halesworth, from designs by Mr. Pells, of Beccles.

The Lyceum Theatre at Stafford has been renovated and redecorated at a cost of £521, under the superintendence of Mr. G. Wormal, architect, of Stafford.

A new reredos of oak, 27ft. in width and 15ft. high to cornice, is being erected in the parish church of Bolton, Lancashire. In the centre will be a painted representation of the "Last Supper," but there is to be no representation of a cross upon the structure. The cost will be about £1,200.

In connection with extensive works in South-west Norfolk, the Great Eastern Railway Company are about to build a railway bridge across the river Waveney at Brandon. The plans of Mr. Tyler show an iron girder bridge on brick piers 69ft. span, and with 6ft. halting way.

Considerable alterations and additions have been made within the last twelve months to Fairhill, near Tunbridge, a mansion in Italian style purchased for residential purposes by the Earl of Derby a few years since. Mr. David Brandon has been the architect, and Mr. Dove, of Tunbridge, the builder.

The Local Board of Southborough, between Tunbridge and Tunbridge Wells, is experimenting with Dietz's patent lamps for burning paraffin oil, as a substitute for gas. The pecuniary saving is estimated at £1 per lamp per annum.

The members of the Somersetshire Archæological and Mutual History Society visited Old Cleeve Alhey on Wednesday week, and made a careful inspection of the premises and site, returning to Taunton in the evening.

The church of All Saints, at Branksome Park, near Bournemouth, was consecrated on the 20th ult. It is Early English in style, and consists of nave and chancel, so planned that nave and transepts may be added at a future day. The materials are Purbeck stone with Bere stone dressings, and the cost has been between £3,000 and £4,000. Messrs. H. M. Burton and T. Stevens are the architects and Messrs. H. J. Saunders the builders.

The new church of St. Michael and All Angels, at Dalton, near Wigan, was consecrated on Saturday. The church has been built at the sole expense of Lord Skelmersdale, at a cost of between £5,000 and £6,000. Mr. T. H. Wyatt, of London, was the architect, and Mr. Winnard, of Wigan, the builder.

Mr. Worth, of Willesden, has been appointed deputy surveyor and inspector of nuisances of Gravesend, at a salary of £100 a year for the former and £50 for the latter office.

Extensive alterations in the National Bank premises at Waterford are nearly completed. The new front is in red brick, with bands and dressings of polished marble of various colours, and a large amount of carved stone. The contractors are Messrs. John Ryan and Sons, of Limerick and Waterford.

Brompton Church, Huntingdonshire, is undergoing restoration, Mr. Williams being the contractor. On Friday week one of the carpenters, John Byfield, while engaged in chopping out some rotting rafters, fell from the roof in an epileptic fit, and was killed. At the inquest a verdict of accidental death was returned, the jury holding that no blame attached to the contractor.

A new iron railway bridge is being erected at Rutherglen to carry the Farnham-road over the Caledonian line. It is in four spans, the widest being 38ft. Mr. Watson is the contractor. A new station is about to be built close to this bridge.

Building Intelligence.

BURTON LEONARD.—The foundation stone was laid on Saturday of a new church at Burton Leonard, near Ripon, in place of a small oblong building erected in the last century, and now falling into decay. The new building will be Decorated Gothic, in style, and will consist of a nave 53ft. by 21ft.; chancel, 28ft. by 18ft., with organ chamber and vestry on the north side, and a south porch and western bell gable. The east window will be of five lights. The roofs are to be open-timbered internally, and covered with red tiles. The nave seats will all be open, and provision will be made for a choir in the chancel. Accommodation will be given to 200 worshippers, at an estimated cost of £2,500. The architect is Mr. C. H. Fowler, of Durham, and the builder Mr. Wood, of Pickering.

CLIFTON (YORKS).—The foundation stone of a new school and parish-room, at Clifton, was laid on Tuesday week. Mr. J. L. Pearson, of Harley-street, is the architect of the structure, which will be Gothic in style. The material used is red brick with stone dressings, and the sole contractors are Messrs. Shilto and Morgan, builders, Campsall, near Doncaster. The building will be 40ft. in length × 20ft. wide measurement, and there will be a playground at the back, about 30ft. long and upwards of 20ft. broad. A bell-turret is to be built upon the north side of the school, and its height will be 40ft. Associated with the school there will be a class-room 16ft. × 14ft., and various out-offices.

COUNTY OF DURHAM.—SEDFIELD NEW AUXILIARY ASYLUM.—In response to advertisements, asking tenders for the superstructure of these buildings, no less than 130 tenders were received, containing 411 distinct offers; of these 22 were sole tenders for the main buildings, and 23 for the lodges and entrance gates, while 85 were for the separate trade sections in each contract. The competition seems to have been very keen, and shows that builders in the district are anxious to secure work, if not to realise profits, to keep their establishments together till better times are forthcoming. £40,000 was the amount voted by Quarter Sessions for the work, but it will be completed considerably under that sum. The work is of a plain yet neat and substantial character. Every improvement has been adopted that could in any way add to the comfort and convenience of the patients. The administrative block contains assistant-surgeon's house, committee-rooms, large dining and amusement hall, kitchens, sculleries, &c. Mr. William Crozier, M.I.C.E., engineer and architect for the county of Durham, has designed and will superintend the carrying out of the works.

LICKEY END.—Newschools, erected at Lickey End by the Bromsgrove School Board, will be opened shortly. The buildings provide accommodation for upwards of 250 children. The premises are substantially brick-built, and tiled with red Black Country tiles. The external walls are faced with very durable red pressed bricks, and are all 14in. thick. The whole of the benches and desks have been made by Messrs. Colman and Glendenning, of Norwich. The elevations are in the Gothic style. The architect's estimate was £2,430, including fittings, being within £70 of the contract sum of £2,500 for which the work has been executed by Messrs. Brazier and Weaver. Mr. John Cotton, of Birmingham and Bromsgrove, is the architect.

LIVERPOOL.—The memorial stone of St. Peter's new Wesleyan Church, Toxteth-park, Liverpool, was laid last week. The new church, it is estimated, will cost, including the site, £9,000. It is arranged to seat 945 persons. A large school-room, six class-rooms, five vestries, chapel-keeper's house, &c., are provided at the back of the church. The school-room will accommodate 425 children for class purposes, or 525 for simple meetings or addresses. The style is Gothic, but made subservient to the requirements of the congregation. The front will consist of a principal gable, with large central window, and large entrance doorway underneath, and a turret of

good design and proportions will rise to a height of about 100ft. The entire front and sides, where seen, will be faced with grey stocks and bands of red and black bricks, with Stourton stone dressings. The architect, whose designs were selected in competition with several others, is C. O. Ellison, Esq., F.R.I.B.A., of Liverpool; and Mr. Alexander Bleakley, of Birkenhead, has taken the contract.

LONDON SCHOOL BOARD.—At Wednesday's meeting of this Board the tender of Mr. J. S. Jerrard, of Loampit Vale, Lewisham, amounting to £8,974, was accepted for the erection of a school for 645 children in Collingwood-street, Ratcliff, and that of Messrs. Kirk and Randall, of Woolwich, amounting to £7,296, was accepted for a school for 572 children, in Sheperton-road, Islington. A recent resolution of the Board, accepting the tender of Messrs. Wall Brothers, of Kentish-town, amounting to £8,026, for the erection of a school for 599 children, at Tanner's-hill, Deptford, was confirmed. A resolution of the 18th July last, accepting the tender of Mr. T. Boyce, amounting to £679, for the erection of a separate cookery school on the Stephen-street, Lisson-grove site, was rescinded, it being agreed that the additional rooms necessary for the purpose be erected in connection with the school on the contract schedule of prices. The works committee was authorised to incur the following expenditure for furniture and fittings for the undermentioned new or enlarged schools:—Enlargement: Saunders-road, Notting-hill (352 school places) £285 8s. 3d. New buildings: Boundary-lane, Camberwell (810 do.), £614 19s. 11d.; Medburn-street, St. Pancras (849 do.), £672 19s.; Hatfield-street, Southwark (1,104 do.), £791 13s. 5d.; and Wright's-road, North Bow (1,083 do.), £779 1s. 8d.

MANCHESTER.—The foundation stone of the new gas-works, which the Manchester City Council, about eighteen months ago, resolved to erect near Philips-park, will be laid on Wednesday next. The work was commenced by the late Mr. Edward Johnson, to whom the contract was let about twelve months ago, and it will be carried through by his executors. The four tanks—each 153ft. in diameter and 36ft. deep—are intended to receive four three-lift telescopic gasholders, to contain together about 7,000,000 cubic feet. The retort-houses will hold 536 single retorts, 10ft. long, which will be fixed in double lengths and charged at each end, and so arranged that hydraulic charging machinery may be used. The other works in progress consist of a canal basin in connection with the Ashton Canal. The works will be erected in four sections, each independent of the rest, and each, when in full operation, will yield a maximum supply of 5,000,000 cubic feet of gas every 24 hours.

METROPOLITAN BOARD OF WORKS.—On Friday the tender of Messrs. Ford and Norris, amounting to £1,350, was accepted for the reconstruction of 750ft. of brick sewer between Thomas and Weaver-streets, Bethnal-green; that of Mr. Charles Prout, amounting to £3,917, for the construction of 2,000ft. of brick sewer between Gray's-inn-road and Vernon-place; and Mr. Prout's tender (£3,710) was also accepted for the construction of 2,400ft. of brick and concrete sewers for the covering in and diversion of a portion of Stamford-brook sewer, near the New-road, Hammersmith. A contract was sealed with Messrs. Laing for cleansing and painting the offices of the board. A letter was received from Mr. W. J. Pearce, submitting for approval plans showing proposed interference with sewer and subway in Queen Victoria-street, by the works of the Metropolitan Inner Circle Completion Railway. As this was the last day for opposing the proposal, it was determined to give notice to that effect to Mr. Pearce. Correspondence was read respecting certain sewer works now being carried out by the National Dwellings' Society at the back of intended houses in Peel-street, Kensington, which the Middlesex Waterworks Company apprehend may affect the stability of their reservoir embankment. The engineer to the board was instructed to inspect and report upon the works and embankment. A notice was received from the New River Company, stating that they intend to provide a constant supply of water in

the parish of Shoreditch from December 10th next, and the works committee was instructed to report where hydrants will be required to be placed in the parish in order to give the public the benefit of a constant supply. Dr. Liddle, medical officer of health for Whitechapel, forwarded an official representation as to the unhealthiness of an area in the district. The matter was referred to the works committee, to whom was also relegated a letter from Mr. T. Woolner, who, on behalf of the John Stuart Mill Memorial Committee, requested permission to erect a statue upon the site agreed upon, facing the School Board offices.

NOTTINGHAM.—Last week Mr. Gladstone was present at the laying of the foundation stone of the new University College at Nottingham. The project for erecting what will now be known locally as "University College" has been materially assisted by a gift of no less than £10,000 by an anonymous donor. The building itself will cost about £45,000. The greater part of the outlay will, however, be met by the Corporation. Designs for the proposed building were obtained by public competition, in which Messrs. Lockwood and Mawson, architects, London and Bradford, gained the first premium, and, therefore, received the commission. The college will be Gothic in style, and is to consist of three sections—the central portion devoted to University Extension purposes. Its accommodation will include a lecture-hall, capable of accommodating 600 persons; two smaller lecture-rooms, and a number of class-rooms, laboratories, &c. The Free Library and Museum are to form the two wings, right and left, of the main building.

PRESTON.—New head-quarters for the county constabulary have just been erected at Preston from the designs of Mr. Littler, architect. The premises will comprise offices for the chief constable, residences for the chief clerk, a sergeant of police, and two married constables, with sleeping accommodation for 24 unmarried policemen or recruits. The frontage of the building will be 120ft., and the depth in rear will be about 200ft. The style will be Elizabethan, of simple character, in red brick, with window dressings and string-course of stone. Over the principal offices in front are to be a room for magistrates' meetings, an ante-room, waiting-room, &c., the remainder of this floor being taken up by the dormitories and stores.

SWANSEA HARBOUR WORKS.—The Swansea Harbour Trust and Town Council are just completing the extension of the west pier into the roads by 1,000ft., and the increase of dock accommodation, commenced 15 months since, and contemplate further works of the same character. The piles for the pier numbered 506, with a cubical capacity of 95,000ft., the timbers varying in length from 23 to 54ft. These were fixed by Mr. Thomas, of Newport, after having been erecoted by Mr. Railton, of the same town. The stone required for filling in the space between this framework was obtained from quarries near Swansea, and in all, block and loose rubble, 30,000 tons were thrown in. The ironwork, of which 72 tons was wrought and 22 tons cast, has been supplied by the Swansea Waggon Company. A lighthouse is yet to be added twice the height of the old one. The resident engineer is Mr. Schenk. The work, it is believed, will be completed at considerably below estimated cost.

SUTTON-ON-THE-FOREST.—Last week the church of Sutton-on-the-Forest was re-opened after restoration. Sutton is about eight miles from York, and its church is dedicated to All Saints. Its foundation dates back nearly to the Conquest, and though it possessed few relics of that time, those which are left are decided, and consist mainly of the half of a walled-up window and a few bases on the north side. The remains of an early Norman church also stand out clearly at the west corner, and there are various wooden piers and stone bases which are also indicative of early work. There are various other styles of architecture which indicate the hands of frequent after-restorers. The font is of about the year 1300. The capacity of the church was perhaps equal to the demand upon it, there being sittings for some 400 worshippers, and the object of the restoration has not been so much to increase this as to preserve the edifice and its characteristics to the parish and

the country, for amongst its vicars in years gone by was the author of "Tristram Shandy." It is now in the Perpendicular style, but the ancient Decorated east window has been preserved in the chancel end. In place of the unique arcade between the nave and large north aisle of massive but decaying oak timbers, rudely fashioned into pillars and arches, one of 15th century character has been erected in Ancaster stone. The roofs are open timbered, and the seats are of pitch pine, but at present no provision has been made for lighting the church. The restoration has been carried out under the architectural superintendence of Mr. Atkinson, of York, and the builder has been Mr. Keswick, of the same place.

THIRSK.—The ancient parish church of Thirsk, after alteration and restoration, was re-opened on Tuesday. The restoration up to the present time has been confined to the interior of the church. The walls, which before were coated with plaster, have been laid bare, and, by the way, whilst this was being done, several paintings of figures of the Apostles were discovered on the spaces of the wall between the windows of the nave. These have been carefully preserved. The chancel arch has been entirely restored, and the roofs have been repaired and re-leaded. The cost of the work already done is about £4,500. The architect is Mr. Street, and the contractor Mr. Brown, of York.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published October 5 contains articles on The Penge Tragedy and its Lesson in Connection with Public Health, The Sanitary Housing of our Population, The Birmingham United Drainage Scheme, The Hospital Schools, Compulsory Registration and Infectious Diseases, The Parkes Museum of Hygiene, Smoke-Laden Air, Fruit Bread, The Meat of Cattle Afflicted with Pleuro-Pneumonia, Patent Medicines and Secret Remedies, The Water we Drink, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c., &c. Price Twopence. Annual Subscription, Post-free, Eleven Shillings. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

W. H. W. (You had better consult topographical works on every county, as no single work will give you a list of "all the old buildings of interest in England.")—P., J. M., X., B. R., C. S., X. (Habershon's "Half-Timber Building," and Dollman's "Domestic Architecture" may give you what you want. The BUILDING NEWS has contained some of the best illustrations of timber work.)—J. DUTTON WALKER, F.S.A. (Next work)

Correspondence.

THE QUEEN ANNE MANIA.

To the Editor of the BUILDING NEWS.

SIR,—Has the Queen Anne mania any *raison d'être* in this phase of the nineteenth century? Is it more representative of the art feeling of our age than the Gothic, or was, or as much? or are they not both exotics, so to speak, though derivatively English, foreign alike to the feelings and sentiments of the bulk of the population, and fostered only by an eccentric few, understood not by, and caviare to, the many?

These thoughts have been suggested by a contemplation of Mr. Brydon's design for the Kensington Vestry Hall. The question has been asked before, and will be asked again, are we to ignore such windows, and all modern improvements and inventions, because they were not co-existent with, and consequently have no sympathy with, Queen Anne and her architecture? And is the return to what was considered, less than 10 years ago, as, perhaps, a picturesque, albeit debased, period of our English architecture, to which a certain amount of admiration might be conceded, *sub rosam*; but to be sketched, or reproduced, by the aspiring young architect—never: Is this a healthy sign, or is it merely one of the many eccentric garbs which our modern buildings have to put on at the bidding of the designer or compiler—this or that article of apparel from this or that age—a fashion not more desirable than, and having no deeper sentiment or foundation than the Dolly Varden costume, and other ultra fashions in feminine attire, and as soon to be discarded?

For it has come to this, the artist in coats and the artist in houses about keep pace with one another, and no more, and as the fashioner of our garments trumpets forth by woodcuts and advertisements the latest fashions in coats or trousers, so does the other and no less potent snip exhibit in the weekly journals "the latest modes" in town-halls or mansions.

There is, according to my mind, in this eclecticism in building, another and a serious danger to be apprehended in the future other than the sufficient one of having no style which is representative of the feelings and sentiments of the age.

Having run through the gamut of all styles; having at pleasure varied the fascinating painter's Gothic of the Venetians by the bold, massive, and simple work of the French; having exhausted the interest of our own 13th and 14th century work, and returned for the second time during the so-called Gothic revival to the latest, and until lately what was considered the most debased of the Gothic periods—viz., the Perpendicular and Tudor styles; having also had a go at the heavy portico or windowless style, dubbing the attempted imitation Greek; having built also with some success in the Italian, and having had final recourse to the Queen Anne; having built in every style under the sun, though, through having no knowledge of the style the Tower of Babel was erected in, have not imitated that, though we should much like to have had a few details and reproduced it; having done all this, and incurred the danger to which I allude, in years to come—viz., running the risk of adding all the brains of all the antiquarians that were not added already—for unless the varied assortments are labelled now, or at a later period whilst we have ample record, who shall decide which is the antique and which the spurious imitation, so that it may be necessary, if things are allowed to take their present course, to label every building as "Resuscitated Queen Anne, temp. 1877;" "Rejuvenated Gothic, 14 cent., temp. 1864;" "Rehabilitated Greek, temp. 1830," and so on. This rage for imitating the old is not confined to architecture only, as we have seen lately a prosecution instituted in the matter of imitating old silver plate, dishonest artificers having found it worth their while to manufacture it, and tradesmen dishonest enough to sell it—selling it, however, as veritable old plate, therein the dishonesty. The Arundel, and other societies also, that devote their time and money to the reproduction of old manuscripts,

engravings, &c., and the reprint of old and scarce works, exactly according to the old editions; not only so, there are some modern writers who delight to clothe their ideas in language ambiguous and peculiar to themselves. If this fashion is not taken from ancient models, it is hard to say whence it is derived, as it is not a modern one.

I don't know whether I am quite in order in making these remarks; they have suggested themselves to me, and I have jotted them down.—I am, &c., ASBURY JACKSON.

ARCHITECTS' COMMISSIONS.

SIR,—I do not often receive such circulars as enclosed, but I think it right they should be made public when I do; so, if you agree with me, perhaps you will note the "kindly" offer as to commission.—I am, &c.,

ROBT. W. EDIS.

14, Fitzroy-square, W., Sept. 29, 1877.

[Copy.]

To R. W. Edis, Esq., London.

Dear Sir,—We have the pleasure to submit our pattern-book and price-list, and shall be glad to be favoured with a share of your patronage. We shall be happy to allow you 7½ per cent. commission on all orders obtained through your influence, and can execute your own designs if required.—Yours truly,

Hanley, September, 1877.

The Wesleyan chapel at Portadown was re-opened on Thursday evening, after the completion of improvements and decorations, and the erection of a new organ, built by Messrs. Conacher and Co., of Huddersfield.

The section of railway between Bradford and Great Horton was opened for passenger traffic on Monday. The station buildings and other works are in the hands of Messrs. Crabtree Brothers and Sugden, of Keighley; Mr. H. Wilson, of Leeds, clerk of works. The tunnel on the Queenbury section of the line is progressing but slowly, owing to the quantity of water the contractors, Messrs. Benton and Woodruss, have met with.

The tenants of the Duke of Sutherland have presented his grace with his portrait, painted by Mr. Herdman, R.S.A.

The West Hartlepool town commissioners are being urged in the local press to purchase the works of the Hartlepool Gas and Water Company.

A new wing is being added to the West of Scotland convalescent seaside houses at Dunoon, at a cost of £4,000.

The new Roman Catholic church of St. Patrick, Newtownards, which has been built from the designs of Messrs. Hanson and Son, of London, at a cost of £10,000, is to be dedicated on the 24th inst.

Contracts have been signed and exchanged between the local board of health and the gas company of Penrith for the purchase of the gas-works, and undertaking by the former body on terms to be settled by arbitration.

New schools and teachers' residence are being erected for the Pevensey School Board at Hancomb, by Mr. Charles Banks, contractor, from the plans and designs of Mr. Elworthy.

The Darlington School Board have supported Mr. R. R. Robinson as their clerk of works to superintend repairs and alterations to their schools.

The town commissioners of Bray have obtained the sanction of the Local Government Board for Ireland, for contracting a loan for £14,000 for general improvements proposed to be carried in the township.

A new Wesleyan Methodist chapel was opened on the 19th ult. at Nursling, near Southampton, Hants. Mr. Ranger, of Finsbury-pavement, was the architect, and Mr. Ware, of Nursling, the builder.

Memorial stones of a new Primitive Methodist chapel and schools, to be erected in Dover-street, Folkestone, were laid on the 19th ult. The entire cost will be about £2,000. The contractor is Mr. Unwin, of Folkestone. Mr. Ranger, of Finsbury-pavement, is the architect.

Messrs. Camin Brothers, of Southwark and Birmingham, have recently erected a memorial window in the parish church of Yardley, Warwickshire, to the late Mrs. Simcox, of Hall-green, representing "Christians entering the valley and river of Death."

The parish church of Northop was reopened on Tuesday, after internal renovation, the cost being £2,000. The church possesses one of the three largest and finest towers in the Principality, all evidently designed by the same hand, and executed about the same period, the 15th century. The other two are at Wrexham and Gresford.

Intercommunication.

QUESTIONS.

[5140].—**Bath Stone.**—I am interested in a large building, erected within the last two years, in which Bath stone has been used for all the dressed and carved portions of the work. The Bath stone is already rapidly decaying. Can you recommend any measures to arrest the decay?—S. C.

[5141].—**Painting Iron Baths.**—Can any reader inform me what is the best kind of painting for a cast-iron bath that has been some years in use? Several kinds have been tried, but all have peeled off after a short time. Is any preparatory process necessary before applying the paint?—A. J.

[5142].—**Covering a Semicircular Roof with Tiles.**—Can any one tell me how a semicircular roof—an apse—can be covered with Roman tiles, all of one size, and where those tiles can be procured?—P.

[5143].—**Barfreyston Church, Kent.**—Will any of your numerous readers kindly inform me if there has been published any general drawings or details of Barfreyston Church, Kent?—C. F. A. V.

[5144].—**Rough Cast Work.**—What are the best and most economical materials for executing rough cast work on the face of a brick wall, and what is the process? Also, may the angles of the building and reveals of the windows, &c., be finished in rough cast, or must quoins of other materials be used?—J. M.

REPLIES.

[5126].—**Chemical Tests for Impurities from Wells.**—Add to a portion of the suspected water a solution of starch, slightly acidulated with acetic acid, containing a little iodide of potassium. If the water be perfectly pure, the colour will remain unchanged, but if there be nitrites present they will immediately strike a blue colour, which is the usual chemical test for the presence of nitrous acid. Another, though not so good a test, is the addition of permanganate of potash, which, if acted on by the nitrites, will part with a portion of its oxygen, and form a brown precipitate. A third test for the presence of sewage in water is to add a piece of loaf sugar to the suspected water, and expose to light, when development of minute infusoria and animalculæ will immediately follow, so as to render the water apparently turbid, and the presence of the animalculæ can be easily detected by means of a microscope.—R. L.

[5130].—**Breaking Weight of Trussed Girder.**—The material of which this girder is made is not stated, nor the mode of loading. Assuming that fir timber is intended, and that the load, W, is uniformly distributed along the top piece from A to A, we have $\frac{W}{3}$ supported at B and $\frac{W}{6}$ at A. The strut, A B, conveys the load, $\frac{W}{3}$ to the point A, so that the total vertical load above A is $\frac{W}{2}$, which produces compressive and transverse strains upon the outer strut; the latter strain will be found equal to $\frac{4}{5} \cdot \frac{W}{2}$ or $\frac{2}{5} W$. The load $\frac{W}{3}$ at B produces a transverse strain on strut A B equal to $\frac{19}{20} \cdot \frac{W}{3}$. The load on horizontal piece, A B, will be $\frac{W}{3}$. All these transverse strains are uniformly distributed over the length of each piece. Consequently, we may represent the breaking weight in cwt. by—

$$80 \times \frac{b \cdot d^2}{l}$$

all dimensions being in inches. For transverse strain on the outer strut we have—

$$\frac{2}{5} W = 80 \times \frac{5 \times 36}{60}, W = 600\text{cwt.}$$

For transverse strain on strut A B—

$$\frac{19}{20} \cdot \frac{W}{3} = 80 \times \frac{4 \times 36}{108}, W = 337\text{cwt.}$$

For transverse strain on top piece between A and B—

$$\frac{W}{3} = 80 \times \frac{5 \times 36}{120}, W = 360\text{cwt.}$$

Now, since the strength of the whole girder is only that of its weakest part, we must take the second of these values of W as representing the breaking weight distributed over the whole length of the top piece—namely, 337cwt. The compressive and tensile strains need not be calculated in this case.—E. W. T.

[5136].—**Measurement of Chimney Breasts.**—There are different methods of measuring chimney breasts in Yorkshire:—1st. By the lineal yard, each flue measured. 2nd. By taking the girth of breasts—face and projections only—by the height up to roof, girth round above roof, calling it all 9" work, if built 4". 3rd. Width of breasts by height by projection, brought into cube yards, as high as roof, above roof girth round, and charge whatever thickness it is, 5' or 9". Take 5" midfeathers to separate flues above roof, yards superficial. The latter I consider to be best. If the breast is in a 9" wall, the wall is measured behind the breast as 9".—J. H.

[5137].—**Lowest Tenders.**—"G. E. H." cannot recover compensation, as the owner expressly stipulated that he would not warrant the acceptance of the lowest or any tender.—L.

[5137].—**Lowest Tenders.**—"G. E. H." must first be sure of the fact that the architect "materially altered his plans" after the first tenders were received and rejected. If he can prove this he might certainly have a fair claim for compensation, the treatment being despicably mean, notwithstanding the protecting clause. The architect should, in fairness, have invited the first competitors to compete after he had reduced the plans.—ARCHITECTUS.

[5138].—**Quantities.**—According to "Provincial Contractor," his tender for work was accepted, and he commenced it, but was soon afterwards stopped; the work was valued and paid for, but the fee for quantities paid to the architect was not returned. He can certainly sue the architect for the amount under the circumstances related.—G. H. G.

[5138].—**Quantities.**—The fee for quantities should have been included in the valuation of work done. "Provincial Contractor" should have ascertained at the time if this course had been taken, and if not should have challenged the omission. If by accepting the amount of the valuation he has given a receipt discharging the owner from all liability he cannot now recover from the owner, nor can he, by law, compel the architect to repay him.—L.

[5139].—**Joiners' Work.**—"Veneering" thinks I have missed the point of his inquiry, and he puts some more specific questions. The first is: Can the treatment he proposes be satisfactorily executed? It can be executed, but I do not think satisfactorily, inasmuch as the foundation or ground has to be sunk instead of the pattern itself. In reply to the second question, I do not consider it would be any cheaper than inlaying, if so cheap, simply because the labour in sinking the lighter wood, added to the cutting or perforating of the veneer, would be as great as simply incising and inlaying. As to the third point, it is true I attached importance to the lighter wood, being the less costly; if it were not so, why should you partly cover it up with less valuable veneer. It appears to me any method to be economical or artistic should insert the decoration or more valuable wood upon the commoner, not cover up the valuable with the commoner. These are my reasons, but "Veneering," if a practical man himself, will be able to estimate them. I admire his speculative turn of mind.—G. H. G.

[5139].—**Joiners' Work.**—The idea of laying ornamentally perforated veneer, as suggested by "Veneering," is impracticable, because, in the process of laying the veneer, the glue would be pressed out, and to pick out the glue without injuring the outline of the ornament would require great time and skill—if the ornament were intricate, utterly impossible. The method adopted generally is to lay a whole veneer in the usual way, then to let the carver have it, who incises the ornament, cutting a little below the veneer, so as to be clear of the glue. "Veneering's" idea would neither be cheaper nor so satisfactory as the usual method.—CABINET MAKER.

LEGAL INTELLIGENCE.

DEVIATION FROM DEPOSITED PLANS.—At Luton, on the 22nd ult., Ambrose W. Ball, builder, of Bedford-road, was charged with violating a bye-law by erecting in Collingdon-street certain cottages contrary to a plan deposited with the Luton Town Council, on July 23rd, and H. B. Rosson, manufacturer, owner of the premises, was charged with permitting the offence. Mr. W. H. Leete, the borough surveyor, proved the case, showing that Ball put the heights of the bedrooms into the plans at his request—namely, 8ft. high, as over half the area, the minimum allowed by the bye-laws. As erected, one of the rooms was 7ft. 3in. in one place, and 5ft. 6in. in another. Rosson, one of the defendants, was called, and stated that Ball prepared the plans, and that he had not authorised the deviations, by which he had lost. Ball, on the other hand, swore that he was ordered to make the alterations in the upper room to get more space in the workshops below. A fine of £1 and costs, 11s. 6d., was inflicted on each defendant.

ANCIENT LIGHTS—UNITY OF SEISIN.—Evans v. Moss.—This was a motion for an injunction to restrain the defendant from building any wall upon the site of the defendants' premises, 135, Curtain-road, Shoreditch, so as to interfere with the plaintiff's ancient lights in the adjoining house, 133, Curtain-road, and for a mandatory injunction and damages. His lordship, on a previous occasion, had in effect decided the question of the injury in favour of the plaintiff, and the case had only stood over for the purpose of a point of law being argued whether the easement had not been extinguished by unity of seisin in 1869. It appeared that both the houses had been sold by auction in July, 1869, by the executors of a Mr. Thomas James, and No. 135 was, on the 3rd December, 1869, conveyed to Mr. Sanl Moss, the father of some of the defendants, and that the vendors continued to be the owners of No. 133 until the 3rd February, 1870, when that house was conveyed to a Mr. James Samuel Spence. It was alleged that there had always been different tenants of the two houses, but the defendants took the point that the easement had been extinguished. Mr. Martin, Q.C., and Mr. Oswald, for the plaintiff, argued that there

had been no unity of ownership sufficient to extinguish the easement. The tender of proof was on the other side, and they had failed to show any such thing. At all events, in the particulars of sale the appurtenances were sold subject to easements. The estate must be exactly of the same denomination, and the possession of the tenant would not be that of the landlord. It was very hard that tenants should be prejudiced by the acts of their landlords. If not entitled by prescription, the plaintiff is entitled by his contract. Mr. Fischer, Q.C., and Mr. Hatfield Greene, for defendant: First we say the case is not ripe for present decision, and should go to the hearing. We are ready to give an undertaking to alter the building, if so ordered. On the point of law we are right; the buildings prior to 1869 belonged to one man, so as to constitute unity of seisin. Mr. Justice Lopes was of opinion that he could not decide the question on the present occasion. He did not desire to express any opinion on the point of law, which was one of some difficulty. He would not grant the injunction, but the defendants must give an undertaking to pull down or deal with their building as the court might direct at the hearing, and the motion would stand to that time.

ROMFORD LOCAL BOARD AND THEIR SURVEYOR.—On Thursday, the 13th ult., William Hood was summoned to the Romford Police-court, charged under the 196th section of the Public Health Act, with failing to render an account in writing, and to deliver up a statement in writing of such moneys as he had received or disposed of on behalf of the Romford Local Board of Health as their surveyor and inspector of nuisances. It was stated that defendant resigned his office, and that his term expired on the night of the 3rd inst. On that evening the Local Board met, but defendant, who was in his office, declined to see the members, or give up his books. Investigation of these had shown that no entry had been made during the past month, and that certain cheques had been issued without vouchers. Defendant set the board at defiance. An order of committal was made by the bench, to be suspended until the following Monday evening, to give him an opportunity of producing the books and accounts.

BREACH OF CONTRACT.—At Cambridge Police-court, on Friday, eight labourers, in the employ of Mr. Glasscock, builder, of Bishop's Stortford, were summoned for a breach of contract. In the first case taken, that against William Reynolds Warren, prosecutor's foreman said defendant was engaged at the Cock and Magpie premises in Bridge-street. He came to witness and asked for work at 4d. per hour. Witness replied that he could have the 4d., and defendant commenced work on the 17th inst., and agreed to stay on the job as long as wanted. A day or two afterwards the men in a body asked a rise of a halfpenny an hour, and he promised to consider the matter, and give them an answer in a short while. The men were mixing concrete at the time, and it needed to be used at once. Eight of them, including defendant, left work, and witness had to take off bricklayers and put them to the concrete work. Prosecutor was under a bond to complete the contract in a given time, and the loss had been 5s. a day. Defendant contended that as he applied for work by the hour he could leave at an hour's notice; but the bench considered there was a breach of contract, and ordered him to pay 5s. damages, together with the costs. A like decision was arrived at in the other seven cases.

WORSBOROUGH WATER SUPPLY.—This village, together with the adjacent ones of Berdwell and Blacker, have been supplied with water by an extension of the mains of the Barnsley Waterworks Company. The work was brought to a successful issue last week, the water being furnished to every house. The contract has been carried out by Mr. Skelton, of Sheffield, and the pipes were supplied by the Staveley Iron and Coke Company. The total cost has been about £3,000.

WATER SUPPLY AND SANITARY MATTERS.

CARLUKE, N.B.—This town, hitherto supplied with water by deep wells into the limestone, which has become totally inadequate to the increasing requirements, is being furnished with a supply of much softer and better water to be brought from springs in the old red sandstone on Springfield-farm, four miles distant. A 7in. pipe is being laid in an open cutting to near the centre of the intervening ridge, through which a tunnel, 660 yards long, is being bored. About half way between the spring and town, on the Lee estate, water is to be led into a tank, with adjacent reservoir, having a capacity of 85,000 gallons. The tank will be enclosed in a house built of square dressed rubble, with slated roof, supported on malleable iron truss roof. The total cost of the works, inclusive of land and wayleave, will be £5,500. Mr. James Tait, C.E., of Wishaw, is the engineer, and Mr. John Scott, of Hamilton, is the contractor.

KILWINNING WATER SUPPLY.—Negotiations have been opened between the Irving and Halfway Joint Local Authority and that for Kilwinning for the supply of the latter borough with water from

the new works in course of formation at Greenwood Messrs. Leslie, of Edinburgh, the engineers, report that 60,000 gallons per day could be furnished, and that a charge of 6d. per 1,000 gallons would be fairly remunerative to the joint authority.

OXFORD WATER WORKS.—The new reservoir on Headington-hill which will provide the inhabitants of Oxford with a continuous supply of water night and day, having been completed, it was opened by the mayor and corporation on Wednesday week. The reservoir has been constructed in a very substantial manner, and is 126ft. square inside and 14ft. deep, and will hold 1,250,000 gallons of water. It is built on a bed of concrete 15in. thick, over which is 15in. of clay-puddle and a thick flooring. The relieving walls are of great thickness, and are backed with clay-puddle. The reservoir is covered in with a roof supported on 64 massive brick piers. The top water line of the reservoir is 120ft. above the level of the High-street at Carfax, and 143ft. above the floor of the engine-house at New Hinksey. The supply of the city dates from 1694, when some plumbers made a cistern at Grandpoint; it has hitherto been furnished by direct pumping from the lake at Hinksey, but this proved inadequate for the public requirements. The works have been carried out from the plans of Mr. John Hawkesley, C.E., under the supervision of Mr. R. Downing, resident engineer, by Mr. Charles Dickinson, of London, who has also completed the drainage works of the city. The expense has been above £9,000, exclusive of land.

OPENING OF TAUNTON SEWERAGE WORKS.—The mayor and corporation of Taunton visited the sewerage works at Target-field on Tuesday week, and after an inspection under the guidance of Mr. J. Smith, the surveyor, formally declared them "open." Hillé's system of deodorisation has been adopted, the solid being afterwards screened off into a sludge depôt for treatment as an agricultural manure, and the effluent water being passed over weirs into the river. The cost of carrying out the scheme has been about £15,000.

SPRINGBURN AND HOGGANFIELD (GLASGOW).—Works of water supply for these high-lying suburbs of Glasgow were inaugurated a fortnight since. The schemes have been designed by Mr. J. M. Gale, and carried out by Mr. Peter Quin, Springburn, as contractor, and Mr. John M'Auslane, clerk and inspector to the local authority; the execution of the Springburn scheme being superintended by Mr. George Romanis, C.E., of Edinburgh; and that for Hogganfield by Mr. A. A. Haddin, C.E., of West Regent-street, Glasgow. Both are designed on the basis of a supply of 30 gallons per head per day of the Loch Katrine water, received in low-lying tanks, raised by force pumps to the requisite level, whence it is distributed by pipes to the houses. At Springburn and Balgray there is a population of 3,000; but houses are in course of erection to give additional accommodation for twice that number. These works are therefore planned for 9,000 persons' supply. The pumping station is situated at Eastfield, where a tank, holding 300,000 gallons, has been constructed. A pair of powerful engines, made at the Canal Basin Foundry, forces the water from this tank through a 12in. pipe to an elevated reservoir at Cockmuir, a distance of 1,590 yards, holding 800,000 gallons. The distributing pipes are 5in. in diameter, and 5,359 yards in length. The pipes have a total length exceeding 4 miles, and have cost £3,700. The total outlay on the scheme has been upwards of £13,000. The Hogganfield undertaking is for the supply of a more scattered population of but 3,000, and has cost £8,000. The pumping station for this scheme is at Riddie, about 2½ miles from the centre of Glasgow. The receiving tank is built of brick, and has a capacity of 41,000 gallons. The engines, constructed by Messrs. Rait and Lindsay, are of 20 horse-power, pumping 17,000 gallons an hour. The water is raised to the second reservoir, a vertical height of 167ft., in an 8in. pipe, 1,670 yards in length. This reservoir is situated behind Letham-hill House, is lined with concrete and brick, and contains 330,100 gallons, or 3½ days' supply. Distributing pipes convey the water thence to the houses; the total length of piping being 11,534 yards, and its cost £4,300. Sufficient ground has been acquired to allow of the duplication of the works should it be found necessary.

CHURCH METAL WORK.

Altar Rails, Alms Dishes, Coronas, Candlesticks, Communion Plate, Medieval Gas Standards, Lecterns, Screens, Trowels, Vases, Gates.

SOLE AGENTS for Powell Brothers' Stained Glass, &c., Doulton Ware, and Architectural Terra-cotta, Ornamental Tiles, Lambeth Faience.

Estimates Furnished for Special Designs.

CHUBB and SON.

57, ST. PAUL'S CHURCHYARD, E.C.

LOCK and SAFE WAREHOUSE, 123, Queen Victoria-st., E.C.

Holloway's Ointment and Pills.—High and low, young and old, rich and poor, have availed themselves of these remedies, and have in grateful testimony to the success which has followed their employment. Few maladies can befall mankind which seek relief, alleviation, or cure from these healing, soothing, and purifying preparations.

SLATES — SLATES — SLATES.

Bancor, Portmadoc, and Importers of American Blue and Green Slates, a large stock of which can be seen on the premises.

SCAFFOLD POLES, 22ft., 2s. 6d. each; 23ft., 2d. per foot; 35ft., 2d. per foot.

DEALS—BATTENS—FLOORING.

Send for price list.—R. MAY & SON, Timber and Slate Merchants Acorn Wharf, Old Kent-road, London, S.E.

Our Office Table.

THE decoration of St. Paul's Cathedral, which was stopped by the recent outcry against the undue use of colour in an edifice remarkable for the severity of its noble proportions, is, according to the London Correspondent of the *Liverpool Mercury*, now being taken up and carried on very vigorously and quietly. At present a number of windows are being introduced. The crypt, for instance, is at once to be provided with stained glass. Next the morning chapel will be similarly decorated. Different artists are to be employed—Mr. Westlake for the crypt, and Messrs. Hardman, of Birmingham, for the chapel. It will not, therefore, be said that the artistic tastes of the restoration committee are not "catholic."

MR. WATERHOUSE reported last week to the Manchester City Council that, owing to the opening ceremonies, and the needful preparations for them, but little progress had been made during the past month with what remains unfinished of Messrs. Clay's work. This has now been taken in hand, and there is no reason why everything under their care should not be speedily completed. It was with considerable satisfaction that Mr. Waterhouse marked the absence of any serious defects in the building during the days of opening, and he is glad to report that the ringing of the bells produced a scarcely perceptible oscillation of the tower, such trifling vibration as was noticeable being confined entirely to the lantern. The bells themselves are remarkably fine in the quality of their tone, and so nearly is the hanging of the whole of them completed that Messrs. Gillett and Bland will probably be in a position to commence fixing the clock and carillon machinery this week.

THAT the present is an age of development is evident, and the results are seen on every hand. For one thing, we have seen how the tailor has passed from his original trade through that of ecclesiastical furnisher to church decorator-in-general, dealing largely in works of iron, glass, wood, and stone, and even executing some of the most important castings in bronze that the time affords. And, again, one has seen how the dealer in paper-hangings has developed into professional decorator, charging fees and taking a leading part in a demonstration against the architectural profession, his original employers. These we have seen, and more, but nothing probably is more strikingly novel than the fact now before us in the matter of the Congress Hall at present building at Croydon for the church meeting in that town next week. The work is proceeding in the usual way under the direction of an architect (Mr. Salter, of London), but, strange to relate, although tenders were offered by eminent builders, the contract has been taken by a fashionable West-end draper, who not only is building the hall, but has undertaken to supply the finishings and furnishings, besides the refreshments which will be required for the congress. If these details are correct, we can only remark that the character of the procedure is novel, and we were not surprised to observe the dilatory manner in which the men were working as we passed the building a day or two since. For the sake of the church people it is perhaps a good thing they have got the supervision of an architect. The hall, we understand, is costing about £4,000.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenhire.—[ADVT.]

Trade News.

WAGES MOVEMENT.

LONDON.—The attempt to solve the difficulty with the masons on strike by importing a German contingent having entirely failed, things now are precisely what they were prior to the arrival of the foreign masons. The usual weekly meeting of the strike committee took place on Saturday at the Sun, Westminster-bridge-road. The subscriptions continue to come in, and the levies are paid with regularity, so that the men out on strike are receiving a certain amount of wage. Telegrams are passing between the masons in London and the Berlin society with a view to stopping any fresh relays being sent off in ignorance of the state of affairs in London.

MANCHESTER AND SALFORD.—Last week was the 22nd of the joiners' strike. The number of men now answering the roll-call is 630. The strike pay has again been increased by 1s. per week, and the committee express a hope to be able to announce a further advance when they make their next report. The average weekly contributions from the London society amount to £70, those from Birmingham between £10 and £50, and proportionately from elsewhere. From the aggregate returns of the several associations it appears that, out of 28,000 enrolled members, only 200 are reported as unemployed.

TENDERS.

BETHNAL-GREEN.—For the reconstruction of 735ft. of brick sewer between Thomas-street and Weaver-street, Bethnal-green, for the Metropolitan Board of Works. Sir J. W. Bazalgette, engineer:—

Williams, Son, and Wallington	£2,800
Webster, W.	2,300
Pearson, C.	1,998
Young, H., and Co.	1,790
Dunmore, Thos.	1,758
Stevens, W. and Co.	1,630
Nowell and Robson	1,550
Batch, Jacob	1,410
Mowlem and Co.	1,407
Ford and Norris (accepted)	1,350

BLOOMSBURY.—For the construction of 2,000ft. of brick sewer between Gray's-inn-road and Vernon-place, Bloomsbury, for the Metropolitan Board of Works. Sir J. W. Bazalgette, engineer:—

Neave, Gohn, and Son	£6,725
Williams, Son, and Wallington	6,390
Pearson, G.	5,997
Mowlem and Co.	5,797
Bloomfield, J.	5,445
Dunmore, T.	5,426
Killingback, C.	4,578
Stevens, W. and Co.	4,550
Webster, W.	4,493
Ford and Norris	4,450
Young, H., and Co.	4,450
Prout, Chas. (accepted)	3,917

BROMLEY, KENT.—For alterations and additions to Baptist chapel. Mr. James Bennett, architect:—

Staines and Son (accepted)	£540
----------------------------	------

CARLISLE.—For the erection of power-loom sheds, warehouse, offices, &c., in Denton Holm, Carlisle. Messrs. Hetherington and Oliver, architects; quantities supplied:—

Armstrong, C. and J. (accepted)	£7,000
---------------------------------	--------

CARLISLE.—For alterations to premises in King-street, Botchergate. Messrs. Hetherington and Oliver, architects; quantities supplied:—

Batey and Forster	£341
Hewitt, Jas. (accepted)	330
McGuinness and Lister	315
Hill and Beatty	301

CHELSEA.—For additions to St. Mark's College for the Rev. Canon Cromwell. Mr. E. H. Lingen Barker, architect:—

Bradley, W. (accepted)	£407
------------------------	------

DEPTFORD.—For the erection of a school for 599 children in Tanner's-hill, Deptford, for the London School Board. Mr. E. R. Robson, architect to the Board:—

Perry and Co.	£9,320
Sewell, J., and Son	9,215
Downs, W.	8,985
Linn, G.	8,810
Thompson, J.	8,775
Johnson, F.	8,750
Atherton and Latta	8,610
Tongue, W.	8,545
Jerrard, S. J.	8,473
Kirk and Randall	8,092
Wall Bros.	8,026

[Accommodation on the old 9 sq. ft. basis for 642 children. Cost of site so far as purchased (area, 24,795 sq. ft.), £2,846 15s.; cost of school buildings, including teachers' rooms and closets, £7,281; cost of tar-pavement, &c., £217; cost of boundary walls and gates, £347; cost of covered playground, £181; cost per head of school buildings only, £12 3s. 1d.; total cost per head of buildings, including boundary walls, tar pavement, &c., £13 7s. 11d.]

FOLKESTONE.—For residence, stores, and stable for Mr. Tite. Mr. Burgess J. Koeve, architect; quantities supplied (residence to be measured and valued):—

For stores only.	
Saunders	£985 0 0
Payne	912 0 0
Butler	777 0 0
Holdom	754 10 0
Webster	735 0 0
Baker, R. and D.	709 0 0
Hoad	698 0 0
Slado (accepted)	612 17 0

THE BUILDING NEWS.

LONDON, FRIDAY, OCT. 12, 1877.

ECCLESIASTICAL ART EXHIBITION, CROYDON.

CROYDON presents, this week, quite a gala appearance. The Church Congress has attracted multitudes to its usually quiet streets. Those interested in ecclesiastical art may spend a few hours profitably in the improvised exhibition of church-furniture and decoration now on view at the skating rink, which has been fitted-up with stalls, and adorned with bunting. We find several eminent ecclesiastical art-firms are represented, the staple of the exhibits being confined to metal-work and church decoration generally. Messrs. Keith and Co., of Denmark-street, W.C., exhibit some choice specimens of church plate and metal work, many of the designs displaying a more than ordinary perception of appropriate forms. The altar plate we saw is certainly in advance of the taste for metal work observed some years ago. We noticed designs for chalices, flagons, and patens, that recall the old types, and it is evident the manufacturers have studied the best models, while the execution is all that can be desired. Mr. George M. Hammer, of 370, Strand, sends some excellent school furniture; and one form of school desk, called Moss's, we have before noticed; it consists of open cast-iron standards for seat and desk, the latter having a movable portion in front, which is hinged, and can be placed to form a widened desk, or turned up for books, as desired. We believe they are largely used by the School Board for London. The slope of desk is from 7 to 15 degrees, and there is a foot-rail, book-ledge, grooves for pens, and slots for slates. Another form we noticed combines the sloped desk and seat, with a flat table for festivals, or a back for lectures. The desk can be turned down, when a capital sloped back with arms is made, allowing the school furniture to be reduced in space, and made available for lectures or services. For small country schools these convertible forms of desks are certainly well adapted. The prices are: for stained deal, 27s. for 6ft. length, or 28s. 6d. in pitch pine. This length has two standards. One of the most novel departments of the exhibition is that devoted to improved funeral furniture. The largest exhibitors in this branch are the Messrs. Dottridge Bros., of the City-road. Their funeral cars are improvements; they display an agreeable and artistic reform of that hideous and forbidding square black van and plumes we call a hearse. If reformation be wanted it is surely in the accessories and trappings of the English funeral. Messrs. Dottridge's covered or polished walnut casket is also an obvious improvement upon the ordinary coffin. One exhibit is a handsome-moulded case or casket, with parallel sides and octagon ends, with opening lid, and decorated with furniture of a far more artistic kind than the Brummagem stamped-tin mountings with which the English eye has been so long satiated. A "mourning armet," to take the place of the old-fashioned band, is another *spécialité*; and a burial robe trimmed with violet upon white merino, designed by Mrs. Anastasia Dalby, attracted attention. In this connection we must mention Mr. Lyne's combined hand-hearse and bier; and Hatchard and Co.'s "Duplex funeral cars." Messrs. Jones and Willis display some admirable metal work and altar plate. We noticed particularly an eagle lectern, in brass, of the Reformation type, made for the Duke of Bedford; another with handsomely-designed foliated

brackets on a tripod stand; a gas standard; pendent for paraffin lamps, painted in low colours; a design for an oak reredos, by W. Scott Champion, architect, now being executed for the French Exposition of 1878, in Late Florid Gothic, with curved tracery as the leading decorative treatment. The centre is pronounced by a curvilinear gable, and there is a Flemish character in the work. The same firm show some choice embroidery for frontals, &c. A fine brass eagle lectern, designed by J. W. Rogers in a Late Gothic style, with a circular base supported by four detached colonettes, may also be noticed. The stall of Hart, Son, and Peard, as usual, sustains the excellence of that firm's manufacture. We noticed a well-designed altar-rail, with well-treated metal standards, painted in colours; a pastoral staff of silver, jewelled from a design supplied by the late Bishop Wilberforce; a brass enamelled cross of Early French character, a reliquary by Pugin, and an alms' dish in *répoussée* silver. Some admirably-finished artistic silver-work, enriched with engraved figure work, pierced, enamelled, and adorned with jewels, in which all the excellences of good design and workmanship are noticeable, call for remark. John Harduan and Co., of King William-street, Strand, have also an interesting collection of metal-work, altar-cloths, embroidery, and stained glass. Their nickel-plated candlesticks are especially remarkable. This process of plating has the advantage, we are informed, of durability: it does not tarnish, and the cost is a very little more than that of brass, while the appearance is equal to silver. We saw a plain but well-designed candlestick in this material. The process can be applied to all metal goods and brass, which latter is known to become seriously tarnished by the atmosphere of towns. We noticed an unique silver chalice from a design by Mr. G. E. Street, R.A., in which yellow work and medallions are introduced in the stem, knob, and base, the bowl being richly engraved. Messrs. Cox and Sons, of Southampton-street, the well-known decorators, contribute a few exceedingly well-executed specimens of their manufacture. We notice especially a fine brass lectern, with octagonal base and lights, designed in a massive style for the Philadelphia Exhibition; a silver-enamelled alms' dish, &c. But their speciality consists in their recently-introduced straw tissue decoration. This appears to us to be a very facile material for cheap and effective wall decoration, and the reredos now on view is deserving of the attention of decorative artists. A plainer description of church plate is exhibited by Messrs. Pratt and Sons. The altar decoration, embroidery, and tapestry, displayed by Messrs. Frank Smith and Co., are exquisite specimens of textile art. We note a beautifully-worked chalice-veil, and some frontals and dossals. Messrs. Bevington and Sons, the well-known organ-builders, contribute a fine organ, the notes of which are very soft and melodious. We see also some capital painted glass, lent by Mr. A. L. Moore, the well-known glass painter. S. Belham and Co. show an east window, designed for Sunningwell Church, Berks, by Mr. J. P. Seddon, and executed by Mr. A. Kennedy in rich dark-blue ground with figure subjects. Mr. Taylor and others also send specimens; we must especially note Messrs. Powell Bros.' cartoons for the Moody memorial window, Newcastle-on-Tyne, in which the figures are admirably drawn, exhibited by Messrs. Chubb and Son, the art metal-workers, who send also some excellent tile subjects, suitable for wall decoration. Messrs. Mayer and Co., of Munich, show in the roof of an annexe some painted-glass subjects, which are too much like pictures to please our taste in ecclesiastical work. We must not omit to men-

tion Mr. Platt's ecclesiastical embroidery and needlework; a well-designed wrought-iron gate, by Hart, Son, and Peard, with gilt foliations; two standards from St. George's Chapel, Windsor, sent by Messrs. Keith, in a florid style of Gothic about George III.'s age; Mr. J. P. Seddon's restoration of Lambeth Palace Chapel, and the screen of Ingham Church, both of which subjects in colour decoration we have referred to on a former occasion; some choice embroidered curtains 200 years old, lent by Miss Lucas, and an old manuscript assessment of Coulsden, in Surrey, dated 1664, signed by Nicholas Carew, of Beddington, sent by Mr. A. Lucas.

Taking the collection as a whole, we may pronounce it to be above the ordinary displays on these occasions. If we regard the exhibition as representative of modern workmanship and design, we are obliged to admit that the last quarter of a century has accomplished quite a revolution in ecclesiastical art. The exhibits by many of the firms we have noticed, made at the Exhibition of 1851, are still fresh in our memory, and comparing the art of that time with the present, we must admit that the efforts of the revivalists and the Cambridge Camden Society have yielded fruits. Both in artistic conception, purity, and excellence of workmanship, the metal-workers and decorative artists of the present time have made as great a progress as church architecture itself. Principles have been felt and combined with the imitation of the old types, and the artist and art-workmen seem to be doing now with intelligence and purpose what they did a quarter of a century ago in a mere transcriptive spirit.

We must not omit to say a word about the Congress Hall. This large wooden structure forms a great hall, with a surrounding gallery, about 120ft. in length by 96ft. between the walls, and has been speedily improvised to house the monster meetings of the congress. As a typical building, we may describe it as an elongated octagon-ended structure, with a projecting platform at one end. It is roofed in one span, though divided into a wide nave and side aisles by two rows of posts, which assist the long bearing of the rafters, which are 56ft. in length.

Entering the building, we find the roof to be composed of principals, formed in three thicknesses, cross-braced at the apex, and strutted from the uprights. The aisles are cross-braced, so that each pair of principals and the two supports of the aisles form one frame, there being 11 of them. The rafters are covered with lin. boarding and asphalted roofing felt, the inside lined with striped paper. Round the ground-floor of hall runs a stepped aisle, following that of the gallery over, and occupying the space up to the range of supports. The gallery over is supported by slanting lattice-work principals. At the back of the platform are retiring room, ladies' room, lavatories, &c., and we understand a dining-room, 88ft. x 32ft., is provided with all necessary fittings. The walls are of stout quartering, with sills, heads, and braces covered with rich boarding, with openings for light, and having three entrances on each side. These are lined with French grey calico, while the gallery fronts are decorated with crimson, and the interior, as we saw it illuminated, looked quite gay. The seating is convenient, and steel springs in the backs enable them to yield to pressure. Mr. E. Salter, of Queen-street, Cheapside, is the architect, and Mr. Whiteley, a well-known draper, took the contract, the price being £4,000.

ARCHITECTURAL CRITICISM.

ARCHITECTURAL critics may be broadly divided into two classes—those who look at a design or a work of art as an expression of an ideal, and those who

look upon it as an inseparable embodiment of a purpose or a plan. It has been said that the "poet sees things as they look," and so the artist, pure and simple, sees things too often in the same way without fathoming the purpose or motive of the design. Critics in art ought to be like those judges of literature who can see through the hollow superficiality of an author, penetrate the brilliancy and gloss, the witticism and humour, and gossip of the expert writer. It is almost a general concomitant of a popular writer that he is shallow; and in proportion to his facetia and wit, he may be generally estimated. He likes to dwell on men and heroes, plots and passions, personal attributes, and has scarcely any taste for generalities, principles, or abstractions. So in art we find precisely the same order of artists. They have a large public, but they must be exceedingly popular or they are nothing. Many manufacturers tell us it is of no advantage to them in discarding articles that were once popular, but are now considered by the cognoscenti to be below the taste of the day; they find that designs to pay must be popular, and so the work of the cultivated artist is left to be appreciated by the *habitués* of Regent and Bond-streets. But as there is a large demand for art that is popular, and what we may call "pretty," so there is a large number of critics and amateurs who judge of art, and estimate its quality by this attribute. There is another sign of popular taste; the objects of its admiration are nearly always *easy* discerned. That is to say, any involved idea or sentiment, any deep underlying truth or principle, anything, in short, that requires mental discrimination that cannot be immediately seen, is voted dull, heavy, or stupid. It was a long time before the inherent beauty of Oriental china was appreciated; and even now the vulgar or the ordinary taste cannot see anything to admire in the nice blending of colour or the exquisite variety, plot, and conventionality discovered in some blue and white china and Japanese ceramics. We have only to go to the popular markets of the day, where art products are found, to estimate at its true importance the almost immeasurable gulf there seems to exist between the common and the refined tastes of the age. In furniture, too, we find as great a disparity. In spite of our revivals in domestic art-furniture, and the principles of constructive truth and colour-harmony inculcated at our art-schools and museums, the vulgar, bizarre, and flimsy piece of furniture still maintains its supremacy in our cheap bazaars. The public buys what pleases them, and the manufacturer, of course, caters accordingly. A great deal of this ill-taste is due to the want of those refining influences which Social Science Congresses are fond of discussing; but perhaps a still more potent cause is the lack of what we may term scientific criticism. Critics are not always very discerning; they are fond of exaggerating a peculiarity, or making some capital out of a very unimportant feature. What we have said of art generally applies with great force to architecture. Architectural criticism is of two kinds, as we have said; but these two kinds represent exactly the pleasing or popular and the refined styles of design. What we mean by the popular style of architecture is that which deals largely in the extravaganza of feature—qualities displaying magnitude or massiveness, minuteness of detail, elaboration of ornament, grotesques, or anything that is strikingly bold, wonderfully delicate, skilful, or ingenious. The columnar or arcaded front is always more admired than a façade devoid of those features, and the popularity of any building will be found to be in proportion to the amount of familiar ornament it displays. Of course even popular taste varies with the

individual bias—one person will like a building full of quaint bits, stories in stone, or in colour, carving, and what may be called individual interest, and another may prefer something grand or massive, and devoid of such detail. Thus the two great classes of architecture appeal to two very different orders of mind. The popular mind is generally pleased with something striking—caryatides, sculpture, painted glass, allegorical decorations, and coloured interiors have far more interest than Doric colonnades, architectural mouldings, or fine proportions, while these latter qualities possess more importance in the eyes of the architecturally educated. In short the refined piece of architecture stands in a similar relation to the work of the common designer as one of Bach's fugues to a music-hall melody. To nicely distinguish between this puerile sentiment and the highest class of beauties in a building is not a common gift, or easily acquired. The critic has to learn how to cast off the rhetorical display, the *persona* of the artist, how to feel susceptible of the fine taste and the *savoir vivre* of the artist, without losing his judgment in matters of utilitarian concern; he must thoroughly understand and duly estimate the two kinds of taste we have described, to estimate the limits of the arts of sculpture and painting when applied to architecture. In a complex work like a design for a public building the difficulty is to duly take into account all the elements which controlled the designer's mind. Unless the plan and its purposes is clearly before one it is futile to attempt to estimate the design of an elevation. A gable, an external break, or a series of large windows juxtaposed with small ones, may appear whimsical to the external observer, unskilled in geometrical drawings; but directly the mind discovers any reason for the anomaly he views it with another eye; we may even perceive a beauty where none was evident before. This expression of a plan, however, may be, and often is, carried too far. There is a want of that quality which has been justly termed "politeness in building," which seeks to express a purpose in the least offensive manner—that is to say, by controlling the general features, and bringing them into something like harmony and rhythmical proportion. The "muscular" Gothicists often offend the public eye in this way; we see every internal peculiarity externalised, and pronounced offensively, and the façade gives one the appearance of an *olla podrida*. On the other hand, the popular Gothicist, who seeks only to gratify the passer-by, often loses sight of his plan altogether, or so bedecks his work with buttresses, parapets, traceried windows, carving, and ornament, that its internal arrangement is completely contravened. Classicists of the same feather employ porticoes and meaningless columns to enthal. Our competitions abound with instances of this *captando vulgum* sort of design; and criticism, if it aims higher than a weak impressive sentiment or opinion, should sternly cast aside such complaisant art. Architecture, while it may be polite, can never descend to the clap-trap of subsidiary arts, without appearing supremely ridiculous and contemptible. One sees numerous illustrations of this sort of architectural burlesque in any of our new streets in large towns. Every kind of device has been pressed into service, from a diminutive portico of the Corinthian order to an Italian cupola. It has been well observed that the ideas of the Germans produce abstractions, the order of the Romans rules, and the profoundest thoughts of the French are *bon mots*. In the architectural expressions of these different peoples we find these remarks wonderfully verified. The English are essentially practical—they are not given much to abstractions, nor to French politeness and epigram,

but they seize on some features, and use them in a hundred different ways. American architecture seems to have borrowed this habit of appropriation to a large degree. These singularities of individual nations are intensified by the ignorant artist; popular taste revels in them, and we must look to sound criticism to educate it in rejecting the extrinsic and incidental qualities of design. To do this the critic must learn to view a design as the embodiment of structural conditions; his judgment must be based upon actual facts, such as site, material, climate, &c.; it must proceed by a synthetic mode, and then it may be looked at by the method of analysis, or *à priori*. Unfortunately, a pre-conceived ideal is at once formed in the critic's mind, and the nearer the design approaches to it the better estimate is formed. We fear much originality and independence of design is sacrificed to this mode of examination.

ENGRAVING, LITHOGRAPHY, AND THE FINE ARTS.

THE PRINT ROOM OF THE BRITISH MUSEUM.

THE British Museum contains probably the finest collection of prints and engravings in Europe. Even the private cabinets which have been bequeathed to it, such as the Dyce and Slade, would, apart from the general repertory, constitute such a gallery of reflected art as neither Paris nor Vienna could parallel. The public, however, are little aware of these treasures, and even in the way of the student impediments are systematically thrown. It would seem, indeed, as though the department contained a private treasure, only to be enjoyed by officials and their favourites, because the general visitors as a body are systematically shut out, upon the plea that Hans Holbein's designs for goldsmiths, jewellers, and so forth, would have no interest for them. Then, why the works of Praxiteles? In this very Cabinet of Holbein, so little known beyond the Bloomsbury frontier, are original drawings, priceless in value, which may be engraved "by permission of the trustees," but which are themselves imprisoned from the general eye even more jealously than the jewels in the Blacas Collection. Now, what does "art-education" gain upon this system? Holbein was, in addition to his other attributes, a great domestic master. He has here a design for a chimney-piece, designed for some palace of Henry VIII., executed in the monumental style of a triumphal arch, but of it the Museum possesses no more than a photograph. Photography, in fact—and even a glimpse of this is begrudged—reigns supreme, at present, in Bloomsbury. What is the sketch of Queen Jane Seymour's gold cup except the shadow of a shadow? And what the design for a time-metre, probably one of Holbein's latest works—on the summit a clock driven by wheel-work, below which are fore and afternoon dials, showing time by shadows, with, beneath them, a clepsydra, indicating time by quarters of an hour? This should be popular art if it should be anything, and yet, if the expression may be allowed, it is buried in the first-floor crypts of Bloomsbury. Still, even this hiding-away might be tolerable were it not that a difficult admittance excludes the students of designs for book-covers and jewel-cases, chains and bracelets, monogramic fancies, and all else which represents the art and imagination of our ancestors, and all those other branches of art-study which the Arundel Society, for example, have endeavoured to promote. There can scarcely be imagined a more refined school of taste, for instance, than the rare plates from the Nielli of Peregrino da Cesena and Francesco Raibolini, who flourished during the latter half of the fifteenth century, and, illus-

trating the chief characteristics of the various schools through the intervening period, conclude with our own unrivalled works in mezzotint, after the paintings of Sir Joshua Reynolds, and, in stipple, especially by Bartolazzi, from the beautiful vignettes, designed by Cipriani, at the commencement of the present century. The Print-rooms at Bloomsbury contain only a small variety of these works, of which the earlier are the most interesting, though the public, as we have said, know scarcely anything of them, the specimens dating from the year 1452, when the first known impression was produced, to the year 1520, at which period three men—three separate workers—Mare Antonio Raimondi, at Rome; Albrecht Dürer, at Nuremberg; and Lukas van Leyden, at Leyden—brought the art to a state of proficiency which, if some consider to have been equalled, has never certainly been surpassed. The portraits of Raibolini, the arabesques of Da Cesena, the Sybils of Baldini are not to be matched at Florence, at Naples, or at Rome. This Italian school, indeed, is richly represented at Bloomsbury, with all its locked doors, dust, and dog-in-the-manger spirit. Those Andrea Mantagna, Raimondi—notably “St. Paul Preaching at Athens,” from an outline by Raffaele—Dürers, and Rembrants, should form a supplement to the National Gallery, instead of being boxed up here as though the British Museum were the veriest harem of art, instead of being, as it should be, a supplement to the National Gallery of England and the other great galleries of Europe. Many masters, in fact, are here represented whose original works might otherwise be only faintly known in England—that mysterious one, “The Master of 1466”—him who painted “The Knave” on a set of Trappola cards—Israhel von Mechenen, Hans Sebald Beham, with the others of his brilliant family, and Weneeslaus Hollar, whose illustrations from Holbein are incomparable. Hogarth, too, is here, with Reynolds and Raphael Smith, and those old shadows, Zasinger, Gloekenton, and Schöngauer; but, for the ordinary student of historical art, they might as well have never emerged from the chiaroscuro of the middle ages, to which they naturally belong. Yet, one of the collections is intitled an “Exhibition in the King’s Library,” which it is not in the slightest sense of the term. But we are told, “the present exhibition”—that is, a section of it—“is intended to convey some idea of what was done in England for the arts of designing and engraving, from the reign of Henry VIII. to the middle of the eighteenth century.” It was not necessarily confined to the works of native artists; its principal characteristics are attributable, indeed, to the eminent foreign artists who were employed by the Eighth Henry and the First Charles. We have practically, in these collections, the chronicles of a real art. The drawings of Holbein are sufficing illustrations of his power at various periods of his career, whether in England or abroad, and tell much of the influence exercised over his genius by the contemporary artists of Italy and Flanders. But, strictly speaking, the engraver, as Strange reminded us in his terrible attack on the Royal Academy, was, when first practised in England, principally applied to the embellishment of books, so that the earlier examples in the obscure department, now referred to, of the British Museum, have generally been supplied from the other department of printed volumes. Then followed a new dynasty—the engravers of portraits, as Reginald Elstracke, the Pass family, and others, all aliens—who flourished in England until they had taught William Faithome to take the work out of their hands. Those who enforce a visit on their own part—not too readily granted—to the British Museum Cabinet will find trea-

asures of which they are not aware. Thus, the pen outlines and Indian-ink washed dressings on the Holbein screens, that marvellous suggestion by the same master of “Time discovering Truth,” “The Descent of the Holy Ghost,” and the portrait—inimitable in expression, although the colour be lost—of Fisher, Bishop of Rochester—all these are engraved in the British Museum Cabinet, a large and various one, dragon-guarded, and most unintelligently classified. But, in course of time, it may be supposed that the exhibitions will prove real, and that the prints and drawings at Bloomsbury will not be altogether veiled from the public. It is, however, in view of such an eventuality that a protest has come from France. If, it is urged, the engraver’s art has become so exclusive, and so secret in England, why are not the powerful processes of photography employed, if not to supersede, at least to assist, the varying and fluctuating genius now at work? At this moment MM. Raffet, Giaeommatti, Charlet, and La Combe come upon the scene, offering lithography as a substitute for the European arts which have been lost or damaged in modern days. It is little more than half a century since the process of Senefeldar was imported into France, and a still less time since it was naturalised in England; but, brief though the period has been, it has developed a new phase of a very old form of controversy. Engraving, it was said, would be the death of painting; lithography would be the death of engraving; and photography would be the extinction of both. Not one of the prophecies has been justified. Never were pictures of merit rated at a higher value; never were copies of them more ardently sought after; never was art better popularised than by the photographer, whose camera supplies the “cheap press” of art, and makes its highest types known, through its most familiar processes. Still, we are asked, by the voice of the French Academy itself, to consider what middle place is held between the faded art of engraving with the comparatively meretricious science of photography, and the true artistic purposes of the nineteenth century. The lithographer, it will be at once admitted, is no rival, in point of pure art, with the engraver. Even Charlet and Géricault, even Raffet and Gavarni, pretended to be no more than the masters of a swift and inimitable sketching power, too rapid to be precise, too earnest to be mistaken. Said Gavarni, “I can write upon stone better than I can scrawl upon paper;” and, whatever conceit there may have lurked in the saying, it contained a grain of truth. Lithography, however, has never yet been promoted to the dignity of a place in a national collection, or even a public display, claiming any importance. It represents, nevertheless, in a considerable degree, the caricaturist history of several years past, all over Europe, and it will prosper in proportion as the engraver’s art, unfortunately, dwindles. Nor is this, by any means, to be regarded as a degradation of the engraver’s art. Bergerat and Denon were second to none in the science which, let us say, led indirectly to the revelations of Finiguerra and Daguerre. Lithography was father to the photograph. It was against a consciousness of this that Horace Vernet struggled; he said, “I am sure all these effects could be produced through an easier process; and if, through this easier process, some sudden effects of light and shadow could be produced, why, the work would fall out of my hands!” At all events, after his appeal, lithography became almost a high art in France, and as such it remains. The “Contested Flag,” the “Aurora,” the “French after Victory,” were never painted in oil on canvas by Charlet; they were given, in the first instance, to the stone, and they have remained there—stereotypes of the trium-

phant French imagination. So, with “The Grenadiers at Waterloo,” the “Voltigeurs,” and the celebrated “le Voilà!” These French lithographers never thought of quoting themselves; they chose a tablet, and inscribed upon it their meaning; well for them that it was not destined for the catacombs of Bloomsbury, where engraving is the foe of lithography, and where the fine arts naturally hold no place whatever. But the French, as is already said, believe in a link existing, and to be perpetuated, between the fine arts pure and simple, engraving as it was practised in the earlier times of the Royal Academy, and photography, as it may be supposed to have intruded upon both domains. They deny, however, that either engraving or photography can faithfully illustrate the genius of David, or Ingres, or Gros, or, even with the help of so consummate a master as Aubry-Lecompte; bring up lithography to a level with the original art of Leon Coignet. “Lithography,” says M. Henri Delabodre, “dismisses all romance.” Yet it has illustrated “Faust,” and thrown a picturesque light upon not a few scenes in the tragedy of “Hamlet.” It is true that, as a rule, the engraver has been a pupil of the painter, and, indeed, his works have, in this respect been all the more valuable, and so much the less deserving to be blocked out of sight in ostentatious red covers and ignominious glass cases. But, with memories of a late Librarian Congress still fresh, and hints from “Centre Tables” that they would prefer “the public” not to interfere with the “books” or “shelves” at all, there can be little wonder that our wealth of engravings, belonging to a National Collection, should be put out of sight, or that lithography should be called upon to fill up the gaps. But for it, where would be “The Fugitive Jongleur,” the “Lion of the Atlas,” or the “Royal Tiger?” These are wondrous pictures, not in colour, but in the simple white and yellow stone painting. Nevertheless, the school opened up at Bloomsbury is so far valuable in itself that it puts those exclusive students allowed to study in it on a par with the pupils of old Aehille Devérie, in Paris, who may, almost be styled the father of French lithography in its latest and richest relation—as a companion of art. It was he, with his pupils, Gavarni and Deecamps, who first made the art possible for portraiture; it was he who bestowed a life so actually vivid upon the traditional victories of Napoleon; and, all before this, lithography had been regarded as, in Victor Hugo’s affected words, “the tombstone of art”—a work of “oil stainers,” “chisellers,” “mock engravers,” and so forth. Yet there came a time when Balzac himself declared it owing to this craft that he was indebted for the best interpretation of his own ideas. However, apart from this, engraving has a place higher in art than lithography, and we do not blame the British Museum authorities for reserving to it a somewhat consecrated place. They have no right, however, to put out of sight an engraving, any more than an antiquity, and, now that their works of architectural improvement are nearly being completed, it may be hoped that some attempt will be made to render the institution what it was originally intended to be—one national and popular, with no doors shut on any side, and no cliques favoured. It is impossible to avoid suggesting some meanings like these. The trustees collect, and the nation pays for, collections worth all they cost, and presumably intended as popular lessons in the history and appreciation of art. “While so,” as Sir Joshua said, “welcome and good; but if for any other end there is little use in them.” This was the great painter’s decision, and he, of all other men, thought that a painter’s work should be given to the people as a study.

VALUATION OF COLLIERIES AND OTHER MINES, LEASEHOLDS AND FREEHOLDS.*

IN these days of commercial enterprise it is important that the comparative values of mineral and other kinds of property should be determined with some approach to accuracy, and that rules of a reliable kind, based on scientific principles, should take the place of approximations. Mr. H. D. Hoskold, F.R.G.S., the civil and mining engineer, has just published a comprehensive work that will meet the want, and the author's experience in valuing coal and other mines will add materially to the authenticity of the tables given. What the author tells us is too true, and has been illustrated by the ruin of thousands who have mixed in mining adventure. Immense sums of money are frequently spent in the purchase of mineral properties, and it is a common occurrence that much more is paid in order to secure them than they are really worth, and cases coming within experience are by no means few where the estimated value has exceeded the true value by 40 or 50 per cent., due in many cases to the employment of an erroneous year's purchase. The tables Mr. Hoskold has published to meet the demands of the profession and the public are full and complete, and are calculated on the principle of allowing interest to the purchaser on his capital, invested at one rate, and redeeming the capital so invested at another rate per cent. Another valuable feature of the book before us is that plain rules and formulæ have been given, involving present and deferred values at different rates of interest. The tables are of a comprehensive character, giving the year's purchase for any rate up to 25 per cent., and redeeming capital at rates of $2\frac{1}{2}$, 3, $3\frac{1}{2}$, and 4 per cent., and indicate a great difference from the old tables. An introductory chapter by Mr. Peter Gray, F.R.A.S., M. Inst. A., is prefixed to Mr. Hoskold's work, and contains some suggestive remarks. It is shown that in the valuation of a mine the elements of an annuity certainly enter—namely, the sum or the annual income to be derived from the mine, the term of years this income is to last, and the rate of interest. Mr. Gray puts the matter in a clear light thus: "In the purchase of mining property the purchaser is usually, perhaps always, allowed a rate of interest on his outlay far exceeding that at which he can invest the surplus of his annuity, which is called the 'redemption fund;' and hence, if the ordinary tables are used in the valuation of the annuity determined and assigned by the valuator, the result must be a loss to the purchaser, more or less heavy according to circumstances, since in them the difference between the two rates is ignored." It is shown that to reproduce the capital at the end of the term, when the tabular value of the annuity is used, the redemption fund must be invested at the stipulated rate, or that allowed to the purchaser. The formula adopted by Mr. Hoskold is

$$P_n = \frac{a}{S_n + r'}$$

where a is the annuity for n years to be purchased, S_n the redemption fund, and P_n the purchase money, and r' the rate per pound on investment. But there is seldom an occasion to resort to any formula, as Mr. Hoskold's book gives tables which solve every case that can occur under the problem. Tables VI. to IX. give the year's purchase, or the value of P_n , for £1, for every practical combination of the stipulated and practicable rates, and it only is necessary to multiply the tabular value by the annuity whose value is required.

* The Engineers' Valuing Assistant. By H. D. Hoskold, F.R.G.S., F.G.S., M. Soc. A., &c. London: Longmans, Green, & Co.

The disparities between these rates are pointed out. Part II., on the construction and use of valuation tables, is a useful part of Mr. Hoskold's work, and will be found of great service to students and surveyors. The formulæ are simply expressed in words; thus, the rule for increase of the principal at compound interest is thus given: "Add to unity, or 1, the interest due upon it at the end of the first year, involve the sum to the power whose index is the number representing each successive year in the given period." Thus, the principal of £1 and interest, .03, thereon = £1.03, the amount, and

$$\frac{1}{1.03} = .9708738,$$

the present value of £1, for $.9708738 \times 1.03 = £1$. Again the amount of £1 per annum, if invested and improved at compound interest in n years may be determined by the following rule: "Deduct unity, or 1, from the amount of £1 in n years, and divide remainder of the rate per £1. Again, the present value of £1, due n years hence, may be found thus:—Divide unity by the amount of £1 in n years, the quotient will then represent the present value of £1 due at end of n years." The subject of deferred annuities is considered, and the author has discussed the matter with great care and skill in this part of the work. The author observes, "The subject of deferred annuities, embracing two different rates of interest per cent., has not, in my opinion, hitherto received so much attention as some other of its branches, although deferred annuities, involving one rate of interest, have been frequently and ably discussed. Nevertheless, after diligent search and inquiries that I have instituted, I cannot discover anything which appears to me to bear directly upon the case—when two rates are considered—in any of the published works devoted specially to annuities." Thomas's and Inwood's tables would, by the author's calculations, give a result that would make a purchaser pay too much for each £1 annuity by £429681335, or 8s. 7d., and if an annuity of £20,000 were purchased, the gross overpaid sum would amount to £8,593 12s. 6½d., or a total loss of 42.968 per cent. upon the annuity. Other instances are shown, to indicate the discrepancies arising from one rate of interest. We cite one case. Allowing 20 per cent. to a present purchaser, and to reproduce the capital at the same rate we have for a duration of 55 years, after three years:—The present value of £1 per annum for 58 years at 20 per cent. = 4.999872221; the present value of £1 per annum for 3 years at 20 per cent. = 2.106481481; thus present value deferred 3 years = 2.893390740. But by allowing the purchaser 20 per cent. upon his investment, and to reproduce the capital at 3 per cent., the period of time, say, as in last case, and using the rule of Mr. Hoskold, we have

$$136.07161972$$

$$\frac{1.728 \times (1 + .20 \times 136.07161972) = 136.07161972}{48.75435056} = 2.790963639$$

the correct value, showing a difference equal to 2s. 0½d. per £1, or 10.243 per cent. We have much pleasure in recommending Mr. Hoskold's treatise to all surveyors and actuaries, as being one of the most complete and scientific expositions of a subject of such everyday importance.

ART REPRODUCTION.

THE marvellous things accomplished in line-engraving, the triumphs of wood-cutting and crayon lithography, cannot possibly, it would seem, preserve these arts under the potent influence now exerted by photography, directly or indirectly, and the invention of rapid modes of reproduction in colour or otherwise lately brought into existence. Line-

engraving is almost dead, and lithography is in a very languishing condition. Wood engraving, the earliest, is still the most vigorous form of the multiplying arts; whether its existence can be much prolonged is doubtful. A brief account of what is now being done in art reproduction may be thought interesting.

Many persons may have wondered what was the meaning of a lately much-advertised so-called "Art Society," affecting to give away copies of expensive engravings under the evidently delusive system of the would-be recipient cutting out a portion of the advertisement called a "coupon," and sending it to the publishing office, a charge being only made for "packing and postage." The whole thing was a cleverly-devised Yankee notion, based on the ready manner in which engravings can be copied by lithography without a positive engraving process. The *modus operandi* of the society was simply this. An ordinary one or two-guinea engraving was purchased from a West-end publisher for, say, £40, with permission to reproduce it. The print was then put into the hands of a lithographer, who placed it face downwards on a stone, and passed it through the press; the ink leaves the print for the stone, which is now treated in the ordinary way. It is inked by the roller, and gives off a great number of impressions almost identical with the original. Although the price for postage &c. was but small, and the society largely advertised, yet so wonderfully cheap is the process, there is no doubt a very handsome profit was achieved. The mischief of the thing was that people were led to believe they would receive the real original engraving. It may, however, be conceived that they certainly got their money's worth. The success of the scheme was quite complete; even with the advantage of steam printing, the exigencies of demand could not be met. Some must needs have several copies, thinking they could give away a thing of value, or perhaps sell again at an advanced price! Of course success was followed closely by rivalry, and the same cumbrous trick of the "coupon" is still being carried on. This mode of reproducing engravings will probably be often resorted to, and prove a boon to the million.

Another most useful application of lithography is that which the BUILDING NEWS has made so well known—copying on stone by photography line drawings and engravings. This engraving is so well done for the B. N., and the subjects so good, that it will do much to establish a distinct phase of art in the Victorian era, even if a positive style be not evolved. The young student obtains in a cheap and attractive style the best works in architecture of the leading favourites of the day, and specially by study and imitation we may fully expect the individual style of our principal professors to be thus perpetuated. Henceforth brick churches will assuredly be Brooksy; stone churches, Streety; and Mr. Shaw's peculiar style become the permanent type for country houses. One way in which the BUILDING NEWS engravings are made available in business is characteristic of these fast and slap-dash days. It is not presented for imitation. A most successful competition architect takes in two copies of the BUILDING NEWS, the one to bind in the ordinary way, the other for the sake of the engravings, which are taken out and sorted according to nature of subject—schools, mansions, town-halls, &c. When this gentleman decides on joining in a competition he desires an assistant, who is to take up the job, to bring the batch of engravings which best applies thereto. A plan or portion of plan is to be taken from this, a feature from that, and something from somewhere else. In a few minutes the design is as good as made, and the architect, instead of spending days and nights on the thing, can go on his way rejoicing, fully assured he will have a better design than could possibly be evolved out of his own limited inner consciousness.

The ordinary, and often extraordinary, chromo-lithography is now well known and an established favourite. Considering the trouble of reproduction many of these are exceedingly clever, requiring as they do twenty to thirty separate printings, yet the "registering," or planting one printing on another, is so perfect as not to have any appreciable varia-

tion. This difficult printing repetition necessarily raises the cost of the engraving, and strictly limits the circulation. A new process, however, styled steno-chromy, is now introduced, which supplies a coloured picture at a very low price comparatively. This most ingenious invention prints a perfect coloured subject without engraved block or plate, and at once. It has, too, the great advantage of permanent pigments, which the ordinary chromo has not. This extraordinary method is the invention of Mr. Otto Radde, of Hamburg, and specimens can be seen at the agent's, Mr. E. Meyerstein, Bank-buildings, Holborn-circus. It must needs be a great puzzle to most people how such a feat as this alluded to can be possible. It seems that a block of colour is made—similar, in fact, to the bundle of sticks in Tunbridge ware manufacture—the various colours and shades passing right through the block, and from this the printing is done direct, until the colour is worn away. The difficulties in preparing the block one might think would prove insuperable, but they have been most successfully surmounted. The productions have the exact appearance of oil paintings. In the development of this invention a colour scale was found necessary, and this has been produced, and as being a long-desired desideratum with manufacturers and artists, is published as an "international colour scale." There are about a thousand shades of colour, the tints being permanent. A clever application of this chromography is made in union with the Woodbury type process—the latter in itself a triumph of ingenuity. The necessary colouring of the subject is printed on the mount, and the photo fixed in front, the special paper being sufficiently transparent to show the colour through. A pretty delicate effect is thus produced without disfigurement of the photo details. This combination is published by the Société Stenochromique, Paris and Hamburg. Although heliography was successfully applied some fifteen years ago on stone and metal, but little was done with it. Now, however, Messrs. Branneck and Maier, of Mayence, have carried the principle to most successful results in copies of pictures, architectural subjects, &c., the whole of which are wonderfully perfect and most surprisingly cheap. For instance, a view they have published of the grand Opera House at Paris (size of view, 16in. by 12in.) is one that any art lover would readily give a half-guinea for. Yet the wholesale price for such is but four-teenpence per copy. The engraving, whilst possessing all the minute delicacy of the photo, is vastly superior, being without glaze, perfectly permanent (being in printing ink), is produced on ordinary plate paper, and with title complete. This invention will probably be for the future, there can be little doubt, the main means for disseminating art knowledge. The work in goodness and cheapness is unparalleled.

An invention called "Cryptotype," by Mr. Arthur E. Smith, son of the well-known architectural artist and engraver, bids fair to assist the well-being, if not existence, of wood engraving. It is a means whereby a photo image is taken on the wood block, minus the defects previously attending the attempt. The result is a more perfect drawing, and a reduction in cost of one-third.

Under the peculiar title of "poikilographie," another German invention comes before the public. It is said to be the subject of patent rights, and the process at present secret to some extent. It is proposed to establish a society here for the development of the invention, with a gallery for the public exhibition of their works. Meanwhile, a few specimens can be seen at Messrs. Colneghi's, Pall-mall, and at the City office. The works chiefly consist of copies of pictures, mostly by old masters, and are very beautiful. It will be an immense boon now attainable to artists and lovers of art to thus possess themselves of the masterpieces of our own national and foreign galleries, the copies being in perfect fac-simile. The basis of the copy is evidently photography, displaying, as it does, the exact representation of the paint and canvass on surface of original. The painting is done in some way at the back, and probably in oil, which, soaking through the paper, becomes visible.

It is proposed that the society shall also apply the art to portrait-taking, and it may be hoped that the ordinary daubs in oil from the photographer's studio will now have an end. With such attractive, numerous, and facile means of reproduction, we may hope that art—sound catholic art—with its graceful happy influences, will be diffused amongst all classes, delighting, instructing, elevating. M.

THE SANITARY INSTITUTE AT LEAMINGTON.

IT is pleasant (says *Public Health*) to be reminded that we live in a more healthy and scientific age than our forefathers; to read of plagues and pestilences which have now departed from our shores; to have pictures presented to us of filth and squalor—the weird attendants of disease and death—and to know that these belong to the past—to have long rows of figures and piled-up statistics, telling of reduced death-rates, and the successful battle with the enemies of life—to know that the accumulated experience of trained minds are even now strung to their utmost tension to grapple with the effects of careless ignorance and stupid superstition. It is pleasant to be reminded of these victories of science, and triumphs of social progress, though, perhaps, we ought not to credit all these improvements to the sanitarians, who have just been holding their first provincial congress at Leamington. Something must be put down to the increased domestic comfort of the people—the more abundant food, and the facilities of travel—all of which have had their effect on the health of the people. Prosperity induces ease and comfort. It enables the recipients of a higher wage to have better houses and warmer clothing; and though better drainage and the removal of fermenting excreta and refuse have done something towards this general result, both have had a share in the improved health and prosperity of the country. If the Congress of the Sanitary Institute has not added much to our previous knowledge of sanitary science, and the appliances necessary to carry out its details, it has given us many facts, and not a few of the many theories and hypotheses which surround those facts, and make it so difficult for the outsider to know either the cause of disease, its origin, or its remedy.

The Congress, which closed its infant session on Saturday last, has been, to some extent, a doctor's congress. The president, Dr. B. W. Richardson, did not discourse on an ideal City of Hygeia, for that would have been out of place in a garden-like town, which, with a population of 25,000, has a death-rate of 16.6 during the last year. He took up a theme on which he lectured eleven years ago in the same place, when a congress on the sewage of towns was held in Leamington, "on the poisons of the spreading of communicable disease." This poison was typified by the secretion of the poisonous fangs of a snake; it was capable of being dried, and in that state was innocuous; yet, when the proper degree of heat and moisture was present, it resumed its vitality. The varieties of poisons require different conditions, so that some diseases, like yellow fever, are only developed in certain latitudes. They affect the human body according as they come in contact with it. We absorb the poison of typhus fever through the lungs, whilst, in the case of hydrophobia, it is inserted through the salivary secretions of the infected animal—under certain conditions, such as nervous depression, starvation, fear, or anxiety; whilst typhoid fever is clearly a disease possessing hereditary transmissible quality. As a rule these communicable diseases only attack an individual once during life. He did not believe in the theory that the air around us was charged with invisible germs, capable of reproduction, which never cease to increase and multiply, and against which the skill of man was of no avail. These might, on some occasion, cause a plague over the whole world, and destroy life *in toto*. Dr. Richardson took a different view from this; an ingenious view—that man, woman, or other animal, might produce, within themselves, a poisonous secretion, and give an hereditary stamp of reproduction to such poisonous product. Such a person should be isolated from the rest of mankind,

his secretions carefully kept from the secretions of healthy persons, and the danger would be then over. If this theory be true, the sanitarians have a mastery over disease, and may yet triumph in the end. Science has, however, not stamped this theory as immutable truth, and we are inclined to await the patient research which it opens up.

The institute is an experiment, and the congress records many of those experiments. Dr. Bartlett raises grave doubts as to the accuracy and infallibility of our water analysts in the past. If the chemists cannot detect the presence of disease-producing organisms in the water they analyse, when they are notoriously present, have we not been relying upon experts and their exactness with too much faith? Water—good, wholesome water—is notoriously one of the inestimable blessings of life. If it is polluted, it is the source of disease. It is capable of taking up, carrying, and disseminating those minute organisms which produce specific diseases. Excess of water does not kill them; it merely spreads them over a wider space. It is, therefore, essential that we should be able to ascertain their existence, particularly in those deep wells where the water is not exposed to the sun's light, or other ordinary means of oxidization. Dr. Bartlett tells us that the exhaustive chemical analysis of water is one of the most tedious and troublesome known to chemists; but, if the object is merely to ascertain its fitness for domestic use according to certain formulæ, then some of the more tedious processes may be omitted. The fees usually charged for these analyses are too small to admit of much labour or research into the recondite conditions of the organic matter which the water may contain. Yet these elaborate analyses are very necessary, for an instance was quoted in which a specimen of rain-water was analysed more than once with the same results, though the medical attendant suspected its pollution. After a week it was placed under the microscope; and then a few minute spores and germs were seen. These induced further experiments, and the result was that these germs were recognised as the well-known *Sarcina ventriculi*—one of the causes of stomachic derangements.

Mr. Baldwin Latham showed the practical results of these experiments. He pointed out, in a totally independent paper, that all subterranean water was due to the rainfall; that the wells were replenished in winter and exhausted in summer; that a drop of water never stood still—if not polluted as it fell from the clouds it picked up and carried deleterious substances; either to the river, the sea, or to those subterranean waters which gushed out as springs, or were pumped up from wells; that in darkness those organisms could not be destroyed. No amount of filtration would destroy contagious matter. Even dilution only modified its action; when the wave of underground water was at its highest, then we had phthisis and similar diseases; when low, cholera, diarrhoea, and fever. It might happen that an undue elevation of the water in certain cases would disturb the filth in the subsoil, and produce fever. The healthiest neighbourhood was where the water-line was not much disturbed, and was furthest removed from the surface. It had long been known that water in contact with the soil produced malaria, and this fact had been taken advantage of in war.

It was this malaria, Dr. De Chaumont said, in speaking of the influence of climate on health, that prevented man, under certain laws of hygiene, from living in any part of the globe; for though some diseases were localised, and their causes obscure, still the army returns showed how much might be done by attention to the laws of health, and by attention to natural causes—such as the planting of trees or cutting down of forests. These subjects were of special interest to Leamington, for the town authorities have been boring into the Keuper sandstone for water, and have obtained a supply 270ft. from the surface, or about the sea-level, which is pronounced to be water of the purest quality by the borough analyst, who read a paper on the subject.

The medical view of the sanitary administration of the county was pointedly put by Mr. Dyke, who wished for medical inspectors in several grades, under a permanent medical

secretary of the Board of Health—each, however, to have a sanitary inspector or engineer to work with him. Dr. Slade King, who took up the question of the sanitary work to be done in English watering-places and summer resorts, suggested that no licence should be granted to hotels without a certificate of satisfactory sanitary arrangements; and that refreshment-houses should be required to produce this certificate every six months. No house should be permitted to be inhabited until it was certified to be in a fit sanitary condition.

Outside the exhibition of sanitary apparatus and appliances, there were but few suggestions of a practical nature to guide the householder or the builder. Dr. Moffat recommended, it is true, the use of beeswax and turpentine as a floor and furniture polish, as it produced ozone. Fir trees and juniper bushes should be planted round cesspools for the same disinfecting purposes. Miss Rose Adams advocated the better education of women in sanitary work; whilst Dr. James Russell, of Edinburgh, showed that plumbers and builders ought to have a knowledge of the laws of health as bearing on their respective occupations. He showed some specimens of indifferent and faulty plumbing in support of his arguments.

The much-vexed question of sewage disposal cropped up at the very commencement of the proceedings, and the members bade each other farewell, after visiting the works of the River Purification Association at Coventry. In the intermediate time, repeated visits were paid to Lord Warwick's Sewage Farm at Heathcote, to which all the sewage of Leamington is pumped; while at Wrexham, where Lieut.-Colonel Jones's well-known farm is situated, the sewage-sludge is separately treated. A model of Mr. Kidd's sludge-drying apparatus was shown at the exhibition—and Lieut.-Colonel Jones gave an explanation of the process. The sludge is made to pass along the grooves of a screw in a high temperature, until it leaves the machine comparatively dry, but not burnt. Its value as manure was discussed, and the possibility of its combination with other materials, so as to be sold at a profit, was not forgotten. The effluent water and the liquid portion of the sewage are used for irrigating the crops at Lieut.-Colonel Jones's sewage-farm.

At Coventry, where there are many large manufactories, the daily volume of sewage is somewhere about 2,000,000 gallons. The chairman and directors of the company stated that the process is more expensive at Coventry than it would otherwise be, in consequence of the manufacturing refuse, and its intermittent quantity. The Town Council, after three years' trial, are satisfied with the sanitary success of the scheme, which is, after all, but a precipitating process, and the advocates of the company only support it where irrigation is impossible. The precipitating material is a cheap salt of alumina, and the effluent water runs on a piece of land about nine acres in extent, for the purpose of filtration, ere it enters the river.

The novelties exhibited were but few. Mr. Ernest Turner, F.R.I.B.A., exhibited a design for the Burdett College Hospital, and there were models and designs of the various apparatus for cremation. The ventilators possessed no few features, though the exhaust cowls of Messrs. Scott, the exhibits of Messrs. Shillito and Shorland, the ingenious improvement on the Arnott valve invented by Mr. D. Crossley, which we recently noticed, and the screw revolving ventilators of Mr. Howorth attracted much attention. Amongst the filters was a floating siphon filter of Dr. Bond, whose preparations of terebene were exhibited by Messrs. Cleaver. Amongst the pans for water-closets those of Messrs. Alcock and Mr. Bostock were the most generally approved. The variety of earth-closets and traps was so great that the jurors have taken some time to consider their award. Taken as a whole, the first Congress of the Sanitary Institute cannot be considered a brilliant success. Much hard work was done by the registrar, Dr. Lory Marsh, but the result, judged by the ordinary standard of scientific congresses, had not added much to our knowledge, or to the improvement of sanitary science.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

VISIT TO THE SOUTH METROPOLITAN GASWORKS.

ON Saturday last, 6th inst., the members of the above society paid their last visit to works for the present session. Assembling at the gasworks in the Old Kent-road, they were courteously met by Mr. G. Livesey, Memb.Inst. C.E., the engineer, and his brother, Mr. Frank Livesey, both gentlemen kindly showing them through the works, and explaining the various apparatus and processes of gas manufacture. The works, like many others of its kind, started in a small way on a narrow strip of land adjoining the canal, whereas the company have now an area of about 35 acres, which is being rapidly covered. Some idea of its importance may be gathered from the fact that the district supplied with gas covers 13 square miles, and requires 180 miles of street mains.

The inspection commenced with the retort-house, where the charging and drawing the retorts were described and illustrated. After passing the condensers the visitors were shown some washing apparatus (Mr. Livesey's patent), in which the gas, after being finely divided by passing through small holes in perforated plates, and then ascending through weak liquor, parts with much of its impurity. Another and improved washer was being fitted up, by means of which it was expected the whole of the ammoniacal impurities might be extracted without the use of the ordinary scrubbers. Much interest was manifested in the gas-holders and tanks, the largest holder, 180ft. diameter, with a capacity of 2,200,000 cubic feet, being constructed without any internal trusses or bracing, the cover or crown, when empty, being supported on a timber staging erected in the tank; but the most remarkable feature, and one showing the boldness and sound judgment of the engineer, was the tank, 184ft. in diameter, 47ft. deep, constructed entirely of concrete, without either brick lining or puddle backing; this tank is in all probability destined to be the pioneer of many similar.

Another striking example of the use of concrete was seen in the new retort-houses in course of construction. The floor being raised 10ft. above the level of the ground, was carried by piers and concrete arches 21ft. span, rising 1ft. 9in. in centre, 18in. thick at the crown. Many other new and interesting points of construction and arrangement were pointed out during the very pleasant visit. The present capacity of the works is 5,000,000 cubic feet per diem, but the estimated capacity when the projected extensions are completed will be more than doubled. Experiments were being conducted in various parts of the works with the object of improving the manufacture, showing that gas managers are fully alive to the necessity of obtaining the best possible results from all available means. Among the members present were the president, Mr. R. M. Bancroft, treasurer; Mr. W. C. Street, Assoc.Inst.C.E.; Messrs. P. Burrell, Memb.Inst.C.E., Hellis Hill, Assoc.Inst.C.E., Alex. Payne, Assoc.Inst.C.E., R. Finlayson, &c.

The next session of the society for the reading and discussion of engineering papers will commence in December.

THE TURNERS' COMPETITION.

THE Master, Wardens, and governing body of the Turners' Company, according to their custom, gave this year their silver medal, the freedom of the company, and that of the City of London to the workmen, whether master, journeyman, or apprentice in the trade in England, who sent in the best specimens of hand-turning in any of the subjects of competition, except pottery, for which they gave special prizes. This year the subjects of competition were turning in ivory, pottery, stone, and jet; and steel, brass, and gold for horological purposes. The competition in ivory included vegetable ivory. The qualities considered in awarding the prize were the following:—(1) Beauty of design, symmetry of shape, utility, and general excellence of workmanship; (2) exact copying, so that two objects produced should be *fac-similes* in every part, or exact measures of capacity; (3) fitness of the work and design for the purpose proposed;

(4) ability to turn, whether circular or oval; (5) novelty in application of turning or in design; (6) carving was admissible, but it was to be subsidiary to the turning. The candidate was to make his own selection from the above conditions; but the one who best fulfilled the largest number, including the most important qualities, was preferred. The work to be all hand-turning produced in the lathe without special rest or tool apparatus, and the carving to be the work of the exhibitor. The results of the competition were exhibited on Tuesday at the Mansion House. The chief prize, silver medal and freedom of the company, has been awarded to C. Crisp, who shows a capability of manipulation in difficult turning and polishing of an exceptional kind. Another exhibitor, R. Bridgeman, has shown admirable work, accomplishing on these minute surfaces the uncommon result of finishing with the cutter only the fine pivots or axes of the balance-staff of the chronometer, leaving them as smooth and bright as if a polisher or burnisher had been used, so preserving unimpaired the perfect truth on which the time-keeping so much depends. C. J. Curzon, aged 18, has gained a special prize for apprentices for a highly-finished specimen of complete lever escapement, double roller, and other turning. A fine specimen of the marine chronometer escapement, by W. Heyes, receives the well-merited award of the bronze medal. There are no specimens in gold. The ease-makers who have been so active lately were expected to exhibit specimens of their turning work. The specimens of pottery, stone, and jet are numerous and interesting, and in the opinion of the judge show general merit. There are some fine specimens of unglazed ware, proving the great skill attained by the "throwing," or moulding by the hand only, and without use of turning tools. The coloured and finished wares are of various and elegant forms. In pottery, class A, the first prize was given to E. Byron, who gained the freedom of the company and £5 for a large vase thrown on the wheel; the second prize, a bronze medal, was given to Henry Byron, for a very large vase "thrown" in white clay. In class B the silver medal went to E. Byron for a large majolica vase. Various other money prizes and certificates were awarded. In stone and marble the specimens are fewer than in former years, but show very general excellence. The first prize, freedom of the City and a silver medal, was awarded for a beautiful tazza in serpentine to John Mankervis, Helston, Cornwall. The second prize, bronze medal and £2 in money, for a pair of cups in fawn-coloured stone on dark pedestals, to W. Coulman, Torquay. In ivory the first prize, a bronze medal and £5, was gained by J. Hegley, 4, Queen's-place, Hoxton, for a pair of ivory vases on ebony bases; the second prize, a certificate of merit and £3, was awarded to G. Freeman, 2, Milton-street, Dorset-square, for a pair of large thermometers in the shape of obelisks. The competitors in this class were but few in number, and none of the work exhibited was considered sufficiently good to receive the silver medal and freedom of the company, which were, therefore, not awarded. Some unique specimens of turning and carving were exhibited, but not for competition, by Mr. T. B. Winsor, a member of the company. In jet there were no competitors.

VENTILATION.

SOME useful observations appear in the current number of Van Nostrand's *Engineering Magazine* on the "Mechanics of Ventilation," by Mr. Geo. W. Rafter, C.E. The author treats the subject comprehensively, though there is little new that is broached. The principles laid down are, indeed, pretty well known to architects—the main purpose of the paper being to show that the laws of ventilation are based on simple mechanical principles, and that by providing a sufficient height of vertical flue of a proper cross-section, a constant velocity of discharge may be maintained. Speaking of the sources of contamination, it is shown that when carbonic acid is the only impurity, from 8 to 10 volumes in 10,000 may be respired without serious inconvenience, though

volumes in 10,000 is taken as the limit of good ventilation. An adult produces 0.6 of a cubic foot of this gas per hour; 0.43 of a cubic foot is produced by the combustion of a cubic foot of coal gas, while a paraffin candle throws off 0.31 of a cubic foot per hour. The combustion of 1 cubic foot of 16-candle power illuminating gas shows a mean of about 750 heat-units. As to moisture, from 4.5 to 5 grains in a cubic foot of air at 62°, is the limit of good ventilation. Mr. Rafter says the cheapest method of heating is by stoves, more than 90 per cent. of the heat being realised in this way, while the ordinary fireplace does not give a greater heating power than 14 per cent. of the total amount of heat produced. Captain Galton's ventilating fireplace is preferred by the writer, its heating effect being 35 per cent. of the total heating power of the fuel. Steam or hot water is pronounced healthful, the healthy effect realised being nearly 90 per cent. Treating of the mechanics of the subject, it is stated that at a temperature of 60° 13.09 cubic feet of air weighs 11b., and a cubic foot weighs 534 grains. A careful discussion of the laws, known as Gay Lussac's Mariotte's, and the principles of Archimedes, showing that the volume of gases vary with the temperature, and that the density is inversely as the volume, is entered into, from which it is shown that when the temperature of air is reduced from 70° to 32° the volume of air is reduced, its density is increased, and becoming thus heavier, tends to fall by a definite excess of weight. Thus the reduction of a cubic foot of air, from 70° to 32°, increases its weight by 40.6 grains; hence the downward currents created by window and outside wall surfaces. Again, air coming into contact with a heated surface, and being raised from 40°, the average, to 98° is made lighter; it rises until the weight of fluid displaced is equal to its own weight. A temperature of from 60° to 65° is about the proper one for inhabited rooms. From a series of observations, taken in 25 school-houses in the city of Rochester at the instance of a Board of Health last winter, the writer has deduced some useful data, to which we may briefly refer. These observations were taken 10 times a day, at the commencement of school and at certain intervals during school hours, and they show great variation of temperature. It was found that, where the ventilation is thorough, pupils and teachers were completely comfortable at a temperature of 60°-62°, and that "the temperatures increase as the perfection of ventilation decreases." The following laws are laid down, of some interest to architects, and we quote them:—1. "In rooms having but one outside exposure the temperature is uniformly higher than in those having two or more outside exposures, other conditions being the same. 2. When the communication is direct by means of roomy halls between lower and upper floors the temperature ranges higher on upper floors. 3. Of two rooms, having equal exposure and equal heating and ventilating facilities, the one containing the greater number of pupils will show the higher average temperature. 4. There is a relation between inside temperature, outside temperature, and outside humidity, which relation appears to be expressed by saying that inside temperature varies directly as outside humidity, and inversely as outside temperature."

It is thus seen that the lowest temperatures occur in well-ventilated rooms and *vice versa*, and that with imperfect ventilation there is an excess of moisture from the exhalations of the body and increase of humidity, and a high humidity produces a feeling of chilliness. The author rebuts the popular notion that air loses its moisture by heating, instead of which heating increases the capacity of air for moisture. Mr. Rafter prefers the vacuum method of ventilation, and enters into a mathematical investigation of the dimensions required for a shaft to produce the required discharge. He says the foul air should be drawn out of a room by creating a vacuum near the floor in the side walls, while fresh air should be introduced at or near the ceiling, and he gives a formula expressing the conditions of the discharge of heated air, which depends on (1) the height of flue or the velocity of discharge increases as the square root of the height increases, the inner and outer temperatures remaining con-

stant; (2) it increases as the difference between their temperatures increases; (3) and as the smoothness and directness of the flue increases. This is the usual formula, founded on the Torricellian theorem. We cannot agree, however, with the author as to the positions of the inlets and outlets, as there can be no doubt the natural ascent of heated air points to the opposite system in ordinary cases.

NEW MUNICIPAL BUILDINGS FOR GLASGOW.

GLASGOW is about to follow the excellent example set her by her southern manufacturing rival, Manchester, and other provincial capitals, by providing for herself a group of municipal buildings in which the administration of all corporate and magisterial business can be carried on under one roof.

On Thursday in last week the Town Council decided on taking this highly important, and, indeed, necessary step, accepting in their entirety all the reports of the special committee and sub-committee recently appointed to consider the expediency of securing a central site for the erection thereon of a town hall, &c. The proposal was strongly recommended by the committee in their principal report, on the ground of the increased efficiency and economy of the citizens' money and time that would be effected if the municipal, police, gas, water and sanitary departments, were brought under one roof, and they urged that the new buildings should be of an architectural character worthy of the city, and should be sufficient to meet all reasonable requirements for a considerable time to come. The committee proceeded further than making a mere recommendation, and requested Mr. John Carrick, the city architect, to report on the probable cost of acquiring the east side of George-square and neighbouring ground as a site, and also as to the value of the detached buildings in which the public service of Glasgow is now with difficulty and inconvenience carried on. Mr. Carrick has reported that the area bounded by George-square, George-street, John-street, and Cochran-street, contains about 6,569 square yards, and is at present wholly covered with buildings not of modern construction, occupied as an hotel, workshops, warehouses, counting-houses, dwelling-houses, shops, and a Wesleyan chapel. The annual assessed value of the property, exclusive of the chapel, is £4,030, and Mr. Carrick estimates the cost of the site at £165,455. The total area of floor space at present occupied by the several departments, which he considers ought to be included in the scheme, is about 3,500 square yards. Part of the surplus ground on the George-square site would be absorbed in improved approaches, but not less than 2,000 square yards would remain, sufficient for a town hall of moderate size, with a suite of saloons at the service of the magistrates and council. The sum of £20,000 would, he thinks, be sufficient for a handsome edifice worthy of the site. If the idea be carried out, he further suggests that the present Corporation halls in Sauchiehall-street might be disposed of, and an art gallery provided in connection with Kelvin-grove Museum, at a cost of about £10,000. To meet this outlay for site, buildings, and art galleries, estimated at a total of £375,455, the Corporation could sell the property at present occupied, and discontinue renting other buildings—the amount of saving on sale and capitalisation of the rent of £730 a year now paid being assumed at £175,175. Mr. Carrick further reports on the cost of obtaining additional land to the east of the suggested site, to admit of future extensions and the erection of public library, &c. The ground referred to extends to 5,373 yards, and the value may be assumed at £98,151. The city architect concludes his detailed report by a reference to the effect on the external aspect of Glasgow of the erection of the projected series of buildings, and to the great benefits that will result to the community by the concentration of the several offices in one building, both in the increased convenience of the citizens themselves, and the improved supervision afforded over all departments of the public service to those entrusted with the management of civic affairs.

The question of extending the City Indus-

trial Museum in Kelvin-grove, referred to above, and reported upon by another sub-committee, was postponed till after the November elections. It was stated that there is an urgent necessity for greatly increased exhibitional space, and they recommended the Town Council to institute steps for providing the needful extension without delay. The plans to be adopted, it was suggested, should be such as would freely admit of large future additions and extensions in a convenient and harmonious manner; indeed, that they should be the very best plans that past experience in other large museums can suggest. A lecture theatre, capable of accommodating a large audience, is an immediate requirement, and the formation of a consulting, technical, and scientific library, and the possibility of adding class-rooms and a laboratory for a technical college, should not be overlooked. With this report were submitted a sketch-elevation and plans for extension, prepared by Mr. Carrick.

NOTES FROM IRELAND.

A NEW CHURCH, in connection with the "Paulist Fathers'" College at Mount Argus, is in course of erection, and will soon be finished, except the chancel, which cannot be built at present for want of funds, from the designs of J. J. MacCarthy, R.H.A. It is in the Romanesque style of architecture, and promises to be a fine bold structure when finished.

It has been definitely arranged that the new Catholic church of St. Patrick, Newtownards, will be dedicated on Wednesday, 24th inst. It stands on a commanding site close to the railway station, and will, when everything has been completed, cost about £10,000. The church has been built at the sole expense of the Dowager Marchioness of Londonderry, who was received into the Roman Catholic Church about twenty years ago. The interior is finished, but the outside grounds, wall, and railings have not been put in order yet. Mr. Hanson, senior, of the firm of Hanson and Son, London, is superintending the works.

The foundation stone of a new Catholic church at Foxford, county Mayo, was laid on Sunday last by Dr. MacCormack, Bishop of Achonry. The church, when finished, will consist of nave, 96ft. long and 28ft. wide, with north and south transepts each 23ft. by 20ft., entered from same by arcades of two arches carried on limestone shafts, with moulded caps and bases. The chancel will be the width of nave, but 17ft. deeper, finishing square at end. Side chapels will be off the transepts. The tower will be placed at the south-west corner of the nave. The building will be faced with hammered work, the dressings being of chiselled limestone. The roofs will be the ordinary "opened-timbered, stained and varnished." The works will be carried out by Mr. Kennedy, builder, of Westport, from the drawings of J. J. O'Callaghan, architect, Dublin.

The erection of a new church at Rattoo, county Kerry, has been commenced from the designs prepared for same by Mr. J. F. Fuller, F.S.A., Dublin. Mr. Crosbie, of Tralee, is the contractor.

A new Chapel of Our Lady of Lourdes is about to be added to the Carmelite Church, Aungier-street, Dublin, from the designs, and under the directions of, Mr. G. C. Ashlin, F.R.I.A.I., architect.

A chapel is about to be added to the Convent of Mercy, Bantry, county Cork. The general material used on the exterior will be red sandstone with limestone dressings. Mr. S. Hynes, Cork, is the architect.

The new Royal Opera House, in Derry, was opened on the 10th of August last. It was designed to seat about 1,500 persons by Mr. Phipps, the architect.

On Monday a new Board school was opened in Westcott-street, Southwark. The building consists of one block, and is three stories in height, with a small detached building erected for the purposes of a nursery. The style is Queen Anne, from the designs of the Board architect. The area of the site is 23,122 square feet, and the total cost of the same £5,727. The cost of the building is £3,332, making a total cost of £14,060, or equal to a cost of £173s. 8d. per head. The school will accommodate 818 children.

THE OAKS, WEST BROMWICH—HOUSES IN CADOGAN SQUARE
—NEW CHURCH, ST. HELENS.

OUR LITHOGRAPHIC ILLUSTRATIONS.

NEW CHURCH, ST. HELEN'S.

This church was designed for a district where the smoke from the local chemical works is more destructive than in the generality of towns. Consequently a severe style has been adopted. The plan consists of the ordinary arrangement of nave, aisles, chancel, side chapels, &c.; the nave being lofty and spacious in width. The exterior shows an unfinished cloister—intended ultimately to join the house for the clergy connected with the church. The estimated cost of the church, as shown, was upwards of £7,800. The design from which our view is taken was exhibited in the Royal Academy this year, and in our criticism of architecture at the Royal Academy (second notice) it was described as “an agreeable return to purity in style,” and “the exterior treated in a common sense dignified manner, a deeply-moulded triplet in gable, flanked by bold turrets, being the feature.” The architect is Mr. Edmund Kirby, Liverpool.

HOUSES IN CADOGAN-SQUARE, S.W.

The two houses illustrated in the present number, and two more adjoining, from the designs of Mr. W. Niven, are about to be erected on the west side of this new square, which is named after the freeholder, Earl Cadogan. The contractors, Messrs. Pink and Son, have not yet begun on them, as they have their hands very full at present with other houses and contracts upon the same estate. In the new portions of Pont-street they are now erecting four houses from designs by the same architect, one of which, at the corner of Walton-street, we shall probably illustrate in a future number. The houses in Cadogan-square will be faced with red brick in conformity with a rule laid down by the estate company, but this will be relieved by Portland stone, which will be used for all principal moulded work and enrichments. The window heads, where stone is not used, will be flat-headed in gauged brick and jambs, &c., in cut brick. The front, with the central bay window, will be repeated in the house next but one adjoining. The houses are not designed in any particular style, though something is borrowed from the classic elegance of last century, but the quaintness of the so-called Queen Anne style is studiously avoided.

THE OAKS, WEST BROMWICH.

The series of drawings which we publish to-day are from those for which Mr. Brown was awarded the Pugin Travelling Studentship for 1876-7. We have received the following description:—This old mansion is a good specimen of the half-timbered work of the 16th century, though now sadly out of repair for want of attention. The brick part seems to have been added subsequently, as the brick work is built on the face of framing. The plan is simple, consisting of porch, hall, three

sitting-rooms and kitchen, &c., with bedrooms over. The lantern tower, which gives the house its picturesqueness, is approached by a steep staircase from landing. The interior is but slightly altered from its original state, most of the rooms still retaining their ancient panelling, and quaintly moulded chimney-pieces. The records are scanty, as Shaw, in his history of Staffordshire, only states a John Turton, of the Oak, is mentioned in the Freeholders' Book of 1653, and that in the old church of West Bromwich were inscriptions to “William Turton, of the Oak, gent.,” who died in 1682, and Eleanor his wife.—W. TALBOT BROWN.

COMPETITIONS.

ELLEN-STREET SCHOOLS, HOVE.—The authors of the design selected by the board at their meeting on Friday last, are Messrs. Thomas Simpson, of 16, Ship-street, Brighton; and Frederick W. Roper, of 9, Adam-street, Adelphi, London. Thirteen designs were sent in.

LUTON WESLEYAN SCHOOLS.—Nine sets of drawings have been sent in for these buildings. Some of the designs would, if executed, completely eclipse the chapel which adjoins the site. The instructions stated that drawings were to be uncoloured, but one of the competitors has infringed this rule.

MANCHESTER.—In July the Manchester Corporation advertised for plans for baths and wash-houses which it had been decided to erect on a site in Ancoats, bounded by Baker-street, Horne-street, and New Islington. Architects were invited to send designs in competition, for which the following premiums were offered:—A first premium of £200 (to merge in the commission, in the event of the author being selected to superintend the erection of the buildings), a second premium of £100, and a third of £50. The site contains 2,210 square yards, and upon this area accommodation was to be provided as follows—namely, first and second class swimming and private baths, and women's private baths, together with a public steam laundry and drying stoves, steam engines and boilers complete, with all the most recent improvements; and also a residence for the superintendent. The plans were to provide, in addition, for two public rooms, each 72ft. by 36ft., for ward meetings and election purposes, balls, or concerts, with the necessary retiring rooms in connection with them; and it was especially required that the designs should be “in a plain style of architecture and free from any elaborate ornament.” The baths committee have received in reply to their advertisement 31 sets of plans, which have been referred to a sub-committee, with power, should they deem it necessary, to seek the advice of a competent architect, in order to make a selection. Many of the plans received have not been drawn in compliance with the instructions, especially as to architecture, and will, therefore, be omitted from consideration.

ODD FELLOWS' HALL, TYDER.—In this competition the committee have selected the plans submitted under motto by Mr. E. A. Landdowne, architect, of Newport, Mon.

SHEFFIELD FEVER HOSPITAL.—A report of Captain Douglas Galton, C.B., on the competitive designs for the proposed fever hospital has been presented to the health committee of the Sheffield Town Council, and states that some of the plans, before adoption, will require some modification of detail. Twenty sets of plans were sent in: one was signed “Can any good thing come out of Nazareth,” and another “Let there be Light.” Captain Galton places the plans in the following order of merit:—1st, “Let there be Light;” 2nd, “Spes” (No. 1); 3rd, “Light.”

WELLINGBOROUGH.—A competition was invited for drawings for a new school and headmaster's house for this town, and ten architects, who sent twelve designs, complied with the request. The *Wellingborough News* says:—“After repeated meetings the twelve designs were reduced to three, and it is now known, and the circumstance is somewhat singular, and certainly highly creditable to the skill of the gentlemen, that these were submitted by architects of the town—viz., Mr. W. Talbot Brown, Mr. Ed. Sharman, and Mr. Mills,

Ultimately the choice of the governors fell on the design bearing the word ‘Plan,’ subject to the approval of the Charity Commissioners and to the published advertisement. The sealed envelopes were next opened, and it was found that the successful competitor was Mr. Brown. The estimated cost of the school buildings of the competing architects ranged from £5,000 to £10,000. The estimate of the cost, according to the selected plan, is £7,500.”

SCHOOLS OF ART.

HASTINGS.—The second annual meeting of the Hastings School of Art took place on Monday week, when prizes and certificates were distributed to the successful competitors. The committee's report showed that the number of students has been quite equal to the former year, and that the work done evinces progress. It is hoped to remove the school to the commodious premises at Clarendon, now being erected at the cost of Mr. T. Brassey, M.P., at Christmas next. The report of Mr. Sullivan, the head-master, states that 891 works by industrial, and 985 by middle-class students, were sent to South Kensington for examination, and one third-grade prize was awarded. In the second-grade examinations 42 passed out of 56 presented. A sketching club has been formed, under the presidency of Mr. Charles Thorneley.

ARCHITECTURAL & ARCHAEOLOGICAL SOCIETIES.

MANCHESTER ARCHITECTURAL SOCIETY.—The second annual *conversazione* of the Manchester Architectural Association was held on Tuesday evening. The chair was occupied, in the absence of the president, by Mr. J. Corbett, who briefly detailed the objects of the association and its progress during the year. It has now 65 members, with classes for design, outdoor sketching, &c. Visits had been paid to many buildings of interest and importance, including Owens College, the Royal Exchange, the new Town Hall, &c. The chairman concluded by an allusion to the work of the Mayor of Manchester in connection with the last-named building, and invited his worship to address them.—Mr. Heywood, who was very cordially received, bore testimony to the genius of Mr. Waterhouse, and said that the arduous labours of the committee, of which for a number of years he had been the chairman, in no way detracted from the greatness of the architect. They might occasionally have made suggestions which met with his approval, but it was only fair to them and to Mr. Waterhouse to say that the architect had had the full control of his work, and, except for the hindrance caused by the strike, there had been the completest harmony during the whole time the work was in progress.—Mr. James Murgatroyd then awarded the prize for elementary construction to Mr. S. Davies, and in the course of a practical address advised plenty of outdoor sketching. The remainder of the evening was occupied by the performance of a selection of music.

ST. ALBAN'S ARCHITECTURAL AND ARCHAEOLOGICAL SOCIETY.—The annual general meeting of this society was held yesterday (Thursday) afternoon at the Town Hall, Saint Alban's. The President delivered an address, and papers were read by the Rev. O. W. Davys, M.A., “A Glance at the Restorative Works in St. Alban's Cathedral. Finished, in Progress, and to Come;” and by Mr. Chapple (the clerk of works for the abbey), on “Recent Discoveries in St. Alban's Abbey.” These papers we may give in a condensed form next week. In the evening an adjourned meeting was held, at which papers were to be read by the Rev. H. Fowler, M.A., and Mr. Ridgway Lloyd.

A fountain erected at Monaghan, as a memorial of the late Lord Rossmore, was unveiled by the Duke of Connaught on Friday. It is Gothic in character, and octagonal in form. It occupies a space of 24ft. in the centre of the Diamond, rising to a height of 50ft. Richly-carved capitals surmount the eight columns, and support a canopy, dome, and spire over the central basin. The structure is surrounded by railing and a gate. The total cost has been £1,000, and the architects and constructors were Messrs. Robinson and Sons, of Belfast.

THE STUDY OF ART HISTORY.

DR. ZERFFI delivered the first of the ninth series of forty lectures on "The Historical Development of Ornamental Art," in the Lecture Theatre, South Kensington Museum, on Tuesday evening last, at eight o'clock. After some preliminary remarks the lecturer said that, passing back even to the remotest periods of the development of humanity, we should find certain traces of art expressed as poetry in popular songs, or in attempts at ornamentation, amongst all nations, even during their most primitive savage state. The farther we went back the more closely should we find æsthetic and religious feelings intermingled, so that it was exceedingly difficult to separate art and religion; as we advanced, however, we should find that the necessity for a "division of labour" had made itself felt, and art and religion had not only separated, but even assumed apparently antagonistic positions. This antagonism, however, was merely artificial, and had no lasting vitality. Art and religion were outgrowths of our emotional element, they were twin-daughters of our higher and most elevated worship of the Creator and His works. The artist worked in absorbing impressions from *without* and reproducing them in new forms from *within*. This process of ideal filtration of the impressions of nature constituted the very essence of art, and transformed a mere *work of imitation* into a *work of art*. This process had to be carried out subject to the rules of taste, and these rules scientifically systematised constituted æsthetics, for taste was based on the refined, well-trained action of the intellect, stimulated to activity by the imagination. It was impossible to deny that this process had had its historical development, and this development was intimately connected with the gradual progress of human civilisation. Many of his (the lecturer's) hearers might possibly still say to themselves, "Of what use can a knowledge of Chinese customs or Greek mythology be to me? So long as I can draw and copy what I see I know as much as I want." If they wished to become mechanical draughtsmen, and not intelligent artists, it was undoubtedly true that they need not know much of Chinese customs to enable them to reproduce Chinese patterns correctly; but if they wished, not merely to reproduce, but to work in the Chinese style, it was essential that they should be able to follow the very mode of thinking of the Chinese artist in order to be able to produce an original Chinese work. Mere imitation, only, then became independent artistic work when such work had grown out of that clear consciousness which stamped a copy of the outward impressions of nature as a product of our inward mental power. The history of art scientifically treated should be as seriously and earnestly studied as the mixing of colours, the drawing of correct outlines, or the general practice of art. History taught us, beyond a doubt, that art had only succeeded in reaching the highest climax of classical or romantic beauty when the technical capacities of the artists were well-balanced by their intellectual powers—when science and taste had combined to guide the merely mechanical in the artists, and had aided them to bring thoughts and ideas into forms. If art did not improve our refined taste for beauty, soften our rude customs, banish vulgarity, and elevate our minds, then, indeed, the study of art would be a mere question of fancy or trade, unworthy the expenditure of physical or mental labour. But an art in which taste tried to grasp the beautiful, and imagination endeavoured to give it form, was well worthy of our highest efforts. The ideal of spotless beauty, which should be the aim of art, was not to be found in nature. This did not mean that the elements of beauty were not given us in nature, but the selecting intellect of the artist had to find them, combine, and free them from the accidental, ugly, and grotesque, in order to change the forms given by nature into consciously conceived and created works of art. He (the lecturer) much regretted that he found it necessary, after eight years' teaching, still to remind his hearers that art history and æsthetics were sciences as strictly as botany or chemistry. Like the other sciences, art history and æsthetics were based on observation, on a correct classification of phenomena or facts, and on the careful tracing of certain effects in

certain cases. That they allowed a broader range of opinion, and did not apparently directly influence our appetites, the safety of our property, or the material welfare of our body, did not in any way weaken their title to rank as sciences. We were not merely composed of phosphorus, chalk, lime, iron, oxygen, hydrogen, carbon, and—money, but we were endowed with consciousness, which we attained, through ideality, poetry, and art, the most glorious fruits of our intellectual capacity. Poetry and art led us into a world of possibilities and probabilities more beautiful than reality. Supposing that we knew all the languages in the world, but were unacquainted with the poetical works of all nations, what dreary philological machines we should be! If reality were our sole end and aim, art would be superfluous, yet art had been practised by man from the moment he had been able to use his intellectual faculty. Just as the rose had its innate beauty in colour and fragrance, so man had his innate power to produce works of intellect and emotion in science and art, united by religion, by faith, and an ever firm belief that the culture of our higher faculties was the most sacred duty of an intellectual being. That mere work could be disregarded in a work of art no one could attempt to assert. It would be as absurd as to seek to give shape to a beautiful creature without using visible materials for its representation. The idea, however, the spirit, the soul, must manifest itself in the work of art as did the Deity in the universe. The beautiful was the representation of the infinite in the finite, and in this in itself lay the close connection between ethics and æsthetics.

These lectures are illustrated with models, photographs, &c., and are delivered in the Lecture Theatre, South Kensington Museum, every Tuesday evening at 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE first meeting of the session of the Liverpool Architectural Society was held last week. The chair was occupied by the president of the society, Mr. James M. Hay, who delivered the usual inaugural address, in the course of which, after giving an account of the annual excursion to Whalley Abbey, including a full description of that building and its various appurtenances, he remarked that these and similar ruins were to us what the celebrated Torso, the mutilated fragment of the antique statue of Theseus, was to Michael Angelo—viz., his school. These were our schools wherein we were taught to read the history of that glorious living art which extended from the period of the Norman Conquest down to the time of Henry VIII. For five centuries we were able to trace the rise and progress and development of architectural thought, but at no period did it become stereotyped. Change was everywhere and ever at work, but it was not the change of caprice, whether of an individual or of a clique. It was a mighty wave of human sentiment, based on thorough acquaintance with scientific law and artistic principle. To the architectural student such a record was simply invaluable. Hence the jealousy with which we should preserve every genuine remain. The so-called restoration was simply destruction. He entered into a history of the Gothic revival, and said it was curious to observe that it was the style lowest down in the historic scale that first found favour in our sight—viz., the Rectilinear. After more study our admiration ascended to the next in order, the Decorated, which was the period when Gothic art had reached the summit of perfection, and it was advocated as the best style for our imitation and adoption, and as a point of departure for a new style of our own. He alluded to the revival of the Queen Anne style, and said surely there was nothing in the architecture of Queen Anne's reign but what might be readily infused into the classic architecture of the 19th century. To be consistent we should go on and recover the Georgian styles. But we had arrears of history to bring up. There was the William and Mary style. Why could we not have the Bloody Mary style? He next referred to a remarkable movement of the present day—the establishment of a society for the protection of

ancient buildings, which could not fail, he thought, to have an interest of some kind for all persons of taste; for than such buildings as Durham and Lincoln Cathedrals, York Minster, or Westminster Abbey, no structures could be more worthy of protection from every species of injury. He called attention to the fact that this society owed its existence mainly, he believed, to the writings of a member and ex-president—Mr. Samuel Huggins—whose first paper on the subject, as well as one so late as last November, was read to them.—A vote of thanks was passed to the president for his address.

A communication was read from the Manchester Master Builders' Association asking that the architects of Liverpool should not, during the present joiners' strike in Manchester, press on the several works in course of progress in that town. Mr. J. Boulton said that if the architects were to ally themselves with one side or the other they should have some information as to the merits of the dispute. During the last thirty years there had been several occasions like this in Liverpool, when, if a third party had come in, the dispute might have been adjusted without loss of time.

The President then distributed the prize awarded at the last session for design and construction to Mr. Alexander Bleakley, jun., a member of the student class, and complimented him on the ability he had displayed.

THE NEW DOCKS AT FLEETWOOD.

THE new docks at Fleetwood were opened on Monday by the directors of the Lancashire and Yorkshire Railway Co. The dock, which has for more than three years been steadily progressing under the hands of Messrs. Aird and Sons, of Lambeth, is from the designs of Sir John Hawkshaw, and forms at once a massive, and wonderfully finished piece of marine architecture. The length of the structure from end to end is 1,000 feet, with a breadth of 400 feet, embracing altogether an area of 9½ acres; in addition to which there is a lock entrance measuring 250 feet by 50 feet. The dock walls are built with square blocks of stone, surmounted by a broad and solid coping of Cornish granite, and filled in behind with concrete, the whole being placed on a solid concrete foundation of 14 feet wide; they have an altitude of 33ft. 6in. The walls themselves vary in width as they approach the surface, and are in the lower half of their distance 12½ feet, then 10½ feet, and in the highest section 8½ feet wide. The sill or floor of the dock is well puddled with clay, and stands 2ft. 9in. above the level of low water spring tides, so that an average spring tide of 26 feet will rise 23ft. 3in. above the sill, and an average neap tide of 20 feet will in like manner furnish a depth of 17ft. 3in. in the dock. The lock entrance is terminated at either end by an immense iron gate, consisting of two leaves, each of which is divided into three compartments weighing 60 tons, giving a total weight in the two gates of 240 tons. The gates are ballasted with 2½ tons of gas tar to each, and the appliances for opening and shutting them are thoroughly efficient and handy. These gates were constructed by Messrs. Easton and Anderson, of London, and some idea of the labour they necessitated may be conceived when it is stated that the four leaves contain no less than 28,800 rivets, being one rivet in every three inches.

THE LATE MR. RAPHAEL BRANDON.

ANOTHER gentleman, who has left a mark upon the architectural history of his time, has prematurely closed his career. With deep regret we record that on Monday afternoon last, at his chambers, 17, Clement's-inn, by his own hand, Mr. Raphael Brandon, well known to the architectural profession, terminated his existence. Some time ago we noticed a change in this gentleman's appearance—an anxious and careworn expression, betraying the yielding of an overwrought constitution to a highly sensitive temperament. The whole profession will receive the intelligence of so sudden a death with pain. It appears, from what we have gathered, that Mr. Brandon went last Friday to see the schools

now building at Ham, near Twickenham, from his designs. Of what occurred there we are at present in ignorance; but he told his brother-in-law, on his return, that he had no idea how he got back again. It also appears that the deceased gentleman became lately addicted to a habit which had gradually increased upon him, due probably to an overwrought mind, and to possibly the pressure of other cares. It appears his lease at Clement's-inn, which he has held 21 years, expired on the 29th ult., and he experienced some difficulty in getting the Inn to renew it. Marked peculiarities in his temper and habits appear to have shown themselves lately. We are told, on one occasion, he did not wish to sleep alone; on another occasion he found himself in his garden with only his shirt on; and his capricious freaks caused some anxiety to his friends as they noticed the breaking down of a once vigorous mind. His wife died about five years ago, but left no children.

Mr. Raphael Brandon commenced life with a burden; he became surety for a near relative for a large amount, which, however, he had to pay off. Those who knew the character of the deceased gentleman found him, in all pecuniary and other transactions, strictly honourable—indeed, this scrupulousness he even carried to an extreme. Mr. Brandon was a pupil of J. Dédeau, of Alencon, and Mr. J. J. Parkinson, of London, and began partnership with his brother Arthur, a promising young architect, who died in 1847, just thirty years ago, after which he joined Mr. Ritchie. Of his earlier works may be mentioned the Town Hall and Corn Exchange, Colchester, the Catholic Apostolic Church, Gordon-square, built in 1840—a building of sufficient importance and architectural merit as an Early English structure to have brought him into notice; the church of St. Peter, Great Windmillstreet; Holy Trinity, Knightsbridge; and latterly he was engaged in carrying on the restoration of St. Martin's Church, Leicester, for which he erected a conspicuous tower and spire. We may here remark that Mr. Raphael Brandon sent in a design for the Nelson monument, which was illustrated only by a perspective. The design was first selected, and the author was asked to make other drawings, instead of which he sent in a modified design, and was thrown out. Mr. Brandon was a thorough Gothickist, but he was a Gothickist on principle and education, not because it was fashionable. He never wavered in his choice of a style, and in 1859, when the "battle of the styles" was raging, we well remember the interest he took in supporting by all he could say Mr. Scott's (now Sir Gilbert Scott) designs for the new Foreign Office. Mr. Raphael Brandon was by no means a copyist. We remember, at the time to which we are referring, that he advocated in this journal the claims of Gothic architecture to form the basis of a new style, and he put the significant questions that retain their import even to this day—namely, "How is it that if Gothic architecture is applicable to such a diversity of buildings it should stop short of these? and what is it that renders Gothic capable of such universal application?" These remarks were written at Clement's-inn eighteen years ago, and published in the BUILDING NEWS. Since that time many changes have occurred. A reaction in favour of Classicism has set in, but we find Mr. Brandon in his latest works still true to his principles. Of other buildings designed by him we may name the new offices of Clement's-inn, on the west side of the Law Courts, and Messrs. Rimmell's premises, Beaufort-buildings. In 1874 we remember he exhibited a fine water-colour drawing of the interior of the Catholic and Apostolic Church, Gordon-square, in the Royal Academy. He also competed for a church at Twickenham, published in the BUILDING NEWS in 1875, Vol. XXVIII., page 372. Mr. Brandon's reputation as an architect was so far established that he was one of the twelve invited to contribute a design for the new Law Courts. His design for this was characterised by great ability, originality, and vigour. The style adopted by the author was a florid rendering of Gothic, in which a freedom of detail, borrowed from foreign and English sources, is noticeable. The loftiness of the towers and fleches,

perhaps, were amenable to a charge of being a little too ecclesiastical, but nothing could be much finer than the Strand front and Mr. Brandon's treatment of the Temple Bar site. Here a segmental pointed arch, with an arcade of tracery windows, forming a passage way over the roadway, joined a nobly-designed tower springing from the pavement, through which an archway was pierced. We refer our readers to the BUILDING NEWS of 1867, pages 190 and 374. About this time Mr. Brandon severed his connection with Mr. Ritchie.

We must not omit to notice the many works on Gothic architecture Mr. Raphael Brandon published. His greatest work, and that by which his name will be longest remembered, even after his practical success as an architect is forgotten, is the "Analysis of Gothic Architecture," published in two quarto volumes in 1847. In this he was associated with his brother, Mr. J. A. Brandon. In this work the inculcation of true methods of study and observation is the main purport of the author, and he instances the difference of old and modern practice, and shows that the builders of the middle ages never fell back upon a past era of their art, even when engaged in completing structures of past times—a lesson some of our anti-Restorationists and Gothickists may take to heart. The "Analysis" will long remain a text-book for the student, and the remarks on the meaning and purpose of Gothic features generally are full of interest. In 1848 he published another work, in conjunction with his brother, that will long keep its place as an authority—"Parish Churches." This book contains perspectives and plans of English parish churches, many of which have since undergone processes of restoration. We remember the first appearance of this work, and the value in which we then held it. Another quarto, "Open Timber Roofs," is well known to all students as the only masterly exposition of a most interesting subject. "Ancient Timber Framing," "Papers on Gothic Tracery," are other works from the pen of this indefatigable student of Gothic. One of his recent works, which created considerable attention at the time, was entitled "Railways and the Public, or How to make them Remunerative," a pamphlet we noticed at the time of its publication. We are told he worked hard, and had he been as careful in his pecuniary affairs as he was of his professional reputation, he might have amassed a considerable fortune. Mr. Raphael Brandon lived quite a retired and isolated life; he was not an obtrusive man; and his independence of mind and disposition was so great that he never won that popularity more obsequious men enjoyed. Many a man with less ability has achieved a more popular reputation. He was often selected in competitions as an arbitrator, and when Sir G. G. Scott was unable to attend to business of this kind he more than once referred applicants to Mr. Raphael Brandon, so high an opinion had Sir Gilbert of him. Mr. Brandon was 60 years of age. The inquest will be held to-day (Friday).

The annual dinner of the Builders' Benevolent Institution will take place on November 8; Mr. William Higgs, the President, in the chair.

A new United Presbyterian church was opened on Snaday at Hillhead, near Glasgow. Messrs. Campbell, Douglas, and Sellars are the architects, and the building, which will accommodate 900 people, has cost £12,000.

A new United Presbyterian church was opened at Partick, N.B., on Friday last. The style is Sixteenth Century, and the designs were prepared by Mr. Leiper, architect, of Glasgow. Accommodation is provided for 800 people.

On Saturday afternoon the Bishop of Manchester laid the corner stone of the church of St. Andrew, Mouton-lane, Eccles. The bishop mentioned in the course of his address that a working man, earning weekly wages, was a contributor to the extent of £20. Contracts have been let to the amount of £8,500, and it is estimated that the church when completed, with the parsonage-house, will cost £10,000 or £12,000. It will accommodate about 800 persons. Mr. H. E. Tijon is the architect, and the contracts have been let separately.

The parish church of Wilslow is about to be restored at a cost of £1,500, under the care of Mr. J. S. Crowther, architect, of Manchester.

Alterations are being carried out at Lady Holles' Schools, Redcross-street, E.C., under the superintendence of Mr. E. Woodthorpe.

Building Intelligence.

BEDFORD.—St. Cuthbert's Church was reopened on Sunday week after alteration and enlargement from the designs of Mr. Horsford, architect. The church, formerly a low and mean building, of presumably Saxon date, was rebuilt, in 1849, as a cruciform edifice, in Anglo-Norman style, and subsequently enlarged by the addition of a north aisle. The present alterations include the lengthening of nave and aisles by 17ft., increasing the accommodation from 600 to 800 sittings, with west entrance porch, the addition of an organ-chamber at north angle of transept, and the re-laying of the chancel floor with encaustic tiles. The fresh seating consists of open benches constructed of oak, from Chicheleypark, Bucks, and the new south aisle windows are filled with stained glass. Mr. S. Foster, of Kempson, was the builder. The cost of the alteration has been about £1,400.

BRADFORD.—Messrs. J. Holden and Sons, of the Alston Concrete Works, Thornton-road, Bradford, are about to erect new premises. The contracts have been let, and the work of extending the combing sheds on the southern side of the present works is proceeding. The extreme length of the new shed is 380ft., the breadth is 80ft. The style of building will strictly harmonise with the existing premises. The arching for the shed is composed of Thomas Cordingley and Sons' concreting, and all the floors finished with their granite-faced concreting. Underneath the new shed there will be a cellar, the floor of which is granite-faced concreting. The roof will be about 45ft. in height from the ground line, and will admit light from the north, and on that side be glazed on Rendell's patent system. The plans have been drawn by Messrs. Milnes and France, architects; and the mason's work is being carried out by Mr. Thomas Patefield, Bradford; concrete arching and floors, Thomas Cordingley and Sons, Bradford. The other contractors are Mr. Charles Nelson, plumber; Messrs. Johnson and Smith, joiners; and Messrs. Hill and Nelson, slaters. Mr. Abner Rhodes is the clerk of the works.—A new Friends' Meeting-house has been opened at Bradford. It comprises two frontages—one to Fountain-street, and another to Brunswick-place. In the centre is the main entrance, admitting to an outer vestibule 21ft. by 12ft. From this vestibule open to right and left ladies' and gentlemen's cloak-rooms. Separated from the outer one by folding-doors is the inner vestibule, 21ft. by 19ft., from which there are entrances to the large meeting-room and school-room, as well as staircases to the galleries of the meeting-room, and to other rooms on the upper floor. The large meeting-room is 55ft. by 45ft., and 33ft. high, with gallery round three sides. A smaller or ladies' meeting-room, 46ft. by 31ft., and 21ft. high, adjoins, and is approached either from the same vestibule, or by a separate entrance. The school and class-rooms adjoin the meeting-room on its western side, the former being 35ft. by 33ft., and 21ft. high. Besides the above arrangements, the premises comprise a large tea-room, kitchen, and other rooms. The style adopted by the architects, Messrs. Lockwood and Mawson, is Italian. The total cost has not yet been ascertained, but with the site it will probably amount to about £23,000.

CAMBERWELL, S.E.—The constant increase of Sunday scholars having rendered it necessary to enlarge the school accommodation of Camberwell-green Congregational Church, Wren-road, (Rev. Clewcut Clewance, B.A., pastor), it was decided to carry out an extensive scheme. The boys' schoolroom is to be doubled in size, the girls' room enlarged, and a library built between these rooms. New buildings are to be erected on a plot of ground adjoining, including new infants' school-room, four class-rooms for boys and young men, four for girls and young women, and pastor's receiving room. Plans have been approved, and the tender of Mr. Joseph Thompson, of Camberwell-green, accepted, and the buildings are in progress. The principal front will correspond with the adjoining church, which is in the

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published October 12 contains articles on The Congress of the Sanitary Institute at Leamington, The Belfast Factory District, The Sanitary Housing of our Population, Smoke-cases on Tyne and the Artisans' Dwellings Act, The Alurometer or Flour Tester, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Cleanings, &c., &c. Price Two-pence. Annual subscription, Post-free, Eleven Shillings. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

ERRATUM. (On p. 319, in our account of the new Tay Bridge, by an absurd lapsus calami, it was described as carrying the railway across the Frith of Forth. The Frith of Tay of course was meant.)

Correspondence.

SHARP PRACTICE.

To the Editor of the BUILDING NEWS.

SIR,—I have always thought that the wisdom of criticising designs submitted in a competition that was still *sub judice* was at least questionable, but the circumstances of a recent competition place the matter, to my mind, beyond a doubt. A public institution advertise for designs for a building adapted to their particular requirements, and their invitation is responded to by a small number of architects, among whom is one whom I will call "A."

"A." sends in his drawings, plainly and legibly signed with his own proper name and address, covered, but not concealed, by a thin paper label bearing his motto. The same thing is done with his report, which is dated from his office, without any attempt at concealment, and his perspective is signed with his initials.

A critique of the designs appears in due course in your journal, and contains almost unqualified praise of "A.'s" design, whilst the other drawings are disposed of summarily, or merely described. An opportunity is thus furnished to "A." for a letter to Mr. Editor, and accordingly a gushing effusion appears in the next impression, thanking him for his kind remarks, and endeavouring most feebly to injure his opponents.

To say that "A.'s" conduct is scarcely what is anticipated or desirable in an opponent is, I imagine, nothing more than a fair and temperate statement of the facts of the case.

detail with moderate cost. The design is described as a broad and square mass of rich red, subdivided by piers and colonnades, with lofty arches, to give light to the respective offices. Relief and further enrichment are afforded by the introduction of stone work for the salient parts of the building. The accommodation of the offices comprises rental office, accountant's office, collector's office, board-room, secretary's room, two staircases, and two strong rooms. The works have been executed, under a contract, by Messrs. W. R. and C. Light, Bros., of Landport.

METROPOLITAN BOARD OF WORKS.—At Friday's meeting consent was granted Messrs. Stutely and Cubitt Nicholls, on behalf of Lord Kensington, M.P., for the formation of two ornamental enclosures in roads now being laid out for building purposes, to be known as Nevern-square, S.W., and Lexham-gardens, W. A discussion arose as to the Brunel statue, opposite the School Board offices, in consequence of a committee's recommendation that the Embankment railings be brought round the pedestal to protect it from injury. Mr. Saunders condemned this suggestion as likely to render the memorial absurd as the stone seats, the only sensible feature of the structure, would be railed-in. He asked also why the hideous flanks had been allowed to be erected? The members of the works committee strongly objected to the design, and referred it to the engineer, and yet it had been erected on its original plan. Sir Joseph Bazalgette explained that in consequence of a defect in the statue's legs it was thought necessary to conceal them by the existing mass of masonry. The matter was referred to the works committee to report upon.

POPLAR.—The memorial stone of the new Hospital for Contagious and Infectious Diseases, at Poplar, was laid last week. The building consists of two pavilions, each two stories high, with the necessary offices. The cost, including the land, will be about £14,000. Mr. E. L. Bracebridge is the architect, and Mr. J. W. Martin, of Stratford, the builder. This is the first permanent hospital founded for non-pauper infectious cases by any Metropolitan Board, with the exception of the Cottage Hospital at Lewisham.

SAPFON WALDEN.—The town council met on the 3rd inst. to consider the desirability of erecting a more suitable and commodious town hall than the existing structure in the market-place. Plans and designs by Mr. Edward Burgess, estimated to cost in execution £3,500, were inspected. A letter was read from Mr. G. S. Gibson, the Mayor, offering to place the sum of £4,000 at the disposal of the Corporation to carry out these plans as an evidence of his family's interest in the welfare of the town. The offer was accepted with hearty thanks, and it was decided that Mr. Burgess's plans be adopted.

SHUTE.—A new board school at Shute, Devon, was opened on Wednesday week. The school is in the Gothic style, and is built of "knobbed flint" dug in the neighbourhood, with Ham stone dressings. It will accommodate 130 children, and has two class-rooms. A house for the residence of the master is attached. Messrs. Board and Wakley, of Whitford, were the contractors, and Mr. Pinney, of Axminster, the architect. The cost of the building, with extras, is about £2,000.

Last week the foundation stone of a new Free Church was laid at Dumbarton. The building will be in the Early English style, and will measure about 88ft. in length, and about 49ft. in width, including the session-house and vestry; it will have a gallery, and will seat about 570. The total cost will be about £3,600.

A new east window in Stanton-on-Peak Church, Derbyshire, was unveiled on the 28th ult. It contains the institution of the Lord's Supper in a canopied base, running through the four lights, and above a large subject of our Lord's Baptism, surmounted by a canopy. The work was executed by Messrs. Camm Brothers, of Smethwick and Birmingham.

The Ladbroke Theatre, Notting-hill, has been re-decorated, and the stage enlarged from designs by Mr. Walters.

An U. P. church, erected at a cost of between £6,000 and £7,000, was opened in Balchagray-avenue, Whiteinch, N.B., on Friday.

Decorated French Gothic of 15 years since, and will, like it, be faced with Kentish rag and Bath dressings, and backed with stocks. The memorial stone was laid on Saturday afternoon by Mr. Whitley, who purchased and gave the new site. The cost of the new buildings will be about £3,500.

CAMBRIDGE.—The foundation stone of new Zion (Baptist) Chapel was laid on Tuesday week. The chapel is being built next to the old one in East-road, which will be altered into a school-room and class-rooms. The style of architecture is Early French Gothic, the front next the road showing a gable in brick and stone, with three windows on the floor level, two above, and a central rose window. The entrances are by side wings into the chapel, which will measure 68ft. by 48ft. internally. Before the rostrum will be the baptistery, which will be lined with blue and white glazed tiles. The seats are to be stained and varnished deal, to provide for 900 persons. The gallery front will be of wood panels, with ornamental ironwork above, and the staircases will be of stone. It is to be lighted with gas and warmed with hot water by apparatus supplied by Messrs. Hearn, of Liverpool. Mr. Peachey, of York, is the architect, and Messrs. Thoday and Son, of Cambridge, the builders. The cost will be £4,000, and that of altering the old chapel for Sunday-school purposes about £2,000 more.

GLASGOW.—Belhaven U.P. Church, on the Observatory-road, was opened on Sunday last. It is Gothic in style, and externally depends for effect chiefly on the largeness and simplicity of its parts; but internally it is decorated to a degree quite unusual in a Presbyterian place of worship. It is roofed in three spans; a nave 120ft. by 34ft., and nearly 60ft. in height to ceiling, being separated from the side aisles, which are each 75ft. by 12ft. wide, by arcades and piers of stone. At each end is a small gallery. The building is lighted entirely by the clerestory windows and a large three-light in the north gable. The accommodation is for rather fewer than 900 persons. The small hall, seated for 200, adjoins the church, as does also the vestry, session-house, and church officer's residence. The nave ceiling is of wood, which has been first stained to a rich warm tone, and then decorated elaborately, black and red being the colours principally used, with gold sparingly introduced; the panels contain symbols of the Evangelists. The upper part of the clerestory walls is painted in a rich buff, and decorated with red, the lower part a neutral green, with ornamentation in darker shades. The spandrels of the arcade, and the aisle walls, have for a ground colour a rich red, with applied decoration in various tones of red, black, and buff. The woodwork throughout is stained to a dark tint, and that of the pulpit and organ will be enriched with gold and colour. The north gable window, and those in the entrance, porch, and staircase, are filled with stained glass illustrating Biblical incidents and parallels. The organ has been built (at a cost of £1,150) by Messrs. Thomas Lewis and Co., of London, from a specification by Mr. Henry Smart. The total cost of the buildings will be about £12,000. The architects are Messrs. Campbell, Douglas, and Sellars; the decorations are being carried out under their personal direction. Mr. J. MacIntosh is clerk of works; Mr. Andrew Wells executed the painting and decoration; and the stained glass is by Messrs. Adam and Small. Mr. Malcolm McRorie has been the mason; Messrs. W. Cowan and Son, joiners; Mr. John Rattray, plumber; Mr. John Bradford, plasterer; and Messrs. A. and D. Mackay, slaters.

GOOLE.—A new cemetery at Goole was opened on Friday. The plans were selected from about a score submitted to the board by various architects, and those of Mr. W. Watson, of Wakefield, were chosen. The buildings include two chapels and a curator's house, with board-room. The total cost has been £2,200, of which £4,000 was paid for the land.

LANDPORT.—New offices for the Portsea Gas Co. have been erected at Landport, from the designs of Mr. Alfred A. Hudson, of Southsea. The architecture of the building is exceedingly elaborate. Terra cotta is largely used in the building material, thus allowing of considerable

I trust that you, Sir, by giving publicity to this letter, will do something towards remedying a state of things little calculated to raise our already much-abused profession in the public esteem. When we have arrived at such a pass as to have architects sending in drawings and reports, signed with their full names and addresses, in a competition ostensibly anonymous, it is surely time that some steps should be taken to set our own house in order, and approach the subject with a view to reform from the other side—*e.g.*, that of ourselves.—I am, &c.,

KEITH D. YOUNG.

11, Red Lion-square, W.C., Oct. 2.

A VICTORIAN STYLE.

SIR,—The letter of your correspondent, Mr. Asbury Jackson, touches a question which is rapidly becoming one of the first importance to architects, and may briefly be described as that of "a new style."

It is an interesting matter of speculation what sort of verdict posterity will pass upon the mass of the most important buildings erected during the last thirty years; but what can it be but that they are imitations—more or less happy? It is also a dreadful thought, but one that will force itself upon us, that after a few generations all the most eminent architects of the day, the most celebrated restorers, all those whom the younger members of the profession now look up to with awe and veneration, may be consigned to oblivion, or only mentioned as clever copyists—men who were sufficiently versed in the intricacies of bygone styles to be able to put up buildings more or less consistent in treatment and pure in detail.

In ecclesiastical architecture especially, a dearth of originality is conspicuous. It would seem that the highest praise that can be awarded to a new church is that "it could almost be taken for old work." Nor is this, on reflection, surprising. So long as the same form of worship exists as, in the main, was practised in the middle ages, so long must we expect the buildings provided for it to retain their distinctive features; so long as men profess a belief in saints and other holy mysteries, so long is it fitting that they should decorate their sacred buildings with symbols indicative of their belief. And it is not unreasonable to suppose that the lukewarm faith which characterises the age is leaving its mark in the spiritless churches which spring up on every hand.

With Nonconformist places of worship there is not the same restriction, and it certainly seems a pity to continue building chapels exactly like churches, when, if they were made to embody the peculiar characteristics of the worshippers, they might pave the way to what so many people are crying out for—an abiding nineteenth-century style—for no lasting style will ever be attained that does not faithfully express the wants of the age. And hence it is to be expected that when architects have come fully to appreciate this, we shall have, considering our multifarious wants, more than one style. We seem to forget that in the middle ages there was only one religion to cater for—consequently we have only one broad type of ecclesiastical buildings, though varied in detail and arrangement of parts. There is little doubt that the servile copying of old forms and fashions which seems to be one of the chief aims of the profession, is producing a very bad impression outside, and helps to strengthen the feeling that architects are not "practical," which results in an increasing reluctance to place our new public buildings under the direction of an architect. Mr. Frederic Harrison lately observed that, were he going to erect a building, he should not employ an architect; he should place it in the hands of an engineer, and rest satisfied that, though the result might not be gratifying from an artistic point of view, yet he would be certain to have the benefit of the best skill and most scientific construction; in fact, that his building, even though it were ugly, would be expressive of the genius of the times. And it can scarcely be doubted that, if our grandchildren are called upon to point out the works of the Victorian period, they will not point to our churches, our mansions, or even our public buildings, but rather to our railways and railway stations and

our bridges—in short, to the works of engineers, and not of architects.

Does not this suggest a solution of the difficulty of a new style? By all means let us study mediæval work, since, if we are imbued with its spirit, we shall be imbued with the spirit of truth; but if, instead of studying old work with the mere intention of reproducing it with more or less modification, we were to give ourselves up rather more to the study of the latest improvements in new materials, and render ourselves more familiar with their properties and peculiarities, is there not some hope that we might learn to treat them in a more artistic manner than our practical brethren allow themselves time for? and might we not hope to apply our knowledge in such a way as to stamp our works with so distinct an impress of the age that we should have the germ, and more, of a new style?

Yet, after all, a new style is wanted, not because it is a "style," but because its existence would imply an appreciative use of the most convenient materials, truthfully and artistically employed to give expression to the wants of the age.—I am, &c.,

J. A. G.

Manchester, October 8.

SHRINES AT HEREFORD AND ST. ALBAN'S CATHEDRALS.

SIR,—The reproduction in your last issue of a sketch of the shrine of St. Thomas de Cantilupe, in Hereford Cathedral, leads me to offer a few remarks on that singular tomb, and the somewhat analogous one recently reconstructed in St. Alban's Abbey, as I have lately visited and carefully examined both structures.

The Cantilupe shrine is unique, its peculiarity lying in the fact that it consists of two feretories (or "altar tombs") of almost equal length and breadth, erected one above the other, upon the altar pedestal. Each (as your illustration shows) has, as a leading feature, a large slab of marble, with the matrices of brasses upon the surface. These slabs are supported on arcaded work and dwarf columns socketed into the substructures. The carving and treatment of the two stages differ greatly, being of very unequal merit in various parts. The lower (feretory) is solid, the arcading being cinquefoiled, with freely-carved capitals, and canopied figures of knights templars; the upper one is of open trefoiled arches; the columns have hollowed-out capitals and bases. Both parts, however, exhibit singular differences, some of the stones dovetailed into the general body of the work being very poor and spiritless; especially is this applicable to the diapering of some of the spandrels in the upper part, which is as mechanical as engine-turned work. Study and comparison during the Archaeological Congress at Hereford of the details, stone by stone, and the mode of socketing together, led me to the conclusion that the lower portion was mainly executed soon after Cantilupe's death (1282), say, about 1290, by a sculptor (presumably of advanced years), who adhered to older traditions of working. Certainly it was not carved so late as the usually assigned date, 1350, when the shrine was erected in its present place—John the Baptist's aisle of the north transept. Half a century later, to do greater honour to Bishop St. Thomas, the second shrine was added—a manifest effort being made to adhere to the conventional character of the older work. In the well-known removals of the shrine, from pillar to post, and from the Lady Chapel and the north transept, it seems to have been injured, and was patched up as well as the sculptors of the day could manage. The spirit of the older work had evaporated, but a fair replacement—as restorations go—of the outline features was made by the copyists.

St. Alban's shrine, although of a more usual type, has great interest, partly from its ornate character, but chiefly as an instance of the recovery of a lost feature in fragmentary form, and its successful rebuilding. Half a dozen years since no trace of the shrine of the patron saint was known to exist in St. Alban's Abbey, but in February, 1872, a small piece of clunch, decorated with blue and gold, was found in the floor of the presbytery. Sir Gilbert Scott directed further search to be made, and between

300 and 400 pieces of marble and clunch were found in the floor, walls, and blocked-up arches of the chapel and ante-chapel. These were carefully fitted, and now stand a nearly perfect "altar tomb" in the saints' chapel immediately to the east of the great stone reredos, and opposite Duke Humphrey's tomb. I spent yesterday (Tuesday) in the abbey, and may write on some notes made as to the shrine. The structure is about 8ft. 9in. in height, 9ft. long, and 4ft. broad. It consists of a low pedestal slab of marble greatly worn into hollows (by kneeling?). Upon this is a feretory about 2ft. 3in. in height, and ornamented with four quatrefoils on each side, and one at each end. In two of these are lozenge-shaped openings into the base of the feretory, possibly for the removal and exhibition of the relics usually kept within it. From between the quatrefoils spring shafts dividing the outer superstructure into a series of niches, each enclosed by a cinquefoiled canopy. These canopies, altogether, on the four sides, are ten in number; each ends in a steep gable, richly cusped and crocketed. Recessed from these is the solid superstructure of the feretory, which is ornamented with tracery less carefully worked than that within. The roofs of these niches are groined with very delicate tracery. The tympana at the extremities are filled, the one with a carving in bold relief of the martyrdom of St. Alban by scourging, the other with the scourging of St. Amphibalus. The latter is much more freely sculptured, and apparently later in date, corresponding in character with the seated figures with which the spandrels of the side niches are adorned. The dignity given to the latter figures, and the graceful folds of the drapery throughout, deserve careful attention. The side tympana merely contain conventional foliage—the spandrels of the ends are occupied by censuring angels, in which the arrangement and flow of the garments are the best features. The cornice above is ornamented with a continuous honeysuckle pattern, and appears of somewhat earlier workmanship than the shrine itself, and I am inclined to agree with the conjecture that it has been removed from an earlier shrine to St. Alban's. The main structure is of black marble, with clunch used here and there for groining and shafts, both the materials revealing on close inspection traces of decoration in gold and vivid primary colour. Outside the shrine on each side stand the bases of three twisted columns, similar to the well-known ones at that of Edward the Confessor, at Westminster. They were probably added a century or two subsequently, to support the reliquary cover, perhaps carrying enclosing gratings of wrought iron, as on Duke Humphrey's tomb opposite. As in Cantilupe's shrine there are perplexing traces of many hands at work in construction, alteration, and ornamentation, each complicating the problem of the date of this beautiful and very elaborate shrine. As a whole, this of St. Alban cannot be attributed to a later period than the opening year of the 14th century. We have documentary proofs of successive erections, including that of Abbot John de Marinis (1362-8), which would fit in with Sir Gilbert Scott's theory that it was erected in the latter year. Possibly, however, Abbot John simply completed and further ornamented the shrine built by Abbot Simon some 20 or 30 years previously.

I have not yet seen a good representation of the Alban shrine. It would be very interesting to possess in the same volume of the BUILDING NEWS illustrations of these remarkable shrines to Thomas of Cantilupe and Alban, which I have endeavoured to show are of nearly contemporaneous workmanship, and are almost the only English specimens of such structures. Perhaps some of your occasional artist contributors will take the hint of a fresh subject for the sketcher, and devote a few leisure hours to measuring and sketching the details of the fabric (by far the most interesting feature of the newly-erected cathedral), and you, Sir, may be disposed to give space for their reproduction in your photo-lithographic pages.*—I am, &c.,

E. W. P.

October 10th, 1877.

* Willingly.—Ed. B. N.

Intercommunication.

QUESTIONS.

[5145].—Hospital Chapel.—How should the seats be arranged—facing one another or facing east? And in a small chapel where there would be no choir seats what provision should be made for the officiating clergyman? Would either a pulpit or a lectern be required, or would it be sufficient to have, say, a prayer desk on each side?—F. J. C.

[5146].—Sending Drawings by Post.—Would any of your readers oblige me with a good method of sending unmounted drawings through the post, otherwise than with a wooden roller?—B. N. D. C.

[5147].—Translation of Term "Quantity Surveyor" into French.—Will you kindly inform me of—either in your "Answers to Correspondents" or obtain for me through your columns of "Intercommunication"—the best translation in French and German of the term "quantity surveyor?" I cannot obtain any information from any of the dictionaries I have consulted.—FRANCO-GERMAN.

[5148].—Measuring Winders.—Will some correspondent kindly explain the mode of measuring winders in a dog-legged staircase?—B. W.

[5149].—Plans for the Laying-out of New Streets.—A and B are the owners of two adjoining fields of building land, each desirous to lay out new streets, and to sell his land for building purposes. A has got good frontages on two sides of his field to two public thoroughfares or highways, but B has only one end of his field open, being blocked in on the remaining sides by land belonging to A and others; and not being on good terms with each other, A naturally refuses to allow B to have through communication with his intended streets, unless the latter pays him compensation, which B refuses to do; but he submits plans and sections to the local authorities of several intended streets having no connections or through communications with any others, and are what are termed "cul-de-sac" streets, which are very objectionable at all times, and if allowed to be built upon in this form, will for ever spoil that part of the town. Have the local authorities any power or control over adjoining landowners to compel them to lay out new streets with some degree of uniformity, and communicating with each other? 2nd. Can the local authorities refuse to pass plans of "cul-de-sac" streets if, in all other respects, the owner complies with the local bye-laws, and if so, what section of the Act gives such power? 3rd. Can any cases be given touching upon this?—ANXIETY.

[5150].—Stain for Pitch-Pine Dado.—What stain is the best for a pitch-pine panelled dado, that will do without varnishing, and bear washing?—D. W.

REPLIES.

[5110].—Separating Fine Sand from Water.—If "K. Y. Z." will call at the Floating Swimming Baths, Charing-cross, I can show him in operation a machine perfectly adapted for his wants. The apparatus is used to filter muddy Thames water, which would clog up any ordinary filter in the way he describes the sand does the charcoal and felt.—W. SMITH, Superintendent F. S. B., Charing-cross.

[5127].—Flooring.—With respect to your correspondent's question as to the best method of "tongueing" wooden flooring-boards, whether with wood tongues or iron, I beg to give him a sketch showing a new system which I have largely used during the past three years in Nottingham, in the construction of lace and bosetry factories—viz., by rebating both boards at the lower edges, and filling up the rebates by a wooden tongue, thus: The advantages are these: 1. Several more years' endurance is obtained, as the wear and tear does not work down to the tongue so rapidly as when the tongue is in the middle of the floor-board. 2. The boards are

much more rapidly laid. 3. A wood tongue is cheaper than an iron one, and beds to the floor-board better than iron. With respect to flooring generally it may be useful to the younger members of the profession to know that the narrower the board the better the flooring will be, as there is much less shrinkage. I very seldom now use boards more than 3 1/2 in. to 4 1/2 in. wide, and have seen them used 2 1/2 in. wide for skating rinks, &c. If the flooring is for a factory the boards are better without planing, but may be simply mill-sawn, as this will save a couple of years' wear; but if for a warehouse, they should be wrought. Of course the rebating necessary for the system here advocated, and the requisite tongues, can be worked by steam machinery.—S. DUTTON WALKER, F.S.A., Architect, Nottingham.

[5142].—Covering a Semi-circular Roof with Tiles.—If "P." applies at the Gillingham Pottery, Dorset, he will obtain information as to the tiles he asks about.—T. P. LILLY.

Our Office Table.

So many goods are now sent into London, coloured by various processes, to imitate the real Staffordshire paving blocks and tiles, that builders and others need to exercise considerable care in selecting. We have recently examined specimens of the blocks manufactured by Mr. Joseph Hamblet, of West Bromwich, which are some of the strongest, cleanest-looking, and most durable of their kind we have ever handled. The chequered paving is especially for footpaths, yards, railway platforms, and similar positions, affording a good foothold, and being easy to clean and impossible to wear out. The plain blocks are suitable for the same purposes, and will also do well for cottage floors. The stable paving, which is made in thicker blocks to allow for deep channels for drainage, is especially designed for coach-houses, stables, yards, and crossings, and may also be used with advantage for general agricultural paving purposes. Mr. Hamblet also manufactures building blocks of the same material, which have most satisfactorily stood the severest crushing strains at Kirkaldy's testing works, together with copings, plinths, and cornices, and in fact every kind of brick that is used in building, tunnelling, sewerage, and heavy engineering work. The colour, which is that of the natural clay, is capital, and we are not surprised to learn that the demand for the goods is daily increasing. Mr. Hamblet employs nearly 400 people in their manufacture, and the excellence of his specialities was duly recognised at the Paris Exhibition of 1875, and the Brussels Exhibition of last year, at each of which he took first prizes in the shape of gold and silver medals.

THE October quarterly statement of the Palestine Exploration Fund announces that the survey of the north of Palestine is at length completed. It was commenced by Lieut. Kitchener on the 27th of February, and finished on the 10th of July. In the course of the work 1,000 square miles of country were surveyed; 2,773 names were collected, and 476 ruins were visited and described, some with special plans. All the villages were also described with regard to the number and religion of inhabitants, the remains of ancient buildings, and the nature of the country. The water-supply has also in all cases been specially described. The whole country has been hill-shaded; the altitudes of a great number of points have been obtained by aneroid readings, besides the observed heights: special notes have been taken on the geology, archæology, &c., of the country. The line of levels connecting the Mediterranean and the Sea of Galilee was completed on the 24th March. Photographs have been taken of the more interesting sites.

THE re-survey of the City of Edinburgh, which was commenced in December last by the Ordnance Survey Department, has now been completed, in so far as the outdoor work is concerned. The last survey of the city was made so long ago as the year 1851, and great changes have taken place since then. Some idea of these alterations and additions may be formed from the fact that, whereas in 1851 the population numbered 132,997, and the value of real property was estimated at £657,665, the population now numbers 196,979, and the value of the real property is set down at £1,468,941. The actual extent of ground surveyed at this time measures about three and a half miles from east and west, and four and a half from north to south—that area including the whole of Edinburgh and its suburbs of Grange, Morningside, Newington, &c., as well as Leith, Newhaven, Trinity, and Granton. Lieutenant Kirkwood has had the direction of the staff engaged on the work.

An interesting scheme of interior decoration has recently been carried out, according to the Academy, by Mr. Aldam Heaton, of Bloomsbury-square, for the billiard and smoking-rooms of Mr. Ripley, M.P. for Bradford, residing at Acacia, near that town. The special character of the work arises from the ornaments being always on a gilded gesso or "raising" preparation, which, whether actually raised above its substratum in any appreciable

degree or not, necessarily gives a different texture, and generally a very superior one, to carry the decoration. In the present instance the raising is in the main not above 1-16th in., occasionally, for the salient parts, approaching 3-16ths; a complex design, however, may have several diverse raisings. As in the Italian gesso, the main factor is lime, mixed with oils and adhesive ingredients which produce, when dry, a surface as fine in grain as ivory, and of much the same appearance. The colours used upon the gilding are delicate and transparent, and the smallest amount of pigment becomes at once of value: glazings of one colour over another, lit up by the gilt beneath, increase the effect. In Mr. Heaton's present series a complete frieze goes round each of the two rooms—one of them of foliage, children, animals, and birds. The walls are divided by pilasters of conventional foliage and flowers, and 24 panels contain subjects of boys climbing, hunting, fishing, shooting, swimming, &c., the motive for these being obtained from work by Luini at Milan. The foliations in the pilasters and friezes are from Italian Cinquecento work. The material of the panels is oak, which, of course, will darken with time.

WE have received a clipping from a local paper, describing a visit paid last week by some Liverpool architects and others, to inspect a new ventilator patented by a Mr. Quack, and with the action of which it is stated all the party were delighted. No particulars are given of the ventilator further than that "it is constructed of an iron frame which fulfils the double purpose of a hearth-bearer and ventilator." We trust it may prove to be based on more rational ideas than have inspired many inventions having the same end in view which have challenged public opinion during the last few years.

CHIPS.

A meeting of the Newhaven Harbour Commissioners was held at Lewes on Monday, when the officials of the London, Brighton, and South Coast Railway Company submitted plans for the enlargement and improvement of Newhaven-harbour, and the construction of a large embankment. The cost of the proposed works is estimated at £300,000, which the railway contemplates raising as a separate undertaking.

The Burgh Commissioners of Partick, N.B., have accepted the tender of Mr. Faill for the cleansing of the streets of the burgh, and that of Mr. Nelson for asphaltting contracts.

It had been proposed to repair Crieff parish church, but it is now decided to build a new church close by, and towards this purpose more than £3,000 has been subscribed.

The Ratherglen Town Council have decided to purchase from the Duke of Hamilton a plot of 16 acres of land at White Cawburn, as a cemetery, at a cost of £8,000.

The branch banking premises of the North British Linen Company at Greenock were re-opened on Monday, after extension and improvements executed by Messrs. James Salmon and Co., of Glasgow, from the designs of Mr. James Cardigan.

Cremorne Gardens will no longer disturb the Chelsea Vestry or the Middlesex magistrates. The proprietress is about to convert the property into building sites.

An up-platform approach and inclined covered way, 200ft. in length, and other extensions have just been completed at Romford for the Great Eastern Railway Company, by Mr. W. H. Springer, contractor, of Stratford-by-Bow.

The Airdrie Town Council have accepted plans by Mr. Carswell, of the North British Railway Company, for the widening of the North Bridge.

Conway and Towyn, Carnarvonshire, are about to be severed into the river Conway, according to plans by Mr. J. Farrar, C.E., at an estimated cost of £1,800.

Mr. Howcroft, of Redcar, has been appointed surveyor and inspector of nuisances to the local board of Kirkleatham. There were 63 applications for the appointment.

The Dwygyfyleli Local Board of Health have appointed Mr. J. Farrar, late of Rochdale, engineer for the drainage works about to be carried out at Penmaenmawr.

The five-light east window of the old parish church of Great Yarmouth (St. Nicholas) is about to be filled with stained glass as a memorial. The subjects, 10 in number, will illustrate principal incidents in the life of our Lord.

The Paisley Abbey Parochial Board accepted, on Thursday, tenders for the new poorhouse buildings, which, together with architects' commission and other incidentals, will bring the total outlay to £3,930.

A monument to the memory of the soldiers and sailors of the city of Boston, Mass., who fell during the late Civil War, was unveiled in that city a fortnight since. It is a lofty marble column on a pedestal surmounted with a statue of America, with thirteen stars around her, the star-spangled banner in her left hand, in her right a sword, while at the four corners are statues of a soldier, a sailor, peace, and history. On the panels of the pedestal are appropriate bas-reliefs. Mr. Milmore, sculptor, of Boston, designed the memorial.

The Stranton School Board, county Durham, have requested Mr. Clayton, architect, to prepare plans for a board-room, master's residence, &c., on a site close to the Ward-Jackson Schools.

The death is announced of Mr. Alderman Bradwell, of Cambridge, a well-known builder, who held appointments in that capacity to many of the colleges in that university.

The Glasgow Town Council have accepted the portrait of Mr. Coucillor James Moir, now being painted for the subscribers by Sir Daniel Macnee, P.R.S.A., and will add it to the collection in the Corporation galleries.

A new skating rink at Handsworth was opened on Monday evening. The building, which is 200ft. long, has cost £2,000. Messrs. Davies and Middleton, of Birmingham and Dudley, were the architects; and Mr. C. Corbett, of Lozells, the builder.

The foundation stone of the new Church of St. John the Baptist was laid at Foord, a suburb of Folkestone, on Wednesday week, by the suffragan Bishop of Dover. At present a nave and aisle are to be erected, leaving the proposed chancel, transept, tower, and vestry till a future period. The style is Early English. Mr. Rowland Harcourt is the architect, and Messrs. R. and D. Baker, of Folkestone, are the builders. The contract amounts to £4,000. Messrs. Saunders, builders, have entered into a contract to build 90 artisans' dwellings in the immediate vicinity of the church.

The foundation stone of the new infirmary in connection with the Holborn Union has been laid on the site at Highgate-hill, lying to the west of the Archway-road. The building will accommodate in its wards 625 patients. The contract of Messrs. Freeman and Burt, Grosvenor Wharf, Westminster, was accepted in June last, and the building must be completed in eighteen months from that date. The contract price is £84,000.

A bust of the late Admiral Rous, executed by Mr. Belt, is now on exhibition at the Jockey Club, Newmarket.

The North-Eastern Railway Company have determined to complete the line between Whitby and Lofthouse, and thence to Redcar and Middlesborough. It was commenced six years ago by an independent company, but abandoned after many thousands of pounds had been expended, and the work is in a state of utter neglect. Deep cuttings have fallen in, bridges have given way, embankments have toppled over, and there is scarcely a section of 100 yards of metalling in proper position. Much of the line will be relaid, and in some cases deviations are to be made.

A new reredos has been placed in Swaffham parish church, Norfolk. It is divided into three panels filled in with glass mosaic. The central one has the monogram "I.H.S." in polished white marble, while in either side panel are the wheat and vine, all the backgrounds being gold mosaic. These panels are enclosed in arches of Derbyshire alabaster, with diaper in low relief in the spandrels, and above is a super-altar of polished grey marble. Mr. W. O. Milne, architect, designed the reredos. The carving has been executed by Mr. Earp, of Lambeth, and the mosaic glass decorations by Messrs. Powell and Sons, of Whitefriars. The south porch of the church is being restored by Mr. G. Jeffries from the designs of Mr. R. R. Phipson, of Norwich. Iron gates have been set up by Messrs. Plowright at the outer entrance.

The foundation stone of a new church in Steelhouse-lane, Wolverhampton, was laid on Tuesday week. The church is to be in the form of a parallelogram, and will provide accommodation for 600 adults and 190 children. Messrs. Higham, of Castle-street, are the builders; and Mr. T. Taylor Smith, of London, the architect.

LEGAL INTELLIGENCE.

ANCIENT LIGHTS.—*Dickey v. Pfeil*.—The plaintiff applied, at the Chancery Division, for an injunction to restrain the defendant from proceeding with some buildings in Charles-street, Drury-lane, which obstructed the light coming to plaintiff's houses; and for a mandatory injunction to pull down the new buildings, in so far as they exceeded the height of the old buildings.—Mr. Locock Webb, Q.C., appeared for the plaintiff; Mr. Marten, Q.C., for the defendant.—His Lordship, after hearing the evidence, granted the injunction on the ground that the new buildings would seriously interfere with the rights of the plaintiff.

GAS COMPANY ILLEGALLY CUTTING OFF THE SUPPLY.—*Blake v. the London Gas Company*.—The plaintiff in this case, a painter and gas-fitter, of Walton-street, Chelsea, brought an action before a jury, in the Brompton County Court, to recover damages against the defendants for improperly cutting off his gas and removing the meter.—Mr. McCall, barrister, appeared for the plaintiff, and Mr. Grain was counsel for the defendants.—It appeared from the evidence that the plaintiff had been but a very small customer of the defendants, and on the 9th of July last two of the defendants' servants passed the premises in Walton-street, and discovered that brokers were in possession. Fearful that the meter would be lost or damaged they went in, and without any notice detached it from the pipes and took it away.—On behalf of the plaintiff it was not denied that he was in a very impecunious position, but it was contended that the loss of the gas, under the circumstances, made his affairs worse; also that the Gas Company were bound, under Act of Parliament, to give 24 hours' notice of the removal of a meter.—The jury returned a verdict for the plaintiff for £5.

ANCIENT LIGHTS.—*Lawrence v. the London and North Western Railway*.—This was a claim under the Lands Clauses Consolidation Act, heard before Mr. Under Sheriff Burchell and a Special Jury, at the Sheriff's Court, Red Lion-square, London. The claim was on account of the premises of the claimant, No. 48, Surrey-street, Bishopsgate, being injuriously affected, by reason of the access of light to his windows having been interfered with by works of the company which they were empowered to construct by their special Act of Parliament. The street was made into a *cul de sac* by the Great Eastern Railway Company, and for the depreciation of his lease the claimant had been awarded £250, and he had a sum of £160 by a verdict against the London and North-Western Company. The present claim was for £280 against the London and North-Western, and witnesses were examined on both sides. The rent was £60 a year, and the lease had 10 years to run. The company had offered £50. As usual the evidence of the valuers was very conflicting. The claimant, a news-vender and tobacconist, and his wife, an artificial flower-maker, had resided a long time in the house, and the premises had been damaged by the encroachments of the company. On the part of the claimant the depreciation was from £150 to £200, while on the part of the company, it was only £37 10s.—Mr. Winell was counsel for the claimant; Mr. McIntyre, Q.C., for the company. The jury went to view the property, and the evidence occupied the whole day.—Mr. Under-Sheriff Burchell told the jury that the fact of two other cases of compensation by the claimant for the same premises should not militate against the present claim. He summed up the evidence.—The jury retired, and returned with a verdict for £75.

WATER SUPPLY AND SANITARY MATTERS.

PUBLIC INQUIRY AT SOWERBY-BRIDGE.—On the 3rd inst. Mr. Arnold Taylor, an inspector for the Local Government Board, held an inquiry at the Local Board Office, Sowerby-bridge, relative to an application to the Local Government Board for sanction to borrow £5,000 for public baths, and £2,000 for local board offices, at Sowerby-bridge. Mr. Barstow, the clerk to the board, furnished Mr. Taylor with the information required, and Mr. J. H. Smethurst, C.E., surveyor to the board, gave evidence in support of the same. No objection was taken to the board borrowing the money for the purposes specified. The plans have been prepared by Mr. Smethurst, and the works are being proceeded with.

NOTICE OF REMOVAL.

CHUBB AND SON, LOCK, SAFE, AND IRON DOOR MAKERS,

Have REMOVED their SAFE and LOCK BUSINESS to new and extensive Premises,
123, QUEEN VICTORIA STREET, ST. PAUL'S, E.C.
Illustrated Price Lists gratis and post-free.
Makers to the QUEEN, H.R.H. the PRINCE OF WALES,
and the Bank of England.

Trade News.

WAGES MOVEMENT.

LANCASHIRE.—The operative plasterers of Lancaster have given their employers six months' notice for an advance of wages at the rate of 1d. per hour all the year round. The men are now receiving 7d. per hour in summer, and 7½d. in winter.

LONDON.—Last week a meeting of masons' delegates and representative working men was held at the Cannon-street Hotel to consider the question of the importation of foreign labour into the English market, especially in connection with the strike now in progress among the London masons. It was decided to adopt measures to counteract the influence of the masters, and a resolution expressing a determination to continue the strike was adopted.

MANCHESTER.—The strike of the Manchester joiners still continues. Last week a meeting of the men was held at Whitby-grove. It was stated that many of the German carpenters who had been imported had returned. An opinion was expressed that the employers had made a mistake in refusing to meet the men when requested by the mayor, and that public feeling and the sympathy of trade unionists had entirely turned in favour of the men in consequence.

PERTH.—The Perth plasterers on Monday struck work for an advance of ¾d. per hour, the present wage being 7½d. per hour.

ROTHERSAY.—The masons working at the new parish church, West Bay, Rothersay, have struck work because the walls were being pointed by slaters instead of by masons. As the builder (Mr. Wm. Hunter) has not the contract for the pointing, the matter is beyond his control. All the men engaged on Mr. Hunter's other contracts have also struck work.

WOLVERHAMPTON.—Great opposition to the fifty German carpenters, plasterers, and bricklayers now in Wolverhampton is being shown by the English operatives. About ninety of the latter struck on Monday, and hundreds assembled where some of the Germans were employed.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—ADVT.]

THE BUILDING NEWS.

LONDON, FRIDAY, OCT. 19, 1877.

OLD AND NEW CLASSICISM IN WESTMINSTER.

IN looking over old prints and memorials of London during the past century we are made aware of changes that have completely transformed the metropolis. To take the city of Westminster as the old maps and prints show it to us, as late as the latter half of the eighteenth century, we are lost in a labyrinth of irregular streets and enclosures that have little resemblance to the locality of to-day. Whitehall and its memories teem with interest for the reader of history under the Stuarts, while the process of its transformation from the old Court days of the unfortunate Charles I. to our own is no less interesting to the archaeologist and topographer. It takes us back to the time of Henry VIII. and Elizabeth, and its later associations are well portrayed by Macaulay, who speaks of the Court of Whitehall as a seraglio, where maids of honour "danced voluptuously," and "romped with lords of the bedchamber and captains of the guards," &c. The palace has been so mixed up with the Tudors and Stuarts that we cannot say how much of the old buildings were due to any one monarch. Henry VIII. had a splendid collection of pictures, which was increased by Charles I.; but perhaps one of the indications of his taste for art was the erection of the well-known Holbein Gateway, which was built, by his command, by the celebrated Holbein, and faced with stone of a check pattern. This old gateway may be seen in prints of the seventeenth century, and stood between Whitehall and the Privy Garden in front of the palace on the south side of the present Banqueting Hall of Inigo Jones. It was faced with square stones and flint boulders of two colours, disposed in a tessellated manner. The archway was flanked by octagonal and embattled turrets, the faces of which, between the windows, were adorned with busts by Torregiano or John de Maiano, if we are to accept Mr. Cunningham. Over the archway, according to a drawing by G. Vertue, was an oriel window with royal arms below the sill, and embattled parapet, and above this was a flat four-light transomed window. The gateway was erected in 1546, and was taken down in 1750 to widen the approaches to Westminster, and the glazed bricks and stonework were "sold to repair the high roads." Another remarkable gateway, called the King-street Gateway, demolished in 1723, was also built by Henry VIII., and illustrations of it appeared in the "Vetusta Monumenta." It had a square centre opening and two circular foot archways, enriched by Classical entablature, with Ionic pilasters; the flanking towers were circular, had mullioned windows above the openings, and were carried up and capped by spherical cupolas, the centre part and the main opening being in a hybrid or Elizabethan style, with a four-light window, crowned by a semicircular tympanum and steppings. Maitland describes this gateway as an "ancient piece of building, opening out of the Cock-pit into King-street in the north part of Westminster." It was adorned with roses, queen's arms, &c., and was a singular mixture of the Tudor and Classical features of the time. It is said the Countess of Buckingham, the mother of George Villiers, Duke of Buckingham, lodged in the gateway. Between these two gateways was a square garden, called the Privy Garden, the bowling green and tennis court being on the south side, through which Whitehall thoroughfare now passes—the

only clues of the position of these parts being the fragment called the Banqueting Hall and the Horse Guards. The former of these is the only portion of Inigo Jones's design for the rebuilding of Whitehall Palace that was executed for James I. It is a mere fraction of the palace as we find it shown in old engravings of the original design now at Worcester College, Oxford, which enclosed a central court, and consisted of four fronts, each with an entrance between towers, the whole palace measuring 1,152ft. in length by 872ft. in depth. Horace Walpole has criticised the purity of Inigo Jones's work. The towers he considered more Gothic than Roman, and the circular court meaningless; yet in another place he says the intended palace, if it had been carried out, would have been the "most truly magnificent and beautiful fabric of any of the kind in Europe." It is at least certain that if Inigo Jones's design had been carried out, Whitehall would have presented us with some of the features of Parisian magnificence; we should have possessed a pile of buildings equal to those of the Cour de Louvre.

A view by Maurer, 1753, gives us a faint idea of the locality at that date. Let us imagine ourselves looking down Whitehall from a point a little on the north side of the Banqueting House, in the middle of the roadway. Instead of a fine open thoroughfare before us, as it is now, we see Holbein's gateway standing across the roadway on the other side of that building, while on the right-hand side are two blocks with pediments and cornices, the opposite side, adjoining the Banqueting House, being rows of low shed-like buildings. Fisher's ground plan of the Royal Palace, made in 1680, gives the student a good idea of the higgledy-piggledy arrangements of the palace and its surroundings in the days of the Second Charles. The fragment still remaining, only one-fortieth of Inigo Jones's palatial design, is well known to every visitor of this part of London as the Chapel Royal. It was commenced in 1619. Its painted ceiling, in nine compartments, by Rubens, illustrating allegorical subjects and the apotheosis of James I., the triumph of Peace and the Virtues, was retouched by Cipriani. Rubens was paid at the rate of £10 per yard, or £4,000 for the ceiling. We believe the Chapel Royal, as it is now called (an appellation given it in the reign of George I.), has never been consecrated. Early in the eighteenth century Whitehall Palace was destroyed by fire, and St. James's took its place.

Since these early times Whitehall has considerably changed architecturally. It is true Whitehall-gardens still remain, and show some of the old houses occupied by notabilities, now dingy, and chiefly to be remembered for their associations and eighteenth-century architecture. We may note, in passing, Gwydyr House, now the offices of the Local Government Board; Pembroke House, Montagu House, rebuilt since 1860, from the designs of Mr. Burns, for the Duke of Buccleuch. On the other side of Whitehall still greater changes have been made. The Admiralty, designed by Mr. Ripley, on the site of old Wallingford House, displays a structure whose style is just now popular. The Doric colonnade or screen in front was designed by Robert Adam, and the composition, as a whole, presents some noticeable features, although very few passers-by take the trouble to look at it. A far more popularly-marked edifice is the Horse Guards, a structure built in the middle of the last century by Kent, and, although comparatively simple in its detail, possessing a certain degree of picturesque massing—a quality Kent seems to have been a master in. We pass a small domed structure call York House, added by the Duke of York in 1789; the Treasury,

originally built by Sir John Soane, and re-fronted by Sir Charles Barry in the Corinthian order, till we reach the Foreign Office, the work of Sir Gilbert Scott and Sir M. Digby Wyatt. The latter in its turn replaced a brick building, the old Foreign Office. Taking these edifices from Charing-cross to Parliament-street as indications of the change of architectural style during the last half a century, we can remark a considerable divergence, a gradual resumption of Palladian features. The Foreign Office façades, indeed, must ever be regarded as an Italian dressing-up of a Gothic conception. This rehabilitation in a Classical garb is due to Palmerston, and we owe to this cause a certain indefiniteness about the Whitehall façade. The superposed orders appear to want more coherence and connection—the carving in the spandrels of the lower arcade is redundant, while the basement generally is too florid for a classical composition. These faults we lay not so much to the charge of the author, as to those who forced him to abandon a style in which he had won a well-earned reputation. But the contrast the new façades present to those of Sir Charles Barry, Kent, and Ripley, give us occasion for the remark that Gothicism has played a decided part in the modern revival of Classicism. A man brought up in the school of Gothicism is far less likely to imbibe the true Classical spirit than a Classicist would be to unlearn the restrictions of academic rules, and think in the freer atmosphere of Gothic. It is far better that an architect should "cut his teeth" upon Classic than the Mediæval style. Nowhere in a better degree does the spirit of modern architecture contrast with the old so remarkably as it does in this thoroughfare, and for that reason Whitehall is a school to the Classical student. We have here within a few yards four or five well-marked epochs of the style. There is first the fragment of Inigo Jones, the earliest revivalist of Italian probably in this country—a work acknowledged by all critics to be one of the purest examples of Italian Renaissance we possess; we have next an example of the style of the reign of George II., by Ripley, in the severer Classic which came into vogue nearly a century later; third, the freer and more picturesque grouping of Kent in the Horse Guards; fourth, the florid Italian of Sir Charles Barry's Treasury front; and, lastly, the work of one of our greatest Gothicists. If we compare the first work with the last we perceive as great a difference in the feeling as that to be found between the Palladian and the less formal Classicism of Kent.

THE MECHANICS OF ARCHED IRON ROOFS.

IN modern roofs of large span the old form of tie-beam truss is now being generally superseded by the more elegant and simple wrought-iron rib, by means of which the whole space between the springing of the roof and the vertex can be rendered available without the interference of cross-ties, struts, or braces. These ribs either spring from the outer walls or are supported on pillars at moderate distances apart, from 12ft. to 20ft., and the load of the covering is borne on purlins securely fixed to the main ribs, by which it is ultimately conveyed to the walls or other supports. The load on the ribs is not uniformly distributed, but is concentrated at the points where the purlins are attached to them. The pressure upon the ribs produces a vertical and horizontal thrust upon the supports, and these must be made strong enough to resist both kinds of pressure. As, however, this form of roof does not admit of the introduction of visible ties to counteract the horizontal thrust, this

must be done either by means of buttresses or by ties placed under the floor of the room or building covered by the roof. The mechanics of arched ribs made of wrought iron differ very considerably from those of voussoir arches, as the iron rib is not liable to break up into masses, and is also capable of resisting strains of any kind, whether transverse or longitudinal, compressive or tensile, since the whole is united in one continuous beam.

Attempts have been made by a few writers to explain the mode of investigating the strains and thrust produced in arched ribs, but it will be found that from the nature of the subject any general theory takes too complicated a form to be of much service to the practical builder. The best way to make the matter clear seems to be to take an individual case and proceed to investigate the strains arising from the known forces. By this means a near approximation can be obtained to the various strains produced, and the necessary strength that is required for the rib and its abutments can be determined. We therefore propose in the present article to investigate the thrust and strains arising in an arched rib of given span, section, and loading, the methods adopted being equally applicable to any other similar example.

The case we take is that of a semicircular arched rib (Fig. 1), covering an opening of 50ft. span, the radius of the intrados being 25ft., and that of extrados 26ft., giving a depth of 12in. to the rib itself. Suppose the cross section of the rib to be as represented in Fig. 2, showing a web or vertical plate $\frac{1}{2}$ in. thick and 12in. deep, and two angle-irons $2\frac{1}{2}$ in. \times $2\frac{1}{2}$ in. \times $\frac{1}{2}$ in., rivetted at top and bottom on each side of the web. Let the purlins which carry the load of the covering be fixed to the rib at the points A, C, E, and I, the load w at each of these points being for simplicity taken as a uniform weight of 50 cwt. We find by calculation that the weight, W , of the half-rib, AZ, is 10 cwt., and this weight acts at the centre of gravity, G , of the half-rib on the line, OG , which bisects the angle, AOZ . The position of G will be found most readily if we assume that the centre of gravity of the half-rib coincides with that of a circular arc midway between extrados and intrados, and whose radius is $25\frac{1}{2}$ ft. By using the formula given in treatises on mechanics for the distance of the centre of gravity of any arc from the centre, we find

$$OG = \frac{r \cdot \sin \theta}{\theta} \dots (A).$$

where r is the radius of the arc, and θ is half the angle which the arc subtends at O , measured in the denominator in circular units, and not in degrees. Thus, for a quadrant we have $\theta = \frac{\pi}{4}$, where π is the ratio of circumference to diameter and equals 3.1416, the angle θ being in this case half a right angle, or 45° . Taking $r = 25\frac{1}{2}$, $\sin. 45^\circ = .707$, $\frac{\pi}{4} = .7854$; then we obtain from (A), $OG = 23$ ft.; which determines the point G where the weight $W (= 10$ cwt.) acts.

If the half-rib were standing alone it would be strained by its own weight acting at G , and by the loads at the purlins, which would tend to pull it inwards about its base at L . But as there is another half-rib pressing against it at A , this must produce a horizontal force sufficient to balance these weights, and tending to turn the rib over the other way about the base at Z ; therefore the moments of these several forces taken about Z must be equal. Only half the load w at A will be borne by the half-rib; so that we have for the forces acting on the rib, H the horizontal thrust at A arising from the other half-rib, $\frac{w}{2}$ acting

vertically at A , w the vertical load at C , E , and F , and the weight W of the rib itself acting vertically at G . Taking the moments of all these forces about Z , we can determine the value of H from the equation

$$H \times AO = W \times Zb + \frac{w}{2} \times ZO + w \frac{(Za + Zd + Ze)}{2}$$

$$\text{or } H \times 25\frac{1}{2} = 10 \times 9.7 + 25 \times 26 + 50 \frac{(16.25 + 7.9 + 2.5)}{2}$$

$$= 2077$$

$$\therefore H = \frac{2077}{25\frac{1}{2}} = 81\frac{1}{2} \text{ cwt.}$$

This horizontal thrust at A is communicated through the rib to the abutment at Z , and must in some manner be counterbalanced in order to secure the stability of the structure. The method adopted will depend entirely upon the character of the building which the roof spans; if the ribs rest upon main walls with buttresses, or cross-walls which act as buttresses, the strength to be given to these can be easily calculated according to the height they rise above the ground. But, as it often happens that the ribs are elevated on iron columns whose weight alone is quite insufficient to resist the horizontal thrust, they must be kept from being pushed outwards either by means of cross girders or struts at the top which convey the thrust on to the outer walls, or by horizontal ties at the base of the columns passing under the floor. When iron is used throughout a structure the whole is firmly rivetted and bolted together, so as to form one continuous beam, the thrusts and strains being made to each other. The general impression which a roof of this form conveys to mind is, that there is no horizontal thrust to be resisted, and that the rib acts like a continuous horizontal beam resting on its ends. The practical builder ought, however, always remember that wherever we have an arch, of whatever form or material, we must have some horizontal thrust to contend with, the amount of which depends on the load the arch has to sustain.

Having ascertained the value of the horizontal thrust we can now determine the strain produced at any part of the rib by taking moments of the forces about that part. In order to find whether the given section of the rib is such as to enable it to withstand safely the strains put upon it, we will calculate the moments of the forces about the points B, D, and F, which lie

half-way between the purlins, and then compare these moments with the moment of resistance of the section about its neutral axis.

To determine the strain at B we may suppose the whole rib from B to Z to be rigidly fixed, and the point B to be strained by the moment of the horizontal force

H at A , the moments of the weight $\frac{w}{2}$ at A and of weight $P (= \frac{W}{8})$ of the part

AB acting at its centre. Taking moments of these forces about the middle point of the rib at B , we have

$$\text{Moments of forces about } B = P \times \frac{Bn}{2} +$$

$$\frac{w}{2} \times Bn - H \times An$$

$$= \frac{5}{4} \times 2.4 + 25 \times 4.9 - \frac{81.5}{2}$$

$$= 84\frac{3}{4}$$

the value of W being 10 cwt., and of w 50 cwt. The dimensions Bn and An can be measured by a scale.

For the strain at D , we have first to find the position of g_1 , the centre of gravity of the portion of rib AD . Using the formula (A) we find that when the angle θ is $\frac{3}{8} \pi$ in circular measure, or $16^\circ 53'$, we have

$$Og_1 = \frac{25.5 \times \sin. 16^\circ 53'}{\frac{3}{8} \pi}$$

$$= \frac{25.5 \times .29}{.945} = 25\text{ft. lin.}$$

which shows that g_1 is just at the inner edge of the rib, at which point the weight $Q (= \frac{3}{8} W)$ will act.

We have now to take moments of the horizontal force H acting at A with a lever arm Am , and of the vertical forces $\frac{w}{2}$ at A , w at C , and Q at g_1 .

$$\text{Moments of forces about } D = Q \times DQ + \frac{w}{2} \times Dm + w \times Dp - H \times Am$$

$$= \frac{15}{4} \times 7 + 25 \times 14\frac{1}{4} + 50 \times 4\frac{1}{2} - 81\frac{1}{2} \times 4.3$$

$$= 256.5$$

In the same manner we find the moment of strain at F ; first obtaining the position g of the centre of gravity of the arc AF from the formula (A),

$$Og_2 = \frac{25.5 \times \sin. 28^\circ 8'}{\frac{5}{8} \pi}$$

$$= \frac{25.5 \times .456}{.491} = 24\frac{1}{2}\text{ft.}$$

In this case g_2 lies 6in. within the intrados, on the line Og_2 bisecting the arc AF . The forces which strain the section of the rib at F are, the weight $R (= \frac{5}{8} W)$ acting at g_2 ,

and the same forces which produced the strain on D , as well as the additional weight w acting at E .

$$\text{Moments of forces about } F = R \times FR + \frac{w}{2} \times Fl + w (Fq + Fr) - H \times Al$$

$$= \frac{25}{4} \times 9.6 + 25 \times 21\frac{1}{4} + 50 (11.5 + 3.2) - 81.5 \times 11.3$$

$$= 405$$

We have, therefore, the moments of the strains at the middle points of the sections at B , D , and F , represented by the numbers

$$84\frac{3}{4}, 256\frac{1}{2}, 405;$$

but since the moment of resistance of the beam to fracture at any section is nearly proportional to the square of the depth, it follows that in order to have an equal power of resistance to the strains at all three of these points, the depth of the rib at B , D ,

and F, must be proportional to the square root of the moments of the strains; that is, depth at B : depth at D : depth at F
 $\therefore \sqrt{84.75} : \sqrt{256.5} : \sqrt{405}$
 or, $\therefore 9.2 : 16 : 20$. (B)

From this rule we see that the depth at F should be more than double that at B. This result also shows us that the rib of uniform depth which we have assumed is not the one that will afford us the greatest strength with a given weight of metal. It has, however, served our purpose in enabling us to ascertain what the proper proportions of such a beam ought to be.

In order to find what actual depth the rib must have we can calculate the moment of resistance of the section about its neutral axis N (Fig. 2); and we will assume that for safety the metal is not to be strained beyond 100cw. per square inch of section. Putting, then, $S (= 100)$ as the strain per square inch, and I for the moment of inertia of the section about the neutral axis, d being the depth of the section, it is shown in works on the strength of materials that the moment of resistance (M) is

$$M = S \times \frac{I}{\frac{1}{2}d} \dots (C)$$

Now, the moment of inertia of a rectangle about a line through its centre is

$$I = \frac{b.d^3}{12}$$

Consequently, in this case we have
 $I = \frac{1}{12} \{ 5.25 \times 12^3 - 4.5 \times (11.5)^3 - \frac{1}{2} \times 7^3 \} = 168$

Putting this value in the formula (C), we find

$$M = \frac{100 \times 168}{6} = 2,800$$

We are now in a position to compare this moment of resistance (M) with the moments of the strains at B, D, and F. But as these latter were taken with the lengths of the lever arms measured in feet, we must multiply each of them by 12 in order to make the comparison with the moment M , in which all the dimensions are in inches. Moments of strains at

$$B = 12 \times 84.75 = 1,017$$

$$D = 12 \times 256.5 = 3,078$$

$$F = 12 \times 405 = 4,860$$

From this we see that the rib is very nearly of sufficient depth (12in.) at D, since the moment at D is very little more than the value of M ; but the section is too deep at B, and not deep enough at F. If, then, we put the depth at D as 12in. we ought by the rule (B) to have

$$\text{depth at B} = \frac{9.25}{16} \times 12 = 7\text{in.}$$

$$\text{depth at F} = \frac{20}{16} \times 12 = 15\text{in.}$$

The proper line of extrados, therefore, of a rib of uniform strength will be that shown by the dotted line Z A (Fig. 1). The moment of the strains reaches about the maximum at or near the point F, and diminishes from that point downwards until it becomes nothing, or the forces balance each other, near the springing.

By the method here adopted it can readily be ascertained whether any arched rib of which the dimensions have been assumed possesses sufficient strength for the purpose to which it is applied, and the calculations will enable us to modify its form to meet the particular necessities of the case.

In the above example we have taken the most usual form of arched rib, in which the height from the springing is half the span; but it is easy to see that where the height bears a greater ratio than this to the span, the thrust H will be diminished, and where it has a less ratio the horizontal thrust will be increased. In order, therefore, to have the horizontal thrust on the abutments as small as possible it will be advisable to have the height of the crown above the springing as great as possible.

In the foregoing calculations we have taken no account of the pressure of the wind, which will only act on one side of the roof at a time, and therefore produces an unequal strain on the two sides and their abutments. When the roof is in an exposed situation a very considerable addition must be made to the pressures in order to allow for the force of the wind, which will be less upon a round or cylindrical surface than on a flat one.

For a full description and details of several important examples of iron roofs of the arched form our readers are referred to a paper in the "Transactions of the Society of Engineers" for 1866, in which the modes adopted for counteracting the horizontal thrust in the various cases are pointed out, and also a general method is given for approximately investigating the stability of wrought-iron arched ribs. There is also considerable information to be found on the same subject in the article on "Roofs," in Spon's "Dictionary of Engineering."

THE "DICTIONARY OF ARCHITECTURE."*

ANOTHER part towards the completion of this long-looked-for dictionary has been issued by the Architectural Publication Society. Subscribers to the work will be glad to find they have at least reached the letter "P;" and that the committee have assured them that the work is being proceeded with as rapidly as funds will permit. We do not undervalue the immense cost and labour involved in such a work as an encyclopædia, nor the increased difficulty in the production of one devoted specifically to one class of the public, not perhaps the greatest of readers; we can estimate pretty well the difficulty the committee have had in selecting a staff of contributors equal to the ability and labour of research required in such an undertaking, and we can congratulate Mr. Wyatt Papworth and his collaborateurs upon the successful result of past labours; at the same time, these instalments appear at longer intervals than even the patience of the subscribers can justify. In these days of rapid publication, when cyclopædias and dictionaries in almost every branch of knowledge are pouring from the press, it is not too much to ask how it is an architectural dictionary cannot be published at a faster rate? The answer to this is, doubtless, that with the abundance and wealth of material at the command of the compilers, it is difficult to winnow the chaff from the grain, to collate and compare the innumerable authorities on certain subjects, and to obtain sufficient reliable information on others. The architectural profession in England is not rich in students; and though a vast amount of scattered and fragmentary literature exists, it requires a great deal of learning and skill to utilise this material for the purpose of an encyclopædia. Again, although science holds an unprecedented position in our day, its application to architecture has been remarkably slow, there has been a considerable hesitation in applying its methods to architectural practice, and we find, as a rule, that theory and practice are woefully at variance. Partly archæological and artistic, and partly scientific, the position of architectural knowledge is in one of those unsettled and transitional states that the encyclopædist is unable to draw any conclusions, and can only lay before the student the experience and results of his own time. For these reasons a dictionary of architecture is a far more laborious and difficult task than that of an ordinary scientific work of the kind, or, for instance, than that of a dictionary of engineering. The part before us appears to sustain the character of its predeces-

sors. The articles begin with the letters "Maca," and to give our readers some notion of this part, we may say that the dictionary comprises not only the scientific, technical, and æsthetic branches, but the historical, archæological, and biographical portions of the theory and practice of architecture. It may be open to question whether if, instead of covering so many fields, fuller and more exact information of the historical, scientific, technical, and æsthetic portion of the art would not have been more judicious. On the other hand, biographical and historical data are necessarily so interwoven, archæological discovery is so closely connected with topography and biography on the one side, and art-history on the other, that it was difficult to give archæological notices without referring to the writings and labours of separate individuals, and to well-known cities and localities. There were certain advantages, therefore, in making the dictionary comprehensive. We may instance the range of subjects by mentioning the terms of M-Roof, Macadam paving, Macario of Siena, Macerata, a town in Italy, Macdougall disinfectant powder, Mackinnel ventilator, Malachite, Malt-house, Market, Matchboarding, Mathematics, Maze, Message, Monk, Mortuary, Mosaic, New York, Nitrogen, Numismatics, Oratorians, Oven, &c. The most important articles under the letter "M," are one on "Malt-houses," illustrated by plans, and those under the heads of "Mortar," "Mosaic," and "Music-hall." We have also a pretty complete notice of "Naples," with a list of its two hundred churches, a sketch of the life of John Nash, and tolerably complete articles on "Ornament," and "Ornamental Gardening," with copious references. We confess ourselves rather disappointed with the cursory notices given of some important subjects—such as those of Mathematics, Mensuration, and the almost exclusive bibliographic accounts of others. In fact, the notices appear to be all that can be desired by the bibliographer or student in search of original authorities; but less so for those who require a concisely-written digest or abstract of all that is known on any given subject. But we must be reminded that the work is not so much an encyclopædia as a dictionary. When we turn for information to any encyclopædia, such as the "Britannica," we expect to find an epitomised abstract of any required subject, an article more or less condensed and complete, written by an unimpeachable authority, and containing all that is known upon the matter. As a rule, a good encyclopædia should take the place of a library of reference, giving in a concise yet exact form everything important on any particular subject. We can hardly view the "Architectural Dictionary" in this light. It is more of a dictionary giving a definition, and supplying the reader with an index of authorities to which he may refer for further information, and we have no hesitation in saying that we know of few works more complete and exhaustive as a bibliographical authority. Another valuable feature of the Dictionary is, that the student or architect can refer to any particular and special class of structure he may be engaged upon, and in this manner it furnishes him with a *vade mecum* not to be found in any other treatise, and in these subjects we find frequent references have been made to the BUILDING NEWS. Thus, the building of a malt-house has been fully described, and the most usual arrangement has been indicated. We read:—"The most convenient arrangement is to have the steep (or cistern) at one end of the building, and the barley store above it, so that the barley is filled into the steep by means of shoots; the working floors form the centre portion of the building, and at the other end is the drying-kiln, with malt store

* The Dictionary of Architecture. Part XX., M, N, O. London: THOMAS RICHARDS.

adjoining. All malt-houses are constructed to steep at one time some number of quarters of barley divisible by 15, as that number of quarters is considered to be one man's work. Therefore, the house is known as a 15, 45, 60, &c., quarter house, as the case may be." The processes of malting and construction are next entered into, and illustrated by wood engravings—an element, by the way, we find has been rather scantily supplied to illustrate the text. For example, in the article "Man-hole," one or two wood- engravings would have been a desirable addition, and a few illustrations under "Mansard's roof," would have been equally acceptable. Under the head of "Mansfield quarries," we have some useful remarks. Referring to the white Mansfield, it is stated "where hardness is required, the lower and thinner beds, about 2ft. thick, are recommended, and may be cut in lengths of 15ft. or 20ft." The weight per cubic foot is 146lb. 9oz. Our own pages are referred to. Marble is pretty concisely noticed. We find its crushing weight stated at 6,000lb. per square inch, but this is only approximate. The experiments made upon the strength of marble under the inspection of a committee of the Institute are recorded, and will be found of interest. The subject, "Market-house," has been rather summarily dismissed, and the types of old structures described are not complete. The term "Master-mason" (*magister-cementariorum*) is described as one equivalent in the middle ages to that of a builder, designer, or architect, and references are made to Dallaway's "Discourses," 1833, which gives a list of master masons in England from the twelfth to the sixteenth century; Papworth's "Historical Account of Masons;" Didron, and other writers. Under the term, "Materials," a reference is made to an article in the BUILDING NEWS, "Materials and their Decorative Treatment," Vol. for 1871., p. 71. Mathematics and mathematical instruments are rather cursorily dismissed, and the references appear to be imperfect, though some well-known authorities are mentioned under the head of "Measure." Mr. Penrose's "Investigation," 1851, and other works, including our own journal, have been consulted. "Measure and Value" is discussed at some length. "Theoretically," we are told, "measure and value is the most equitable and accurate method of ascertaining the amount due from an employer to a builder or workman for work executed. . . . But, in practice, however advantageous this system may be to the tradesman, it has been found open to serious objection on the part of the employer; thus, until the accounts have been finally made up, the total amount of expenditure cannot be ascertained with certainty." The system of contracts, the writer proceeds to say, finds more favour from employers, who think they thus gain the benefit of competition between builders, and their skill and business capabilities in taking advantage of the markets. The article proceeds:—"Measure and value have been brought into much discredit from having been adopted amongst tradesmen to ascertain the respective values of work done for each other on speculative buildings—a class of work termed 'blood work,' value being charged as by custom, and not with reference to the manner in which the work was executed, whether good, bad, or indifferent, and each tradesman endeavouring to take advantage of the other to the utmost of his ability." It is stated, under the term "Measurer," that a measurer or measuring clerk was formerly one of the architect's staff, and that measuring as an independent system arose about 1800. Since then measuring or quantity surveyors have established themselves, especially since the contract system was adopted. As regards "quantities," if

the building be not proceeded with, the surveyor appointed by or with the concurrence of the client or his architect looks for his remuneration in preparing quantities to the client for whose benefit they have been prepared, it being held that "the providing of quantities being a necessary preliminary to the obtaining of tenders, the architect has by custom authority to employ the surveyor on behalf of the client, although the latter may not have directly authorised such employment." The process of measuring is also referred to in regard to the different practices adopted. The article says:—"The practice of claiming by the profession remuneration for measuring work, distinct from the ordinary commission of 5 per cent., appears to have originated about 1790." Various references are made to this subject. In the article "Memel Timber" our own pages are referred to (1867. p. 899). An interesting article on "Mortar" appears to be exhaustive and well written. The different kinds of mortar are mentioned, including "pargetting," plaster, putty, taras, &c. Various authorities are quoted amongst them Reid, Langley, Higgins, G. Aitchison's experiments, recorded in the BUILDING NEWS, 1871, XXI., 5, Moxon, Donaldson and Glen, Burnell, &c., besides notices of mortar found in old buildings. "Mosaic" has been written on pretty fully. Roman mosaic is divided into four classes, thus:—

Tesselatum Lectile	} Applied to pavements, and mentioned by Vitruvius.
Figlinum Vermiculatum	
	} Usually applied to walls and vaults.

Most of the Mosaics found in England belong to the first class. Wyatt's work on "Geometrical Mosaic" has been largely used in the compilation of this article. We have also notices of the various revived manufactures, such as Salviati's Venetian mosaic, Rust's enamelled mosaics, Mr. Minton Campbell's process, and others. We find, under the term "Ornament," frequent reference to our own pages and illustrations, as in Egyptian, Greek, and Etruscan, Medieval, Japanese, Mexican, and other varieties of ornament. A complete list of works on the different styles of ornament is given, classified according to style and period, which will be found of service to students and others. We take leave of the Dictionary with the hope that it will find a large public, and that, at least, the labours and learning of its editors and those who have contributed to it will be amply rewarded, as the want of an architectural dictionary, worthy of the profession, is daily more felt.

THE YEAR'S BUILDING OPERATIONS IN OXFORD.

IN accordance with a custom of long standing, the *Oxford Journal* gives this week, by way of marking the end of the Long Vacation, an account of the principal alterations and improvements that have been carried out in the University and City of Oxford during the past twelve months, and to that source we are indebted for the condensed report below.

The alterations at the principal quadrangle of Christ Church have been continued until now about three-fourths are completed [the Renaissance parapets and other additions of Wren being replaced by others of Perpendicular character]. New pinnacles and parapet have been placed on the hall, in keeping with the remainder of the quadrangle, and a gable has been placed in the east end. The wooden casing which is placed round the bells is now hidden from sight by the parapet and pinnacles of the new tower [on the north side of the quadrangle], which, it is understood, will be surmounted by a dome. A commodious residence has been made for the treasurer out of the almshouses opposite Christ Church, in St.

Aldate's. The whole of the above work is entrusted to Messrs. Symm and Co., builders, Oxford, who are carrying it out from the plans of Messrs. Bodley and Garner, London. At Merton College the whole of the fellows' quadrangle has been re-roofed with Westmoreland slates by Messrs. Fisher and Hobdell, and the chapel is being redecorated from the designs of Mr. Pollen (one of the fellows) with floriated work in colours. The same firm have substituted Westmoreland for Stonesfield slates at Oriol College, and they are about to erect a house, bar, &c., on the site of the Three Cups Hotel. At All Souls' College Messrs. Symm and Co. have erected a handsome stone paneling on the north wall of the chapel, deeply moulded and carved, to correspond with that on the south wall. Sir Gilbert Scott is the architect. At Keble's College the warden's house has been finished. It is for the present isolated, but will hereafter be connected with a proposed second quadrangle. The dining-hall (127ft. by 35ft.) and the library (86ft. by 35ft.) have been steadily progressing, and will, it is expected, be finished to come into use on St. Mark's Day next year. The western half of the hall, though in an entirely unfinished state, is now used by the college. Its ceiling has been painted, and its permanent floor has been laid during the past four months. Mr. W. Butterfield, of Aldelphi-street, London, is the architect, and Mr. J. H. Newton the clerk of works; Messrs. Parnell, of Rugby, are the builders. At Worcester College the hall has been panelled all round up to the usual height with walnut paneling, the upper panels containing the arms of various fellows and scholars, and the other panels are inlaid with wreaths and ornaments executed in marquetry. A new buffet, carved and inlaid so as to agree with paneling, is placed at the west end, and a carved chimney of statuary and coloured marbles has taken the place of the old one. The ceiling is slightly decorated in distemper colour, with borders round panels in polychrome. The walls are very simply treated in distemper colour. The warming has been rearranged. The work has been done under the superintendence of Mr. W. Burges, of Buckingham-street, Strand. The north side of the college has been reslated with Westmoreland slates, and there has been a restoration of Stonesfield slating in other parts of the college. This work has been carried out by Messrs. Wyatt and Son. The north and south sides and west end of the Bodleian Library are being restored, and a new parapet and pinnacles erected by Messrs. Symm and Co. The floor of the room over the stone-groined ceiling of the Divinity School has been removed, and a new one laid down, and by means of trussed girders the whole of the weight has been transferred from the roof to the walls.—Messrs. Symm and Co. have also executed the following works:—In the Radcliffe Library they have removed the stone floor, and strengthened it by means of concrete, massive brickwork, and iron girders, from the plans of Mr. Alfred Waterhouse, of London. An extensive enlargement of the chemical department is being carried out at the University Museum, from the designs of the architect, Mr. Deane, of Dublin. The addition is above 100ft. in length, in a line with the present front of the museum, with which it is in keeping, and 64ft. in depth. A lecture-room and library are being added to the new observatory in the Parks on the north side, the architect being Mr. Barry, of London. The old parapet at New College is being replaced by another of similar design in Teynton stone. A bay window in University College, facing the High-street, and others in the front quadrangle, have been restored, the hall cleaned and coloured, and new heating apparatus, by Hayden and Son, fixed in it. In connection with the Oriol-street improvements a wall, from the designs of Messrs. Bodley and Garner, is in course of erection. Carfax Church has undergone considerable improvement and restoration. The slates have been taken off, and replaced with a boarded roof covered with felt, and new heating apparatus has been supplied by Messrs. Hayden and Son. The new Wesleyan chapel*, in New-inn-hall-street, is making good progress at the hands of the same

* Illustrated in the BUILDING NEWS, Feb. 18th, 1876.

builders. The edifice, which is being built from Mr. Charles Bell's designs, will be in the Decorated Gothic character, with a spire in the chief front, and will be built of Gibraltar stone. Internally it is 70ft. x 48ft., and 40ft. high, providing for 850 worshippers. The total cost will reach £10,000. By the same firm was erected the new chapel of St. Edmund's School, Summertown, from the designs of Mr. Wilkinson, the style being Early English. The chapel is 94ft. x 26ft. 6in., and 50ft. high to ridge. There is a clock tower rising to a height of 113ft., and the whole being of stone, forms a prominent feature in the landscape. At St. Clement's Church Messrs. Symm and Co. have removed the organ gallery from the west end, the instrument being re-erected in the east end of the south aisle.—A much-needed improvement is being carried out at the Sheldonian Theatre in the substitution of a new and powerful organ for that which has occupied the gallery for so many years. The maker of the new instrument is Mr. Willis, of London, and a finely-carved case, from the designs of Mr. Jackson, is being erected by Messrs. Farmer and Brindley, of Westminster-bridge-road.—The new buildings undertaken at Balliol College were finished a few months since, and include, besides twenty-two sets of rooms, a new hall 90ft. x 20ft., kitchen, buttery, common-room, laboratory, and lecture-room; the old hall is being converted into a library. The laying out of the foundations for the new University Examination Schools,* to be erected from Mr. Jackson's designs, has been commenced. They will consist of a quadrangle open on the front side towards the east. On the ground floor will be nine *viâ voce* schools, and three large writing schools and two *viâ voce* schools occupy the first floor. The building will be heated on Messrs. Hayden's principle. Messrs. Fisher and Hobdell have erected a laboratory, class-room, and microscopic room at the botanic gardens on the right-hand side of the entrance gateway. The interior of St. Thomas's Church has been cleansed and repainted, and the seats re-varnished, the works being carried out under the direction of the senior churchwarden. The new children's wards and fever blocks of the Radcliffe Infirmary, formally opened by Prince Leopold in June, were built from the designs of Mr. A. W. Blomfield, of London—the former by Mr. George Castle and the latter by Messrs. Wyatt and Son. The last-mentioned firm are now erecting a presbytery three stories in height, adjacent to the new Roman Catholic Church in St. Giles's, and amongst other works executed by the same firm are the restoration of stonework at Jesus' College and at Brasenose, where the old hall is being decorated for use as an undergraduates' library, and two more sets of rooms are being added; and internal and external repairs to St. John's, Queen's, Pembroke, and Trinity Colleges. The Armoury in the New-road is being rearranged for the county police from the designs of Mr. Tollit. A new Liberal Hall has been erected in New-inn Hall-street, containing, on the first floor, a room 55ft. square and 20ft. high, and seated for 300. Mr. T. Selby, of Oxford, is the builder, and Mr. F. Codd the architect and superintendent. A new Conservative Hall is on the point of completion at the rear of the Plough and Anchor, Great Clarendon-street. The dimensions are 60ft. by 26ft., with a height of 20ft. to ridge. The roof is open-timbered, with light iron rods; the walls are of white bricks, with diamond patterns in red bricks, and the floor is of wood. Mr. Selby also built this hall, and has effected considerable alterations and extensions in the licensed house itself. During the vacation both the Great Western and London and North-Western stations have been improved and renovated.

During the past twelve months important progress has been made with the main drainage. The outfall sewer has been finished, as have also the difficult works of carrying the iron tubes underneath the river bed at Osney and at Saunders Bridge, the last-named being the link required to connect the district of New Hincksey with the drainage on the Oxfordshire side of the valley. The whole of the remaining street sewers, the crossing in St. Aldate's, under

Trill Mill-stream, and the canal from the same to the site of the pumping station at Littlemore, have been completed. Nearly all the land for the intended sewage irrigation farm has been purchased, and the rising main between it and the pumping station, a mile and a half in length, consisting of 2½ft. iron pipes, has been laid. The contract for the building of the pumping station has been let to Mr. T. Jones, of Oxford, and the excavations are in progress. The contract for the engines, boilers, and pumps has been taken by the Northmore Foundry Company, Oldham. The Local Board of Health having determined to take the sewage from Oxford and dispose of it at the pumping station, pending the erection of the permanent pumping power and the preparation of the sewage farm, temporary pumping buildings and machinery were erected early this year. The sewage is lifted at an average rate of 24,000 gallons per minute into a brick tank, from whence it flows by pipes laid underground and along the bed of the river into the latter at midchannel, near the railway bridge at Ilfley. The reservoir at Headington-hill, in connection with the waterworks, was opened on the 29th ult. (see p. 348, ante). The principal street improvement has been the new road connecting the south with the north of Oxford, *viâ* Holywell; this has been carried out by Messrs. Fisher and Hobdell, the next most important being that just completed in St. Ebbe's-street. Extensive progress has been made in the laying out of the Hincksey Park estate, the property of Mr. E. W. Harcourt, of Nuneaton Court. The probable cost of the laying out will be about £6,000, and on its completion, twelve months hence, the estate will be divided into plots, on which residences will be erected.

THE PARIS EXHIBITION OF 1878.

WE have received from the hon. secretary to the "Paris Exhibition (1878) Architectural Committee" the following memorandum for the information of architects who may be desirous of exhibiting drawings at the forthcoming International Exhibition in Paris:—

"The Royal Commission for Great Britain have entrusted to the Institute the duty of organising this portion of the Fine Art Section. It has been decided to aim at forming a select collection of works of genuine excellence, rather than a large one including works of moderate or inferior character, in the belief that such a collection will most adequately represent our art as practised in this country at the present day, and will be worthy of the position which English architecture may justly claim before Europe.

"The architects of Great Britain and Ireland are invited to forward such drawings as they may be willing to exhibit as representing their best recent works. These will be received in London at a place in which they will be subsequently arranged, in the month of February, 1878 (due notice of the exact day and place being given hereafter by circular to all intending exhibitors). These contributions will not be publicly exhibited in London. From them the committee will make a careful selection, having regard to the space placed at their disposal and the actual merit of the works.

"Drawings must be framed; frames and margins must be narrow. There will be no space for plans, except key plans to a small scale, which should be included in the same frame as the drawing they illustrate. It is uncertain whether any space can be afforded for models. The regulations require that the works exhibited shall have been executed within the last ten years. Works that have been already publicly exhibited are not excluded, nor are projects for the restoration of ancient buildings.

"The British Commission will undertake the whole responsibility and expense of packing, transmitting to Paris, hanging, exhibiting, and returning to London the selected works. It is expected that a representative selected by the committee will be sent to Paris to superintend the hanging of them. The insurance, and the cost and risk of carriage both ways between the exhibitor's own house and the place of reception in London will rest with exhibitor."

This statement of conditions is signed by the chairman, Mr. Charles Barry, P.R.I.B.A., and

by Mr. T. Roger Smith, to the latter of whom all communications are to be addressed, at the Royal Institute of British Architects, 9, Conduit-street, Hanover-square, London, W., endorsed "Paris Exhibition (1878) Architectural Committee." The works of art admissible are those of French or foreign artists executed since 1st of May, 1867.

BRISTOL CATHEDRAL.

THE restoration of Bristol Cathedral has so far progressed that the new nave will be opened on the 23rd and 24th inst. (Tuesday and Wednesday next). The erection of the nave has been 10 years in progress, and has cost £45,000, in addition to the sum of £13,000 which has been expended since 1860 in the restoration of the choir. The new nave has been erected on the lines laid down by Abbot Knowle in the fourteenth century, the foundations which he began for the nave and north porch, but never built, having been discovered in 1866. The nave (which we illustrated on October 20th last year, when we devoted three pages of photo-lithos to the elevations, section, and plan) is 120ft. long and 68ft. wide, and is divided into six bays. The west front is to be flanked by two steeples, furnished with dwarf lead-covered spires, but the money is not yet forthcoming for these. Mr. Wait, M.P., has, at his own cost, erected the north porch, whence the objectionable figures were removed two years since. With a few trifling alterations the style of the choir has been followed in the lengthening of the structure, a plan unique in this country amongst our cathedrals, and only matched by that of Poitiers, the peculiarities being there is no triforium or clerestory, and that the main building and aisles are of equal height. The flooring is of Remnant and Portland stone and Goodwood tiles arranged in pattern. A local journal states that the view from the new nave has made a most striking alteration in the hitherto dumpy and dwarfed appearance of the choir, the *coup d'œil* being now exceedingly fine. Most of the new windows are filled with memorials of deceased Bristolians in coloured glass. Mr. G. E. Street, R.A., was the architect, and Mr. Booth, of Bedford-street, Covent-garden, W.C., the contractor.

DEAN OF GUILD COURTS.

THESE Scotch courts opened a new session on Thursday, the 11th inst., when the occasion was taken advantage of in several instances, by the Dean, to make a statement as to the work of the past year. At Glasgow Sir James Watson delivered an address, in which he stated that the business of the past year had not been equal to that of either 1876 or 1875, although still very considerable. Linings for property had been passed to the value of £1,564,360, including 851 single apartments, 2,190 houses of two apartments, 643 of three, 131 of four, 84 of five, and 64 of four apartments each; 586 single shops, and 297 double shops. He confidently expected that the business of the coming twelvemonth would not be so extensive as for the past few years, and would not be surprised to see a considerable lull in the building trade. A good many cases of bad and insufficient work had been brought before the court during the year, and they had dealt pretty severely with some of the parties. In one case they obliged a builder to take down his property, and he made himself a bankrupt on the plea that he was not able to rebuild.—At Greenock, Dean of Guild Erskine stated that the prosperity of the burgh was made abundantly evident by the great amount of work that had passed through the hands of the Dean of Guild Court during the year; the total value of new buildings authorised, according to the estimate of the master of works, was £210,500, and the alteration of buildings £12,600, which, when the work of the day had been passed, would show a total addition to the town property of a quarter of a million sterling in value during the past twelve months.

A new organ, built by Messrs. Hill and Son London, at a cost of £266, was opened at Long Sutton parish church, near Somerton, on Wednesday week.

MESSRS. AGNEW'S NEW PREMISES, OLD BOND-STREET.

This drawing shows the front, towards Old Bond-street, of Messrs. Thomas Agnew and Sons' new property. The face has been set back from the building line a little, in order to give a slight prominence to the porch, which conducts through a wood-lined passage to Messrs. Agnew's galleries. This projection of the porch helps to separate the gallery entrance from the adjoining shop, with which it has nothing to do; it is for this reason also that the porch has been raised above the level of the first floor. The site extends from Old Bond-street to Albemarle-street, and on it are raised Messrs. Agnew's galleries, consisting of a large basement, with entrance from Albemarle-street, a saloon for general purposes, two sale-rooms, offices, and an exhibition gallery. Besides this establishment there are two large shops with basements, four sets of chambers in Old Bond-street, and seven in Albemarle-street, with a large studio and flat at the top of the latter. The highest story of Old Bond-street, as here shown, has not been carried up—it was objected to by the shopkeepers opposite. This top story may, perhaps, be added at some future time. With the exception of the top balusters and the balconies this front is carried up in red brickwork of the best kind, every brick rubbed and laid 12 courses to 2ft. 6in. Messrs. Holland and Hannen were the contractors; Messrs. Knox, Finlay, and Smith, carvers; and Mr. Shrivell, ironworker. The whole from the designs, and under the direction, of Messrs. Ed. Salomons and R. Selden Wornum, architects, 21, Whitehall-place.

CHURCH OF ST. PETER, REGENT-SQUARE.

The Church of St. Peter, Regent-square, built soon after the erection of St. Pancras, is one of those edifices the ecclesiastical interior of which is so familiar to the London church-goer. It is a vast space well roofed, certainly well-pewed, and admirably galleried, just the kind of arrangement which, in the dead-alive ages, both in church and art, in this country, at the beginning of the present century, appeared to be the *beau idéal* of the decorous and comfortable Churchman of the period. Still withal, there is a vast amount of good design, and a capital proportion in the building, and it has been the desire of the architect to make the present structure a thoroughly church-like interior, without destroying the characteristics of style; and especially avoiding anything like a "Victorian" Gothic appearance in the renovated interior. First and foremost in the

scheme comes the removal of the enormous galleries, and in a line with the pillars now supporting the same is introduced an arcade of stone, with red Mansfield insertions, caps of Bath stone, and panels in the square shafts of della robbia ware, and terra cotta in alternate bays, surmounted by a cornice inlaid with marbles. The present roof is kept intact between the arcades, the large space of ceiling being relieved by panels of moulded wood and other ornaments; the aisle roof would be carried somewhat lower down. The walls of the present sacarium have been thrown out to the end of the space now existent towards the railings, eastward of the church enclosure, a chancel being thus obtained of 35ft. 6in. in length, by 26ft. breadth, of which 20ft. 6in. of length is gained by the extension. Choir stalls of walnut or oak, a pavement of marble and stone, dwarf screens of stone and marbles, new east window, reredos and wall decorations, complete the usual adornment of the sanctuary. A chancel arch is built from the old walls. The existing vestries for clergy and choir have been retained. At the eastern end of the south aisle is formed a morning chapel, and over north aisle is an organ chamber. A new pulpit and lectern, together with reseating throughout the nave, the floor of which it is proposed to lay in parquetry, complete the sum of details which can be mentioned in this general outline of the restoration scheme in prospect. Mr. Wm. Scott Champion is the architect, and the cost has been estimated at about £5,000 to £6,000.

SCREEN AND STALLS, LAVENHAM CHURCH.

IN the BUILDING NEWS, June 29th last, we published several measured drawings and details of the remarkably fine parish church at Lavenham, Suffolk—the well-known example of Perpendicular work. To-day we give some details of the screen and stall work, drawn by the author of the former plates, Mr. W. Gillbee Scott, who writes:—"The oak screens in this church are very beautiful, but in many cases have suffered greatly from neglect, and worse still, from those antiquarians, who, with itching fingers, pull off a little piece here and a little piece there, till the thing is but a wreck compared with what it once was. All this is, however, stopped now. The church has been carefully restored, and is well looked after. One of the screens has been adapted to its present position, and was not made for it. On this one are traces of colour, principally red and gold. They are drawn exactly as they now exist, nothing having been restored in the drawings." There is also on the plate a drawing of an earlier chancel screen from Northfleet Church, Kent.

PONT DES MOULINS, STRASBOURG.

STANDING on the canal which passes through Strasbourg are the picturesque old half-timber houses represented in the sketch. This is one of the only remaining groups left untouched. Formerly tanneries, these buildings are now used for dwellings and various other purposes. Like most old houses in this part of Germany the roofs span each building, and many contain (as in one instance here shown) several floors in the roof. The accompanying sketch was made in 1875 by Mr. W. West Neve, of 5, Bloomsbury-square, and was in the Royal Academy of the present year.

BUILDING NEWS DESIGNING CLUB.

WE illustrate the best sets of designs received in the competition for a village school, which, the conditions prescribed, was to accommodate 100 children, at a cost, together with master's residence adjoining, not to exceed £1,000. We reviewed the drawings a fortnight since on page 327.

COMPETITIONS.

HALIFAX BOARD SCHOOLS.—At Monday's meeting of the School Board for Halifax the building committee reported that ten sets of plans for the proposed Board School at Haughshaw had been submitted in competition by Halifax architects, and that the committee had instructed Mr. Adams, architect to the Leeds School Board, to examine the drawings and report thereon.

NEW CHURCH OF ST. PHILIP, TRIPPETT, HULL.—By invitation, a limited number of architects recently submitted designs in competition, under motto, for the above church, which is to seat 600 persons. The design marked "Experto Crede" has been selected by the committee as the best, and it is to be carried into execution. Its authors are Messrs. W. Botterill and Son, of Hull, architects.

OXSPRING.—New schools for 120 children and a master's house are about to be erected at Oxspring, near Sheffield. Three designs were sent in in competition, and those by Mr. C. S. Milne have been selected for execution.

PUTNEY.—A new boat and club-house is about to be built at Putney for the Thames Boat-house Company. For the purpose of obtaining designs, a competition was instituted, and seventeen sets of drawings were submitted. The design selected is that by Mr. H. Townley Sugden, architect, of 12, Buckingham-street, Strand. There will be a public exhibition of the competing designs at the club-rooms, Star and Garter Hotel, Putney, on Monday next, from 10 a.m. to 4 p.m. The cost proposed is £1,500, and the premium paid is £25. This sum, however, will merge into the architect's commission in the event of the chosen design being executed.

THE LIEBIG MEMORIAL COMPETITION.—Immediately after the death of Liebig, at the suggestion of the German Chemical Society an International Committee was formed for the purpose of preserving to future generations in a visible form the memory of the great investigator. This committee has now so far advanced in its preparations as to be able to proceed to the accomplishment of this task. The monument is to be erected in the Maximilian-platz in Munich, which is laid out as a garden. More exact information concerning this Place and its surroundings may be obtained on personal or written application from the "Stadtmagistrat," in Munich. The sum of 120,000 marks is allotted to the execution of the memorial. This sum should be able to erect a bronze statue upon a richly-decorated pedestal for the artistic adornment of which Liebig's varied activity affords most appropriate materials. The executive commission offers for the best of the models sent in a prize of 2,000 marks, for the second a prize of 1,500 marks. The award of the prizes depends upon the decision of at least eleven members (who will assemble in Munich) of a jury upon which, at the invitation of the executive commission, eighteen gentlemen have consented to serve, of whom the only Englishman is Sir Benjamin Brodie. The competitors are requested to choose such a scale for their models that the figure, considered as standing upright, should be 40 centimetres in height. The models, which will be publicly exhibited, first in Berlin and then in Munich, must be sent in between the 1st and 15th of June, 1878, addressed to *Kastellan der Königl. Akademie der Kunst, 38, Unter den Linden, Berlin*. The cost of carriage both ways will be borne by the commission. The executive commission reserves the right to erect in Giessen a bronze cast of the memorial executed in Munich.

SCHOOLS OF ART.

WIDNES.—On Monday evening Mr. J. Warrington Wood distributed the prizes to the successful students of the Widnes Science and Art Classes. The report of the committee stated that during the session 116 individual students attended the classes, of whom 81 came up for the Government examination. The following was the result of the examination:—Free-hand drawing, 34 examined, 8 passed; machine construction and drawing, 12 examined, 10 passed; building ditto, 8 examined, 7 passed; theoretical mechanics, 6 examined, 6 passed; mathematics, 14 examined, 11 passed; inorganic chemistry, 23 examined, 18 passed; acoustics, light, and heat, 14 examined, 14 passed.

A new Congregational chapel, at Sibbertoft, was opened on Monday week. Mr. Adkins, of East Farnon, is the builder; the architect being Mr. W. Horton, of Mowsley. The premises are enclosed with palisades, and the building is of red brick, relieved with Bath stone dressings.

BUILDING NEWS DESIGNING CLUB.

REVIEW OF DESIGNS.—NO. XV.

A Conservatory.

IT is somewhat remarkable that so few have entered the list in this subject. We proposed a conservatory attached to a Gothic house partly because it is a problem few architects have satisfactorily mastered, and partly that it was one that left a good deal to the inventive skill of the designer. These reasons have, it would appear, been insurmountable obstacles, and have rather deterred than encouraged competitors. We are sorry for this manifest want of courage and resolution. The designs we have received certainly indicate a praiseworthy attempt to overcome the inertia of commonplace, and we are quite conscious of the difficulties in the way of harmonising a structure like a conservatory with a solid building. "Noah" sends the best sketch from an artistic point of view. One end is finished with a half-hip, with louvres at the top in the vertical part; the other end is supposed to stop against brickwork. The roof is span, with a lantern with pivot-hung lights at the sides for ventilation. There is a brick plinth about 3ft. high all round, except at the doorway at the end; above this is the framing, composed of sill, uprights about 2ft. 3in. in the clear, filled with pivot centre hung lights divided into four panes, with diamond intersections for ornamental glass. Above these runs a transom, the upper lights being subdivided by a centre upright, with metal pivot-hung lights and trefoiled heads, above which is a deep projecting cove of horizontal perforated boarding. We doubt the artistic value of a cove of such proportions, and we certainly cannot justify the manner this cove is formed. We can understand a plaster cove, with sgraffito ornament, but not one made up of boards cut into ornamental notches at the edges. The roof has an iron tie. No plan is sent. "Fleur-de-lis," whose design is only just to hand, sends a conservatory attached to wall at end, in which a French casement is shown. The other end has a projecting porch. The structure stands on a plinth, and is of eight bays, with wooden uprights and transom, but the mode of opening is not shown. The entrance porch is gabled, but on each side of it the roof is hipped back. The upper lights are alternately fixed, and open by quadrant lifts, and pivot ventilators are introduced in the plinth below the flower-stand. Thus the air is admitted, and passes over the hot-water pipes. The roof is framed with wrought iron T-section ribs of pointed form. The gabled end is somewhat fussy, and out of agreement with the flank. We place the design "Nil Desperandum" third. The author shows a plan 20ft. by 12ft. in clear, with a door opening into a drawing-room at one end, and an entrance-porch at the other. The conservatory is only attached at the end, both its sides being free. These are divided into five bays by punshons 6in. by 4in., placed 3ft. 8½in. apart, filled with sashes apparently fixed, having pointed heads. In front of these punshons are detached iron hexagonal pillars, standing on Portland stone bases, which project from a panelled dado of the same material. The stiff folial capitals of the pillars are badly drawn, and are devoid of any design. The conservatory is proposed to be heated by 3in. hot-water pipes, which traverse both sides, and are concealed by grating. A white marble fountain stands in the centre, and a flower-stand of three shelves is placed on one side, and beds on the other, the centre pathway being of best white Portland paving. In elevation the roof is hipped at ends, the centre part being carried up as a ventilator. The ridge and eaves' cresting, finials at ends of hips are flimsy. There is too much of the stereotyped greenhouse ornamentation to please us, and the detail is below par. There are no means of opening the lights indicated, though it is stated the sashes are to be hung on centres. We, however, commend the care evinced in the four sheets of drawing and the figuring of dimensions. "J. W. C.," in circle, shows a plan and elevation only. The doorway is placed in the middle of the side, but we cannot understand the value of the notch-like recesses on each side of doorway, unless it be to give the necessary *raison d'être* for domical roof

over the entrance, which has a pointed half-octagonal-hipped end, with square semi-domes on each side forming wings. The intention of the author is not so clear as it should be from the roof plan, but we imagine he intends to form a span roof, one side having the three domical hips already mentioned; 4in. piping is provided round the interior, with iron shelf for flower-pots, and two rows of stands dividing the plan into three bays. The elevation displays nothing original; the upper finishing of the lights is commonplace, and no detail is furnished showing the construction or mode of opening the lights. "Omega" in circle is a flashily got-up design, with two gables in flank, centre entrance between, chiefly of timber, with a brick filling in between studs in the plinth. The elevation reminds us more of a timbered cottage with gabled fronts than a conservatory. The framing consists of moulded mullions or uprights, a transom with fixed trefoiled lights, open-timbered gables above, and a sloping roof from the house between them. This is apparently fixed, as are the upper lights of gables, and the only lights that open in the upright framing are a range of circular-headed openings just above plinth. Stands for flowers are shown at the ends, and the heating apparatus and pipes are indicated. The author has certainly neglected the details for the elevations, which are over-timbered and wanting in simplicity.

A Mullion Window with Shutters.

We have received several carefully-prepared drawings for this subject, but only one that quite comes up to our anticipations. "Début," to hand just in time to be noticed, exhibits the only ingenious method of shuttering. A groove or hollow is formed between the external mullions, which are flush with the outside wall and the window, and the shutters are made to slide in this space. When open the shutters run behind jambs pierced with narrow openings, with transom and trefoiled heads on each side, forming, with the double-light and traceried window proper, a pleasing combination. The lights are filled with sliding sashes, and the shutters run on grooved wheels, and are each framed into four panels in height, filled in with narrow feather-edged panels. The tracery is of a late Flowing Gothic though Domestic character. "J'Espere" shows a neatly-finished drawing for a two-light mullion window, with enriched and moulded transom, above which is a row of four lights, with trefoiled heads and carving. The whole is enclosed under a pointed label moulding of double flexure. The shutters close the two-light window, and are made to fit in a square in the transom, allowing its outer members to run through. They are made with the ordinary horizontal slips, Venetian-blind pattern, fixed in a frame, and they are hung folding, and fall back into a recess on each side, formed in the masonry of wall, with bolt on the inside. The drawing is carefully executed, and there is a Flemish character in the design. "B.," in two circles, shows a double-light mullion window, divided by transom into four casements; the shutters fold back on the outside into moulded recesses, and are hung with triple-jointed strap hinges, which allow the shutter when opened to throw back over the jamb mouldings, and when shut to fit into a rebate or square close to the outer face of mullions. The shutters are Venetian in kind, but the slips are centre-hung to pivots in frame, and can be made to close or open to any angle. The details are clearly shown, and the casements are of plate-glass in iron frames, with borders of lead lights round. The design of "Mechlin" has a window of four lights, divided by a centre large and two subordinate mullions, with pointed cinquefoiled heads, with casements in ornamental panes opening outwards. The shutters are of oak, hinged with ornamental strap-hinges to the outer jambs, the external flaps being of four upright boards, and each with an inner leaf or back flap of the same width. No recesses are shown. When closed the leaves fit into the outside moulding. The defect of this arrangement is that there is no protection for the shutters, which are thus exposed to rain. "Discere Volo" shows a similar plan for a narrow two-light window, the shutters being framed and braced inside with upright match boarding, hung with

three strap-hinges on each, and folding back against the wall on each side. The fastener consists of a wrought-iron flat bar with hinged joint, with a centre bolt which passes through the sill, and fastened on the inside. We do not like the carved cusped head. "Torpedo's" design has framed shutters filled in with rebated and beaded boarding hung close to the casements and between the stone mullion and jambs. When open they fold over the jambs below moulded cappings. Details are below par.

An Organ Case.

The best design submitted for this is "B." in circle, who shows a pleasing case in three parts or bays, the centre one including the keyboard. This is projected on brackets, but the treatment of corner uprights is a little archaic for the rest of the design. The sides are recessed, and the angles are emphasised by square posts with the tops carved with tracery. A bold cove springs above the keyboard, and supports the centre row of pipes. There is simplicity and correct feeling displayed in the general framework of the case. "Josephus Orangeblossom" is a design of a more elaborate character, rather too pretentious for a small church. The lower portion is panelled, with centre doors hung in two. Above this the centre bay of organ pipes is set back, and is crowned by a flat cusped arch with gables above, but the angles protrude as square angular wings, and are filled with small pipes. The treatment is somewhat tawdry, but the detail shows some education and refinement.

LIST OF SUBJECTS.—XVII.

A. A cottage hospital for a dozen beds, 6 of each sex, with attendant's room, kitchen, and offices, showing means of ventilation, and dead-house, &c.; plans, elevation, and sections. Scale, 8ft. to the inch.

B. An oriel window, in stone, to a private building. Projection, 2ft. 6in.; height of room, 12ft.; plan; elevation, and details; ½in. scale, and ¼ full size.

C. An architect's drawing desk, with drawers, movable flap, and stool, in deal. Length, 4ft. 6in., exclusive of flap. Scale, 2in. to the foot.

A new chureh for the parish of St. Thomas, South Shields, built at a cost of £8,000, to seat 500 persons, was consecrated on Thursday week.

A new Congregational chapel was opened at Aveley, South Essex, on Tuesday week. It has been built from the designs of Mr. J. Sulman, of Furnival's Inn, W.C., and is Gothic in style, of stock bricks. It is 74ft. by 30ft. internally, and is fitted with open benches, stained and varnished, with an open platform pulpit, occupying one end of the chapel. At the rear is a schoolroom, planned for 150 scholars, and measuring 28ft. by 16ft., a minister's room, and vestry. The chapel seats 240 adults, and was built at a cost of £1,000 by Messrs. T. L. Wilson and W. Hook, of Uppminster. The site, in the centre of Aveley-street, was given by Sir T. Barret-Lennard.

A conspicuous site in the borough of Portsmouth has just been purchased by the Roman Catholics from the War Department, as a site for the proposed new cathedral.

It was reported to the Metropolitan Board of Works on Friday, that Mr. Charles Prout had withdrawn his tenders for sewage works, Gray's Inn-road, and New-road, Hammersmith, which were accepted a fortnight previously. The matter was referred to the works committee.

On Tuesday week the memorial stones of a new Primitive Wesleyan chapel were laid at Stretford, Manchester. The chapel will accommodate over 500 persons. It will be erected in the Early English style, of red brick and Yorkshire stone. The schools, which are to be erected in the rear of the chapel, provides accommodation for 70 infants and 360 elder scholars. The cost of the whole is estimated at £5,000. The architect is Mr. A. Morry, Moss Side, and the builder Mr. Gell, of Stretford.

A new church was consecrated at Swainby, near Northallerton, last week. The church seats some 300 people, is built of the native stone, and has been erected in the Early English style, from designs of Mr. T. H. Wyatt, of London. The plan comprises chancel, vestry, organ chamber, nave, and north aisle, with tower surmounted by a broad spire at the north-west corner.

The building for the proposed International Exhibition at Melbourne will cover 10 acres.

New Board schools and residence are about being erected for the united parishes of Lyston and Borley, Essex. Mr. Arthur Grimwood, of Sudbury, is the architect.

THE RESTORATION OF EXETER CATHEDRAL.

THE great work of restoring Exeter Cathedral, under the direction of Sir Gilbert Scott, has now reached its final stage. The work has cost about £40,000. The choir was opened on 29th June, last year. Since that time the nave has been undergoing a somewhat similar renovation, and the work being now almost completed, re-opening services took place yesterday (Thursday) and to-day. We condense a report that recently appeared in the *Western Morning News*:—The nave, as we now have it, was probably designed by Bishop Quivil (1281-1282), though Bishop Grandisson carried out the greater part of the work nearly a century later. Former generations had covered the whole of the stone wall with many washes. All this colouring has now been swept off, and the original surface of the stone exposed. The decayed portions of the Purbeck marble pillars, together with their beautifully moulded bases and caps, have been carefully renewed with the same kind of stone, and now contrast more effectively than ever with the light beerstone and sandstone of the walls and roof. The beautiful vaulted roof has been found to possess elegant moulded ribs of beerstone and freestone, with spandrels consisting of an intermixture of brown Thorverton stone and light freestone. On either side of the west door there are now to be seen remains of extensive frescoes; but they are very much decayed, and the subject is quite undistinguishable. Under the windows of the south aisle some heraldic bearings of a tolerably distinct character have been found; Mr. Robert Dimond, F.S.A., of Exeter, is bestowing his attention upon them. But the most striking piece of fresco "unearthed" is on the wall over the door of the north porch, where a figure of a cherub has come out with remarkable clearness. The walls of this north porch were found quite flush; but on removing the colour-wash, Mr. E. G. S. Luscombe, the son of the builder, found signs of an opening in the east wall, and on proceeding further he discovered a panel on which were some carved figures much mutilated, evidently the remains of an old rood; there is a crucifix as the central object, and standing on either side are the B. V. M. and St. John. On turning out the rubbish which filled the niche over the inside doorway of the same porch, traces were found of what is supposed to have been a Madonna, but the figure itself had entirely gone. The central "boss" of the roof has been found to be beautifully carved with a lamb and flag. There is not very much new work connected with the fabric itself. A south door, in the first bay from the west, has been opened up, and an oak door, with handsome mediæval fittings, corresponding with the original work in the great western door, has been constructed. Near this door has been placed a font, which was made specially to baptise Henrietta, the daughter of King Charles and Queen Marie, who, by a fortuitous circumstance, was born at Exeter in 1644. In this north-west corner of the nave, too, opening up under the first bay, is the chapel of St. Edmund, now known as the consistory court. Under the east window can be seen the remains of the altar slab of the old chapel. The chapel is divided from the nave by an oak screen, the doorway of which has been restored to its original position. After clearing out the incongruous fittings, which a recent but tasteless age had placed there, the remains of a tiled pavement were found under the wooden floor. This pavement has been reproduced, the new tiles being made from the old pattern by Mr. Godwin, of Lugwardine. A new oak door has been made to the famous minstrels' gallery, about the redecoration of which there is a certain amount of controversy. As at present "cleaned" the effect is certainly not so good as its elegant composition would make it capable of. Its redecoration is largely a question of money. The most striking feature, however, of all that is new is the pulpit, erected by subscription, at a cost of £700, in memory of Bishop Patteson. It was designed by Sir Gilbert Scott, and has been exquisitely sculptured by Messrs. Farmer and Brindley, of London, and Mr. Luscombe, of Exeter. It is in the Decorated style, and—with the exception of four Devonshire marble shafts among the

clustered columns of the base—it is composed entirely of yellow Mansfield stone; not a very effective material, especially when seen from any distance, but capable of most delicacy of outline, and light and shade tell well upon a closer inspection. The body of the pulpit consists of three elaborately canopied panels, and three similar niches. In the centre panel there is a representation of friendly natives bringing the body of Bishop Patteson, just after his martyrdom, to the boat, and the panels on either side contain respectively sculptures of the martyrdom of St. Alban, and the departure of Bishop Boniface from Britain to Germany. The niches between the panels contain figures of St. Paul, St. John the Baptist, and St. Stephen, and running round underneath are the words, with carved foliage between, "The noble army of martyrs praise Thee." The deal fittings, generously placed in the nave by Chancellor Harington, were all very well at the time they were given, for the choir fittings were then likewise of deal. But when those in the choir were transformed into magnificently carved stalls, and the screen was pierced, the deal in the nave became very much out of character. Then Chancellor Harington again came forward, and offered to defray the cost of refitting the nave with oak, and to provide a carved oak lectern. All this work is being executed by the contractor, Mr. Luscombe, of St. Sidwell-street, Exeter. A little work, not belonging to the nave, but being carried on at the same time, has been done in the Chapel of St. George (or Speke's Chapel) at the north end of the ambulatory—between the choir and the Lady Chapel. A stained glass window has just been placed here in memory of the late Archdeacon Bartholomew. The chapel is Perpendicular in style, and the window is a small one of five plain lights, the glass in which illustrates the text "Come unto Me, all ye that are weary and heavy laden, and I will give you rest." The work was executed by Messrs. Clayton and Bell, of London. This chapel of St. George should correspond with the chapel of St. Saviour at the opposite end of the ambulatory. They are both of about the same period. That of St. Saviour was in a comparatively good state of preservation, and has since been restored. The remains of a window and of an altar piece similar to those in St. Saviour's have been found in St. George's Chapel, and their restoration is contemplated. A large door occupies the place where there was originally a window with the altar underneath. The chapel of St. Gabriel, on the southern side of the Lady Chapel, has two new stained glass windows—or, at least, as good as new, the old glass, of no particular value, which was taken out of one having been very successfully re-arranged in pattern in the other by Mr. Drake, of Exeter. Messrs. Clayton and Bell have the east window of this chapel in hand, in memory of the late Archdeacon Freeman. The south window of the transept is also filled with stained glass in memory of the late Lord Coleridge; and a window in the eastern bay of the nave is to commemorate a member of the Devon family. Of the total outlay of £40,000, expended on the restoration of the cathedral, about £9,000 has been devoted to the operations in the nave described above.

BRABY'S SELF-ACTING EXHAUST VENTILATOR.

MESSRS. F. BRABY & Co., Limited, have just introduced a new ventilating apparatus, which they assert is superior to any other before the public. The principle, which is said to be the invention of Mr. Anderson, is undoubtedly a good one. The apparatus, which is meant to be attached to the roof externally, consists of a series of vertical pipes—two, four, or more—arranged at equal distances around a centre, and communicating at their lower end with the room or space to be ventilated. Each pipe is divided into two parts by a vertical partition set radially to the central point, around which the tubes are arranged. There are also, besides, four other partitions, each of which is situate midway between two of the pipes. Facing these partitions there are long vertical openings in the pipes for the escape of foul air, and the approach to each opening is guarded by inclines to direct the air in the

course most favourable to its escape, and to prevent the wind blowing into the pipes. The wind, no matter in what direction it blows, will pass between the pipes and the partitions; and just at the points where the space is more contracted, and the current consequently most rapid, there are openings in the pipes, and hence induced currents are set up from the pipes outwards in the same course with the wind currents between the pipes. In no possible situation where the apparatus can be applied will a down draught result. For railway ventilation the ventilator is especially applicable, as it can be so arranged that the draught will always be in one or other of two directions.

We are glad to notice that Messrs. Braby and Co. have sought the aid of a competent designer in preparing patterns of their ventilators. Those submitted to us are an agreeable contrast to the hideous excrescences which too often, at the plea of health, are allowed to offend the eye of all who behold them. Of course, other makers of ventilators, like Messrs. Braby and Co., will make to any design; but the majority of people buy these appliances as they find them, and it is a matter of congratulation that every thing erected or supplied by the makers of this ventilator will be an ornament, and not an eyesore.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

GLASGOW INSTITUTE OF ARCHITECTS.—The tenth annual general meeting of the Institute of Architects was held on Tuesday, Mr. John Honeyman, I.A., vice-president, in the chair. The committee of management for this year were appointed, and afterwards held a meeting, when Mr. John Burnet was re-elected president; Mr. John Honeyman, vice-president; Mr. James Sellars, jun., 266, St. Vincent-street, treasurer; Mr. James Thomson, St. Vincent-street, auditor; and Mr. W. McLean, 157, West George-street, secretary.

THE DORSET NATURAL HISTORY AND ANTI-QUARIAN FIELD CLUB made an excursion into Somersetshire on Tuesday week, Yeovil being the starting point for the day's operations. From thence they proceeded in carriages to the amphitheatre near Ham-hill, locally known as the "Frying-pan." On the top of the promontory Professor Buckman delivered an address, in which he contended that the encampment around them was originally a British one, before the Romans took possession of it and altered it to its present form. That an army was here for some time was certain from the Roman remains abounding in the neighbourhood. Near by was an extra-mural amphitheatre, made during quarrying in the corner of the camp, for the diversion of the army. Its name came from the fact that it was exactly the shape of the short-handled frying-pans and saucepans of the Romans, of which he had dug up specimens near the site. It was smaller than those at Cirencester and Dorchester. On proceeding to Stoke the members were shown over the ancient Chantry, now occupied by a farmer, and afterwards went to Stoke Church, which is in a dilapidated state, except the south transept, recently restored by Mr. J. W. Walters. In the Norman tympanum, over the principal door, is a carving of Sagittarius shooting at Leo, with a nearly-defaced inscription to that effect upon it. From thence the members proceeded to Montacute, where they visited the handsome cruciform church recently restored, and containing some Norman work, the beautiful gate-house of the Priory, and the fine collection of portraits in the Elizabethan mansion that has replaced on a lower site the famous Castle of Robert of Mortmain. Time was not sufficient to allow of a complete examination of these interesting fabrics, nor to more than glance at the quaint half-timbered houses in the main street of Montacute, and the party returned to Yeovil after a long autumn day's excursion.

The negotiations between the town council and gas commissioners of Haverfordwest for the transfer of the gas-works and undertaking to the former body have been completed, and at their meeting last week the town council appointed a committee to carry on the business of the works, and make all necessary orders.

Building Intelligence.

BREADSALL.—During the restoration works now going on in Breadsall Church, near Derby, several antiquarian discoveries have been made, including a "squint," in the south-east angle of the north aisle, the stairs of the roodloft, some stones sculptured with Norman mouldings, and a delicate piece of fifteenth-century sculpture in white alabaster, the subject being the dead Christ upon the knees of the Virgin Mary. This last, the most valuable find, was unfortunately broken by the workman's pick in removing it from beneath the floor of the west gallery; it is about 2ft. 6in. high, finely carved, and as sharply chiselled as when fresh from the sculptor's hands, with some traces of colouring and gilding upon it. The fragments of this very uncommon instance of a Pieta are to be carefully fitted and replaced in the church.

CALTON, N.B.—The memorial stone of the St. Clement's Established church, now being built in Brook-street, Mile End, Calton, near Glasgow, was laid on Saturday by the Lord Dean of Guild. The church is placed at the south end of the site, and occupies 52ft., the rest of the frontage being given to a two-story building, the lower part of which will be occupied as shops, and the upper part as a hall, 38ft. 6in. by 29ft. 6in., for meetings and Sunday-school purposes. This hall is entered by a gallery staircase from the church, and an external stair in the court behind. Externally the nave and aisle arrangement of the church is indicated, and at the north corner of the church the staircase is individualised by a bold corbelled cornice, above which there is to be a timber and slated belfry in two stages, rising in all to a height of 65ft. from the street. On the ground story the centre part of the building has a large deeply-recessed arched doorway, with small lobby windows flanking it; on either side is a gallery door, also deeply recessed, and finished alike with a trifoliated moulding. Above the central door are two slender windows filled with simple geometrical tracery, and in the gable above there is a large wheel window, with plate tracery. Internally the church follows the ordinary nave, and side-aisles' arrangement, with high open-timbered central roof. The buildings are being erected from the designs of Mr. J. K. Dempster, of Bath-street, Glasgow. The contractors are:—Mason work, Mr. Jno. Adam; wright work, Messrs. Allan and Baxter; slaters, Messrs. John M'Quat and Sons; plumbers, Messrs. Jas. Johnston and Sons; and plasterer, Mr. James Kemp. In the course of the proceedings on Saturday, it was mentioned that this is the fifth new church erected within the past ten years in Calton parish.

CHESTERFIELD.—On Wednesday the foundation stone was laid of the Stephenson memorial at Chesterfield. The plans have been prepared by Messrs. Smith and Woodhouse, of Manchester. The style is Gothic, and simple in detail. The buildings are divided into two sections—one comprising the free library, and science and art schools, and the other the public hall and its accessories. In the first section there are, on the ground floor, a reading-room, a library, a lecture-hall, and two classrooms, while on the floor above there are a number of good-sized rooms, fitted with all appliances for science and art teaching. The hall itself is 68ft. long, 47ft. wide, and 36ft. high. Including the gallery, which is continued along three sides, it will give accommodation for 900 people comfortably. In addition to the principal salons, there are a number of committee and ante-rooms. The exterior walls are to be constructed of brick-work, relieved with stone dressings.

CHRISTCHURCH PRIORY.—The Earl of Malmesbury has just placed in the chancel of this church a memorial to the late Countess, executed under his personal supervision by Signor Trentanove. The monument is of Caen stone, the lower part ornamented with carving. Upon it is a recumbent figure of the deceased lady. The likeness is considered to be exceedingly good, but it has not been explained why the Countess, who only died last year, should be represented in the attire of the 16th century.

CLUN.—The parish church of Clun, Hertfordshire, which has been rebuilt, was re-opened last week. Mr. Street, to whom the work was intrusted, has succeeded in preserving much of the old building, but it has been necessary to rebuild the whole of the columns and arches. The modern south aisle has been removed, and an aisle of the same narrow width as the original aisle erected in its place; and this has allowed of the clerestory windows on the south side being restored. The main roof has no less than eighteen arched principal trusses, with tracteries all along above the plates, and quatrefoil wind-braces between the purlins. The east end is quite new. It has an eastern triplet, immediately over which is suspended a fine tester or baldacchino, which existed, covered with whitewash, over the old vestry, and has now at last been restored to its old place. Of utterly decorative work in the church there is but little. The tower, with its low-tiled spire, is remarkable as being connected with the nave only by a small doorway. This has been left almost untouched, as it was the only part of the building which did not urgently require repair. The whole of the works have been executed from the designs of Mr. Street, R.A., by Messrs Fisher and Dyson, of Huddersfield, Mr. Chapelow having acted as clerk of the works under the architect.

EDINBURGH.—Part of the vegetable market at Edinburgh is to be devoted to the purposes of an aquarium, and the necessary works are to be commenced at once under the direction of Mr. T. B. M'Faden, architect. A triangular area has been reserved, which will, in the first instance, be screened off from the market by means of a wooden partition run up between the pillars which support the gallery. A width of about 12 feet of floor space is to be laid off as a promenade, this being carried from end to end of the semicircle, with a height of 11 feet, and roofed so as to present a rustic or grotto-like appearance. Alongside of the promenade, and opposite the mirrors, will be placed the aquarium tanks, eleven in number, each measuring 16 feet in length, by 6 feet wide and as many deep. At the third tank from the south end, a passage will lead from the promenade to the triangular space, now outside the market, but which is to be roofed over, and treated in much the same manner as the promenade itself. Here a central area, 45ft. long by 22ft. wide, will be available for walking about. Table tanks will be placed here and there, and while the north angle, measuring about 40ft. by 20ft., will afford space for a seal pond, the east angle, of rather smaller dimensions, will be turned to account for the exhibition of crocodiles.

EDINBURGH.—Trinity College Church, Edinburgh, was opened on Sunday. Mr. Lessells is the architect of the building, which has cost £10,000, and will seat 900 persons. The church proper is an oblong building. The front elevation shows, in the centre, a gable having its apex surmounted by a cross. Immediately under the cross is a circular cusped window, and below this again a large pointed window. Under it is the principal entrance, being an exact reproduction of the deeply-moulded doorway, with arch of Norman Gothic pattern, which formed a notable ornament of the former church. On the west side of the gable rises a square tower, the windows in the different stories of which are closely copied, as are also the crocketed terminals surrounding the buttresses that support the corners. At a height of 70 feet the tower takes the form of a broached spire, of octagonal section, which is relieved, half way up, with a row of dormer windows, and terminates at the height of 115ft. with a gilt vane and weathercock. The frontage, including the tower and turret, has a width of 62ft., with a height of 70ft. to the cross which crowns the central gable. The walls are 35ft. high, and to the apex of the roof, which is high-pitched and of a single span, the height is about 65ft.

LONDON SCHOOL BOARD.—On Wednesday last the following tenders were accepted by this board:—For a school for 792 children in Stanley-road, Deptford, that of Mr. J. Thompson, of Camberwell-green (£7,940); for one for 592 children in Vittoria-place, Barnsbury, Mr. T. Boyce, Eagle Works, Hackney (£8,169); for enlarging May-street school, Bromley, by

88 places each for boys and girls, Mr. Nightingale, Albert Works, Lambeth (£2,670); and for a school-keeper's house at Hornsey-road schools, Mr. J. Tyeman, Walworth-road (£397). The truant schools committee recommended the acceptance of a tender by Mr. Wilmot, the lowest received, for altering Upton House, Homerton, so as to adapt it for use as a truant school; this was referred to the works committee. For the enlarged school in Park-street, Peckham, £365 11s. was voted for additional furniture and fittings.

MANCHESTER.—A new Conservative club at Longsight, Manchester, was opened last Thursday by Mr. W. Houldsworth and Mr. Birley, M.P. The club buildings contain a reading-room, to be used when required as a concert-room, 54ft. wide and 19ft. high; a billiard-room, 58ft. 6in. long, 33ft. wide, and 24ft. high; card-room, 20ft. long and 16ft. high; and all usual offices, keeper's residence, &c. The building is Gothic, and the main feature of the work is the turret at the angle. The whole is warmed and ventilated in a most satisfactory manner by the apparatus patented by Messrs. Shillito and Shoreland, of Manchester. The architects are Messrs. Smith and Heathcote, Mosley-street, Manchester; and Mr. Thos. Shaw, of Longsight, is the contractor.

PILTON.—The parish church of Pilton was reopened on Tuesday week after restoration. The church consists of a nave and two bays of pointed arches, with an octagonal pillar in the centre, and small columnar responds at the east and west ends, the latter standing upon a stone bench; a small aisle, font and chancel are mostly of 13th century work, with some later (14th century) additions. The works now carried out refer mainly to the nave, aisle, and porch. The whole of the roofs are new, of framed deal, covered with grey slate. The walls have been restored and a new west window inserted, which is a great improvement internally, the great thickness of the wall adding much to the effect. The work has been done by Messrs. Halliday and Sons, under the direction of Mr. James Fowler, of Louth, architect.

RAWDON.—A new convalescent home at Rawdon was opened last week. The building is designed to accommodate 120 persons. The central block is apportioned to entrance and dining halls, conservatory, the culinary department, serving and waiting rooms, and a number of small sitting-rooms. The two wings forming the southern front are divided into sitting-rooms and dormitories for the men, and for the women and children respectively. With the exception of the dining-hall, the building is two stories high. The building is designed after the style of the domestic architecture of the seventeenth century—flat pitched roofs, projecting eaves and corbels, mullioned and transomed windows, being its prominent features. The architects have been Messrs. Andrews and Pepper, Bradford; Mr. F. Haley acting as resident agent and clerk of works.

SALISBURY CATHEDRAL.—A meeting of the Cathedral Restoration Committee was held on Tuesday week, at the Palace, Salisbury. The financial statement showed that for works about executed £1,000 was now owing, and that the following sums were required:—Pavement of nave, £1,000; restoration of north porch, £1,200; to complete Bishop's throne, £300; architect and clerk of works, £360. Other works contemplated were gates to choir aisles, canopies to stalls, organ case and polychromy of organ case, and stained glass for windows. It was stated that the dean and chapter are settling with Messrs. Crossley and Co., of Manchester, for the blowing of the organ by an Otto silent gas engine. The great work of restoration of nave is progressing satisfactorily, and it is hoped that the walls and marble shafting will be finished in August next, and that, provided funds come in for the new pavement, the entire cathedral may be re-opened next Michaelmas.

The Town Council of Leicester decided on Tuesday week, by a majority of 33 to 2, to purchase the waterworks from the present company at 7 per cent. premium, this being 1 per cent. higher than has hitherto been obtained on the shares of the company.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.O.

To OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASKOVÉ EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 90c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—A. L.—Looker-on. — R. P.—D. J. M.—J. T. P.—J. H. B.—C. B. A.—G. G.—E. W. H.—J. P. S.—H. H.—Semper.

H. E. J. (We gave an illustration of the tower of St. Nicholas Church, Newcastle-on-Tyne, March 4, 1870.)—J. M. MURPHY, (Drawing of tower to hand and returned with thanks, unsuitable.)—J. PUGH, R. L. BUILDING NEWS DESIGNING CLUB.—Drawings received: Leizlad, A. L. B., Laborator, J. E. C., A. L. B., J. Wilson. (They teach architectural drawing at the "Architectural Museum," Westminster.)

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published October 19 contains articles on Habitual Female Drunkards, The Philosophy of Play, Sanitary Law, The Mechanics of Ventilation, Missing Links in the Sanitary Administrative Service, The Consumption of Smoke, Braby's Self-acting Exhaust Ventilator, House Drainage Regulations, Birmingham Association of Medical Officers of Health, Dr. Deville and the Harrogate Commissioners, Aston School Regulations for Prevention of Infectious Diseases, Public Health Reports, Legal Intelligence, Water Supply, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c., &c. Price Two-pence. Annual Subscription, Post-free, Eleven Shillings. 31, Tavistock-street, Covent-garden, W.C.

Correspondence.

SHARP PRACTICE.

To the Editor of the BUILDING NEWS.

SIR,—Although the writer of "Sharp Practice" (Mr. Keith D. Young, in your last issue) shields himself by not openly informing your readers of the particular criticism he is referring to, it is evident, from one of the circumstances mentioned, to which competition he is referring. It is also clear that Mr. Young is an interested party. But Mr. Young does not content himself with exposing what he considers to have been a trick by one of the competitors, but charges the writer of the critique with complicity in regard to "A.'s" design. He says the critique "contains almost unqualified praise of 'A.'s' design, whilst the other drawings are disposed of summarily, or merely described." Now, this charge would be unworthy of notice were it not that the writer places himself in the position of an independent critic, and talks about a state of things little calculated to raise a much-abused profession. But your readers, by referring to the article mentioned (page 221 *ante*) will be able to judge for themselves of the correctness of this assertion. Neither "A.'s" design nor any other design has had praise bestowed upon it, as I considered that there was no one that combined a well-studied hospital plan with an exterior suitable for the locality of Hampstead. Further, your readers will see that every design has had its need of merit given to it. In fact, no one reading the article could conclude the writer had a predilection for any of the designs. If by "A.'s" design the design with

the motto "Hampstead" is meant, it will be noticed that the recommendation is confined mainly to the picturesque style its author has adopted, and that another design is spoken of in equal terms of commendation. As the writer of the critique I may say that I know nothing either personally or indirectly of any of the competitors, and if Mr. Keith Young, or any other of those interested in the selection, thinks they can throw disparagement on a brother professional's work by implying a want of independence in the writer of the article in the BUILDING NEWS, they are for once in their lives sadly mistaken. No one values that quality in criticism higher than

THE WRITER OF THE CRITIQUE.

[After a long experience of journalism we never knew any one put himself more hopelessly and ridiculously in the wrong than Mr. Keith D. Young. On the 2nd of October last he wrote us a letter on this business. After a sentence or two of introduction, he said:—"A gentleman, connected with the professional press, whom I will call 'B,' unless I am misinformed, assisted 'A,' in the preparation of his drawing. 'B,' I am further informed, next proceeds to write a detailed criticism of the drawings for his employers. This criticism appears in due course, and contains almost unqualified praise of 'A.'s' design, whilst the other drawings are either summarily disposed of or merely described." As neither the name of the architect, the name of the supposed draughtsman and critic, nor the name of the professional journal was given, we dropped Mr. Young a note, saying we would publish his letter if he would mention the journal referred to so that it might have an opportunity of vindicating itself. Finding that he was probably misinformed, he withdrew his letter, and wrote another, which we inserted last week, and which has now been answered by the writer of the article, and "A," the architect referred to. Mr. Young appears to have a very low opinion of architects, draughtsmen, and literary critics, and he might make a pretty good critic himself if he understood what he was writing about, exhibited a greater respect for facts, and was less disposed to think ill of others. We will let architects and draughtsmen defend themselves, and if they never meet more formidable opponents than Mr. Young their dreams need never be disturbed. We beg, however, to inform him, and others whom it may concern, that as far as the BUILDING NEWS is in question, we have never yet permitted any writer in our pages to criticise competitive designs who was in any way interested in them. We have in this matter been scrupulously particular. When Mr. Keith D. Young leaves the region of art, and descends into the critical arena again, we trust, for his own peace of mind, that he will take a little more trouble, exercise a little more caution, be less disposed to deal in insinuations which he cannot substantiate, and be a little less distrustful of his neighbour's honesty.—ED. B. N.]

SHARPER PRACTICE.

SIR,—In reply to Mr. Keith D. Young's "friendly" epistle in your issue of the 12th inst., I will try to put him, and all whom it may concern, right in the matter on which his mind appears to be so much exercised and his indignation so righteously aroused.

In the competition to which he refers there were no written or printed instructions of any kind, each competitor being left to get what information he could verbally from the secretary of the institution. As no stipulation about mottoes was ever made to me, I naturally concluded the drawings were to bear their authors' names, and sent mine in duly signed accordingly. On calling to ask if the designs would be exhibited, I was surprised to find them bearing mottoes, and learned, for the first time, that an advertisement had been inserted in a local paper requesting this, but which I had neither seen nor heard anything about. As the committee had not yet seen the designs, I then and there covered up my name with pieces of ordinary note-paper—the only thing available—and wrote thereon a motto. In doing so the address from which the report is dated was overlooked. The perspective does not bear my

initials, the assertion to the contrary being simply untrue. This is the whole story, rather a contrast to Mr. Keith D. Young's "fair and temperate statement of the facts of the case;" but though it disposes at once of his tissue of accusations, I am not so sure it clears him from the "sharp practice" with which he is so anxious to charge me.

There may be two opinions about the wisdom of criticising designs that are still sub judice, but there can be only one about the animus displayed in writing letters such as his while a competition is undecided. If it is not to directly damage the subject of them, then I am at a loss to know what is intended. Indeed, so much is this object seemingly in Mr. Keith D. Young's mind, that he even goes so far as to charge your critic, by imputation, with writing a one-sided article, and me with "endeavouring to injure" my opponents when writing to correct an error in the said article. Thus, through all his letter, runs the base insinuation that the whole proceedings form a premeditated attempt to gain a dishonourable advantage "in a competition ostensibly anonymous!"

"Save us from ourselves!" may be the prayer of every architect who finds one of his professional brethren only too ready, without the slightest inquiry, to charge him with the most contemptible motives, and rush into print to injure him if he possibly can. Does Mr. Keith D. Young think this "a state of things calculated to raise our already much-abused profession in the public esteem?" It is, indeed, "time he should take some steps to set his own house in order," and begin the "reform" he craves for by reforming himself. It seems to me his conduct in this case savours of much "sharper practice" than even he, in the "purity" of his heart, has been able to impute to me.—I am, &c.,

THE COMPETITOR WHOM MR. YOUNG DESIGNATES "A."

CONCRETE.

SIR,—In view of the importance of concrete and of its eventual popularity as a material for house construction, it may not be out of place to offer a few comments upon the terms, aggregate and matrix, which are sometimes applied to its solid constituents—the pieces cemented and the cementing medium respectively—so that, if possible, through the agency of your columns, their use or disuse may be determined upon; for, doubtless, many of your readers may and do consider the terms in question somewhat puzzling and singular from having no clear idea of their derivation and meaning.

It may not be generally known that the term aggregate was formerly used in physics to denote either an undivided body formed by the direct union of other smaller bodies of the same sort, without the intervention of any uniting substance, or else it signified an integral homogeneous body as opposed to one that was compound; that is to say, it was used in a sense that implied oneness in constitution and body, and was not applied to masses or heaps of unconnected pieces, or to anything of the kind. The use of the word, however, in this sense is nearly obsolete, but the correct and accepted meaning of aggregate (the substantive) at the present time is a sum, mass, or collection of items of anything whatever. Aggregate is, in fact, an abstract noun, and applies equally to animals and vegetables, mineral, and artificial productions. Does it not seem, therefore, quite at variance with custom to single out a word of such wide and comprehensive range, and attach it by way of significance (to the exclusion of all the incontestable glories of nature and art), simply to broken pottery and drain-pipes, clinkers, brick-bats, gravel, slag, and a few other lowly products of catastrophe or carelessness?

Inappropriate, however, as this term appears to be for the purpose under consideration, it is surpassed in incongruity in the application of the word matrix to the cementing medium of concrete. Matrix or matrice, besides being a term met with in anatomy, in mining, and in dyeing, has been incorporated into the English language as meaning a mould or cavity, in the sense of something which gives form and shape to something else, and it is a word in use amongst moulders, letter-founders, coiners, &c. Now, in concrete it is not the cementing ingre-

ient which imparts shape; on the other hand, it receives or takes a certain form or figure in setting, which is of course dependent upon the configuration and disposition of the loose materials that it bonds together. As concrete appliances, however, give definite form to concrete, they may with propriety be called matrices; but there is here, at all events, no authority for employing the word in association with the cementing substance. Again, apart from technical usage, the word matrix denotes a place favourable for the generation of any natural product as, for instance, the earth is said to be the matrix in which seeds germinate; but where is the imagination that an picture lime or cement, when once mixed up in concrete, and bound up for ever with their fast friend water, giving nourishment and living energy to any compound, or calling out of their dull and inanimate fixedness the faintest approach to a distinct organism or element? In this sense, therefore, of matrix, there seems a total want of analogy in the employment of the term for the bond of union in concrete, but those who avour its use fancy that there is sufficient agreement between the matrix in mining and the so-called matrix in concrete, to countenance its adoption in a building vocabulary. Prof. Hunt, in Weal's "Dictionary of Terms," says, under the head "Matrix," that it is "that portion of the contents of a mineral lode which holds the metalliferous matter. It may be quartz or carbonate of lime, or any other such substance. It is sometimes used in the sense of being the original (the parent) from which the mineral ore has been produced. Schorl is a lode is spoken of by many miners as the matrix, or the mother of tin." Also, in the same book, vein-stuff is described as "the non-metalliferous matter found in a vein or lode, or, more strictly speaking, the matter which is no use to the miner. Veins have been formed by the filling up of cracks or fissures in rocks with metalliferous and non-metalliferous matter, or matter rather which contains no metal the object of extraction to the miner. Such matter is termed vein-stuff, matrix, or gangue." Now, taking a lump of properly prepared concrete, with one of its sides rubbed smooth to show its constitution, and attempting to apply this explanation of matrix to the sample, the first thing that strikes one is that real matrix would make a capital aggregate. Also the term matrix would be seen to be more appropriate to the so-called aggregate than to the cementing substance because if the cement, which is palpably the most valuable, is looked upon as the metalliferous matter, the aggregate becomes the stony matrix in which it lies embedded, whereas if the cement is assumed to be the matrix it is metaphorically worthless. Again, if the concrete is made of chalk or ballast, the so-called cement matrix is enveloped by carbonate of lime or quartz, both of which are common natural matrices; or if the small, but comparatively valuable, quantity of cement is a second time viewed in the light of the most important ingredient, the so-called aggregate must be the matrix, for like the schorl it would contain it. Again, if the cementing medium, which appears in streaks or veins in the concrete, is called matrix because of its resemblance to the filling-up of cracks or fissures in rocks, the mining matrix refers only to the non-metalliferous matter, and not by any means to the whole contents of the vein; and, finally, if the cement is called matrix because it holds the stones or brickbats, like the mineral matrix holds metal, then the natural order is reversed, because in the best concrete the artificial holds the natural product, whilst in nature the natural produce or outcome of the mine holds what, by artifice, becomes useful metal. I know of no sound reason, not even one arising from the chemical composition of concrete, to establish the right of either cement or lime to the title of matrix in the artificial conglomerate from any analogy to the matrix of the mine, and I think enough has been said to show that there are *prima facie* grounds, if not better ones, for giving new general terms to the two distinct descriptions of solid matter which are required to make concrete.

Generally, it is easier to find fault with existing words than to propose fitting equiva-

lents; but in this case the word concrete, if divided into its two syllables, appears to afford all that is desired. If any specific name at all is necessary for the nuclei or particles which the cement agglomerates, none is more simple than the first syllable—con. Not only may it be taken to stand for congeries in the congeries of pieces now called an aggregate, but, having regard to the peculiar force of the inseparable preposition *con* in Latin, which in composition often signifies together, it might by fair license be made a new word, used separately as a noun, and adopted as the name of the non-cementing fragments that are to be cemented together. The second syllable, crete, is manifestly just the word for the uniting substance, or so-called matrix. The name creta was in ancient times given to chalk, and certain kinds of clay, and when it is considered that the vast strata of chalk consist for the most part of soft earthy limestone, or carbonate of lime, that lime is the basis of all cements, and that Portland cement is manufactured from chalk and clay, it will, I presume, be considered that creta altered to crete furnishes an elementary and peculiarly suggestive appellative in lieu of the scarcely applicable matrix in concrete. But this of course is merely a proposition.—I am, &c.,

W. J. CHRISTY.

40, Green-road, Southsea.

THE PRINT ROOM OF THE BRITISH MUSEUM.

SIR,—I trust you will allow one who has used the print-room, British Museum, for nearly thirty years, and constantly worked there for about ten years, to say, in the least mistakeable way, that the assertions contained in your notice (No. 1,188, pp. 350-1) of this department of the museum, to the effect that it is inaccessible to students, "only to be enjoyed by officials and their favourites," the treasures being "imprisoned" and so on, are simply unfounded in facts, or anything approaching to facts.

The fact is that which any person may prove, that by the unvarying courtesy of the officials in carrying out their instructions, and those instructions themselves, the print-room, and those treasures which are even more precious than you describe them to be, are constantly available, and readily accessible to any one who chooses to apply for admission to inspect them; if for a temporary occasion immediately, and if for lengthened and often-repeated visits, on obtaining a student's ticket, of exactly the same kind as that which is required for the reading-room, the various artistic and scientific collections in the Museum, at the National Gallery, at South Kensington, the India Museum, at Kew, and, in short, at every other public collection of works of art, books, and the like materials for study and research.—I am, &c.,

F. G. STEPHENS.

Oct. 15, 1877.

THE MASONS' STRIKE.

SIR,—So much misunderstanding appears to prevail on the part of architects and their clients as to the circumstances of this dispute that I beg the favour of being allowed through your columns to repeat what, no doubt, to many of your readers, will be rather stale. Several master builders have received letters from architects to the following effect—"The masons are but a small body as compared to other building artisans, and it would be much better to accede to their demands than to stop so many important buildings." But in thus writing it seems to be forgotten that the masons made two demands—one for a reduction in the hours of labour, and another for a uniform rise of wages to 10d. per hour instead of 9d. It is obvious, and indeed generally admitted, that these changes could not have been confined to masons, who, of necessity, must work the same hours as bricklayers, &c., and it was distinctly avowed that if the masons obtained a rise of wage the carpenters were prepared immediately to strike for the same. The question, therefore, before the masters was a general reduction in the hours of labour and an increase of 12½ per cent. in wages throughout the trade.

The masons' union sent a deputation to the master builders to talk over the matter in dispute, but the discussion turned very much on the rules and practices of the masons' union. The masters stated that there is a great difference in the skill and ability of masons, that many of them, if unrestricted by their own rules, could easily earn 10d., 11d., or even 1s. per hour, whilst other masons were so unskilful or idle that they were not worth half. What was the answer of the union men? "Our principle is that the strong must support the weak," or, in other words, that the skilful and intelligent man must eke out his time so as not to surpass the most unskilful man on the same work. And this principle has for some time past been most assiduously carried out, so that the cost of mason's labour has been brought to such a pitch as to defy all calculation of the most experienced estimators. I need hardly say that if such foolish, arbitrary, and immoral principles were made a part of the law of the land a revolution would ensue.

During the last few days symptoms appear to show that many masons are dissatisfied. Two or three men at a time have been taken on at various jobs, and it is stated that the strike fund is very much lowered, while the demands on the same are very much on the increase, and that within the next week or two the strike may be at an end. There are vast numbers of masons unemployed in America, and it is only a question of cost as to getting them over. The masters have also letters from different parts of Germany from piecemaster masons, who offer to bring over men, and execute stonework by contract, and in one way or other the master builders hope to bring about a reform of a system of rules which they believe to be a disgrace to the intelligence of the age, and at the same time to defeat demands which they know to be only a beginning of demands for a still further reduction in hours of labour, and a much larger increase in wages than is now sought to be enforced.—I am, &c.,

A MASTER BUILDER.

THE KENSINGTON VESTRY HALL COMPETITION.

SIR,—It has come to my knowledge on good authority that in the late Kensington Vestry Hall competition a most important *sine qua non* was omitted in the instructions given to competing architects—namely, that the grand hall should be placed on the ground floor, and I am informed that all those plans showing this hall on the upper floor (where it is placed in the best modern vestry halls) were at once without further examination, and, irrespective of all other merit, thrown out of the competition.

I ask was it fair or even honest that the members of an honourable profession should be asked to expend their time and money on a venture where the plans would not have a chance of being even looked at, and this owing to a culpable omission in the instructions given to them?

Every one may not be aware of the great cost incurred in the preparation of designs for such a purpose, and for the information of the uninitiated I can say that I know of one architect who spent no less than £100 on this competition; therefore I argue that it is unfair that the instructions for the guidance of competitors were not more full and complete.

I would also ask if it is true that the architect selected by the arbitrator, Mr. Whichcote, as being the best, was shelved with the paltry sum of £30, in favour of the three other prize-holders, one of whom, I am led to believe, was the son of a vestryman, and another associated in the work with the surveyor to the vestry board. I vouch for the truth of none of these statements. I simply ask, through the medium of your columns, are they true?—I am, &c.,

F.R.I.B.A.

The Local Board of Frome have agreed to pay Lord Cork £1,000 for 2½ acres of ground for a reservoir and well-boring; should the experimental well fail, no liability will be incurred by the board, except to make the ground good.

It is proposed, at Greenock, to build, by public subscription, a school and laboratory for scientific and art instruction.

The Prussian Government has resolved to expend fifteen million marks (about £760,000) in the improvement and enlargement of the port of Pillau—an undertaking which will add greatly to the commercial importance of Königsberg.

The organ of Lyme Regis parish church was reopened on Sunday, after repair and enlargement, by Mr. Vowles, of Bristol.

Intercommunication.

QUESTIONS.

[5151].—Registration of Plans.—If I make a plan of a township, or parish, or local board district from actual survey or other sources, and register it at Stationers' Hall, how far does it protect my plan, and if any one copies it on the same or another scale and publishes it for sale, what is my remedy, and how do I proceed? Is the registration really a protection?—BUCHANAN, Yorkshire.

[5152].—Plaster of Paris.—Can any of your readers inform us of a mixture which will dissolve or render soluble plaster of Paris after it has once become set? Any information on the subject will be esteemed by—E. B. B.

[5153].—Damp Ceiling.—To my house I have under the garden a cellar, which is covered with what are known as rag landings; on the top of part of these there is a flagged path, the remainder being gardened. In wet weather this ceiling is very wet, constantly dropping down. This, I imagine, comes through the joints, though the whole surface of the ceiling is wet. I should be very thankful if some practical person would kindly point out how this might be remedied without very much cost. I may say that I could not do with the path raising.—J. A. C.

[5154].—Ironmongery.—A villa residence, which will cost about £8,000, is being put up from plans by me, and has now reached that stage of progress when the ironmongery for doors and windows needs to be selected. I have a difficulty in this matter, and like all who find themselves at a loss in such matters, I have come soliciting your advice, and trust to have the favour through the well-known channel in your very valuable issue. The woodwork of dining-room, billiard-room, and entrance hall is pitch pine. The drawing-room is furnished with the same wood, but will be painted in light shades, perhaps white enamelled paint with gold relief. The bedrooms will be in pitch pine, and, like the dining-room, varnished and stained. The practice at Glasgow is to use ebony or buffalo with the pine and white china in the drawing-room.—JAMES FERGUSON.

[5155].—Projecting Perspectives.—In the "Intercommunication" column of a previous number (I believe some time last year) some correspondent mentioned that a large perspective might be projected from a small scale plan by projecting the rays backwards. I have thought something on the subject, and cannot quite understand how it is done. In the first place, I presume there is some definite limit decided upon and a line drawn (I should suppose parallel to the plan) for the projected lines to finish at and be carried down. If I am thus far correct I am perplexed how the heights are obtained. Is it by the use of the proportional compasses, setting them at the proportions one plan bears to the other outline, and so setting off the heights, or how? I myself, and no doubt many others, would be greatly obliged if some of your more efficient contributors would fully elucidate the method, as my own impression is that if it can be done, and correctly, it will save much time.—A PERPLEXED STUDENT.

[5156].—Glazed Tiles.—Can any of your readers recommend a good book upon the manufacture of glazed tiles for wall linings, hearths, &c.?—H. L.

[5157].—Slates.—Will any one kindly tell me how to judge between good slates and bad ones, more especially when they are fixed on the roofs?—A. B. C.

[5158].—Castings.—How can I tell a good casting?—A. B. C.

[5159].—Perspective.—What system is generally adopted in placing buildings in perspective? Is it either of those described by Burchett in his "Linear Perspective?" If so, which? I have gone through the above, but do not know which system to adopt, both appearing intricate, and not knowing whether there is some better and simpler method, shall be glad to hear some one's experience. Also, are the perspective sketches of portions of buildings which sometimes appear in this paper—as font, &c., Oct. 5; details of St. Giles's Cathedral, Sept. 7, and others—drawn according to the rules, or sketched by free-hand at place?—STUDENT.

[5160].—Queen Anne.—Could you or any of your readers (through your medium for "Intercommunications") kindly inform me where the best specimens of Queen Anne architecture, in or about London, may be found, as I wish to study the ornament of that style? I should also be very grateful for the titles of the best illustrated works upon the subject.—CARVER.

[5161].—Fixing Lead Lights.—Will some kind being explain the mode of getting in and fixing lead lights in stone frames and mullions? also, at what stage of work are they fixed?—F. K. S.

[5162].—School Grate.—Can any kind reader inform me the best grate I can adopt of an inexpensive character for a schoolroom about 37ft. x 17ft., and its cost and advantages?—CALOR.

[5163].—Testimonials.—Some time ago I was a candidate for the surveyorship of a large town, and my board gave me testimonials for it. If I apply for a similar appointment in another town, would it be legitimate to alter the dates and names, so as to suit the testimonials to the more recent appointment? For instance, suppose Liverpool to be vacant,

and I apply with testimonials addressed to Liverpool, and dated, say, June, 1876, would it be legitimate to use the same testimonial for another town, supposing I was unsuccessful at Liverpool, and address them, say, to Manchester, and date them October, 1877? In short, would it be a forgery to alter dates and name of town?—A. F. G.

REPLIES.

[5140].—Bath Stone.—I have seen so much Bath stone decay that I am very averse to its employment unless the proper quarry-bed can be selected—a point few architects have the time, if they possess the ability, for detection. The only remedy likely to be of any use is to apply several coats of boiled linseed oil to the work after the exfoliated parts have been cleaned off. I have adopted this plan on one or two buildings. Some very good patent liquids are sold—the "Petrifying Liquid," and other silicate paints—particulars of which may be seen on referring to any number of the BUILDING NEWS. These may arrest decay for some years.—G. H. G.

[5147].—Translation of Term "Quantity Surveyor" into French.—Quantity surveyor, verificateur; specification, devis descriptif; quantities, devis estimatif.—E. P. S.

[5149].—Plans for the Laying-out of New Streets.—The local authorities have no powers under public Acts of Parliament to compel adjoining owners to lay out their streets so that they shall be continuous or communicate with each other. (2) The local authorities have no power to disapprove a street terminating in a *cul de sac*.—BOROUGH SURVEYOR.

The plans for the new municipal buildings at Portobello, prepared by Mr. Paterson, Edinburgh, have been approved of by a committee of the town council, and estimates will soon be invited. The new building will consist of two stories in the Scotch baronial style. The cost of the building is not expected to be under £5,000.

The ceremony of laying the foundation stone of a new harbour at Burnmouth was performed on Tuesday. The present extension will cost £9,000, and has been contracted for, for that amount, by the Messrs. Morrison, contractors, Edinburgh. The design is by Messrs. Stephenson, C.E., Edinburgh.

Mr. Raphael Brandon, whose death we recorded in our last, was buried on Monday, at Brompton. 1840 was mentioned as the date of the erection of the Irvingite Church, Gordon-square—it should have been 1850.

A new Congregational church was opened at Leyland, near Preston, Lancashire, on Tuesday. It is a Gothic building, of stone, 52ft. by 39ft., accommodating 500 persons. The principal external feature is a saddle-backed tower. Handsome brick-built schools adjoin. The cost has been about £4,000. The church was built from the designs of Mr. Grant, architect, of Preston, by local contractors.

A Congregational church is being built at Yeovil from plans by Mr. Lewis Banks, of London.

The Local Government Board has sanctioned the borrowing by Baenp Local Board of the sum of £2,500 and £5,500, to be expended in paving and sewerage works, and in street improvements.

Drainage works are being carried out at High-bridge for the Axbridge rural sanitary authority, in accordance with the plans of Mr. Estridge, C.E. Mr. Robert Lee, of Barnham, has been appointed clerk of the works by the committee.

The local board of Hucknall Torkard have accepted the tender of Mr. McPhail, of Newark (the lowest received), for the supply of Yorkshire flagging.

A new Primitive Methodist chapel and school-room are being built at Orich Carr, near Belper, from the designs of Mr. Willis, architect, of Derby. The chapel will be 33ft. by 24ft. within, and will seat 180 persons; the schoolroom will be 25ft. by 24ft., and is planned for 120 scholars and teachers. The entire cost will be about £800.

The Academy states that Prof. Moritz Thausing has acquired for the Albertina Collection at Vienna Michael Angelo's rough sketch for his "Soldiers Surprised Bathing." The sketch is declared to be undoubtedly authentic.

The parish church of Dunnington, Yorks, has been reopened after restoration, at a cost of £1,200, from designs by Mr. C. Hodgson Fowler, Mr. John Brown, of York, was the contractor.

A correspondent of *La Semaine des Constructeurs*, who has been troubled by the condensation of moisture on the inner faces of stone or plastered walls of houses built near large forests or damp places, has overcome the difficulty by interposing between the air and the impermeable wall a permeable substance. This he effected by furring off upon the damp walls with laths, and nailing upon this furring a lining of stout lincu. The wall-paper was pasted upon this; and the walls no longer reek with moisture.

At the annual meeting of the Bingley Mechanics' Institute, on Monday, it was mentioned that two students of the school had taken away both the prizes offered by the Leeds Association of Master Builders for the best designs for a modern town cottage and an ornamental frieze decoration.

Our Office Table.

At the quarterly meeting of the New Town Council, last week, it was stated that new municipal buildings would not be completed before Lady Day if the work went on its present rate. One of the council inquired whose monogram it was that appeared between the county and borough arms over principal entrance. It was stated by the M. that it was the monogram of the architect, Money. The councillor who had made inquiry then declared that the architect overstepped the bounds of common sense, any monograms were carved on the building they should be those of aldermen and councillors, and he thought the architect ought to be censured and ordered to remove objectionable inscription. Nothing definite, however, was resolved upon, and two of members of the council pointed out that it was a customary thing for architects to refer their connection with the buildings they erect by inscribing their monograms thereon.

At the Art Exhibition held at Croydon last week, in connection with the Church Congregational Messrs. Chubb and Son, who have opened St. Paul's-churchyard premises for the sale of this class of work, exhibited, in addition to specimens of ornamental brass and iron work, some cartoons executed in tiles, to which briefly alluded last week. The subjects were copies of the prints issued by the Wesleyan Sunday School Union, illustrating the life of Christ, and their clearness and beauty attracted much attention. They are designed either to be mounted in a frame, or to be built into wall in the ordinary way of tile decoration. Arrangements are being made to produce a series of the cartoons in this form, and as they are reasonable in price, and adapted for a great variety of uses, we think they will prove very popular.

The trustees and judges of the Taylor Scholarship and prizes bequeathed by the Captain G. A. Taylor, for the promotion of art in Ireland, announce that £90 a year will be awarded for two scholarships and one prize for students. These are open to all students of art, male and female, not exceeding 25 years of age, who shall have attended for 12 months at least a school of art in Ireland, or who, being of Irish birth, shall have attended for a period a school of art in Great Britain or elsewhere. The sum is divided into two scholarships of £40, each and one money prize of £10. The exhibition of works of art in competition, therefore, is fixed to be held on Thursday, April 18th, 1878, the subjects being this time for figures "Courage" and for landscape "Eventide." Works may be executed either in oil or water colours, but must conform to stipulated size—3ft. by 2ft. 4in.—and be sent in to the Royal Dublin Society, at Leinster House, in that city, not later than Saturday, April 13th, 1878. The trustees further explain that the prize of £10 is for the best work, without regard to subject, and that this prize can be awarded to either of the works which have gained the £40 scholarship.

The parish church of Langham has been restored at a cost of £2,000, from the designs of Mr. J. Hakewill.

On Saturday afternoon four memorial stones for new chapel and school for the Methodist New Connection Society at Hanging Heaton, near Dewsbury were laid. The new building will be in the Italian style, the school being beneath the chapel. The latter will contain about 350 sittings. The estimated cost of the structure is £2,500.

The corporate seal has been affixed to an agreement between the Limerick Corporation and the United General Gas Light Company, whereby the undertaking and works will be transferred to the former body at a valuation of £26,000. The company shares have been purchased at par, and the transaction is said to have been managed on very favourable terms for the municipality.

A meeting was held at Steynton, Pembrokeshire, on the 4th inst., to consider the desirability of restoring the parish church, which was stated to be in a disgracefully dilapidated state, the walls being in a very imperfect condition. A committee was appointed with power to consult an architect, and should be requested to report on the state of the church.

STATUES, MEMORIALS, &c.

ADAM BLACK.—The colossal bronze statue, 10ft. gh. of Adam Black, cast by Messrs. Cox and Sons, Thames Ditton, from a model by Mr. J. Hutchin-

DAVID LIVINGSTONE.—The bronze statue of the missionary explorer, Dr. Livingstone, has just been successfully cast by Messrs. Cox and Sons, of hames Ditton, from the model by Mr. J. Mossman,

CHIPS.

The rural sanitary authority for Dungarvan, nty Waterford, have adopted plans by Mr. Frazer a water supply for Villierstown.

Premises are being fitted up and altered in Gont-ne, Swansea, for the reception of the free public rary. Mr. David Morgan is the contractor.

The Town Council of Aberavon, Glamorganshire, ve adopted the plans of Mr. Waring, C.E., for air new waterworks.

A vestry meeting was held at St. Michael's, wes, on Thursday, the 11th, for the purpose of ariing the report made by Mr. Philip Currey, chitect, of London, for the improvement of the nrch. Mr. Currey recommended that new seating open benches be provided throughout, with gang-ys in centre and next side walls of church, so as economise bench ends; that a new pulpit in oak, tar rail, gas standards and brackets are necessary, d the choir stalls ought to be rearranged. These tations would cost about £550, and increase the mber of sittings from 231 to 276. Mr. Currey also ge the desirability of removing the unsightly leries which disfigure this ancient church. The eting accepted the report, and appointed a com-tee to assist Mr. Currey in carrying it out. The leries will be removed if the consent of the occu-rs of sittings therein can be obtained.

The Boston Court of Sewers met on Saturday to nsider tenders for the repairs of the sea banks, ich are in a highly dangerous state, it being feared at they would succumb to a heavy gale from the rth-east, when the whole district near Boston uld be inundated. Three tenders were received, ounting, respectively, to £503 3s. 6d., £346 4s., d £291 8s.; the lowest was accepted, and proved e from Mr. John Leverton, of Haven Bank, ningsby. The estimate of the surveyor (Mr. mes Lancaster), who has prepared the contract ns, was £335, exclusive of soil, for which two er tenders were accepted.

A drinking-fountain, which has been erected over e "Bonnie wee well, by the breast of the Brae," out three miles from Paisley, to the memory of uph Macdonald, author and poet, was dedicated on turday. It is a grey granite structure of Roman pe, rising in the form of a little temple, from a sticated base, to a height of 10ft. Below the urn, hich the fountain is surmounted, is a bronze dhalion, showing the profile of the poet, and scribed, "Hugh Macdonald, 1817-1860." Round e water-tap is carved a verse by Macdonald, riptive of the well. Mr. J. Mossman, of Glas-ow, designed and executed this very appropriate mento.

Land has been acquired at Braehead for the pur-ose of a public park for Kilmarnock, by the trus-ees under the late Mr. Kay's will, who will pay the ke of Portland £9,000 for the plot of 41 acres. e Town Council of Kilmarnock have undertaken maintain the area as a public park on condition at they are to be the sole judges of the way and le in which it is to be kept up.

Balby parish church was reopened on Monday by e Archbishop of York, after the addition of a rth aisle, and the erection of a new organ; the ter was built by Messrs. Brindley and Foster, of efield.

The Corporation of Waterford have adjourned the rther consideration of the proposed purchase of e gas-works for a period of twelve months.

The foundation stone of new Roman Catholic ools was laid in East Shaw-street, Greenock, on turday afternoon, by Archbishop Eyre. The ools are being built from designs by Messrs. ram, of Glasgow, and will accommodate nearly 00 scholars.

A grant of £2,000 was made at the Wakefield ichaelmas Quarter Sessions, on Monday, towards e widening of the Engine Bridge at Huddersfield.

The annual meeting of subscribers to the Water-rd School of Design and Art was held on Wed-riday week, when a report was received, stating at the school is in excellent working order, and at the prizes and numerous certificates awarded e students by the Department testify to the icency of the instruction and the industry of the idents. It appears that the school is in need of eater pecuniary support.

A new chancel is about to be added to Orton parish urch, near Peurth. Mr. Bland is the contractor. The Halifax School Board have accepted the rder of Mr. Joshua Wormald, amounting to 200, for works of drainage and asphaltating at een's-road Board School.

An obelisk, provided by subscription, as a memorial over the grave of John Kane, the late operative secretary to the North of England Iron Trade Arbitration Board, and secretary to the National Association of Ironworkers, has been completed this week. It is 10ft. in height, and is of polished red Peterhead granite, standing on a fine-axed base of grey Aberdeen granite. The monument is the work-manship of Messrs. Priestman and Sons, of Birmingham.

A bust of the late Dr. Morton, of Crosshill, has just been executed by Mr. J. F. Gilmer, of Glasgow.

The Liversidge Local Board accepted, on Monday evening last, the plans of Mr. W. Ellis, architect, for the proposed public offices at Hightown.

The Dublin Exhibition Palace is about to be con-verted into a place of public amusement.

A new free library was opened at Wigan on Tues-day. Mr. A. Waterhouse is the architect.

The Wilts magistrates, at Tuesday's Michaelmas session, authorised the erection of an additional building on the female side of the county lunatic asylum, at a cost not to exceed £4,500.

The second annual exhibition of modern pictures has just been opened at the Gordon-street galleries, Glasgow, and includes about a hundred works. An additional feature this year is the display of a collection of antique works of art, including china, bronzes, ivories, and plate.

The prizes and certificates, 40 in number, awarded by the D-partment to students in the science and art classes at Motherwell, N.B., were distributed on Monday evening.

The first annual meeting of No. 7 section of the Sheffield United Building Society was held on the 9th inst. The statement of accounts shows that £32,650 has been advanced during the year on satisfactory mortgage securities, and that after setting aside £1,348 19s., as a reserve fund, being £3 per share on the 449 advanced shares, a gain was declared of £2 0s. 2d. per share on the 879 shares taken up by the members.

SLATES — SLATES — SLATES.

Bangor, Portmadoc, and Importers of American Blue and Green Slates, a large stock of which can be seen on the premises.

SCAFFOLD POLES, 22ft., 2s. 6d. each;

25ft., 2s. per foot; 35ft., 2s. 6d. per foot.

DEALS—BATTENS—FLOORING.

Send for price list.—R. MAY & SON, Timber and Slate Merchants Acorn Wharf, Old Kent-road, London, S.E.

Epps's Cocoa.—Grateful and Comforting.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—Dr. Service's Gazette.—Sold only in Packets labelled "JAMES EPPS & Co., Homoeopathic Chemists, London."

Trade News.

WAGES MOVEMENT.

MANCHESTER.—On Wednesday, at the meeting of delegates representing the General Union which is now being held in Manchester, it was unanimously resolved that the support given to Manchester should be continued until an honourable settlement shall, in the opinion of the local trade committee, have been arrived at. This seems to point to a prolongation of the joiners' strike. The body which passed this resolution is composed of upwards of 40 delegates from all parts of the United Kingdom, representing the whole membership—about 12,000—of the General Union of Carpenters and Joiners. It is the supreme court of the carpenters and joiners of Great Britain, and meets only once in about ten years. The last delegate meeting was in 1866.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenhire.—ADVT.]

Holloway's Ointment may be relied upon in cases of inflammation or irritation of the internal mucous membrane. When it is diligently rubbed upon the back and chest it relieves shortness of breath, fluttering of the heart, stitch in the side, cures colds, asthma, bronchitis, and protects the delicate against consumption.

CHURCH METAL WORK.

Altar Rails, Alms' Disbes, Coronas, Candlesticks, Communion Plate, Medieval Gas Standards, Lecterns, Screens, Trowels, Yanes, Gates. SOLE AGENTS for Powell Brothers' Stained Glass, &c., Doulton Ware, and Architectural Terra-cotta, Ornamental Tiles, Lambeth Faience. Estimates Furnished for Special Designs.

CHUBB and SON.

57, ST. PAUL'S CHURCHYARD, E.C. LOCK and SAFE WAREHOUSE, 128, Queen Victoria-st., B.C.

TENDERS.

BARNBURY, N.—For the erection of a school to provide seat accommodation for 529 children on a site in Victoria-place, Barnsbury (the accommodation on the 9ft. and 8ft. basis being for 597 children), for the London School Board. Mr. E. R. Robson, architect:—

Table with 2 columns: Name and Amount. Includes Hobson, J. D., Perry and Co., Scrivener and White, Pritchard, G. S., Brass, W., Grover, J., Williams, G. S. S., and Son, Lawrance, E., Boyce, T. (accepted).

[The new building has been designed with a view to future extension. The site is small, and the school has, therefore, been planned on arches, at an estimated additional cost of £713, in order to save a still larger expenditure for the purchase of additional land. A provision of £262 has been made for extra foundations, and £252 for boundary walls and gates.—Cost of site so far as purchased (area 10,052 sq. ft.), £4,963 7s.; school buildings, including teachers' rooms and closets, £7,292; tar paving, playground, &c., £125; boundary walls and gates, £252; schoolkeeper's house, £400; foundations for ditto (provision), £100; cost per head of school buildings only (calculated on seat accommodation), £13 15s. 8d.; total cost per head of buildings, including boundary walls, schoolkeeper's house, &c., £15 8s. 10d.]

BENFIELDSIDE, CO. DURHAM.—For new Board Schools for 500 children, masters, &c., at Benfieldside, for the Benfieldside School Board. Messrs. John Smith and Son, Shotley Bridge, architects; quantities by Mr. G. D. Irwin, Sunderland:—

Table with 2 columns: Name and Amount. Includes Stephenson, R., Glaister, G., Elliott, J., Middlemiss Bros., Bell, J., Snowdon, J., and Son, Armstrong, C. D., McAdam, T., Knox, W., Westgarth, G., Westgarth, W., Eltringham, J., Sbell, W. (accepted).

Bow.—St. Paul's Church, Bow. Messrs. Newman and Billing, architects:—

Table with 2 columns: Name and Amount. Includes Forrest, Colls and Son, Bangs and Co., Dove Bros., Perry and Co., Wood, F., and F. J. (accepted).

BRACKLEY.—For hunting stables, Mr. R. J. Russell surveyor, Brackley:—

Table with 2 columns: Name and Amount. Includes Franklin and Sons, Deddington, Oxon., Hawkins, W., Kimberley, A., Banbury, Claridge, C., Banbury, Wootton, A., Brackley.

BRIXTON.—For the finishings to 12 houses (in carcass) in Brailford and Arlingford-roads, S.W., for E. G. Chapman, Esq. Mr. J. W. Brooker, architect, 2, Railway Approach, London-bridge, S.E.:—

Table with 2 columns: Name and Amount. Includes Croaker, W. and F., Battley, Cullum.

CANNING TOWN.—For fire brigade station, Canning Town, for the West Ham Local Board. Mr. Lewis Angell, architect; quantities by Messrs. R. L. Curtis and Sons:—

Table with 2 columns: Name and Amount. Includes Charlton and Mansell, Rivett, North Bros., Atherton and Latta, Abrahams, Boyd, Wood, Hart, Judd and Hawkins, Sheffield and Prebble, Horlock (accepted).

CANNING TOWN.—For engineer's residence at the sewage pumping works, Canning Town, for the West Ham Local Board. Mr. Lewis Angell, architect; quantities by Messrs. R. L. Curtis and Sons:—

Table with 2 columns: Name and Amount. Includes Boyd, Wood, Atherton and Latta, Abrahams, Horlock, Charlton and Mansell, Rivett, Hart, North Bros., Sheffield and Prebble, Judd and Hawkins.

CHELSEA.—For alterations, &c., at the Fountain public-house, Lower Sloane-street. Messrs. Drury and Lovejoy, architects:—

Table with 2 columns: Name and Amount. Includes Shurmur (accepted).

DEPTFORD, E.—For the erection of a school to provide seat accommodation for 792 children, on a site in Stanley-road, Deptford (the accommodation on the 9ft. and 8ft. basis being for 845 children), for the London School Board. Mr. E. R. Robson, architect:—

Table with 2 columns: Name and Amount. Includes Perry and Co., Sewell, J., and Son, Wood, F. and F. J., Brass, W., Johnson, F., Downs, W., Atherton and Latta, Kirk and Randall, Newman and Mann, Tongue, W., Thompson, J. (accepted).

[Cost of site as far as purchased (area 20,212 sq. ft.), £3,171 16s.; school buildings, including teachers' rooms and closets, £6,900; tar pavement and playground, £390; boundary walls and gates, £600; adapting house for schoolkeeper, £50; cost per head of school buildings only

(calculated on seat accommodation), £8 14s. 3d.; total cost per head of buildings, including boundary walls, tar pavement, &c.), £10 0s. 6d.]

HACKNEY.—For building a Mission Hall in Morning-lane. Messrs. Parr and Strong, architects:— Hanley ... £665 Bays Bros. and Allen ... 656 Shurmur (accepted) ... 639

HOLLOWAY.—For the erection of a house for the school-keeper of the Hornsey-road school, Holloway, for the London School Board. Mr. E. R. Robson, architect:— Mark, F. ... £590 Roberts, L. H. and R. ... 517 Williams, G. S. S., and Son ... 486 Grover, J. ... 478 Hobson, J. D. ... 456 Tyerman, J. (accepted) ... 397

HOBERTON.—For the conversion of the building known as Upton House, Urstwick-road, into a truant school for the London School Board:— Wilnot (recommended for adoption) ... £630 [Lowest tender received.]

HORTON, NEAR EPSOM, SURREY.—For the erection of a gardener's residence. Mr. Hatchard Smith, architect, 44, Ebury-street, Chester-square, and Epsom:— Chuter Bros. ... £354 Jeal (accepted) ... 345 Laundry ... 200

HULL.—For the erection of the Lime-street school for the Kingston-upon-Hull School Board. Messrs. W. Botterill and Son, architects; quantities supplied:— Including old buildings upon site. Excluding buildings upon site.

Sergeant, R. ... £3,050 0 0 ... £8,250 0 0 Skinner, J. T. ... 8,025 0 0 ... 8,225 0 0 Drury and Harper ... 7,893 0 0 ... 8,026 0 0 Haddershaw and Son ... 7,778 0 0 ... 7,905 0 0 Brown, A. ... 7,715 0 0 ... 7,832 0 0 Barry, J., Scarbro' ... 7,670 0 0 ... 7,850 0 0 Stamp, A., Barton ... 7,650 0 0 ... 7,855 0 0 Hoekney and Liggings ... 7,518 17 0 ... 7,868 17 0 Jackson, G., & Son (acc.) ... 7,260 0 0 ... 7,530 0 0

KENT.—For the erection of school in rear of Baptist Chapel at Tunbridge. Mr. J. W. Brooker, architect, 2, Railway Approach, London-bridge, S.E.:— Austin ... £560 10 0 Eason ... 557 0 0 Battley ... 518 0 0 Wickham ... 485 0 0

MIDDLESBOROUGH.—For the construction of a tank at the gas works, for the town council:— Mr. Livesey's plan. Mr. Cail's plan. Pearson Bros. ... £2,550 0 0 ... £11,928 0 0 Brunley, H., Sheffield ... 1,350 0 0 Johnson, Jno., and Sons, Middlesbro' ... 6,945 0 0 ... 5,637 0 0 Inglis, F., Middlesbro' ... 5,685 0 0 ... 8,255 9 0 Doewra & Son, London ... 8,255 9 0 Wilkinson and Pounder Middlesbro' ... 7,900 0 0 ... 9,100 0 0 Johnson, J., Middlesbro' ... 8,900 0 0

MIDDLESEX.—For the erection of 20 houses on the Chiswick Glebe Estate. Mr. Fred. Beeston, architect:— Downs and Co. (accepted)

NOTTINGHAM.—For stabling for 54 horses, coach-house, dwellings, &c. Mr. S. Dutton Walker, F.A.S., architect:— Messom ... £3,109 0 0 Fish and Son ... 2,999 10 0 Hodson and Facon ... 2,995 0 0 Vickers ... 2,940 0 0 Wheatley and Maule ... 2,930 0 0 Bell and Son ... 2,897 0 0 Hind ... 2,893 0 0 Jelley ... 2,885 0 0 Wool ... 2,875 0 0 Stevenson ... 2,870 0 0 Scott ... 2,817 0 0 Clarke ... 2,822 0 0 Daubeny ... 2,817 0 0 Doughty ... 2,800 0 0 Bailey (accepted) ... 2,765 0 0

LONDON.—For rebuilding the Yorkshire Grey Tavern and Restaurant, Gray's-inu-road, W.C., for Messrs. Legge and Chapman. Messrs. J. W. Brooker and Isaacs and Florence, architects:— Lawrance ... £5,650 Croakes, W. and F. ... 5,390 Wagner ... 5,183 Downs ... 5,045 Tink ... 4,983 Morter, J. ... 4,878 Oxford, J. B. (accepted) ... 4,795

NOTTINGHAMSHIRE.—For villa residence, stabling, at Burton Joyce, Nottinghamshire. Messrs. Robt. Clarke and Son, Nottingham, architects:— Hodson and Facon ... £1,236 12 0 Key, W., Carlton ... 1,166 0 0 Vickers, H. ... 1,137 0 0 Welley, John ... 1,077 10 0 Jolly, C. ... 1,050 0 0 Bradley and Barker ... 1,035 0 0 Clarke, A. B. (accepted) ... 997 0 0

SHOREDITCH.—For the erection of shop premises in High-street, at corner of Gt. Eastern-street, E.C., for A. Ewin, Esq. Mr. J. W. Brooker, architect, 2, Railway Approach, London-bridge, S.E.:— Sub-structure. Super-structure. Crabb ... £420 ... £1,985 Morter, J. ... 375 ... 1,670 Oliver ... 366 ... 1,669 Lawrance ... 360 ... 1,640 Axford, J. B. ... 318 ... 1,625 Downs ... 333 ... 1,536 Cullum ... 273 ... 1,525 Wagner ... 295 ... 1,465

SHOREDITCH.—For repairing and dividing into two compartments the large water tank, and supplying and fixing connections and valves thereto, at Shoreditch workhouse. Mr. J. Wallace Peggs, civil engineer:— Ellis, James, ... £695 Jeakes and Co. ... 512 Pontifex and Wood (accepted) ... 350 [Engineer's estimate, £400]

SPITALFIELDS.—For alterations at The Queen's Head, Commercial-street, for Mr. J. S. Cakebread. Mr. Edward Brown, architect:— Eaton ... £948 0 0 Onthwait and Son ... 885 0 0 Kiddle and Son ... 883 0 0 Anley ... 850 0 0 Marr (accepted) ... 831 0 0

Warne, J. (accepted) ... 103 0 0 Paddon ... 88 13 0 Gasfitter's work:— Winn ... 48 0 0 Christian (accepted) ... 40 13 0 Steadman ... 40 0 0

STAFFORD.—Lycæum Theatre improvements, Martin-street, Stafford, for the Committee of the Mechanics' Institute. Mr. George Wormal, architect:— Accepted tenders:— Building and decorating:— Moss ... £435 0 0 Upholstery and mirrors:— Sproston ... 48 19 0 Gas:— Gardner ... 37 6 0

Total £521 5 0 STRATFORD, E.—For the erection of 12 houses and a shop, Leyton-road, for J. Dowsett, Esq. Mr. J. W. Brooks, architect, 2, Railway Approach, London-bridge, S.E.:— Cullum ... £3,675 Sheffield and Prebble ... 3,483 Cardoza ... 3,404 Reed ... 3,225 Charlton and Mansell ... 3,180 Smith (accepted) ... 2,850

STRATFORD, E.—For fire brigade station at Stratford, for the West Ham Local Board. Mr. Lewis Angell, architect:— Rivett ... £576 Charlton and Mansell ... 560 North Bros. ... 550 Norton and Sons ... 417 Sheffield and Prebble ... 375 Hart ... 325 Judd and Hawkins (accepted) ... 287

STAFFORDSHIRE BLUE TERRA-METALLIC PAVING & KERBING SUITABLE FOR FOOTPATHS, &c., &c. Now largely used. ALSO STABLE PAVING Made in same Material to any Patterns or Designs. The Cheapest and Most Durable Paving now in use.

PLUMSTEAD.—For the erection of three houses, Plumstead-park Estate. Mr. W. Seckham Witherington architect:— Coombs (accepted) ... £825

TUNBRIDGE WELLS.—For 400ft. in length of iron roof ing, covering retort-house and coal-store, and two high service water tanks, for the Tunbridge Wells Gas Co., a. designed by Mr. R. P. Spice, of Westminster:— Abbott and Co., Gateshead ... £5,100 Horsley Iron Co., Tipton ... 5,000 Cutler and Sons, Millwall ... 4,497 St. Pancras Iron Co., London ... 4,452 Cockey and Son, Frome ... 4,400 Wrightson, Head, and Co., Middlesboro' (accepted) ... 3,900

BATH STONE OF BEST QUALITY. WESTWOOD GROUND BOX, GROUND, CORSHAM DOWN and COMBE DOWN.

RANDELL, SAUNDERS, & CO. LIMITED. Quarrymen and Stone Merchant.

Prices, delivered at any part of the United Kingdom, furnished on application to BATH STONE OFFICE CORSHAM, WILTS. [ADVT.]

Lamplough's Pyretic Saline is refreshing, most agreeable, and the preventive of FEVERS, BILIOUSNESS, SMALL-POX, SKIN DISEASES, and many other spring and summer ailments. Sold by chemists throughout the world and the maker, 113, Holborn Hill. [Es no substitute.—ADVT.]

Geometrical and Encaustic Tile Pavements in every variety. Over sixty New Designs at 5s. 6d. per yard super. "The Tiles are excellent, both in quality and colour."—BUILDING NEWS. "They are of great excellence in design—the material is not surpassed by any found in this kingdom."—Art Journal. "For paving conservatories they are the best tiles we have seen; there can be no end to their wear."—Gardener's Magazine, &c. &c. Designs and sample Tiles free on application to WEBB'S WORCESTER TILERIES COMPANY (Limited), Worcester.

FREEHOLD VILLA FRONTAGES, SLOUGH, BUCKS, to be LET or SOLD. Situate in the Bath-road, leading to Salt-hill, and within 5 minutes' walk of the Slough Station. The Land averages 200 feet deep. Suitable for 5 or 6 detached residences. The site gravel. Gas and water. For particulars apply to Mr. E. CORFIELD, Architect, Slough, Bucks.

To be LET by TENDER, on Repairing Lease, the House and Premises, No. 22, VERT STREET, Lincoln's Inn, for 21 years, from the 25th day of December, 1877. Tenders to be sent in on THURSDAY, the 25th October, 1877, at 12 o'clock, to Messrs. DRIVER, Surveyors, Land Agents, and Auctioneers, No. 4, Whitehall, London, from whom further particulars may be obtained.

BALLAST.—For SALE, upwards of 2,000 yards of good clean Ballast.—Apply to A. THORN, Elm Park Estate, Fulham-road, S.W.

RAMSGATE.—St. Lawrence-on-Sea.—To be LET, FREEHOLD BUILDING SITES on the Wingham Lodge Estate, situated in the immediate rear of the Granville Hotel.—For Plans and Particulars, apply to Mr. JOHN GLENN, Architect and Surveyor, Mansion House Chambers, 11, Queen Victoria-street, E.C.

TO BUILDERS.—To be LET on Building Leases eligible Plots of FREEHOLD LAND, on a fine broad road in a favourite suburb.—Apply to WEATHERALL and GREEN, 22, Chancery-lane.

TO TIMBER MERCHANTS and OTHERS.—Great Warley, Essex.—To be SOLD by TENDER 273 OAK TIMBER TREES and Saplings, 67 Ash Trees and Poles, and about 15 acres of underwood, standing and growing in Great Warley Wood, also 6 Oak, 5 Elm, and 12 Ash Trees on Mr. Dennis's Farm, adjoining, close to Great Warley Church, and within 3 miles of the Brentwood Station on the Great Eastern Railway, with a good hard road up to the wood.—Forms of Tender and further particulars may be obtained of Messrs. CHINNOCK, GALS WORTHY, & CHINNOCK, Land Agents and Surveyors, 11, Waterloo-place, Pall Mall, London, S.W.

JOSEPH HAMBLET WEST BROMWICH, STAFFORDSHIRE. COPINGS FOR WALLS, STRING COURSES, BUILDING BRICKS, FOR RESISTING DAMP, BEARING GREAT STRENGTH, &c., &c. Made from this Material.

STAFFORDSHIRE BLUE TERRA-METALLIC PAVING & KERBING SUITABLE FOR FOOTPATHS, &c., &c. Now largely used. ALSO STABLE PAVING Made in same Material to any Patterns or Designs. The Cheapest and Most Durable Paving now in use.

PRICES and BOOK of ILLUSTRATIONS on APPLICATION. Through the widespread reputation which these goods have gained, many makers have been induced to send into the London and other markets spurious imitations, which are only COLOURED by a chemical process, and will not bear any comparison for strength, durability, &c., with the genuine article. Gold and Silver Medals Awarded at Paris and Brussels Exhibitions.

THE BUILDING NEWS.

LONDON, FRIDAY, OCT. 26, 1877.

BUILDING AT CHELSEA.

STILL true to its tradition, the modern architecture of Chelsea is a revival of the old Classic of the 17th century, and the visitor seems to realise the old "Chelchey," which Stow describes as "a town not large, but graced with good well-built houses;" or be can imagine the aristocratic Chelsea of the days of Charles II., so graphically described by Macaulay in his history, when it possessed a college for the theology, and when Wren had built its well-known hospital. Proceeding up the river the steamboat passenger, as he passes in front of the advancing wings of that old structure of pristine English Classic, sees an extensive row of large, new-built red-brick houses fronting the river, and recalling in their features the style of the Stuarts. We have thought it worth while to jot down a few remarks on these new buildings, which present more than usual interest to the architect. Few travellers by the river boats passing Chelsea can have failed to have noticed also a block of bright red houses in a massive vernacular style of brick, with narrow windows, small panes, and white sashes, putting one in mind, but for its spick-and-span freshness, of the old brick farm-houses and town residences of William the Third's era, with their tiled roofs, white-painted dormers, and sturdy English unimaginative plainness. We seem only to want the periwigs, laced coats, or spreading hoops of the time. There is an almost Dutch look about this building, yepeled "Old Swan House," which has been erected from a design of Mr. Norman Shaw, A.R.A., the drawing of which attracted much notice in this year's Academy, and a view of which we gave in the BUILDING NEWS, Vol. XXIII., p. 592. Now, it is an executed reality we can speak of it in more decided terms than we did in our review of the drawing in the Royal Academy. It has perhaps lost a little by realisation; the front oriels of the first floor have a rather flat look, and appear to be rather crushed by the overhanging stories of red brick above, with their picturesque narrow sash windows, and octagonal bracketted oriels. With this exception, Mr. Shaw's picturesque combination is highly telling. He has at least, as we have had occasion to remark before, displayed a wonderful and almost captivating *naïveté*, which strangely contrast, with another example to be spoken of by and bye; but we realise the best and most pleasing grouping when viewing it from the western side. It seems indeed a pity its author had not selected this point of view for his drawing. The group of buildings looked at from this direction is far more striking; we see the canted end, which forms so pleasing an object from the embankment opposite Cheyne-row, with its white lofty pedimented and galleried dormers, while the octagon-ended bay and square masses unite with the front and form a highly agreeable *ensemble*. The diversity of the two treatments is well kept in subordination; the plain lofty chimney stacks help to separate them, and to break the roofs, while the dormers set back with their white balconettes, and the deep cove of the cornice of the western block, do not embarrass. A closer inspection reveals other qualities; the moulded features are exceedingly quiet and devoid of grotesqueness, and there is nothing far-fetched. The three oriels below the sills have dados of carved parge-work, in which are characteristic ornaments of bold design in relief, but the ground story looks dwarfed under them. Indeed one failing quality is

the want of proportion observable in the east part of the block, and the disconnection of the horizontal lines of the two structures. The interior has been treated in the same spirit, the wall papers are rich of subdued Queen Anne patterns, and we notice rich coved side recesses in blue pattern tiles within the centre oriel. This story contains the drawing-room, which extends the whole frontage. Of the plan we may say that it shows a skilful adaptation of the space, and that artistic ingenuity has been evinced. The frontage towards Cheyne-walk is of red brick, treated in a massive style, without ornament or breaks, and the redeeming point of this *rechauffé* of an old style is to be found in the honest working out of plan, and the avoidance of fritter. Adjoining Swan House are two plots, the first about to be occupied by a large house, to be built by Messrs. Gillow for Mr. Holt, who has a large collection of Japanese art at Bethnal-green; while on the second a house is to be built for Mr. E. Armitage, R.A., from Mr. Norman Shaw's design. Next we come to a house being built by Messrs. Lucas and Son, of St. James House, Kensington-square. It has a plain front, with square bay, surmounted by a well-moulded red-brick cornice, with dentils returned at each end. The architects are Messrs. Goldie and Child. The materials are stock and red brick. A few yards farther down the embankment we come to a second batch of houses by different architects. Messrs. Gillow and Co., of Oxford-street, are building, for speculation, three or four large residences, the peculiarity of which consists in recessing, so to speak, above the ground floor, the bay windows, which are canted—that is to say, the canted returns are obtained inside by setting back within the frontage line of wall. The effect is striking, if not agreeable, but we fail to see any advantage of the plan, as the square parts must interfere with the main intention and value of a bay window in such a front—namely, that of getting side views up and down the river, and the angular recesses made are perhaps questionable. The end or return house has its corner canted, the entrance being obtained in front in an angular recess. The ground story has the entrance on one side in the square bay, and an arcade of two arches unites it with the adjoining entrance. Within this two-arched screen are the windows, arranged in two lights to each arch; the centre mullion, which forms also the outer pier between the arches, rather awkwardly, we should say, interfering with the side views from the windows. The arches are elliptical, and have keystones, and the centre pier sustains a deep-red Mansfield corbel, which helps to carry a balcony to the first floor windows. The houses have already reached 3 stories, and a well-designed red brick dentil cornice runs round the top. The windows are plain, with moulded jambs and segment heads, the recessed bays and arcades being executed in red bricks, and the square bays in stock. The exteriors are not far enough advanced to enable us to judge of the result, but what there is evinces taste and some refinement. There is evidence of a judicious blending of material, the red brick is not scantily applied, but appears to preponderate over the stock work, and the work is at least removed out of the category of commonplace. There is a rather clever treatment of cast iron in the dormers to imitate plaster—that is to say, if we can honestly make one material represent another. Lifts are provided. There are five reception-rooms and ten bedrooms. The lease is for 85 years, and the ground rent is £90.

We next come to a block of three houses. The first is unfinished, and presents nothing striking except that its windows and arches are slightly set within the stock brick front,

and enclosed within a moulded brick reveal. A projecting window and balcony, upon large corbels of tasteless design, occupies the centre of the front. These corbels are bolted down to an iron plate some 6ft. below. The architects are Messrs. Bodley and Garner, of Gray's-inn; and Messrs. Gillow are the builders. Following is a front, displaying an agreeable front of red brick, with a tile roof treated in a somewhat dignified and monumental manner. It has a centre canted bay window to the first floor, which, in the upper story, sets back on the straight, and is emphasised by three brick pilasters and a high pediment of brick, enclosing a carved tympanum of the same material. On each side are narrow wings with single lights, and the ground floor has a square centre bay of the same width as the octagon-fronted one above. A red sandstone cornice runs above the bay of first floor, above which the façade is treated as an attic with the usual members. Though there is nothing particularly original in the composition, the design is bold, and partakes of the Italian, with the breadth of treatment of the seventeenth century brick style. The architect is Mr. Arthur Blomfield, M.A.

But the most interesting house of this group is that built for Sir Percy Shelley from the designs of Mr. Joseph Peacock, of Bloomsbury-square. We have here a building conceived in a Late phase of Gothic, with a decided touch of Elizabethan. Externally it presents towards the river a wide frontage, broken by an ornamental gable, with octagonal bay window in front, and from two angles project oriels of different design. The building is isolated, and every advantage has been taken of the fine views its situation commands. The west angle has a square oriel placed angle-wise upon a stone-moulded corbelling, with weathered stone capping, and the east angle has an octagon-shaped oriel of two stories, also corbelled and capped with a conical roof of stone. The materials are red brick in the walling, with a liberal use of Tisbury stone in the windows, dressings, and cornices. There is a low stone porch of semi-Classic character. The roof is tiled. The interior of this residence is more than ordinarily sumptuous. The entrance on one side is through a vestibule, with a flight of steps at its inner end, the ceiling of which is enriched with cross beams of pitch pine varnished, on ornamental cut brackets. Ascending the steps we reach an inner hall, transversely placed, from which we enter the front reception-rooms, a dining-room of handsome proportions, and a drawing-room; the latter having the octagon-angle oriel, previously described, commanding a view down the river. It would be difficult to convey to the reader the costly workmanship of these rooms. The windows are executed in cherry-wood; the linings, mullions, elbows, backs, and jamb mouldings being entirely of that material, finished in the highest style of joinery, and polished. In the dining-room the window, a flat bay, occupies the entire end of the apartment; the whole being finished in polished cherry; the shutters and wall linings being framed in small panels of various proportions, enriched by beautifully executed stop chamfering and moulded edges. Few could realise, without seeing, the labour and finish bestowed in these window finishings, which, despite certain incongruities of design, are models of joiners' work. The builders, we understand, are Messrs. Lathey Bros., and great praise is due to them for the execution of these features. The octagon oriel at the corner of the drawing-room is a *chef d'œuvre* of artistic finish. A circular-framed dado in small panels, each elaborately worked by hand, supports the moulded and polished mullions, above which is a flat ceiling, with radiating

panels of the most delicate design entirely of polished cherry-wood—the very acmé of the joiner's skill. This oriel, indeed, may be pronounced unique. The two upper rows of lights over the transoms are filled with subjects in grisaille glass in rich tints, and the circular dado is surrounded by a low seat. The doors are also framed in small panels, with stop-chamfered edges, and are surrounded with flat incised and moulded edged architrave members, framed with intersecting ends, in what we may call the "prettiesque" type of Victorian Gothic. Opening from the drawing-room is a small conservatory behind. In the hall there is an arch of pitch pine separating the staircase from the front hall. This is segmental-pointed, with pierced tracery, spandrels, and panelled soffit—the outer mouldings of which die against splayed jambs. The stairs, of two flights, are of pitch pine varnished; the stair soffit is of the same material, panelled; and the walls are lined with panelled dado. On the first floor a centre shaft of the same material divides by a double arch the landing from stairs. We first enter the smoking-room over the drawing-room; here we have the angle oriel made a useful feature and lounge—the woodwork being of pitch pine, simply varnished. The visitor here is struck by the corners of the room being filled with what appears to be fancy pieces of furniture or whatnots, but which are part of the appointed fixtures. In one corner is an unique circular-shaped cigar stand, with dish for tobacco, and shelves for pipes, &c., with glass panels. The fireplace is of the Queen Anne type and simple—scarcely in unison, however, with the other parts. Entering Lady Shelley's room or boudoir we find similar kinds of furniture fixed to the walls for paintings and bric-à-brac. In the corner is an angle bay, square on plan, which forms a pleasing lounge, and commands an extensive view up the Thames. But what are the lessons to be learnt? Exceedingly elaborate and rich, we confess there is a want of unison and purity in the design; the ceilings seem to mar the furniture; the cornices are neither Gothic nor Classic in some of the rooms, but a peculiar kind of mixture; the profuse stop-chamfering and notching is offensive, and inharmoniously blends with the semi-Classic features; the linen panelling is quite out of place in rooms whose ceilings are plain to a degree, and where the cornices run up against the woodwork in the most awkward manner, and the woodwork exceedingly nice in parts, seems to quarrel in style. We cannot fail to observe a want of care in combining and harmonising. For such costly fittings panelled ceilings were demanded, and parquetry borders to the floors, and we think a great deal of labour has been injudiciously lost. Architects, we know, have to suffer for these blemishes from the tastes and whims of their employers, and we are fain to think the architect in this case is not answerable. Those who visit Chelsea will do well to obtain, if possible, a glimpse of this house, and after that pay a visit to Swan House, where the extremes of architectural taste may be met with, where the devotees of two styles, which cater for popularity, have employed every device which art can bestow to enthrall the eye, and where the two opposite tastes of the day may find ample gratification. To the close observer of architectural taste and its constantly shifting tactics, the contrast will be interesting as indicating two very opposite art policies.

BOAT AND CLUB-HOUSE COMPETITION AT PUTNEY.

THE Thames Boat-house Company are about to erect a boat and club-house at that favourite boat-racing locality—Putney. In response to their advertise-

ment, seventeen designs have been sent in, from which a design by Mr. H. Townley Sugden, architect, of Buckingham-street, Strand, has been selected by the committee. We have made an examination of the designs which were on view last Monday at the Star and Garter Hotel at Putney, and the result of our notes we now lay before our readers. The conditions were for a boat-house, club and committee-rooms, besides steward's and secretary's apartments, a refreshment-bar, and the necessary conveniences, the cost being limited to the rather low sum of £1,500. The design selected for the premium of £25 by Mr. Townley Sugden bears the motto "Stroke." We are not prepared to say it is the best design in an architectural point of view, but we must unhesitatingly award it a high place for the essential requisites of appropriateness and economy. Looking round the room of drawings, we confess that only two or three of them are capable of being realised for the sum named, and we find the majority of competitors have boldly estimated the work at a more reasonable figure. The plot of ground faces the river, and the plans generally show a boat-house on the ground floor, averaging an area of about 70ft. by 60ft., with the club-room, bar-saloon, and residential apartments above. The author of "Stroke" shows on ground floor a boat-house of 72ft. deep and 60ft. wide, with four entrances in front, and divided into four parallel bays or divisions by iron columns, with a row of four windows at the end. On the left side, a small projection is obtained, the front part being a lobby-entrance and staircase to the club-room, &c., on the first-floor, and the back portion being utilised for w.c.'s and urinals. On the right side, a similar projection contains the steward's apartments, entrance, kitchen, bedrooms, &c. The first-floor has the club-room and committee-room, occupying the entire front, behind which is a middle landing or hall, forming the chief entrance to the club-room, a lounge and bar with counter, and the stores, with lift, at the right-hand side. In the rear of these is a large dressing-room, leading from the other side of hall, and at the back a lavatory. The dressing-room is well-lighted at both ends over roof of boat-house. The principal entrance is thus kept distinct from the boat-store, and a flight of stone steps in easy flights gives access to the club-room; the steward is well located to exercise command over the building, and the lavatory and conveniences appear to occupy positions that would least interfere with the chief apartments. The elevation towards the river, shown by a pen-and-ink sketch, is simple, a covered balcony on iron pillars being carried round the front and return sides to the projections, above the roof of which the club-room is lighted and ventilated by a row of clerestory quatrefoil-shaped lights. Four large windows, and two end windows, with casements and mullions, open on the balcony, which is about 10ft. wide. The interior is weak in design. The club-room, with its balcony, forms a span-roofed building, and the dressing-room behind another parallel range, between which the landing, bar, &c., are covered by a low lean-to roof. The estimate is £2,000, and the plan exhibits economy with a careful study of the requirements. Another plan by the same author, motto, "Bow," has a very similar arrangement below, a club-room 45ft. by 22ft. above, the only apparent difference being that the steward's rooms are got above the club-room in front, partly in roof. The treatment is plain brick, with a curved roof, and red terra cotta is introduced as frieze panels above the club-room windows. Taking the other designs, we may briefly describe their peculiarities. "Stroke Oar" is the motto of a rather feeble attempt. The club-room

is 45ft. × 22ft., with balcony opposite towing-path, a committee-room at end, a steward's room, bar-room, lavatories, and dressing-room at back. The estimate is £1,700, and the material is yellow stock and red stock dressings with tiled roof. The elevation with two end hips and centre gable, has a tawdry effect. A design exhibiting some study and artistic merits is signed by Mr. E. L. Swatman, of Wimbledon-common. The boat-house—68ft. 6in. × 58ft. 6in.—is divided into parallel rows by iron pillars, with sheds 58ft. × 19ft. in rear; on the first floor is the club-room, 44ft. × 30ft, a committee-room at the left-hand corner, behind which is the secretary's room and landing of stairs, with a bar. The dressing-room, &c., is behind. The author places the principal entrance and stairs to club-room on the left. Red brick and half-timbering are combined somewhat picturesquely, but we might easily imagine we were looking at a country school-house with gables, the corner tower adding to this impression. Another design, with motto "Stroke," in a Queen Anne style, is shown by a vigorously drawn ink perspective, its salient features being a large centre bay window, carried up above the eaves as a dormer, and a lofty gable at one end cut up a good deal. The plan shows a very confused idea of the requirements. "Economy" is a well-considered idea, expressive of a boat-house, and simply treated. The boat-house, with four entrances, occupies the entire area of ground floor, and forms a brick basement to a superstructure of iron, concrete, and wood. The club-room is 44ft. × 23½ft. along the front, with a balcony treated simply. The hall and bar are in the centre, the steward's rooms, dressing-room, and lavatory being in the rear. The author has worked out his estimate of £1,576 very carefully. He shows that a boat-house 8ft. high, at 6d., of this area, would cost £364; but if the walls are not plastered, and the floor is of concrete, it may be done for 4d. = £576. He works the club-room floor out at £1,274. The roof is shown mainly as a flat of concrete and iron adapted for seats to view races from. The iron columns of boat-house are utilised by collars to hold the boats. The design is half-timbered, and has a tower over entrance. "Well Considered" sustains its motto in the plan, but its elevation, conceived somewhat after the stock pattern of a waterworks station in an Italian style, with flanking campaniles over the entrances, is an expensive idea. The ground-floor space is 72ft. × 60ft., and is divided into nine rows of stands for boats and sculls; above is the club-room, 45ft. × 26ft., with centre bar, dressing and steward's rooms behind, and secretary's on the right side. On a second floor at the back the rooms for steward are obtained, and the front space or flat roof over the bar and club-room is intended for grand stand for race-days. A bracketed balcony surrounds the front and return sides. A sliding partition is shown between club and committee-room, which we deem a desirable arrangement. The bar is perhaps too large, and the campaniles over side staircases are useless. There is a pretentious and monumental character in the design which is beyond the requirements of the Boating Company at present, and much beyond their proposed expenditure. "Luff" is a timbered, ornamental, and highly-tinted design with two flat gables, in a kind of fancy pleasure-garden style. It shows three stories, but the plans are expensive and uneconomical. One of the most picturesque and pleasing designs is that of "Go." The boat-store is 71ft. × 41ft., and does not occupy the entire width of land. Along the left side is an entrance-hall, a staircase, a steward's room, &c. The boat-house is divided into three rows of stands, with three entrance-gates in front, and one

centre one at back, with end windows. On the first floor, the club and committee-rooms are in line, the bar-saloon is in the centre, lighted from side lights, and having its independent stairs. The steward's apartments are in the rear, but we do not see any separate entrance. This floor is of stud-work of Memel framing, the boat-house forming a red-brick basement, with bracketed posts, and verandah along the front. The entrance stairs and steward's rooms are pronounced externally by a high gabled end. There is, perhaps, too much of the domestic type about this design to suit a boat-house, but the timbering and detail exhibit good taste. Estimate is £1,985. "De Mieux Je Pense en Mieux," estimated at £3,500, is artistic, but has too much of the Domestic Gothic character to please us, and it might be mistaken for a rectory or a residence. A monastic air pervades the narrow slit-like openings of the boat-house, the massive red-brick walling and timbered gables, and the corner oriel and roof. In plan, the store is divided into two sheds, 72ft. x 22ft. 6in., each, with octagon stairs at the side. The club-room is placed the wrong way on the left side, the stairs lead to the balcony in front as well as to the club-room, through which latter the bar is reached. The external and independent stairs to balcony is judicious, but we object to the separation of committee and club-rooms by the passage between them. The other rooms appear ill-planned. "Charon" is another villa-like building, shown by a coloured perspective. The boat-house is divided into three aisles or racks. The serving-bar and stairs are contracted and awkward, the winders in the latter being sufficient to overthrow the plan; style, Italian. Design, with "Architect" for motto, has a plain treatment, not without character, of red brick with dormers and tiled roof. The boat-house is canted at corners with four ranges of racks, and side entrances and stairs. On first floor are the club and committee-rooms, with a narrow passage to bar, a dressing-room with lockers, and a washing-room behind. In a second floor the steward's rooms are placed. "Enterprise" has more the appearance of a grand stand from the poor-etched drawing which accompanies it. The boat-house is in four ranges, with a narrow stairs to club-room and bar, the latter being lighted through the former. Another misconception is "Cincinnatus;" it reminds one uncommonly of an engine-house; the stairs are ludicrously small, the bar is equally so, and the arrangement ill-considered. "Isis" (in triangle) is little better; the bar-room is contracted, and is lighted through steward's room. Besides the requirement of a convenient boat-house, the points of most importance in selecting a suitable plan are—1st, an independent and easy approach to the club-room and balcony, so that ladies or visitors may use it, and the best mode of doing this is obviously to project the entrance and staircase, or make it form an ornamental feature externally. We believe a separate access to the balcony would be found useful; 2ndly, the bar should be conveniently placed near the landing and club-room, with a serving door in the latter; 3rdly, the dressing-room, lavatories, &c., should be well-placed, but not obtrusive, in the rear, or at the side, and be well-lighted and ventilated, and have lockers for the "jerseys" and other dress occasionally left by the members; 4thly, the steward's apartments should have a separate entrance and a private stairs, and his room and stores should be as central as possible, to enable him to control the wants of the club; lastly, the club-room should be near the committee-room, and be well-lighted and ventilated by upper lights in the roof or above the balcony-roof. We think, also, the conveniences should be placed outside

the building, if practicable. Externally, the building should express its use—it should make the boat-store, club-room, and balcony the main features; the stairs should be pronounced, and the treatment should be dictated by adopting the main features of the ordinary boat-shed and stand. A massive basement, as a boat-house, in brick, may be surmounted by a brick and timber superstructure of a lighter design; the balcony should be spacious, well-supported, and covered by a roof, and an additional stand for race days seems to be an essential auxiliary. It would be absurd to adopt the features and style of a dwelling-house or villa, and it appears to us the shed type, with balconies on the front and sides, might be architecturally adapted, so as to render the building a pleasing object from the Thames, and worthy alike of the club and the boating community. We shall illustrate the selected design.

COMPETITION DESIGNS FOR BOARD SCHOOL, HOVE, NEAR BRIGHTON.

WE have deferred giving the results of the competition for the Ellen-street Board Schools at Hove till we had made an examination of all the designs that had been sent in. The collection on view on Wednesday and Thursday last was an interesting one. The plans, as a rule, display considerable merit, and the selecting committee must have had a task that required some judgment to perform with impartiality. As we stated in a recent issue, the special committee appointed to consider the thirteen designs have selected, as best adapted to meet their requirements, the design with the motto "Mens," the authors being Mr. Thomas Simpson, of Brighton, architect of the School Board in that town, and Mr. Frederick W. Roper, of Adam-street, Adelphi. As might be expected, this decision has caused some opportunity for dissent, and there appears to be a strong feeling that justice has hardly been meted out evenly. However this may be, let us at once disarm those who entertain the idea that favouritism has influenced the scales by saying that this design, if not perfect, yet so closely fulfils the required conditions that the most biassed competitor must admit it possesses considerable merit. But let us take the plans in the order of hanging, and confine our attention to points of importance. These may be briefly enumerated, as convenience and separation of the entrances for the infants, girls, and boys, ample hat and bonnet space and lavatories, easy staircases, division of departments, lighting and ventilation, arrangement of desks, &c. We may just recall to our readers' minds that the instructions required a school for 150 boys, 250 girls, and 400 infants; two class-rooms to be provided for boys, three for the girls, and two for infants, with playgrounds, and a careful study of ventilation and light, besides other requirements of the Education Department as to rows of desks, &c. The site is a long parallelogram, facing Ellen-street, 200ft. in length by 44ft. in depth. In looking over the plans we were agreeably struck with the care which the authors, as a rule, have shown in calculating the areas of their rooms, and in giving the dimensions and other particulars. "Hova Villa et Hova Ecclesia" is the first design we note. The author provides two blocks of buildings, one for infants, one story high, and the other adjoining it of two stories for boys and girls. This arrangement is open to the charge of being rather uneconomical. The infants' large room is 63ft. by 22ft., with a recess for galleries; the class-rooms are 17ft. by 20ft. each, placed as a projecting wing at one end, with entrance and cloak-room in the angle. The babies' room projects on the east side, and is 37ft. 6in. by 25ft. The author works out

the area per child at about 8ft., or rather over. On the west side stands the other block raised on an arcaded basement, which forms a covered playground. The block plan of the general building is somewhat the same. The girls' school is on the first floor, 62ft. by 22ft., and is well lighted, has dual desks, and three class-rooms, two over the wing adjoining the infants' school, and one over the other wing. The entrances and lobbies are large, with a mistress's room near, opening from school-room. The area per child is stated as 10ft. The boys' school is on second floor, over the girls', with class-room at each end, the entrance to both these departments being obtained in the arcaded basement. The plans are well got up, with clear statement of areas, &c. We notice also a master's room near lobby, with conveniences attached. Size of school is 43ft. 6in. by 22ft. Externally the design is in the London School Board style, and shown in a well-prepared line elevation, the features picturesquely handled. "Compact" shows a rather confused ground plan. The girls and infants are in one two-storied range to the right, and the boys on the left; the entrance to girls and infants are at one end; the infants' school has a gallery recess and two groups of desks, the two class-rooms being in front, on each side of a projection of the infants' room. Coming to the first floor we find the girls' school-room over the infants', 65ft. by 22ft., in three groups for forty each (dual system), lighted at back and ends, with fairly planned class-rooms. We do not like the awkward protrusion of infants' school recess behind, shown in back elevation. The drawings are carefully prepared and worked out. The style is Queen Anne, shown in a large coloured elevation, and a detail of gables; but it is bad architecture to place the red-brick angle pilasters to gable on the pipping quoins of ground story. There is, we think, a tawdry use of yellow and red stocks in quoins. A detailed table of areas, cubical contents, &c., accompany this set. We next come to "Mens," which the committee have placed first. We mark a compactness of plan and a well-considered distribution of the departments. The authors found nothing to restrict them as regards site, and have wisely adopted a symmetrical disposition. As the infants numbered 400, and the girls and boys combined, 400, the authors have met this by giving them each a floor of the same area, the infants being below and the girls and boys on the first floor. The plan is a long rectangle, with end cross-wings; the infants are divided into two, the larger room being 46ft. by 22ft., with end galleries in front; a babies' room behind, 29ft. by 17ft.; and another, for advanced infants, 38ft. by 22ft., is placed at the left end, also with a babies' room. The entrance is in the centre at the back, with babies' cloak-rooms, lavatories, &c., right and left. The girls' and boys' entrances are at the extreme ends in the rear of the building, the girls and boys passing through the arcaded stories of the two wings, which thus form playgrounds below and class-rooms above. The stairs are in short flights. Cross-ventilation is adopted by having lights over the lavatories, the height of the ground floor being 16ft. A class-room for thirty advanced infants is arranged at the western end, and well-lighted galleries are shown. Covered ways lead from the back doorways to the conveniences in the yard. We consider the breaking up into two sections of the control of 400 infants a desirable point. On the first floor is the girls' school, 62ft. x 22ft., for four classes or 130, with the cross-wing divided into two class-rooms about 20ft. square, and another at the west end of the same width as school, each accommodating 40 pupils. The remaining end of this floor is devoted to the boys' school-room, 33ft. x 22ft., accommodating 70,

the two class-rooms being arranged in the end cross-wing, as on the girl's side. The conveniences are compact; a kitchen for teaching girls cooking is provided in the rear, easily approached from either stair or school-room. The ground floor being 16ft. high, a mezzanine floor is obtained for the master and mistress, below the cap and bonnet-rooms respectively of the first floor. These additional rooms have separate lobby-entrances. Externally, the authors have adopted a long frontage in a quiet expressive Queen Anne style, with slightly projecting wings; the middle portion is broken by four gabled windows of red brickwork, which rise above the eaves' line, each of which has two lofty segment-headed lights the tympana of the gables being ornamented with carved and moulded brickwork. These dormers project slightly from the front of the first floor, though they are flush with the wall of the ground story, a moulded brick cornice separating the two stories. The wing-gables are broken, but devoid of grotesqueness. Their lower portion is arched with semi-circular arches, the space being utilised as playing grounds and lobby approaches. We notice in the section the panels below the first-floor windows are pierced, and fresh air is introduced through vertical flues over the heads of the children. Boyd's ventilating stoves are also introduced. The material is picked stocks, the wall faces being relieved by quoins, dormers, and strings of red brick. An almost equal division is preserved, and an external balance in the elevation has therefore suggested itself. We have described the features of this design in detail, for the benefit of those who have not seen the drawings. Cost is estimated at £6,000. "Fleur-de-lis" contrasts rather noticeably with the last in style—a kind of Victorian Gothic—the elevation being highly coloured. In the plan, the author has chosen a symmetrical disposition. The boys' school is on one side, and the infants' on the other, the girls' forming a centre two-storied block with centre entrance. The infants are in two divisions, junior and senior, the large room being 60 × 25ft., with a smaller one, 45 × 16ft., running crossways, and forming half the centre block. The boys' division, on the left side, is a corresponding wing, 60 × 22ft., with end entrance, lobby, and class-rooms at each end, the babies in the rear part of centre. The infants' and boys' schools thus form one-story wings. Covered playground and approaches are formed at back. The centre tower over girls' porch, with curved cupola, has a screw ventilator. Boyd's grates are proposed, and the set of plans are well detailed. Another well-studied plan is that with motto "Salome." The blocks are arranged with a centre and two cross-wings. The infants' entrance is in centre, the girls' to the left, and the boys' to the right. A centre lobby from the infants' entrance leads to right and left wings respectively for senior and junior infants. This centre is made a projecting feature in elevation, and contains hat and cloak room, lavatories, &c. The junior school-rooms are each 41ft. 6in. × 21ft. 3in., the babies' and class-rooms being made projections at each end. The girls' school for 130 (61 × 22ft.) is placed over the larger half on the left, and the boys', for 80, over the right part of the building. Three dual groups are shown in the girls' schoolroom, and the rooms are, perhaps, rather over-lighted. A mistress's room is arranged at one end from stair lobby, and a master's corresponding on the boys' side. The Gothic is poor and vapid, and the elevations are weakly tinted. The plans indicate ingenuity, however, and the author is the only one who shows hollow walls. We next come to a design, "Spero," with infants' school arranged in a confused

way. The girls and babies' entrances is at the left side, under covered approach, but with a tortuous access to junior infants' school. Boys enter at right side. The class-rooms are straggling and disconnected. The upper floor is far better. The boys' school is for 90, its end class-rooms forming a projecting wing on the right. The girls' school-room for 130 (66ft. × 22ft.), forms a parallel front range to the left, but set farther back, with projecting class-rooms at end. Mezzanine floors are provided for cloak-rooms, teachers' rooms, &c., under the stair lobbies, which are arranged in the angles made by class-rooms with school-rooms. The tinted elevations show a Jacobean treatment in red brick, expressive and feelingly rendered, though rather cut up in front, with expensive roofing over the latrines and yards at back. The playgrounds are in front. Another design, "Griffin" (Messrs. Holford and Clayton, of Brighton), places the infants' school for 240 in one long range in front, and the junior infants' at the end in a receding wing to the right—the advanced class being at the other end. The school-room is 88ft. × 22ft.—too long for management; it is lighted on both sides, and has galleries in three groups. The boys' school is placed over the double advanced infants' classroom in the left wing; the girls' school-room is over the large infants' room and wing on right, with entrance in the rear of the latter. The other entrances are, for the infants, in front of right wing, and for the boys at the side of left wing, and are narrow and wasteful to our minds. The elevation of a Gothic character, with red brick arches, but the design might have been better. "Intersecting Triangle," in circle, is the motto of an elaborate set of drawings. In one of the alternative plans we have a long infants' school for 400, in one range, with end class-rooms as cross-wings, and two others behind in centre. The entrances are at the back, the boys' porch on left, the girls' on right side. No. 2 plan shows a reversal of this arrangement, the entrances being turned towards the south. There is a carefully-planned first floor arrangement. The boys are located over one end—the left—and the girls over the other part. We prefer the elevation to that in plan, No. 1. It is a well-balanced composition, with long front and end wings, treated classically, in a Jacobean spirit, with high-slatted roof and broken-end gables. The elevation of No. 2 is more intricate in parts, but still pleasing, with a double gable in centre. The elevation is feelingly drawn and coloured, and large details are sent. We cannot approve, however, of the front blocks of latrines between the wings. Another set, with "Intersecting Triangles" as device, divides the infants' school into senior and junior departments, each with two galleries for 60. The infants' entrance and mistress's room are in the centre, with the babies' room detached behind; this is undesirable. The class-rooms are at end. The girls' and boys' entrances are on right and left, respectively, as large porches. The first floor seems well grouped, and the boys' and girls' divisions are well lighted. The master and mistress's rooms are provided over the porches, and near the lobby and stairs. A mezzanine floor for cloaks, &c., is obtained. The exterior, in a mechanical-looking, stereotyped species of Gothic, is not improved by the ugly bell-turrets over porches. "Fiat," in triangle, is an imperfectly-finished set of plans. The infants' department is divided, but a large useless lavatory is placed as a centre apartment, and entrances as well. The class-rooms are arranged in wings. The upper plan is much better, the boys being on the left and girls on right. The author has at least a good idea, but he has not worked it out with care. The elevation is common-

place Gothic, of a stereotyped school type, with red-brick arches and strings. Another arrangement is shown in which all the departments are in one story, the infants' school being placed transversely, and dividing the boys from the girls. There are three front entrances. The plan is clever, and the author is the only one who shows an acceptable single-story arrangement. This elevation is broken by gables and a *fleche*, and is happier. "Lux" shows a confused-looking plan, arranged more after the Lancasterian principle, in which the infants are placed in a room, 59ft. by 40ft., transversely arranged. The entrances, cloak-room, kitchen, &c., form a projecting block on the right, and a smaller gable projection on left is arranged as classroom and boys' entrance. On the first floor the boys and girls are over the infants' school, divided by a centre wall, with three stacks of fireplaces back to back; thus each room is lighted entirely on one side. A straight-arched style of Gothic is adapted, shown in effectively-tinted elevations, with half-hipped dormers. Last of all we come to "Fiat Justitia in Loco," a single-story arrangement. Here the author arranges his school and class-rooms in parallel ranges, divided by a centre wall. The infants' school is made the centre, and is placed transversely, projecting considerably behind, with gallery recesses. It is a spacious room, but awkwardly planned in the front. The entrances are well located. A babies' room is arranged at the side of infants' entrance hall in front. The girls' and boys' departments are intermixed, the boys being on the right and the girls on the left, but the infants' school dovetails rather undesirably into both sides. The girls' lobbies are wasteful, and there is a decided want of classification. Ventilation has been indicated. The boys' playground is below the infants' school, which rests on an arched basement. The elevations are picturesquely treated, with gabled wings in a Queen Anne spirit; but we cannot see the object of the large tower, striking though it be, which rises over the infants' entrance. A board-room is, we find, obtained in it over the porch. The sections are piquantly handled. We notice a shifting screen is adapted in the infants' school to divide the classes.

Altogether the collection of drawings is creditable to the authors. The degrees of merit between many are very few, and as Brighton is now full of visitors, we hope the designs will receive their fair share of attention. The plans show a considerable development of school architecture, for which we are indebted chiefly to Mr Forster's Education Act, and to the scientific classification and systems of building brought into notice by the efforts of the School Boards. It is obvious to any one who takes the trouble to look at plans of this sort, that the system is beginning to dawn on England that schools must be planned and built for children of varying age and sex, in lieu of trying to squeeze children into buildings of inadequate design.

THEORIES OF RESISTANCE.

IT is amusing to see how scientific theorists, in certain well-worn branches of construction, borrow from and repeat each other in the elaboration of new theories. Engineers, as a rule, have to deal with subjects that are pretty well exhausted, yet we are constantly seeing a fresh *réchauffé* of some well-understood principle. Few subjects have admitted of diversity of treatment to a greater extent than that of the resistance of materials. Every now and anon we have a paper on the subject viewed in a new aspect, but virtually throwing little or no light on the question. There are in all these instances two classes of readers—those who read to learn, and those who read

from an interest in the question, or to pick up anything new. For the first large class, comprising all students, we can only say the value of these speculative essays is small, as we would much sooner advise the young architect or engineer to study Tredgold, or Barlow, or some recognised compilation of their labours; while to the other class who are seeking for extended investigation, the results of experiments have more value. In *Van Nostrand's Magazine* a paper by Mr. William Kent, M.E., discusses the "Relation of the Resistance of Materials to Transverse Stress to their Resistances to Tension and Compression," a matter that has received a great deal of attention lately. Mr. Kent alludes to a paper by Mr. John D. Crehore, in the same magazine for August, in which that writer gives a formula for transverse stress, and adduces experiments to prove its correctness. Mr. Kent has found that Mr. Crehore's formula for the relation between transverse resistance and tensile and compressive resistances is substantially the same as the one discovered by himself about two years ago, and communicated by Prof. Thurston to the American Society of Civil Engineers. That formula assumed that resistances vary each way from the neutral surface proportionately with their distance from that surface. For a beam fixed at one end and loaded at the other, $M = \frac{1}{2} RBD^2$. The values of the modulus of rupture, R , being as under:—

Cast Iron. Wrought Iron. Ash.

R (theoretical) ... 32,280 ... 60,000 ... 12,120
R (experimental) ... 35,000 ... 60,000 ... 12,000

In this formula B represents the breadth as unity, D the depth of beam. The author remarks the true theory of rupture by transverse stress has probably never yet been given; and the conclusion that the sum of the moments of compression is equal to the sum of those of tension has been disputed by some writers. A complete theory, says the writer, must include the effect of the "flow" of the material after it has passed its elastic limit, and this will modify the proportionality of resistance to the distance from the neutral axis for every material. The author next, in referring to recent theories, mentions Mr. D. K. Clark's theory given in his "Manual for Mechanical Engineers," called "diagonal resistance," a theory which he says "is far from being a correct theory." We believe we were the first to take exception to the theory alluded to, in noticing Mr. Clark's otherwise excellent treatise. Since Galileo's time the true theory has been a doubtful question, but it seems to us that the hypothesis of equal resistances above and below the neutral axis cannot be set aside so readily, and that the proportionality of resistance varies with every material; or, in other words, the neutral axis accommodates itself to the nature of the material under stress. An equilibrium of the forces must take place—a point where the extending and compressing forces neutralise each other.

THE ANNUAL REPORT OF THE SCIENCE AND ART DEPARTMENT.

THE twenty-fourth annual report of the Science and Art Department of the Committee of Council on Education has been issued. A substantial increase during the year 1876 in the number of schools examined in scientific knowledge is reported—the total number being 1,426, containing 57,988 children; and the results of the examinations are generally of an encouraging nature. The number of competitors for Whitworth Scholarships was 51, and of these 19 were admitted to go forward to the examination in practical workmanship. The facilities for advanced scientific instruction afforded by the Royal School of Mines, the Chemical Schools at South Kensington, and the Royal College of Science, Dublin, continue to be appreciated.

Under the head of the Art Division it is stated that, during the year 1875-6, 36 students in training to become art teachers, and 16 national scholars in training to become designers or art workmen, received allowances to enable them to study in the school and the museums, 20 students were admitted on payment of half fees, and 100 others, including the

students in training, the national scholars, and 21 men of the Royal Engineers, received gratuitous instruction. Three students in training were appointed to masterships in schools of art. New schools of art were established during 1876 at Bolton, Elgin, and Plymouth. The total number of schools of art in operation throughout the kingdom was 141, and the total number of students therein 27,973. The annual increase in the work done in these schools continues to prevail. At the annual examination in April, 1876, 17,069 students submitted 122,553 drawings or models. The number of works selected for the National Competition was 1,230. The number of students in art night classes was 31,158, in 883 classes; 3,797 of these passed the examination of the 2nd grade, 663 obtained 2nd grade prizes, and 465 obtained prizes for works sent up for inspection. In 3,335 elementary schools 450,961 children were taught drawing, and 331,348 were examined at the annual examination in March, 1876. At the examination of school teachers in training colleges 609 obtained certificates for drawing. The grand totals of persons taught painting, drawing, or modelling through the agency of the Department, during the past three years, were as follows:—In 1874, 345,382; in 1875, 449,689; and in 1876, 530,412.

At the South Kensington Museum the acquisitions by purchase during 1876 were more numerous and of more importance than usual. Among them may be noticed the very interesting collection of Japanese pottery formed by the Japanese Government for the Museum, and first exhibited at the Philadelphia Exhibition. Among gifts and loans, the collections of drawings and books bequeathed or presented by the late Mr. Forster, Mr. William Smith, and Sir Digby Wyatt, and the Athorp paintings lent by Lord Spencer, some articles of gold and silver plate belonging to the Barber-Surgeons Company, and a reproduction in plaster of the Tabernacle in the Church of St. Léau, near Brussels, are amongst the most noteworthy additions made to the collection of reproductions. The Special Loan Collection of Scientific Apparatus, which was visited during the year by 275,813 persons, is referred to at some length. The purchase of oil and water colour paintings during the year was confined principally to works required as examples for study. Some valuable drawings have been bequeathed to the museum by the late Mr. William Smith, a fresco painting was presented by Mr. J. F. Austen, and some oil paintings by Baron de Ferrieres and the late Mr. S. Redgrave. The system of circulation of art objects among provincial schools and museums has been kept up, but not, it would appear, in anything like a sufficient response to the demand. Very few books have been bought for the National Art Library during 1876, but several handsome donations are recorded. The total number of readers was 24,033. Courses of public lectures were delivered during the year by Mr. Ernst Pauer on the Pianoforte, and on the Human Form and Ornamental Art by Mr. Bellamy and Dr. Zerff. The total number of visitors to the museum during the year was 1,173,351. The Bethnal-green Museum has also marvellously increased the number of its visitors during the year—938,794, as compared with 416,696 in 1875; but the exhibition of the Prince of Wales' Indian presents probably accounts for many of the new comers.

BOOKS RECEIVED.

House Drainage, by M. Ogle Tarbotton, M.I.C.E., C.E. (London: E. and F. N. Spon), is a cheap and most useful guide to the regulations which should be observed in the drainage and water supply of town and country houses. The author, who is the well-known borough engineer of Nottingham, has turned his long experience to valuable account, and has given us a reliable and simple manual, which should be read and kept by everybody. Five sheets of illustrations accompany the pamphlet, in which are shown the evils of the old system of drainage into cess-pits without disconnection or ventilation, and the methods by which the same may be remedied, together with various details of house drainage and sanitary appliances. Mr. Tarbotton's book is, and will, in

our opinion, long remain one of the best handy guides to house drainage published. It ought to sell by thousands.—*A Handbook for Young Brewers*, by H. E. Wright, B.A. (London: Crosby Lockwood and Co.), is a popular but scientific outline of the art of brewing, combined with some directly practical hints on points of importance. We are not competent to express an opinion as to the technical value of the information, but the author seems familiar with his subject, and expresses himself clearly.—*Building Societies, not as they are, but as they should be*, by Samuel E. Platt (London: E. W. Allen), is a very sensible inquiry by an actuary of building societies into the operation of building societies as at present managed. The author comes to the conclusion which, it was generally agreed, was arrived at some years back after an exhaustive correspondence on the subject in the pages of this journal—viz., that the interest charged to borrowers is, in nearly every society, too high, and the consequence is, that not half the business is done that might be done by them. A prejudice does undoubtedly exist in the public mind against building societies, and no one who really knows anything about the matter can assert that borrowers are fairly dealt with. The interest is not only too high, but it is almost invariably calculated in such a manner as to render it almost impossible for the borrower to know what rate he is paying at. The result is, want of confidence, decline of business, and ultimately a reduction of interest to the investing members. Building societies generally are just now in anything but a flourishing condition. There are, of course, exceptions. Some of them are unable to continue the issue of subscription shares, nearly all have large capital lying idle, which the most persistent advertising fails to float, and only those who have managed to add other business, such as banking, to their original work, are able to pay anything like a good return to investors. We believe, with Mr. Platt, that a new society established in London on fairer principles betwixt the society and the borrower, would receive a very large amount of support, and would effect a salutary work for the whole community.

CHIPS.

The foundation stone of a new wing to the Mechanics' Institute at Jarrow was laid last week. Mr. Edward Shewbrook, of Newcastle, is the architect, and Mr. John Smith, of Jarrow, the builder.

A new church, to accommodate 150 persons, is approaching completion at Nether Silton, Yorks. The altar rails are carved from part of the timber of the old Dreadnought.

Mr. Facon, architect, of Mexborough, has been instructed to draw plans for a new Board School of three departments, with master's house, for that town.

The foundation stone of a new convalescent hospital, at Belfast, was laid on Thursday week. The architects are Messrs. T. Jackson and Sons, and the builders Messrs. H. and J. Martin.

The restoration of Christchurch, Warley, near Brentwood, which is fast approaching completion, was celebrated by the builder, Mr. Hammond, of Warley, by giving a dinner on Saturday week to the workmen engaged on the job; Mr. W. Cudby, foreman of works, took the vice-chair.

The footpaths of Barking, Essex, have just been tar-paved by Messrs. Wright and Sheardown, of Great Queen-street, Westminster.

The tender of Mr. Lewis Shrubsole, amounting to £4,900, has been accepted for the erection of a school and residence for 40 boys at Westgate-on-Sea.

Mr. Waring has been appointed deputy county surveyor of Glamorganshire.

Works of restoration and repair are being carried out at St. Mary's Church, Ely, by Mr. Brown, builder.

The organ in Bridport parish church has just enlarged and improved by Mr. Vowles, of Bristol, and the organ case altered and decorated in gold and colours so as to harmonise with the prevailing tones of the stained windows in the church, by the Brothers Grant, of Frome.

The parish church at Bolton, recently restored at a cost of £65,000, has just been further enriched by the addition of a reredos from designs by Messrs. Paley and Austin. The material used is English oak, elaborately carved, the panels being filled with painted subjects. The carved portion was entrusted to Mr. Roddis, of Aston, for execution. The cost of the whole work was £1,200.

HOUSE AT DATCHET—MR. J. O. SCOTT'S DESIGN FOR THE NEW KENSINGTON VESTRY HALL—SECOND PREMIATED DESIGN FOR NEW SPA BUILDINGS AT SCARBOROUGH—"BUILDING NEWS" CLUB DESIGNS FOR ESCRITOIRE, STAIRCASE, SOFA, AND EASY CHAIR.

OUR LITHOGRAPHIC ILLUSTRATIONS.

HOUSE AT DATCHET.

This house is erected for T. E. Howe, Esq., by Messrs. Haward Bros. of Old Quebec-street, from the design of Mr. F. P. Cockerell. The walls are of concrete, the dressings are of brick. Boards were used for the casing of the concrete, instead of any of the patent apparatus. This method offers the advantage that the casing being adjusted to the brick dressings, and the latter not being enclosed in it, their projection offers no difficulties, and the smearing of the brickwork by the cement or the concrete avoided. The surface decoration consists of rough cast in plain panels, with the cement margins, and here and there an incised pattern. The house being placed close to the water, the plan is arranged with special reference to the enjoyment of the views up and down the river, without exposing the principal rooms to the glare of the sun from the water, or to the sight of the numerous passers-by. A principal feature in the S.E. front is a spacious and deep verandah, with a lead flat above. The verandah is paved with marble mosaic by Messrs. Burke and Co. The interior of the house offers no special features worthy of notice.

SCARBOROUGH SPA.

Our illustration this week is the preliminary sketch submitted in the first competition for the above by Messrs. S. Crosby, Hetherington, and George Dale Ourer, A.R.I.B.A., architects, of Carlisle. Their design was one of the four chosen for final competition, and eventually their elucidated drawings were placed second by the referee, Professor Cockerell, and awarded a premium of 60 guineas. The ground plan explains itself. On the first floor, over the refreshment-rooms, were placed an exhibition-room, suitable also for small concerts, and a reading or newspaper room. Over the kitchen department at the back were placed the keeper's residence. An important point in the "instructions to architects" was to provide largely-increased promenading space, and it was suggested that this should be done by throwing back the building an average of 20ft. Messrs. Hetherington and Ourer, however, for reasons of economy, and also as their scheme was to adapt, as far as possible, the existing buildings and foundations, and to avoid cutting into the cliff, met this condition by removing the tower and extending the present promenade to the south in the direction of an estate adjoining, belonging to the company, and divided by a tramway, with a view of opening out this estate to meet future requirements. They also suggested to form a quadrangle at this end by enclosing a portion of the sands, as shown on the plan. The winter garden or covered promenade was considered by the architects a most important accessory to the Spa, for the following reasons:—1st, by prolonging the season; 2nd, by rendering the Spa independent of wet weather; 3rd, economy in working expenses. The area of the concert-hall was not proposed to be permanently seated, so that in wet weather, by throwing open the door

between the winter garden and concert-hall a fine indoor promenade was provided. Another feature in Messrs. Hetherington and Ourer's design is the flat roof over the buildings, being easy of access both from the Cliff-bridge and the Esplanade above for Bath-chairs, and commanding a fine view of the sea and all around. The buildings present an extensive frontage to the sea of over 400ft., and are designed in harmony with that portion of the old building designed by the late Sir J. Paxton. The cost of carrying out this scheme was estimated by the architects at about £38,000.

KENSINGTON VESTRY-HALL.

We have already published one of the most notable designs* prepared for the new Vestry-hall, Kensington, and to-day we publish another, consisting of two illustrations of Mr. John O. Scott's design, which, under the motto, "Kensington," was awarded one of the premiums by the official referee, as will be seen by the award which we published at the time. The selected designs of this report were, however, set on one side by the committee, and others chosen. Mr. Scott's design has already been very favourably spoken of in our review of the whole series, leaving nothing to be said here excepting perhaps the author's description:—"The style is Classic, with a studious avoidance of so-called Queen Anne Barbarities."

BUILDING NEWS 'CLUB DESIGNS FOR ESCRITOIRE, STAIRCASE, SOFA, AND EASY CHAIR.

We illustrate this week a selection of designs contributed for a hall staircase, an escritoire, a sofa, and an arm-chair, the critical remarks on which appeared on pages 327-8, on the 5th inst.

SCHOOLS OF ART.

AYR.—The annual distribution of prizes to the students of the Ayr School of Science and Art took place on Saturday, at the Assembly-rooms, the walls of which were hung with selections from the works executed during the year. The report showed satisfactory progress. In the science classes 60 papers had been wrought, and 50 passed—18 first and 32 second-class. In art 28 students obtained full grants. The number of art students (who are under the tuition of Mr. Black, of Kilmarnock) had been greater than in any previous year.

BROMLEY.—The annual distribution of prizes to the students of the Bromley Science and Art Classes took place last week. The report stated that there were 61 art students, and 44 presented themselves for examination, 19 being industrial. 23 passed the examination, and obtained certificates (double the number obtained last year), 12 with the remark excellent. Work for competition had sent up 36 students as against 28 in 1876, with the result of 1 third-grade and 5 second-grade prizes. Two obtained the full grant of 15s. each for the teachers. The amount awarded for the work of the others, was £5 17s. Three science classes were taught during the session. Four local prizes had been presented to the industrial students who passed with the remark excellent. Prizes had also been given to the students who obtained the highest number of marks in the chemistry and mathematical classes.

NORTH LONDON SCHOOL OF ART.—The Lord Mayor presided on Monday evening at a meeting held for the purpose of presenting the prizes gained in the classes of the North London and Hackney School of Art. The annual report, recorded the continued prosperity of the school. Opened nine years ago with a roll of 17 students, the attendance had progressively increased until last year the numbers reached 276. The present year showed a slight decline, but the increased income of the school might be taken as an evidence of greater regularity of attendance, and this was reflected in the additional number of honours earned. It was a matter for regret that a considerable disproportion existed between the number of students attending the art classes and those who devoted themselves to the technical and scientific subjects of the course. Whilst there were 250 in the former, only 30 had entered for the science classes.

* BUILDING NEWS, September 28, 1877.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

LIVERPOOL ENGINEERING SOCIETY.—This society held its usual fortnightly meeting at the Royal Institution, Colquitt-street, on Wednesday evening, the president, Mr. C. Graham Smith, A.I.C.E., in the chair. Mr. C. J. Tisdall, B.A., read a paper on the "water supply of large towns," in which he laid before the meeting—1, the geological and hydrographical features upon which the supply depends; and 2, the means adopted for drawing water from various sources. After briefly alluding to various historical waterworks, the author proceeded under the first head to point out the qualities that must be possessed by water for domestic use, and then showed from what sources a supply of suitable water might be procured. The chalk, lower greensand, and red sandstone formations were considered at some length as water-bearing strata—the two former in relation to the supply of London, and the latter as a source of supply for Liverpool. The chalk undoubtedly contains an unlimited supply of good water, but wells sunk in it have often proved to be unproductive, owing to the presence of faults. The sandstone around Liverpool is peculiarly permeable, and acts as a vast reservoir, containing an enormous quantity of good though rather hard water. At present about 6,000,000 gallons per diem are procured from the red sandstone for the supply of Liverpool. Under the second head artesian, reservoirs, and other wells were considered, and the principles upon which they are constructed explained. In conclusion the author described the formation of filter beds, and the manner of using and cleaning them.

SUSSEX ARCHEOLOGICAL SOCIETY.—The autumn excursion of this society took place on Wednesday week, when Forest Row and the ruins of Brambletye, near East Grimstead, were visited. In a meadow at Forest Row the proceedings of the day commenced with the inspection of a cist discovered near a streamlet in September. It is of sandstone, 4ft. 6in. in length, by about 3ft. 6in. wide, and was embedded in charcoal. Within it, when dug up, were some bones and lime, but the former crumbled to dust. Mr. Slack said the cist was one of the Romano-British period. One or two of the bones had been preserved and one had been identified as part of a sheep's trotter—an anatomical revelation which provoked much laughter amongst the members, who, after some discussion on the alleged Roman custom of placing burial cists near streams, proceeded to Brambletye, where the ruins of the old house of the Compton family were examined, and addresses were given by the Rev. W. Powell and Mr. G. Somers Clarke, jun., of Brighton. The latter speaker drew attention to the plan and arrangement of the premises, which seemed to have been rebuilt in 1631. Brambletye House was based on a square, with the main front towards the north. A tall square tower containing small rooms stood at either end of this front, and another tower of which the lower story formed the porch projected from the centre, with a bay on either side. This front was two stories in height. The tower was three stories high, and crowned with square domes of ogee outline—a feature not often seen in the southern counties. The basement of the house was once vaulted, for the springers yet remained in several places.

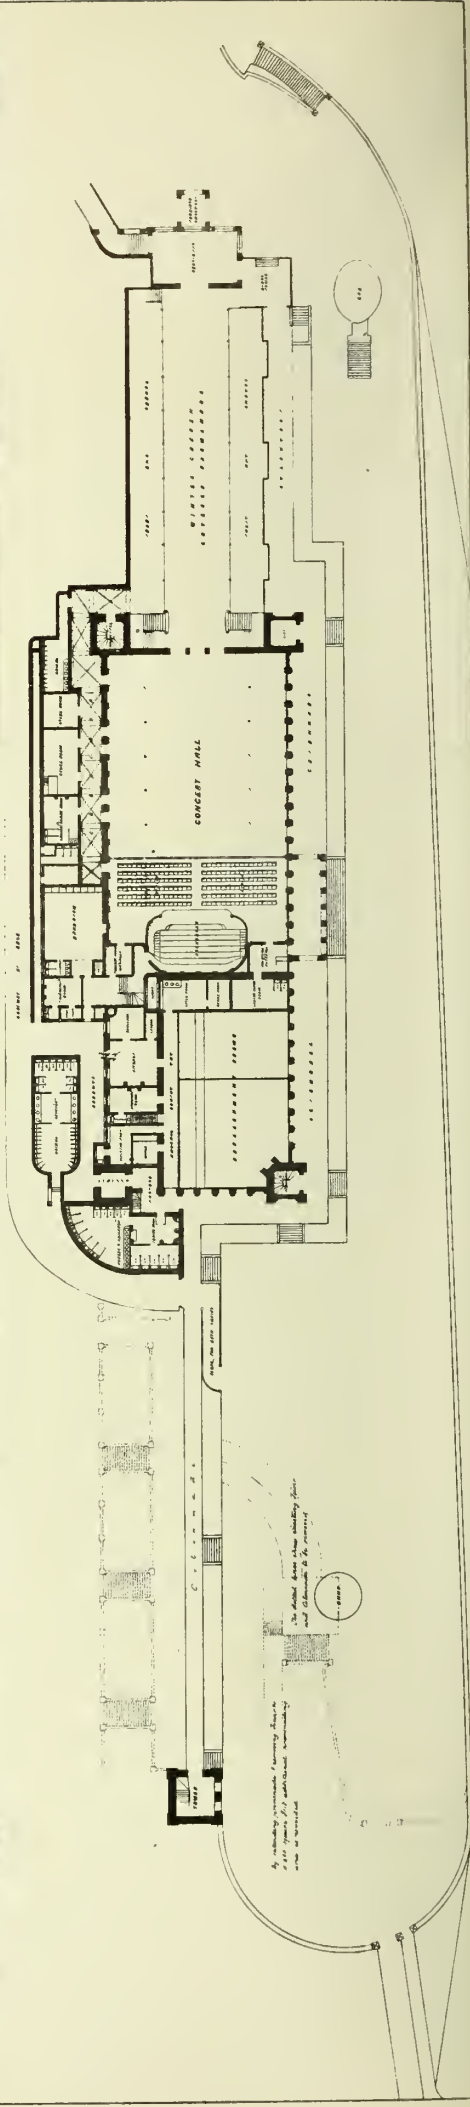

The parish church of Barningham, Suffolk, was re-opened last week after restoration under the care of Messrs. Satchell and Edwards, of 37, Norfolk-street, Strand.

A new reredos has been erected in the Church of St. Barnabas, Bristol, from designs by Messrs. Pope and Paul, architects, of that city.

The Stockton-on-Tees Town Council have elected Mr. James Hall, late surveyor to the South Stockton Local Board, as borough surveyor, vice Mr. Edwards, resigned. There were 91 applicants for the post, to which attaches a salary of £300 a year. Mr. Edwards has been retained as consulting engineer at a salary of £100 per annum.

Mr. Hawes has been elected bridge-surveyor for the county of Norfolk at a salary of £100 per annum. There were 28 candidates for the appointment, which has previously carried with it a salary of but £50 per annum.

ARCHÆOLOGY AT ST. ALBAN'S
CATHEDRAL.

THE following papers relating to the restoration works at, and recent archaeological discoveries made in, the Abbey Church, and now the Cathedral of St. Alban, were read before the members of the St. Alban's Architectural and Archæological Society at the Assembly-rooms of that city, on Thursday afternoon, the 11th inst.

The first paper, contributed by the Rev. O. W. Davys, M.A., of Hemel Hempstead, was entitled

A GLANCE AT THE RESTORATION WORKS IN ST. ALBAN'S CATHEDRAL, FINISHED, IN PROGRESS, AND TO COME.

We are able to look, and that with no small satisfaction, said the lecturer, upon some reparation works of great importance finished, while those in progress require careful observation, and those to come are of a character so important, in order to restore and complete the noble design of this most magnificent building, that we can hardly hope to accomplish them during this generation; cathedrals took generations to build, and even in these days of hurry the longest of them may well take generations completely to restore. In order to take a view of so vast an undertaking as the repair and completion of St. Alban's it will be necessary to glance at what its original architects intended, and what its restorers ought to keep in mind. I am hardly so sanguine as to suppose that all the plans of St. Alban's can be carried out in our day, though the progress already made may well encourage us; but it is our duty to work on by the guidance of a perfect plan, making every step one forward towards the repair and completion of that design, or rather group of designs, which we have original evidence of. We have, then, in the present church, speaking roughly, the designs of three great architects, Abbots Paul, John de Cella, and say John de Hertford—these without the Lady Chapel of Hugo de Eversden. The first designed, and apparently finished, a vast Norman church, the largest in England; the second, as many Early English architects did, endeavoured to add to the Norman nave a western front of extraordinary beauty; the third, as was the case elsewhere, planned the removal of the Norman apse and sanctuary, and the substitution of the richer work of his own day. To complete St. Alban's, then, you must repair and complete the designs of these three architects. The work of the first is now nearly all satisfactorily repaired; the work of the third needs further external reparation; and as for the western front of the second—one of the most remarkable designs in the kingdom—we can hardly hope at present to get beyond the three western portals, which, though common in France, are, I believe, peculiar to St. Alban's in England. I have heard it said that though St. Alban's, from its vast size, is a very grand building, yet that its form is remarkably ugly. But those who thus condemn the appearance of our cathedral must remember that we have now to look upon a very incomplete building, with sunken roofs, the wreck of a west front, and a presbytery, the lofty clerestory of which looks bare and gaunt without its flying buttresses. Given restored roofs, and a completed west front, together with these eastward additions, and we should have a cathedral second to none in grandeur, dignity, and beauty. I should vote for the restoration of the short lead spire peculiar to this district, which till lately crowned the central tower; we have plenty of length at St. Alban's—what we want is proportionate height, which we should make every effort to obtain. Our principle should be to lay down a plan which can in course of time be carried out, and which we can defend against those anti-restoration gentlemen who wish ancient buildings rather to crumble and fall than to be restored, however tenderly, to the condition which their first builders designed for them. I will now glance at such restoration works as are finished at St. Alban's. We may mutually congratulate each other that up to this time, in all that has been done, no single mistake has been made, and that if the work had to be done over again we could not wish it to be done more successfully than it has been; though our work has been

slow, as perhaps it was better that it should be, it has been sure. At a cost of some £20,000 the great church has been made structurally sound, in its future cathedral position, up to the ancient rood screen. True, the roofs of presbytery and transepts have still to be raised to their ancient pitch, but this can be done at any time when it can be paid for, without any injury to the completed work within. The Lady Chapel, too, through the exertions of the ladies of Hertfordshire, is nearly in a condition to be thrown open to the rest of the structure, whenever the unfortunate pathway which has hitherto cut it off can be carried, as it ought to be, round the outside of the building. When the permanent stalls can be provided, form and appropriation will have to be discussed; perhaps, as canopies are so expensive, it might be sufficient to provide them for the return stalls, and those terminating the principal lines of the western piers of the tower, only using arcading behind the others. With regard to the restoration works now in progress, the tide of repair has now left the eastern portion of the building, and is employed in the care of the nave; the Early English bays of William de Trumpington on the south side have been pronounced to be in a dangerous condition, owing to the loss of those natural buttresses which the cloister and adjacent buildings had originally provided, and some £10,000 was required to preserve and repair this beautiful work. It is certainly a great misfortune that this had to be undertaken, as it is swallowing up funds which were urgently needed more directly to advance the cathedral arrangements; but there is no alternative but to save in its integrity a magnificent nave, and restore to the use for which it is so admirably fitted as the church of the parishioners, for of all great naves this has been one of the best to see and hear in. In repairing it I trust nothing may be done which may preclude the idea of the restoration of such of the adjacent buildings as may be practicable for the use of the cathedral (such as the project for the insertion of windows where none existed before), for we should then leave the principle of repair, which has hitherto guided us, and lay ourselves open to a fierce attack from the anti-restoration party. In conclusion, I trust that it may not be long before St. Alban's is able to put on a distinctly cathedral character; nothing will be grander than the restored choir may be made. At present, looking above its temporary fittings, the structure, with its noble roofs of ancient decoration, is imposing in the extreme.

Mr. JOHN CHAPPLE, clerk of works for the restoration, then read the following paper, termed

A FEW REMARKS ON THE RECENT DISCOVERIES
IN AND ABOUT ST. ALBAN'S ABBEY.

I resume my narrative of some discoveries made in the abbey and its precincts, and of the progress of the works since February, 1876. At that period the contracts for the repairs to the choir and part of the Lady Chapel had nearly terminated, and an interval of twelve months took place, during which time comparatively little research was made. During my absence abroad for about eleven months important changes had taken place. In anticipation of the repairs to the nave it became necessary to excavate the earth on the outside of the south wall of that portion of the building. This was carried out under the direction of Mr. Wood, Sir Gilbert Scott's assistant. The object was to ascertain the state of the foundations and the amount of resistance which they were likely to offer as an abutment to the great system of shoring in the south aisle. In doing this Mr. Wood discovered the bases and parts of the shafts of five responds, built against the south wall, showing unmistakably the position of the forensic or outer parlour. These bases have been preserved, and although new buttresses are now being erected in immediate proximity, care has been taken that the antiquary and archæologist shall have every facility for examining them. Mr. Wood also laid bare some of the foundations of the great south-western tower, which was commenced to be built about A.D. 1208, by Abbot John de Cella, who left the work unfinished for want of funds; and it appears that his successor, Abbot Trumpington, although

he continued the building of the nave, stopped short in the work of the erection of the flanking western towers; the original scheme for that one on the south-west being carried out so far only as the putting in of the foundations and the completion in an altered form of the piers and arch leading from the projecting towers to the south aisle of the nave. The height of work is clearly defined where the one abbot ceased to build and where his successor recommenced. This arch was afterwards made use of as an entrance from the nave to the forensic parlour. The Abbey Restoration Committee have decided to have the buried works of Abbot John de Cella exposed to view. The extreme western bay across the nave and aisles will be excavated to a depth of about 3ft., and a noble flight of steps added in order to ascend to the highest level of the nave. The excavation is also to be continued so as to include the floor of the great western porch where the sedilia and vases for a period of four centuries have been buried. John de Cella's scheme was a grand and comprehensive one, being no less than the rebuilding of the whole west front of the abbey, with its three porches and two great towers; also to rebuild the nave and aisles. For this purpose the Norman work of Paul de Caen, westward, was entirely destroyed, except the foundations, and the rebuilding commenced in the Early English style of these foundations. It had evidently been the intention of Abbot John de Cella to vault this portion of the building, and add flying buttresses to support the walls; but he died, leaving the building unfinished; and his successors completed what had been so grandly designed, and, up to a certain point, so artistically executed. This completion was made at a much less relative cost; not only were the two towers omitted, but also the vaulted ceilings and the flying buttresses. Heavy shoring and trusses are being erected in the nave, with the object of assisting in lifting the roof off that portion occupied by the five western Early English bays. That being done, it will be the next endeavour to force the south arcade, with its triforium and clerestory, to an upright position, it now leaning considerably and dangerously towards the south. After that is accomplished the roof will be dropped to its original place on the walls, and flying buttresses erected to maintain the whole structure in its recovered position. In excavating the nave floor for the necessary examination of the south piers, two mutilated stone coffins were found, the upper edges of which were at a depth of 3ft. from the surface. Fragments of tiles are also turned up occasionally, showing the patterns used in this locality. A most interesting and important discovery was made in laying down gas mains in the public way on the south side of the south transept during August last. The workmen were excavating a trench from east to west throughout the whole length of the destroyed chapter-house, when on the north side of this destroyed building, against the south wall of the slype, or locutory, was found a stone seat or sedilia, corresponding in position to a similar one in the slype, and in addition to this was laid bare the north-west angle respond of the chapter-house. The west wall was then followed for about 7ft., and another respond found at an interval of 4ft. 6in. from the first mentioned. The architecture is of the most elaborate description, with zigzag and beaded moulding. I found the internal length of the chapter-house to be 95ft.; the width is unknown, until excavations can be made in the shrubbery adjoining. I have no doubt that a perfect mine of wealth to the architectural world lies under the surface in this vicinity, as when the great destruction of monastic and other buildings took place, the *débris* covered the ground to a depth of several feet, and hence the fortunate though unintentional preservation of the various foundations with the moulded bases and parts of columns. This chapter-house, with the slype adjoining, was, according to the late Rev. Dr. Nicholson, the work of Robert de Gorham, eighteenth abbot. During the past year I was looking over the Dom Kirche in Lubeck, and saw there a brass of about twice the size of the handsome one in this abbey to the memory of Abbot Thomas de la Mare. In the lower border was a representation of the legend of St. Dunstan, and I

was struck with the similarity of the engraving generally to the one here. On making inquiry I found that the artist was lent from Bruges, and that he travelled to Lubeck and to St. Alban's to engrave these brasses. I obtained a print of that at Lubeck, together with some details, which now lie on the table. Now for a little discovery nearer home. About two months ago some alterations were being made in the house in which I reside in St. Alban's, situate in Romeland, on the north side of the Abbey churchyard. About 3ft. below the surface of the ground floor many fragments of raised tiles were found, similar to those now laid in the floor of the presbytery of the abbey, also some pieces of stained glass of the Decorative period, which, from being so long buried, resembled talc, and crumbled readily on being touched. A few words on the Lady Chapel: All the windows except the eastern one have been repaired, every attention having been paid to the refixing of the old details in their original position, adding nothing more in the shape of new work or material than was absolutely necessary. The other necessary repairs to this part of the building are at a complete standstill for want of funds, every farthing subscribed by the ladies of Hertfordshire having been expended on structural repairs. I wish also I could announce that the contemplated public way around the eastern end of the abbey was an accomplished fact, so that the citizens of St. Alban's might have the opportunity to shut up that passage through the antechapel which is a cause of so much desecration. I do not, however, yet despair of seeing this done. On the occasion of the enthronement of the first Bishop of St. Alban's, on the 12th of June last, temporary stalls were fitted up in the choir of a rather substantial, though plain, character, exactly on the old foundations in the Benedictine choir. When the great central tower was under repair a few years since it became necessary for its better preservation to remove the bells from the position they occupied in the bell-chamber to another area, so that their weight should rest in the strongest corner—an arrangement involving the removal of the chimneys, which have since been silent. It has recently been resolved by the committee to re-instate these chimneys with some modern improvements. In concluding these notes I must allude to the recent establishment of a bishopric, having for its episcopal church the glorious old abbey, and the raising of the ancient borough to the dignity of a city. These changes should certainly be an earnest of good things to come in the completion of that work of restoration of which I have given a necessarily imperfect account.

COMPETITIONS.

DERBY SCHOOL BOARD.—In response to advertisement about 50 designs have been received, and are now on view from 10 to 5 daily, until the 26th inst., at the Masonic Hall, Gower-street, Derby. The Ashbourne-road school, to accommodate 1,100 children in four departments, will be erected from the design of Messrs. Coulthurst and Story, of Derby; the second premium being awarded to Messrs. Giles and Brookhouse, of Derby. Messrs. Coulthurst and Story have also been placed first for the Traffic-street school for 700 children; the second premium being awarded to Mr. A. N. Bromley, of Nottingham.

NEW FEVER HOSPITAL, SHEFFIELD.—For this competition twenty designs were sent in, and the following is the result:—1st, Mr. Swan, architect, Sheffield; 2nd, Mr. Wm. Hill, architect, Leeds; 3rd, Mr. D. Dodgson, architect, Leeds.

WELLINGBOROUGH GRAMMAR SCHOOL COMPETITION.—In our notice of this competition we placed the design of Bonner and Mills third. These gentlemen inform us it should be placed second.

It is suggested by some correspondents of the South Wales press that an effort ought to be made by the Dean and Chapter of Llandaff to recover and restore the detached bell tower of the Cathedral, now lost to sight and encircled by cottage property. Mr. John Pritchard, diocesan architect, writes strongly commendatory of the suggestion.

Building Intelligence.

BRAY.—A company is being formed for the purpose of erecting an aquarium and winter garden at Bray, county Wicklow. The object is to erect, on the site known as the Carlisle Grounds, near the Railway station, a building which will comprise a marine aquarium, a floral-hall, and a refreshment and reading-room. The floral-hall will be in the centre of the building, will be furnished with seats, and will have a large orchestra and a suite of artistes' retiring rooms at one end. Mr. J. F. Fuller, of Dublin, is the architect for the scheme.

BRISTOL.—A new Bible Christian chapel is about to be erected at Bedminster, and the foundation stone was laid on Monday. The chapel will be about sixty-six by forty-three feet in the clear, with a main central entrance and lobby, and will seat together 650 persons. The height of the chapel, from floor to the springing of the ceiling, is about 20ft., and from floor to apex of vault, about 31ft. The exterior walls are to be of dressed Pennant stone, with freestone quoins, arches, and other mouldings. Red Mansfield stone will be intermixed in some cases. In the principal elevation a free use has been made of Early French Gothic—the central features being the main entrance double doorway, and large tracery window. The architect is Mr. James Crocker, of Exeter. The contractor is Mr. R. J. Crocker, of Bedminster. The total cost will be about £5,000.

BYKER.—The Leighton Primitive Methodist Chapel and Schools, in Heaton-road, Byker, were opened on Tuesday. The building measures about 76ft. in frontage by 131ft. from front to back. The erections comprise a chapel measuring 64ft. by 41ft., with 600 sittings; Sunday-schools in the rear, 50ft. by 33ft., and two stories in height; and also four classrooms, to accommodate about 600 Sunday scholars. The style is Classic, freely treated. The principal elevation of the chapel is towards the east. The dressings to doors, windows, cornices, &c., have been executed in terra-cotta work, manufactured by Messrs. Graham and Co., of Blaydon. The cost of the scheme is about £5,000. The buildings have been designed by and carried out under the superintendence of Mr. Thomas Parker, architect, Newcastle-on-Tyne.

CITY OF LONDON.—The parish church of All Hallows the Great and Less, Upper Thames-street, was reopened yesterday week after restoration. The tower and vestibule on the north side of the church, which projected far into the roadway, have been removed, and the site on which they stood has been thrown into the street. A new vestry, with a tower for the bells and the necessary offices, have been erected on the south side of the church. The cost of the alterations, with the necessary fittings for the interior, has been very nearly £4,250. The church is famous for its beautiful carved oak screen, supported on spiral columns, which, with the richly ornamental pulpit and reading desk, was presented shortly after the Fire of London by the merchants of the Steelyard, which was in the parish of All Hallows the Great. The church was formerly called All Hallows the More, to distinguish it from that of All Hallows the Less, and before the Fire had a large cloister on the south side. The steeple was much admired, while in 1632 all the aisles were raised a foot and a half, and the pews a foot above that.

EXPENSIVE ASYLUM ANNEXES.—The Norfolk magistrates last week considered in Quarter Sessions the tenders for the new county lunatic asylum buildings, of which the lowest—that of Messrs. Cornish and Gaymer, amounting to £33,290—had been recommended for adoption. Mr. C. S. Read, M.P., and others, thought this very high, for as the buildings—mere annexes—were only to accommodate 117 males and 133 females, it was at the rate of £134 per head, and the county surveyor had said the buildings, if for 200 inmates, would cost about £22,000. The county surveyor explained that the buildings were perfectly plain, nothing but bricks and mortar, with a display round the windows which would cost nothing; but in the estimate there was nearly £2,000 for extension of present chapel, £2,008 for water supply, and

£700 for washing arrangements. He was building an asylum for the city of Norwich which would cost £55,000, and would house 330 patients. Sir F. Powell Buxton said that Caterham and Leytonstone asylums held about 200 patients each, and cost only about £60 or £70 a bed. Earl Kimberley stated that the average asylum expenditure throughout England was £200 a bed. After some discussion the tender of Messrs. Cornish and Gaymer was accepted.

KELSALE.—The chancel of the parish church of Kelsale, Suffolk, has been rebuilt from designs by Mr. R. Norman Shaw—Mr. H. Luff, of Ipswich, being the contractor. The style of the work is Perpendicular, and the cost has been about £2,000. The east window is of five lights, with bold yet delicate tracery. Below the window will eventually be erected a carved stone reredos. The chancel extends some feet beyond the chancel aisle, and in the south wall is a two-light window. In the north wall is another two-light window, in which the old tracery is retained. The roof is an open wooden one of pitch pine. On the north side of the chancel is an arched recess occupied partly by the key-board of the new organ, and partly by the entrance to the two vestries. The rest of the church sadly needs attention, the removal of an unsightly gallery over the south aisle being especially to be desired.

LEEDS.—A new Presbyterian church is about to be erected in Cavendish-road, Leeds. The size of body of church is 62ft. by 46ft., giving accommodation for 443 adults, allowing 20in. to each, the pews all radiating from the rostrum. A gallery is provided at the tower end of church, with accommodation for 157 persons. Under the church is placed a large schoolroom with class-rooms attached, book and store-rooms, duplicate lavatory arrangement, staircases leading to church, a residence for care-taker, and entrance from Cavendish-road and Tonbridge-street. The style is Italian, the principal front being divided into five parts by pilasters, the outer portions being wings occupied by staircases, and the remaining three composed of entrance doors to church and a central tower 17ft. square, rising to a height of 126ft. above street level, divided into five stages. The facade is three stories in height, and will have a rusticated basement of stone, with superstructure executed in red pressed bricks, having stone string-courses and dressings to arched windows, the whole finished at the top with a bold moulded cornice and blocking, and ornamental pedestals at the two corners over pilasters. The cost of the building will be about £4,800. The architect is Mr. James B. Fraser, Park-square, Leeds.

LEYLAND.—A new Congregational church was opened last week at Leyland. Mr. Grant, of Preston, is the architect of the building, the cost of which, with the schools, is about £4,000. The church, which is built of stone, is 62ft. in length by 40ft. in width, and the ground floor will accommodate 380 people. The style is Early Gothic, and the tower, which rises to a height of 80ft. over the main entrance, is of the saddle-backed pattern. Over the entrance to the church is a plate-traceried window, and to the right is the main staircase to the gallery, emphasised by a sharply-pointed roof. A gallery, stretching right across the church at the south end, is capable of seating 120 people, and at the end under the tower there is ample accommodation for the children. At the northern end of the building is a semi-octagonal recess, with a groined ceiling, and this place forms the organ chamber and choir gallery.

MARESFIELD.—The old parish church of St. Bartholomew, Maresfield, Sussex, is about to be restored and enlarged from plans by Mr. John Oldred Scott. The church is in a very neglected condition, and is in need of immediate repairs, while the interior is blocked and disfigured by galleries. These are to be cleared away, and the building extended so as to provide 50 additional sittings. Tenders have been received from 6 contractors, the highest (£4,400), being that of Messrs. Carruthers, of Reigate, and the lowest that of Messrs. Checman, of Uckfield, £3,664. The latter, after reductions in plans, reducing the contract to £3,149, has been accepted. At the same time the chancel is to be restored by the rector, at an additional

cost of £500, and a chapel of ease is to be built in Ashdown Forest. The latter is to accommodate from 180 to 208 persons, at an estimated cost of £1,800 or £2,000, under the direction of Mr. Rhode Hawkins (who has presented his services) as architect.

METROPOLITAN BOARD OF WORKS.—On Friday deputations were received from the vestries of Rotherhithe, Whitechapel, and St. George's-in-the-East District Board, who presented memorials praying that a new bridge, free of toll, may be constructed across the Thames east of London-bridge, the site suggested being to the east of the Tower. The memorials were referred to the works committee. Permission was granted to Mr. Thomas Woolner, on behalf of the John Stuart Mill committee, to erect a statue and pedestal on the Victoria Embankment-gardens, east of the Temple Station. A contribution of £125 was granted towards the cost of setting back Norway Wharf, in Bermondsey-wall, so as to increase the width of the thoroughfare by about 4ft. for a length of 98ft. The Floating Swimming Baths Company recently applied for permission to convert their baths lying in the Thames, immediately at the foot of Northumberland-avenue, into a gymnasium during the winter months instead of a glaciarium as last year. The works committee moved that the sanction be not granted, and that the agreement as to the bath be terminated; but the matter was referred back to the committee in order that the company's secretary may be heard before such a step be taken. On the motion of Mr. Runtz it was "referred to the works and general purposes committee to consider and report what amendments are urgently required in the Metropolitan Building Act, 1855, the Metropolitan Management Act, 1855, and the Acts amending the same respectively, with respect to houses and buildings, and especially to report what amendments are desirable with reference to the width of roads, foundations of houses, buildings and erections, and recovery of expenses relating to dangerous structures, with power to instruct counsel to settle any bill."

OXFORD.—The increased requirements of the University and the growth of the Bodleian Library having necessitated an entire new suite of buildings for examination purposes, it was resolved a few years since that new schools should be built. Plans were chosen by two successive delegacies, but afterwards rejected by Convocation. A third delegacy was appointed in 1875, which invited Messrs Bodley and Garner, Mr. Champneys, Mr. Deane, Mr. Jackson, and Mr. T. O. Scott to prepare designs; each competitor was to receive 100 guineas, and the plans were to be estimated by a surveyor. The design chosen was that of Mr. T. G. Jackson, and this time the consent of Convocation was obtained to the plan selected. The building is now in progress, the past year having been spent in putting in the foundations. The plan consists of a quadrangle standing back from the High-street, surrounded with the examination buildings, or "Schools" on three sides and open on the fourth side towards the east. Between the quadrangle and the High-street a block of buildings is interposed, containing a large hall, the offices of the clerk of the schools, some rooms for examiners, and residence for a porter. Nine *visu voce* schools, with retiring-rooms for examiners, occupy the whole ground floor round the quadrangle, from which all but one of them are lighted. The three large writing schools and two *visu voce* schools occupy the first floor, and are lighted by both sides. The three great writing schools accommodate 200, 200, and 120 candidates respectively, seated at separate tables. The builder is Mr. A. Estcourt, of Gloucester.

RADCLIFFE.—New Church schools were opened at Radcliffe on Thursday week. The schools are planned in the form of the letter T, the top portion being the girls' school, 60ft. by 30ft., and the stem the boys', 50ft. by 30ft. In the event of a meeting the whole can be thrown into one room accommodating 800 persons. The building is of brickwork, with stone dressings. The woodwork inside is pitch pine, varnished. The style is a Late period of Gothic. The total cost will be about £2,400. The architects are Messrs. Maxwell and Tuke, of Bury.

ST. ANNE'S CHURCH, SUTTON BONNINGTON, NOTTINGHAM.—The chancel of this church having been restored has recently been reopened by the Bishop of Nottingham. The church is of a simple and interesting character, erected during the Decorated period upon a site about a mile from its present position, and appears to have been rebuilt upon its present site during the Tudor period. It consists of a chancel, nave, and one aisle, divided by Decorated arches, nearly semi-circular, formed of very small stones, in two orders, and supported upon alternately octagonal and circular shafts, with pleasing capitals of simple character; at the west-end of the nave is a double bell gable, and the whole building groups picturesquely. The chancel having recently given way in some places, it was decided to repair it, at the same time to make it more in harmony with the older part of the work. An inspection was made by the architect some months ago, and he found it necessary to erect a new roof and buttresses to prevent the further spreading of the walls at the top, and to entirely reconstruct the lower part of the walls to the height of about 4ft. above the floor line. Great anxiety was caused by the dilapidated state of the walls, both externally and internally, and more than usual care had to be bestowed upon them to prevent their falling altogether; but, thanks to the patient attention and care of the contractor, they have been saved, and although they now lean outwards at the top to a considerable extent, it is believed they are perfectly safe; they have been supported by large buttresses outside, corresponding with those of the nave. The new works consist of a new roof of pitch pine, with framed and trussed principals, wind-beams, and braces, and an embattled wall-plate, all covered with Swithland slates and red ridge tiles; new stone gable copings, and crosses of Attleborough stone; new floors of encaustic tiles, of antique make, by Goodwin, of Lugwardine; new oak chancel stalls and altar, a stone and alabaster screen, and a beautiful reredos of white statuary marble and alabaster, the subject being "The Last Supper," by Mr. Earl, of Kennington. The whole work has been well and carefully carried out by Mr. H. F. Allen, of Leicester, from the designs and immediate superintendence of the architect, Mr. Edwin Dolby, of 40, Great Marlborough-street, London.

STERNFIELD.—The parish church of Sternfield, Suffolk, was reopened last week, after restoration at a cost of £1,325. Mr. J. P. St. Aubyn was the architect, and Mr. Beedon, of Marlesford, the contractor. Externally the roofs throughout have been repaired and retiled, that of the chancel being entirely new. A little vestry, with organ-chamber adjoining, has been built on the north side of the chancel. The walls of the nave and chancel have been relieved of plaster, and that part of the chancel wall which was built of brick has been rebuilt with rough flints, and the south porch has received a new roof, of open timber inside, and has been generally restored. In the interior the disfiguring west gallery is gone; for the pews open benches have been substituted; a new oak pulpit has been provided; a new open timber roof given to the chancel; the windows reglazed throughout, a new three-light east window inserted, and filled with stained glass; a stone chancel arch erected, and the chancel paved with glazed encaustic tiles by Godwin, of Lugwardine, Hereford. The new oak pulpit was carved by Mr. T. Stopher, Ipswich.

TOPSHAM.—To-morrow is fixed for the consecration of the rebuilt church of St. Margaret, Topsham. The new edifice is not a restoration of what the original church is supposed to have been, but consists of a nave with aisles, chancel, and transepts, on larger scale, and more suitable to the wants of the parish than the first church could have been, whilst the old tower is retained. The dimensions are—nave, 83ft. 3in. by 24ft.; the entire width of nave and aisles, 58ft. 6in.; transepts, in length, 91ft. 9in. by 22ft.; chancel, to which there are aisles and vestry, 34ft. 6in. by 19ft. The style is Early Decorated. The walls are of Torbay limestone, the windows and dressings of Bath stone. There is a low screen of Bath stone, with tracery and marble shafts, between the nave and chancel, and the

stone pulpit harmonises with the screen. The seating is of red deal, with tracery in a portion of the bench ends. There is accommodation for 848 persons, including children, 449 seats being free. The carving is by Mr. H. Hems. The tower, chiefly built of red Kenn stone, had suffered much mutilation. Its facing has been restored, and new windows, consonant with the date, inserted in the place of wood substitutes. The works have been carried out by Messrs. Stephens and Son, Exeter, from plans by Mr. Ashworth, architect. The outlay has been upwards of £5,500.

WAKEFIELD.—The foundation stone of the New Town Hall at Wakefield was laid on Thursday week. Mr. T. E. Colcutt is the architect of the building, which was illustrated in the *Building News* of May 25, 1877. Mr. William Hedsworth is the contractor. The building is to be completed by January 1, 1880. The building will include a council chamber, committee-rooms, a borough court and police-offices, a suite of rooms for the Mayor, rooms and offices for the different departments of municipal work. The principal entrance to the building will be in Wood-street, and will form, with the window above it, the central feature of the elevation. Since the plan was approved some alteration has been made in this entrance, the effect of which will be to bring it more forward to the pavement line, whilst a balcony has also been formed over it. The council chamber will be on the first floor, and will be approached from the principal corridor. It will be well lighted by large bay windows, with stone pilasters and arches. The walls of the room will be covered by wood dado, with richly-moulded panels and carving. It is planned to accommodate fifty councillors, and will have a projecting balcony at one end for the use of the public, who, it was originally intended, should gain admission from the principal staircase. It has been decided, however, on Mr. Street's suggestion, to form a staircase in the tower, direct to the balcony in the council chamber, so that the general public may reach that room direct, without interfering with the arrangements of the building. The public entrance to the Borough Court will be in King-street, and will open into a corridor twelve feet wide, leading by the public stairs to the court on the principal floor. The whole of the elevation in Wood-street, and the return at either end, including the tower, will be faced with best rubbed Huddersfield stone. The whole of the corridors and rooms will be, as far as practicable, of fire-proof construction, on Dennett's principle. All the walls of rooms will be finished in plaster, with cornices and dados in some. The total cost of carrying out the building as designed is estimated at £35,000, which does not include the upper part of the tower, but this could be added at a cost of from £2,500 to £3,000.

YORK.—A new Board school and residence have been completed at Baburth, near Selby. The accommodation is for 100 boys and girls, and 55 infants, and comprises a mixed school-room, 42ft. 6in. by 18ft.; class-room 18ft. by 13ft.; and infants' room 25ft. by 13ft., with lavatories and cloak-rooms attached. The cost, including fittings, will be about £1,800. Mr. Clamp, of Hull, whose design was selected in competition, is the architect, and the work has been carried out by local tradesmen.

The tender of Mr. Lawson, contractor, of Birkenhead, has been provisionally accepted by the Swansea Harbour Trustees, for the construction of new docks in St. Fabian's Bay. Arrangements are being made by the trustees for speedily commencing the work.

The memorial stone of a new Free Church was laid at Nithhill, near Paisley, on Saturday afternoon. The church, which is being built from the designs of Mr. Wilson, architect, Glasgow, stands on an excellent site, given by Lord Glasgow. It will seat between 300 and 400 sitters, and will cost £1,200.

At a meeting of the Sir John Gray Memorial Committee, held at the Dublin Mansion House on Friday, it was announced that a model of the statue had been completed by Mr. Farrell, and that £1,600 had been received in subscriptions.

In consequence of the satisfactory way in which the Tay has been bridged, it was resolved, on Thursday, by the directors of the Forth-bridge that steps be taken with the view to an immediate commencement of the bridging of the Firth of Forth.

PUBLIC HEALTH.

The Leading Journal of Sanitary Science and Progress. The number published October 26 contains articles on Household Economy and Health, Vaccination and Small-Pox Statistics, The Philosophy of Play, Metropolitan Fever Carriages, Missing Links in the Sanitary Administrative Service, The Association of Certifying Medical Officers, The Society of Medical Officers of Health, The Regulation of the Supply of Fresh Air, The Yorkshire Association of Medical Officers of Health, A Smokeless Stove, What Chemical Analysis does not do, New Tests for Milk, Public Health Reports, Legal Intelligence, Water Supply, Intercommunication, The Editor's Table, Cleanings, &c. Price Two-pence. Annual Subscription, Post-free, Eleven Shillings. 31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33l. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

Cases for binding the half-yearly volumes, 2s. each.

"BUILDING NEWS" DESIGNING CLUB.—Received:—Chas. C. Mort. (Your suggestion shall be considered.)—Henry, Leopold, Foster, Guernonprez, Beginner. (You do not say what competition rules you require. Do you mean our club rules?)—John Weaver, Caulbour, Jacobs, Jag, B in 2 circles, Fleur-de-lis, L in G., Another for Hector, Laborateur, Leizlad, A. C. Lanyon. (Your suggestions shall be noted.)

DRAWINGS RECEIVED.—Robt. A. Bushby.—Wolstencroft and Son.—H. T. Sugden.—G. H. Goldsmith.—J. M. Brookes.—Joseph Gibson. (We do not think it has been published.)

RECEIVED.—H. G. C.—J. O. P.—J. P.—C. H.—H. W. M.—J. T. L.—S. T. H.—T. S. H.—J. R. W.—W. W.—H. E. J.—S. & H.—G. B.—J. B.—A. W. R.—F. J. McK. J. P. (Published by Spon, 48, Charing-cross.)—AN OLD SUBSCRIBER. (Your query is an advertisement.)

THE QUANTITY QUESTION AT SOUTHAMPTON.—(Mr. J. O. Parmenter has sent us an unnecessarily long vindication of his views in reference to the "quantity question," and his recent motion at Southampton, which we cannot find room for; but he fails to touch the main issue raised by us—namely, whether a town surveyor is justified in taking out his quantities for work done under his supervision. The facts he relates are of a purely local and isolated character.)

Correspondence.

CLEOPATRA'S NEEDLE.

To the Editor of the BUILDING NEWS.

SIR,—As Cleopatra's Needle will probably be here in a few days, and, as far as I know, nothing has been definitely settled as to the place of its erection, I should be glad, with your permission, to say a few words on the comparative merits of the various sites that have been suggested.

It will, I think, be universally accepted by those at all conversant with art matters that an obelisk should form a central point in a symmetrical architectural composition.

Greenwich Hospital seems to me to afford a site in every way admirable. The style of the building is large and palatial, its square is ample, it has a noble terrace to the river, the opposite side of the square is flanked by two beautiful domes in pleasing contrast to the needle-like form of the obelisk, while the space between the domes, through which we see the distant park, presents a most beautiful background. In this respect Greenwich is almost unique. The composition has no central building. Indeed, this site seems almost made for an obelisk, and has only one objection. It is too far from London. People seem to expect a more central position.

The front of the Royal Exchange, the very heart and centre of the crowd and bustle of our great city, would, of course, in this respect,

be pre-eminent, and this site, with a re-arrangement of the statues, might perhaps be made respectable; but the buildings in Cornhill are not only totally wanting in uniformity, but their commanding height so dominates the Bank that the want of symmetry would be disagreeably obvious, and the general proportion and lines of the Royal Exchange are not sufficiently horizontal in character to enhance the beauty of an obelisk.

The same remarks apply to the front of St. Paul's, while the space should be at least four times what it is to admit such an architectural feature with any propriety.

The front of the British Museum, though comparatively deserted, is free from these defects, for the facade is more horizontal in proportion, while the centre is flanked by projecting wings—important advantages in this matter. The style, too, is more simple—I had almost said more Egyptian, than that of either St. Paul's or the Exchange, and there can be no question that the Alexandrian obelisk would find an appropriate resting place in our national museum of antiquities. But there is one obstacle, and, I fear, that an insurmountable one. English officials have a mania for railings. Unluckily they do not often put up handsome ones, but the railings in front of the Museum are so massive and handsome that there is even less chance than usual that they will be removed. They completely spoil the effect of the building, and I have no wish that the obelisk should share the same fate.

With a proper arrangement of the avenue and a symmetrical plan, the front of Buckingham Palace would afford an unexceptionable site, though perhaps not equal to a central spot in the parade-ground of the Horse Guards.

The site that has been spoken of on the Thames Embankment, where the obelisk would appear above the centre of the new floating bath, is quite out of the question, for the size and proximity of the railway bridge and station would take away all sense of symmetry.

Far better would it be to place it on the centre pier of Waterloo-bridge, for though such a position is not free from objection, the obelisk would have a more imposing appearance from such an eminence than in any other site I can think of, and since the Embankment has cut off one of them, the river is spanned by 8 instead of 9 arches, and we get what is unusual, a pier instead of an arch in the centre. By substituting square for the present circular columns, the pier would be made, æsthetically as well as practically, sufficient for so imposing a burden.

The site in Palace-yard, on which the wooden model is now erected, seems the worst that could be found, for symmetry is impossible; while the general proportion and lines of the surrounding buildings, especially of the clock-tower, are exactly those which neither set off the beauty of an obelisk nor are themselves in any way improved by it.

Were it not for an expense which it would be vain to expect our Government to incur, I would suggest the re-erection of the noble semi-circular colonnade, once the glory of Burlington House, now prostrate and overgrown with grass on the banks of the river in Battersea-park. If this were combined with a stately flight of steps, having Cleopatra's needle as the centre, we should have a most striking feature in a reach of the river which, flowing as it does between two parallel embankments a mile in length, seems to be peculiarly adapted for architectural display.

The front of Chelsea Hospital, on the opposite side of the river, is already occupied by the paltry obelisk put up some years ago to the memory of the officers and men who were killed at Chillianwallah. This has lately been taken in hand by the gardener, and with its accessories now presents an excellent example of everything we should avoid.

I will mention one more site—Portland-place. No doubt that handsome but somewhat dreary street would be improved by such an ornament, but the houses are not of sufficient architectural importance to deserve it.

In conclusion, I will put down the foregoing sites in what appears to me the order of their architectural merit:—Greenwich, 1; British Museum, 2; Battersea-park, 3; Buckingham Palace or Horse Guards, 4; Waterloo-bridge,

5; St. Paul's or Royal Exchange, 6; Portland place, 7; Palace-yard, 8; Floating baths, 9.—I am, &c.,
PHILOSYMMETRE.

PRINTS IN THE BRITISH MUSEUM.

SIR,—From Mr. Stephens' letter in your current number, any one would suppose you had attacked the officials in the print-room in the very interesting, and I regret to say too true, account of its mismanagement which you gave on Friday week.

Owing to the extreme kindness and attention of the gentlemen in charge it is possible for students like Mr. Stephens and myself to work in the print-room without losing our time. But the writer of your article is, from my point of view, quite right in asserting that, as a means of public instruction, the print-room is practically inaccessible, and its contents hidden.

Let me put the case of a schoolmaster who would show some of Holbein's, Dürer's, or Hollar's masterpieces to a class of boys or girls studying art. We have the finest drawings of these and other masters in our possession, and we seclude them from the public eye. I am always sorry to hear that the Museum has had a fresh bequest, unless a condition is attached to it such as Mr. Slade attached to his—namely, that the objects be exhibited. As it is, the Slade prints are placed in the darkest part of the King's Library, and ostensibly for want of room—want of room in the dark place, I suppose—only a portion of the collection is shown. This is certainly not the fault of any official in the print-room.

Could we find out where the fault lies, we should know who is to be blamed for the absurd and vexatious regulations of the reading-room. It would not, perhaps, be very hard to name names, but this is not the place or the time.

Let me remind you of a sentence in one of the newspapers last year:—"No country has drawings equal to those in England, and no country but England would keep them concealed."—I am, &c.,
W. L.

Burlington Fine Arts Club, Oct. 19.

THE MECHANICS OF ARCHED IRON ROOFS.

SIR,—The article in your last is calculated to do some little mischief to those who read it, and expect to find themselves advanced in knowledge thereby. Several gratuitous references to the "practical builder," who, so far as I know, has never yet had occasion to design a large roof, disfigure the article; but much worse than these is the off-hand way in which the investigation is treated. The writer commences by stating that "the iron rib . . . is capable of resisting strains of any kind . . . since the whole is united in one continuous beam," and yet the whole investigation is a very cumbersome attempt to find the stresses, on the assumption that the rib is hinged at the crown. The most usual object of the continuous arch is to reduce the horizontal thrust, and inasmuch as the thrust varies inversely as the rise of the curve of equilibrium, it follows that it will pass above the rib at the centre if the designer's wish is effected. Now, it is necessary to observe that these arched ribs but rarely fit exactly between the supports, and that a very small springing of the foot causes a very great variation in the position of the curves, and in consequence of this the rib readjusts itself to a considerable extent. How it does this has been well shown by Mr. B. Baker in his paper on "Arches" in the little work entitled "Beams, Columns, and Arches," and the result is to show that an uniform section to provide against bending is not far wrong. Of course the direct thrust is greater at the springing than at the crown, and more metal is consequently required there.

The whole investigation is exceedingly unsatisfactory, and the number of formulae quite unnecessary for the result aimed at. When the purlins are far apart and the rib shallow there is a strong tendency in the rib to buckle between the loaded joints; consequent on the discontinuity of the curve of equilibrium this does not appear at all. Nothing whatever is said about the rib as a long column, or about the direction of the pressures from the purlins, which are not unfrequently so arranged as to throw all the tangential components on the walls

y means of secondary rafters, the purlins only exerting a normal pressure on the rib. The raphic method affords easy solution for any proposed loading and for any irregularly-shaped rib, and is being adopted by engineers almost the entire exclusion of algebraic computations.

Starting with the profession of regard to the practical builder, why not have taken the centres of gravity from cardboard moulds? It is certainly simpler and clearer to the mind; and why introduce moments of inertia which are not considered requisite for large engineering structures? To teach, our pupils must be ready to learn and properly grounded, and not "practical builders," and we must be accurate and plain in statement.—I am, &c.,
October 20th, 1877. C. G. H.

THE CHURCH OF ST. PETER, REGENT-SQUARE.

SIR,—In your issue of last week appears a design by Mr. W. Scott Champion for renovating the interior of the above church, and without attempting a criticism of the design, except to say that if carefully worked out in detail it promises a successful divergence from the stock interiors of the day, I should like to make a few remarks which the descriptive account accompanying the design have suggested. It appears to me somewhat singular that the particular portion of London in which the Church of St. Peter has been erected is favoured with an example of a church in the Gothic style, and another in the Classic style, each I think the very quintessence of unadorned and unmitigated ugliness; the Gothic structure is in Tavistock-place, and is now advertised for sale, and I have not sufficient patience to describe its faults. The man or woman who designed it is probably sleeping with his or her fathers, and may be or she rest peacefully! The Classic study is that of St. Peter, Regent-square, and in the descriptive account above referred to there occur the words: "Still withal there is a vast amount of good design, and a capital proportion in the building, and it has been the desire of the architect to make the present structure a thoroughly church-like interior without destroying the characteristics of style." Now, Sir, I should be sorry to criticise any work without being able to point out clearly the bases upon which the criticisms rest, but as regards the interior of this church, I should esteem it a favour if Mr. Champion or anybody would inform your readers, not where a "vast" amount, but where any amount, the least bit, of good design is to be found in this church, either in proportion, arrangement, or detail; or, in fact, any one redeeming feature in the most depressive, gloomy sepulchre I know. If Mr. Champion does not intend to destroy the "characteristics of style," however he has succeeded in producing the design you publish I cannot conceive.

Mr. Champion makes no mention of the exterior of the church, which is one of those erected at a time when church designers appear to have had the Choragic monument of Lysicrates upon the brain; but he who designed St. Peter's Church had more than this, for he has, as quantity surveyors would say, *timesed* the monument. Except as regards order, two monuments has he stuck one on the other, and both stuck on the roof behind the portico, out of all proportion with the church, and apparently very much surprised how they got there, and how it is that they keep up. The north and south windows of the church are lanky, and the relation of the semicircular heads to the openings and the pilasters, as a matter of detail, is execrable. The stone pilasters, which are probably intended as responds to the angles of portico, are absurd. They are practically flush with the face of the wall, and carry nothing but wretched ornament on the caps—the whole of the mouldings throughout are the very worst that could be found in the style, or want of style; and it is to be hoped that any restoration of the interior of this church will be accompanied by the total abolition of the two monuments over the portico, and the re-use of the stone as far as practicable in the new tower or steeple, which should be erected, not in "the characteristics

of the style," but in harmony with the proposed new interior. The other portions of the exterior might be satisfactorily dealt with without much expense.—I am, &c.,
WILLIAM WOODWARD.

KENSINGTON VESTRY-HALL COMPETITION.

SIR,—We beg to enclose you for publication copy of a letter we have addressed to the chairman and members New Vestry-hall Committee. Possibly, the other gentlemen who were selected by the referee will co-operate with us in the matter, and forward their views through the medium of your columns.—I am, &c., ONE OF THE EIGHT SELECTED BY THE REFEREE.

[Copy.]

"To the Chairman and Members Vestry of St. Mary Abbots, Kensington. (Vestry-hall Competition.)"

"GENTLEMEN,—We have read in the professional papers recently published that neither of the four selected or premiated designs for the above can be carried out for the respective amounts of tenders submitted therewith. Under these circumstances, we beg to submit that the authors of the remaining designs recommended for adoption by Mr. Whichcord should now have the opportunity of sending in detailed estimates, or that there should be a fresh competition among the eight.—We are, &c.,

"THE AUTHORS OF ONE OF THE EIGHT
"London, Oct. 22." "DESIGNS.

Intercommunication.

QUESTIONS.

[5164.]—Surveyors' Charges.—A builder on his last legs submits a low tender for a job, and is accepted. The contract is signed, and in a few days the creditors of the builder are called together, and a receiver appointed to liquidate the estate. The surveyor who took out the quantities has never sent an account to the receiver, nor has any notice of a meeting of creditors been sent to him. The employer has paid the surveyor, and deducted the amount from the balance due to the receiver, who has completed the contract. The receiver argues that the charge for quantities should be paid to him so that he could hand the surveyor a shilling in the pound. Opinions on this will oblige—SURVEYOR.

[5165.]—Girders.—Girders are said to be supported only, or fixed at their bearings. In the latter case (say, in a cast-iron girder) the flanges need not be so strong as in the former one. But what is the precise meaning of the word "fixed"? Should that (say, bolts) which fixes the girder be of equal strength with the flange itself, and should that to which it is fixed be something that will keep perfectly rigid during the time that the beam is fully loaded? I presume that the slightest yielding at that point would result in the girder becoming a supported one only, and the flanges consequently not equal to their work.—LANGHAM.

REPLIES.

[5163.]—Testimonials.—The legitimate thing to do would be to get the persons giving the testimonials to re-write them. If the applicant altered the name and dates with the intention of deceiving it would clearly be forgery. There can be no reason why the alterations should not be made by the individuals who gave them. If I were on a selection committee, and ascertained testimonials had been so tampered with, I should think something detrimental to the character of the applicant had occurred between the date of the original testimonial and the application. No professional man of honour would so alter his testimonials—he would send them as originally written.—BOROUGH SURVEYOR.

The Galway Guardians discussed on Friday a letter from the Local Government Board last week, asking for plans and specifications of the alterations now being executed at the workhouse by Mr. McDonald, when it appeared that Mr. Brady, the architect to the board, had not been consulted in reference to the work. A member pointed out that Mr. Brady's services ought either to be dispensed with altogether, or he should be treated as the board's architect; and on a division being taken, it was decided that Mr. Brady superintend and certify on the repairs and alterations now going on.

The foundation stone of a new Board school for 40 children was recently laid at Adlingfleet, near Goole, by Mr. R. C. Empson, of Goole Hall. The architect is Mr. Robt. Clamp, of Hull, and Messrs. Jackson Bros., of Goole, are the builders.

A bridge over the Arun, between Houghton and Amberley, has just been rebuilt in stone at the joint cost of the county of Sussex and the Duke of Norfolk. Mr. F. D. Bannister was the engineer, and Mr. Bushby the contractor, who undertook to build the new structure for £3,050, but who has also been paid an additional £500 for extra works of foundation and piling executed according to Mr. Bannister's orders.

LEGAL INTELLIGENCE.

IN RE T. F. COOKE.—This case was last week again before the London Court. The bankrupt, Thomas Frederick Cooke, of the Napier Works, Blackfriars, and Lancaster-road, Lower Norwood, builder and contractor, was adjudicated on the 4th inst., and an application was made on Thursday for the appointment of a receiver and manager of the estate, with a view to the completion of certain valuable contracts. Mr. Registrar Brougham declined to make the order, but intimated that the court would be prepared to entertain an application by the petitioning creditor for leave to advance the funds necessary for the completion of the contracts, and to be recouped by the trustee, when appointed, out of the first moneys properly applicable to the purpose. The application was accordingly renewed in that form. His Honour made the desired order.

IN RE J. F. AND E. VAN CAMP.—The debtors, Jean François and Edward Van Camp, carrying on business as builders and contractors at Kilburn-rise, have failed for £230,000, returning their assets at about the same amount, and the court recently appointed a receiver and manager of the estate and granted an interim order restraining various actions.—Upon the application of Mr. Herbert, his Honour now continued the injunction, and also granted a further interim injunction against several other suing creditors.

LOST PLANS.—At the Saffron Walden County Court on the 16th October, an action—Wright v. Clay—was heard, in which £5 17s. 6d., balance of account for building a house at Littlebury, was sued for. Mr. Naylor, for defendant, said that when plaintiff was employed defendant furnished him with plans and specifications. They had applied to plaintiff for the plans, so that they might see whether the work was completed according to them, but plaintiff had never produced them. Mr. B. F. Ackland, for plaintiff, said this house was built in 1874, and over £300 had been paid for it; the defendant had had opportunity to ascertain whether it had been built according to contract. His client had searched for the plans, &c., but could not find them, and he believed he had delivered them to defendant; at all events they were missing. The county court judge (Mr. Edmund Beales), considered there was no substantial defence, and gave judgment for plaintiff.

LIGHT AND AIR, OBSTRUCTION OF.—Chancery Division.—Spottiswoode v. Godbold.—Mr. Willis Bund, on behalf of the plaintiffs, moved *ex parte* for an interim injunction till next Wednesday, to restrain the defendant from carrying up some new buildings so as to obstruct the light and air enjoyed by the plaintiffs. Plaintiffs are the Queen's printers, who have a branch office on the west side of Chancery-lane. On the eastern side are being erected some magnificent buildings, in place of some small houses and shops, which some few years ago were pulled down. These old buildings, it was said, were 43ft. high, and the plaintiffs had discovered that the new buildings were to be of the height of 63ft. The additional height, they alleged, would interfere with their light and air, especially on the first floor, which was used by employes engaged in drawing plans for lithography. The width of the lane at the point in dispute was, from house to house, 37ft. On the plaintiffs giving the usual undertaking as to damages, his lordship granted an interim injunction against the defendant till next Wednesday, restraining the defendant from erecting his buildings so as materially to interfere with the plaintiffs' light and air.

PARTNERSHIP AND BANKRUPTCY.—At the County Court, Newport, Monmouthshire, on Monday, a claim by Messrs. Turner, Lanphire, and Co., of Newport, was made for £19 1s. 4d., balance of building materials supplied in October and November, 1875, to it, was alleged, Messrs. Day and Palfrey, builders, of Hereford, who were carrying out a contract at Newport. Since the work was done Day had filed a petition in bankruptcy, and plaintiffs now sued Palfrey, on the ground that the goods were ordered by the firm of Day and Palfrey. Evidence was given for Palfrey, to show that the goods were for Day's sole use. Judgment was given for defendant, the judge being of opinion that Palfrey did not hold himself out as Day's partner.

SPECIAL RATES FOR PAVING NEW STREETS.—WORSHIP-STREET POLICE-COURT.—During the hearing of a number of summonses, taken out by the Vestry of the parish of St. John's, Hackney, against owners of house property therein for non-payment of paving rates, an important question as to appeal against parish ratings was raised. Most of the summonses were heard *ex parte*, the defendants not appearing, and the order for the payment of the amount claimed, with imprisonment in default of sufficient distress, being made in their absence. Those defendants who did appear complained that the rate was excessive, one gentleman saying that he was charged £13 5s. for paving the footpath in the front of his house. The rates, one for the paving of a road exceeding £1,000, were proved to have been made, and allowed by the Vestry, and the apportionment to the defendants was also formally proved. Mr. Busby told those defendants who complained that they had a right of appeal against the rate, but it must be made before the allowance.

To this it was said that there was no knowledge when the rate was to be made. One defendant complained that the Vestry had things so much their own way that it was impossible to appeal. He had been called upon to pay £130 at a moment's notice. Mr. Bushby said that the sum was undoubtedly large, but he could not give time. His function was merely ministerial—to make the order for payment or to send the defendant to prison in default. The parish must be applied to for time. On behalf of the Vestry, it was said that some three months had passed since the assessment, and those who held over were unfair to those who paid at once. The right of appeal against ratings was to quarter-sessions, but it may be mentioned that periodically the rate-books for the parishes over which the court has jurisdiction are brought to the court for the magistrate to make the allowance, which is done in a purely formal manner. The rates are proved, the books are produced and signed, and it is then that the parishioners should appear to appeal, but do not. Mr. Bushby, when making the orders in those cases which came before the court, told the defendants that if they had not appealed he was unable to help them. He advised them to look after their parish matters for the future.

LATERAL SUPPORT.—"NEIGHBOURING LAND." **WHAT IS IT?**—A point which appears never to have before arisen was decided in the case of the Mayor of Birmingham v. Allen (37 L. T. Rep. N. S. 207), reported by us last week. The long series of cases relating to the right of one man to lateral support for his land or for the buildings erected upon it from the soil of another, consists entirely of decisions upon points arising in disputes between landowners whose lands have been contiguous. The terms "neighbour," "neighbouring lands," and "adjacent lands," have been universally employed to express the relation between the persons and properties of the disputants, and a body of law regulating the rights of "neighbours" with regard to this subject has gradually grown up, but the question as to what constituted such a "neighbour" and such "neighbouring lands" was never decided. A definition of these terms by the Master of the Rolls in the case above mentioned has been fully adopted by the Court of Appeal in confirming his decision. This definition we shall mention hereafter, with the facts to which it was applied, but we would first wish to remind our readers of the general law as deduced from the series of decisions above-mentioned. Every landowner has, as an incident of property, a right to the lateral support of the land "adjacent"—that is, contiguous to his own. But if he chooses to build on the extremity of his land he has not, as an incident of property, a right to the lateral support of such adjacent land for such building. He has no right by loading his own soil to increase his neighbour's liability to support it without a grant to that effect. Such a grant will be implied by law after an uninterrupted enjoyment of such lateral support for twenty years. If, however, the soil upon which the building is erected has been excavated, the lateral support necessary from the contiguous lands must evidently be much greater, and in such a case a grant will not, it seems, be implied unless both the building and the excavation beneath it are twenty years' old, and the owner of the adjacent land was during that period aware of the existence of the excavation. Possibly since Lord Tenterden's Act (2 & 3 Will. IV., c. 71, s. 2) the proper basis for such a right is no longer an implied grant, but the mere lapse of twenty years, though this is by no means certain; but whether that be so or not the result is the same, inasmuch as the proper construction of that Act requires that the easement should have been enjoyed for twenty years under a claim of right, which it could not be if the owner of the servient tenement was unaware of its existence. The case of the Mayor of Birmingham v. Allen was as follows:—The action was for an injunction to restrain the defendants from working the mines or minerals lying near to the plaintiff's land in such a manner as to cause its subsidence. The plaintiffs, the Corporation of Birmingham, were the owners of a piece of land whereon were erected certain retort houses and other gas works, some of which were upwards of twenty years old. The defendant was the owner of a piece of land situate at a short distance from the gasworks. Between the gasworks and the defendant's land a strip of land intervened. This strip had been conveyed in 1834 by the company to a third person, and such person had, more than twenty years ago, and to the defendant's knowledge, excavated the soil beneath it for the purpose of getting coal. There was evidence that if this intervening strip of land had not been undermined the defendant might have worked his coal on his own land up to his boundary without injury to the plaintiffs' land, and he would therefore have had a right to do so. The question was, whether the intermediate excavation by a third party could have the effect of lessening that right. It is clear that if the defendant was to be considered the plaintiffs' "neighbour," and his land "neighbouring" or "adjacent" to the plaintiffs' land, as those terms are used in the decided cases, he could be restrained, if his mining operation became dangerous to the plaintiffs, inasmuch as their buildings were more than twenty years old. It was argued that all landowners must for this purpose be considered to be a man's neighbours whose operations do in any remote degree injure his land. The Master of the Rolls, however, was of opinion

that the term could not have so wide a meaning. "The neighbouring owner," said he, "for this purpose, must be the owner of that portion of land—it may be a wider or narrower strip of land—the existence of which, in its natural state, is necessary for the support of my land. That is my neighbour for that purpose; as long as that land remains in its natural state, and it supports my land, I have no right beyond it." "There might be land of so solid a character, consisting of solid stone, that a foot of it would be enough to support the land. There might be other land, so friable and of such an unsolid character that you would want a quarter of a mile of it; but, whatever it is, so long as you have got enough land on your boundary which, left untouched, will support your land, you have got your neighbour, and you have got your neighbour's land, to whose support you are entitled." The above definitions were unanimously adopted by the judges in the Court of Appeal, and it may now be considered as settled that a man's "neighbour," who is bound to afford natural support to his land, or (if such a right has been acquired) to the buildings upon it, is the owner of that land which in its natural state would have afforded the necessary support. If this were not so, a man might be made liable for, and the value of his property greatly deteriorated by, the acts of another, which acts he would be, by no possible vigilance, in a position to prevent, and a responsibility which he did not originally bear would be cast upon him by the acts of a stranger. The judgment of the Master of the Rolls, therefore, which has been fully confirmed by the Court of Appeal, is in accordance with every principle of natural justice.

THE RIGHT OF LAYING DOWN GAS PIPES.—An adjourned summons against the Wimbledon Local Board, for refusing to permit the Mitcham and Wimbledon Gas Light Company to lay down a certain gas main pipe under the footway in the Merton-road, came on for hearing last week at the Wandsworth Police-court. The proceedings were taken under the 9th section of the 10th of Vict., chap. 15, which provided that, in a dispute, a plan should be determined by a magistrate. The company wished to lay the pipes under the footway on grounds of economy and safety to the public; the board, on the other hand, wished the pipes to be laid under the roadway to suit the convenience of pedestrians, and because it was intended to cover the footpath with asphalt.—Mr. Bridge was of opinion that the gas company had a right to put down the pipes where they liked, and that the highway authority had to see that they were put down in such a way as not to be detrimental to the public. But both parties did not agree to that construction of the Act, and asked him to decide in what part of the road the pipes should be placed. He said he had listened attentively to both sides, and he had been to see the road. The safety of the public was the only thing to be considered, and he was of opinion that the best place to lay the pipes was under the footway. He added that he would back up the surveyor of the board in any plan which he thought was the best for carrying out the works.

IN RE J. F. AND F. VAN CAMP.—This case, which came before the Court of Bankruptcy on Friday, was a heavy failure in the building trade. The debtors, who have presented a petition for liquidation, are described as of Station-terrace, Kilburn-rise, builders and contractors. Their liabilities are stated at £230,000, with assets to about the same amount, consisting of stock-in-trade, plant, fixtures, debts, and freehold and leasehold property.—Mr. F. S. Herbert, for the petitioners, mentioned the case to the court, and asked that Mr. S. Lovelock, accountant, should be appointed receiver and manager, and for an interim injunction to restrain actions.—His Honour granted the application.

STAINED GLASS.

LIGHTCLIFFE CHURCH.—The members of the family of the late Sir Titus Salt, Bart., have put up a large stained glass window in his memory in the west end of the above church. Figures of Noah, Abraham, Moses, Samuel, and Daniel are introduced, and under each figure is represented an incident taken from the life of the personage represented above it. The work is richly coloured upon a silvery-white ground. The inscription reads:—"In memory of Titus Salt, first Baronet, born Sept. 30, 1803, died at Crow Nest, Lightcliffe, December 29, 1876. This window is erected by his children." Messrs. Heaton, Butler, and Bayne, London, were the artists.

MELTON MOWBRAY.—A new stained glass window, by Messrs. Wales and Co., of Newcastle, has just been erected in the parish church of Melton Mowbray. The subjects are "Faith, Hope, and Charity," illustrated by Biblical examples of those virtues.

WATER SUPPLY AND SANITARY MATTERS.

FALKIRK.—Plans for the drainage and sewerage of the burgh, prepared by Mr. James Deas, C.E., Glasgow, were submitted to the Falkirk Town Council on Friday, and after examination remitted to a committee that the probable cost of carrying them into effect may be ascertained. Mr. Deas pro-

poses to divert several small burns into the sewer and to build new sewers, inverts and culverts, so that the discharge may take place into the river Carron, within the limits of the tidal flow.

SOUTHWRAM, WEST RIDING.—The Local Board of Southwram, having applied to the Local Government Board for sanction to borrow £700 for carrying out a scheme of drainage and water supply, an inquiry was held before Mr. Samuel Joseph Smith, C.E., inspector, on Friday last, when the details of the scheme were explained by the engineer who has planned it, Mr. Horsfall, of Halifax, and several minor alterations were suggested by the inspector. The sewerage proposal is to carry the sewage in 12in. pipe to Cromwell Woodbottom, where it will be passed through two settling tanks, and afterwards disposed of in irrigation on an area of about 30 acres of farm land.

CHIPS.

A new bank for the London and County Banking Company was opened at Redhill, Surrey, on the 1st of this month. It is a Classical building, and was erected from the designs of Mr. Edward Larmer architect, Reigate, the works being carried out by Messrs. Holdsworth, builders, of the same place.

A new school has been commenced at Dutton for the Dutton School Board, by Mr. Davies, builder, Frodsham, from the designs of Mr. Edmund Kirby Liverpool, architect to the board.

The Town Council of Barnsley were informed on Tuesday that 122 applicants had appeared in answer to an advertisement for a foreman mason, and 8 applicants for the post of surveyor. The appointments to these offices were adjourned pending further inquiries as to the candidates by a committee, whose choice will be by no means a restricted one.

The new post-office for Rotherham was opened on Wednesday. The new building is situated in Westgate, and was formerly used as the railway station of the Midland Company, but has been altered for its new purposes by Mr. John Garlick, of Saltley Works, Birmingham, at a cost of £4,000. The public-office and letter-sorters are on the ground floor, the telegraph instruments being on a store added above. The building is of stone, and the fittings are of the best description.

The independents of Hucknall Torkard, near Nottingham, have decided to erect a new chapel and schools on the site of the present structure. Messrs. Smith and Heathcote, Mosley-street, Manchester are the architects.

The foundation stone of the new Yorkshire College, at Beach Hill-grove, Leeds, was laid by the Archbishop of York on Tuesday. Mr. A. Waterhouse has prepared the plans for the entire collegiate building, but it is only proposed at present to build on the ground level, so as to accommodate the textile department as the only funds in hand are the £10,000 given for the object by the Clothworkers Company of the City of London.

The organ in Lisburn Cathedral was re-opened on Sunday, after enlargement and repairs executed by Messrs. Telford and Telford, of Dublin. Improvements are about to be made in the churchyard and in the approaches to the cathedral.

The Cottingham School Board have appointed Mr. Robert Clamp, of 20, Scale-lane, Hull, as their architect. The Board are about to erect a school for 300 children in St. John's-wood—a rapidly extending district in the suburbs of Hull.

The Mirfield Local Board, at their meeting last Wednesday, appointed Mr. M. Helliwell, of Hebden-bridge, surveyor and inspector of nuisances, at a salary of £150 per annum. There were 42 applications.

The first stone of the church of a large monastery about to be erected at Cowfold, Sussex, for the monks of the Order of St. Brune—a branch of the Grand Chartreuse de Grenoble—was laid on Tuesday week.

At the fortnightly meeting of the Stockton-on-Tees urban sanitary authority, held on Friday, the surveyor (Mr. Edwards) reported that John Ewbank had deviated from the approved building line of a new thoroughfare to be called Eggleston-street. The width should have been 35ft., with permission to project bay windows on either side 2ft. 6in. from the wall line; but as carried out the width is but 34ft. 6in. Proceedings were ordered to be taken against Ewbank, the owner, and Alfred Sawden, the builder, and also against several other persons, for not adhering to the plans submitted and approved, in the matter of sculleries and widths of yards.

Wisbech Town Council have asked the Treasury Commissioners' sanction for borrowing £6,000 for the purchase and laying out of a new cemetery.

It was decided at a meeting held in the County Buildings, Ayr, on Friday, to take steps for establishing an archaeological society for the counties of Ayr and Wigtown. Earl Stair, K.T., was nominated president, and a committee was appointed to draw up constitution and rules.

Our Office Table.

AMERICAN ART, like American Literature, has a cause to be ashamed of itself, and there is herefore no reason why some of its professors should be so dishonest. We have once or twice before had to rebuke some of these gentlemen who, with a coolness that is to be envied by honest people, have appropriated some of our own possessions. But the most barefaced instance of the kind that we have ever come across, has just been brought under our notice by Messrs. Cox and Son, of Southampton-street. The offenders are Lang and Nau, a Brooklyn firm of upholsterers and furnishers. These highly respectable tradespeople have just issued a catalogue of mediæval art furniture, and every page of it is copied from Messrs. Cox and Son's Catalogue, except the title page, which seems to have been begged, borrowed, or stolen from another London firm. An ingenious attempt to disguise the theft has been made in some cases, but generally the Yankee firm seem to have been convinced that Messrs. Cox and Son's arrangement could not well be improved upon, and they have accordingly appropriated page after page just as they stand in the English original. The introductory paragraphs to the catalogue, and a horrible design on the back page are the only original things about the book, and they are rubbish. How flattered Messrs. Cox and Sons must feel if an old proverb is true!

The people in one part of Anatolia, according to Captain Burnaby, have a very economical way of building their habitations. The man who is old enough to take unto himself a help-mate, and who is about to leave his father's roof, marks a piece of ground, generally of an oblong shape and on the side of a hill. He next digs out the earth to the depth of about 7ft. Then, hewing down some trees, he cuts six posts, each about 10ft. high, and drives them 3ft. into the ground, three posts being on one side of the oblong and three on the other. Cross-beams are fastened to the tops of these uprights, and branches of trees plastered down with clay cover all. A few planks, with a hole made in them to serve as a doorway, inclose the outer side of the building, and a broad heavy plank closes the entrance, hinges being replaced by strips of cowhide. A wooden railing divides the room into two parts; one of them is tenanted by the sheep, oxen, camels, and cows of the proprietor, and the other by himself and family. No partition wall separates the cattle from their master, and the smell which arises at night from the confined air and from the ammonia in the building is excessively disagreeable to a European. In cold weather a hole in the roof, which serves as a ventilator, is stopped by a large stone.

THAT the ritual and precedents of the Church of England require the font to be at the west end, and near the entrance of its churches, is evident, and no architect who studies the objects of the building he is designing would think of placing it anywhere else, even if he did not place a proper baptistery for the font's reception. But to place the font immediately

in the centre aisle is always a questionable procedure, especially when the steps are so arranged that little more than a foot is left on either side for passage way; and this has been done, to the evident inconvenience of worshippers, in the singular but clever church of St. Agnes, Kennington-park, lately built by Mr. G. Gilbert Scott. Here on Sunday last we saw a lady thrown headlong in consequence of the unreasonable planning of the font's steps, if not of the font itself. We did not expect such a mistake as we have just alluded to from such an architect, and we mention it as an example of what to avoid.

An interesting discovery of so-called Druidical remains has been made this week on Beckhampton Downs, Wiltshire. They consist of a circle of stones about 50 yards in diameter, with an "entrance" or gap on the turf on the eastern side. The stones show marks of fire, suggesting a cremation theory, are all recumbent, and very small, only about two or three feet in length. About 24 or 25 stones have been raised, but the excavation of the circle has not yet been completed.

CHIPS.

Lanside-road, U.P. Church, Glasgow, has been re-opened after completion of extensive alterations and repairs, effected from the designs of Mr. Alex. Skerving, architect, of the same city. The ceiling has been lined with wood, and varnished, the seats cushioned, windows stained, walls decorated, and pulpit removed to a fresh position.

Plans have been prepared by Mr. C. Pertwee, of Chelmsford, for the improvement and modernisation of London-road Congregational chapel in that town. The present flat ceiling is to be removed, open benches substituted for high pews, lohhies and vestry to be enlarged, and a ventilation system carried out, the total cost being estimated at from £1,500 to £2,000.

Saffron Walden Town Council have finally decided to purchase the gas and waterworks, and to give £6,400 for the former and £10,300 for the latter undertaking.

Extensive alterations have just been carried out in the Dorset County Hospital, under the direction of the executive committee, with the aim of improving its sanitary condition.

A workmen's supper was held at Castle Cary, Somersetshire, last week to celebrate the completion of the Camnock-terrace by Messrs. Seaward, contractors. Mr. W. J. Allen, clerk of the works, presided.

NOTICE OF REMOVAL.

Makers to the QUEEN, H.R.H. the PRINCE OF WALES, and the Bank of England.

Throat Irritation.—Soreness and dryness, tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jujubes. Glycerine, in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in 6d. and 1s. boxes, labelled "JAMES EPPS & CO., Homoeopathic Chemists, 48, Threadneedle-street, and 170, Piccadilly, London."

Trade News.

WAGES MOVEMENT.

EDINBURGH.—The following circular has just been issued to the "Master Plasterers of Edinburgh, Leith, Portohello, and Vicinity," with a view to bring about a change in the working arrangements of the trade:—"The United Operative Plasterers having had under consideration the manner in which the plaster work in a number of buildings in and around the city has been executed for some time back, resolved that it was their duty to do their utmost to prevent employers who may contract for work at an unremunerative rate, with the hope that they will get men to do the work in a manner at once detrimental to the best interests of masters, the public, and the trade, from underselling the employers who wish to execute their work in a fair and honest manner, at a fairly remunerative rate. The United Operative Plasterers will decline to do three-coat plaster in any other manner than the following, viz.:—All angles properly straightened with a rule; walls and ceilings to be slack-floated and hand-floated with water; all the finishing coat to be hand-floated and polished."

LONDON.—A meeting was held on Saturday evening at the Spread Eagle, Charles-street, Tottenham-court-road, comprised of delegates from the Amalgamated General Union and non-society men of London belonging to the carpenters and joiners, for the purpose of obtaining from the employers a rise in wages and a diminution in the hours of work. It was resolved: "That in the opinion of this meeting, composed of delegates representing the carpenters and joiners of London, the time has arrived when we can ask for a reduction of the hours of labour and an increase in our wages."—The present aspect of affairs in connection with the strike of the operative masons in London represents both parties as being confident of success. The masters have gone to America, France, Germany, Italy, and Belgium for labour, with a certain amount of success, and the men represent themselves as being no worse off, but even better than they were three weeks ago. With respect to the importation of foreign and provincial labour, the only point where such labour is having a trial is at the new Law Courts. The stone yards on the building have never yet been entirely closed, but last week a great impetus was given to the works by the introduction of about sixty Italian and German masons. There are also about thirty Englishmen in the same shop. The foreigners went to work yesterday week, and on Friday last, as the Italians were leaving for their lodgings, they were set upon and hooted by a mob of roughs. They went to work on Saturday morning, but it is stated that they have not since left the scene of their labours, having been provided with hammocks in some of the cellars of the new building. This influx of nearly one hundred masons has set the works going again, and the eastern building is being paved with the stone which has been cut and squared by the machines during the past ten weeks. On the other hand, the men are equally confident. So far from there having been three hundred masons recently discharged, the central committee state that the number of men on strike is about the same, or a trifle under what it was three weeks ago, the number in receipt of strike pay being about 650. The central committee also boast that their funds show a better state than they did at that period. The amount then paid to the men on strike was 18s. per week. This was increased, on the 6th inst., to 20s., and last week the committee paid 21s. to each man, showing that the levies come in regularly and in sufficient amount to carry on the work they are engaged in. Some of the delegates who went over to the Continent, with a view to checking or stopping the importation of foreign labour, have returned, and they speak hopefully as to the result of their mission. Reports of their journeys will be submitted to the next general meeting of the union.—The first contingent of 58 masons engaged through the Master Builders' Com-

CHAPPUIS' PATENTS

REFLECTING LIGHT.—DAYLIGHT REFLECTORS

OF EVERY DESCRIPTION, ALSO

ARTIFICIAL LIGHT REFLECTORS.

P. E. CHAPPUIS, Patentee. Factory: 69, Fleet Street, London, E.C.

N.B.—DIAGRAMS AND PROSPECTUSES ON APPLICATION.

mittee in America arrived in London on Wednesday. Eight or ten of the new arrivals at once deserted, and were taken away by the English masons on picket in cabs. The Americans allege that they were told in New York by the agent that there had been a masons' strike in London, but that it was ended. The men also complain of the great discomforts of the voyage. The men are to be employed by Mr. Booth on the new Temple buildings. It seems not unlikely that they will accept strike pay, which, it would appear, the strike committee are in a position to give them if they join the men on strike. On Wednesday the Italian and German masons brought over to work at the New Law Courts remained inside the hoarding surrounding the building. They require the aid of several interpreters, for they have come from various districts and speak several distinct dialects. The strike committee are as confident as ever, and they say that they do not in the least fear the importation of American and foreign masons. The funds of the committee are stronger than when the strike commenced, and they are paying increased strike allowance to the men who are out.

MANCHESTER.—The Executive Committee of the Manchester Master Builders' Association have informed the representatives of the men on strike that in their opinion "it is undesirable to renew negotiations" with a view to a compromise.

ST. HELENS.—The joiners at St. Helens, after having been on strike for 23 weeks, have resumed work on the terms offered to them by the employers before they struck on the 1st of May last—viz., 8½d. per hour. This is the same wage as is paid at Liverpool, and ¼d. per hour less than the Manchester joiners receive.

WOLVERHAMPTON.—A Wolverhampton correspondent states that negotiations have been carried on between England and Germany, which have resulted in German builders and contractors having expressed their readiness to undertake work in England with their own men. These they will bring over with the requisite foremen. In pledge of their resolution to carry through any work upon which they may enter, they are prepared to sign contracts for its completion within specified dates under a heavy penalty. They say they shall meet any opposition by simply placing themselves under the protection of the German consul.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—ADVT.]

Holloway's Ointment and Pills.—At all seasons throat and chest complaints are more or less prevalent. It should be universally known that their relief and subjection can be radically effected by this treatment, which every one can safely carry out without losing precious time or risking present and prospective danger.

CHURCH METAL WORK.

Altar Rails, Alms' Dishes, Coronas, Candlesticks, Communion Plate, Mediaeval Gas Standards, Lecterns, Screens, Trowels, Vases, Gates.

Through the widespread reputation which these goods have gained, many makers have been induced to send into the London and other markets spurious imitations, which are only COLOURED by a chemical process, and will not bear any comparison for strength, durability, &c., with the genuine article.

Gold and Silver Medals Awarded at Paris and Brussels Exhibitions.

JOSEPH HAMBLET WEST BROMWICH, STAFFORDSHIRE.

COPINGS FOR WALLS, STRING COURSES, BUILDING BRICKS,

FOR RESISTING DAMP, BEARING GREAT STRENGTH, &c., &c. Made from this Material.

THE BUILDING NEWS.

LONDON, FRIDAY, NOV. 2, 1877.

SCIENCE AND TRADITION IN DESIGN.

There is rapidly being created in France a school, at the head of which stand, perhaps, MM. Littré and Taine, which devotes itself to the culture of pure taste in regions other than those of the High and Fine Arts, conventionally so called. Of course they appeal to larger classes, and to a more popular ambition, since the French are a nation of working inventors and inventive workers, every one of whom hopes, through some happy idea, to rise above the ordinary level. But, of recent years, it has been discovered that this is rather an instinct than actual power, and accordingly the Practical or Technical Institute of Paris will, for the future, direct its forces towards the organising, as it were, of an immense amount of suggestive ingenuity which is at present wasted. No doubt the preliminaries of these associations are invariably tedious. They are immersed in discourses on æsthetics and the other alphabets of study, but M. Lèveque speedily emerges from these clouds and goes to Nature for an allegory in illustration of his solid subject. The nest of the swallow is exactly what it was when the swallow was first created, the throat of a man is precisely similar in London and in the Pacific Islands, and the bee has not improved upon his architecture since she began to build. This is an old argument, yet we shall see to what use it is put by the Parisian Practical Institute, with its lectures and demonstrations. They commence by asserting that a genius for design is not acquired, is inborn, is a matter of necessity in the individual—that Phidias was created to be a sculptor, Raffaele a painter, and Mozart a musician. They insist, moreover, that the beautiful arts have been influenced by circumstances almost innumerable—climate, personal temperament, the reign of peculiar tastes, religious and political, hereditary and social accidents, and that even whole populations are acted upon in a similar manner—as the Swiss and Germans with their toys, the Red Indians with their painted skins and wampum; and, in the history of mankind, a thousand other illustrations of the human imagination struggling towards art. It is to be regretted that the learned discussion just opened should confine itself so exclusively, or almost exclusively, to sculpture and painting, because, in a hundred other forms, their study might be varied. They themselves, indeed, supply a proof of what is here said. Says one of the members, "From the window at which I write I perceive the Dome of the Invalides, which is a mile and a half from my house. At this distance it appears 75ft. high. If I want to paint it from the place in which I am, and I want to represent it realistically as it is, I shall exhibit rather the dome than the main structure. I give its actual proportions, and leave the others out of the account. They are not in my sight, and they are not for my work." This is no more than a passing exemplification of the spirit which is passing over French, and therefore all Continental art of the present time. Not a few examples are given us as warnings of the pernicious tendency that exists. Thus Charles de la Berge, a painter of unquestionable talent, some of whose works hang in the Louvre, has been adopted as a master by a certain section of the school already referred to. He was a painter of the ultra pre-Raffaellian type—allowing this term to have any meaning at all—his notion of art consisted in reproduc-

ing every minute detail of circumstance and fact. If he had to represent a house he mounted to the roof and painted every separate tile, every decaying chimney, every invading patch of ivy or moss. "Nature thus," he said in his lecture to the Institute, "teaches us design," and so, he added, "will a school be henceforth founded." It is founded, though whether owing to the enthusiasm of M. Charles de la Berge may be doubtful.

The French academies of painting are wonderfully superior in their theories of colour and grouping, but woefully wrong in their ideas of perspective. This is admitted by their most eminent art critics. Thus, in the very Salon of the present year, an eminent landscape-painter, intending to have a rock in his background, brings it down into the front of the canvas, and splashes the sea upon its base. The effect is striking, but the art is nowhere. It is this want of principle in design which mars and wastes so much of the inherent French genius for all work requiring fancy and thought. Between the ideal and the realistic, in fact, the students of the Quartier St. Germain frequently lose themselves, and allow their mythological traditions to get the better of their efforts in design. At the same time it is curious to observe how they, "pupils of the Romans and the Florentines," as they term themselves, make a great ostentation concerning aerial and linear perspectives, borrow effects from the photographic apparatuses, talk about the inexorable application of mathematical laws, dilate upon geometrical systems, and finally, sit cynically down to their easels, saying, "A man, in these times, to be a painter, must copy without scruple." But that, we are glad to think, is only the irony of a young and, as yet, unsatisfied generation. Even from it, however, arises, through the new Institute, a protest against the profanations of photography. It makes, we are told, the hands and feet of the human figure too large. It violates the laws of perspective, it paints beauty out of sight as with a brush, and it is a fraud upon the genuine painter of portraits. M. Charles Lèveque, entrusted with the drawing up of this report, does not explain how or why he came to make it so miscellaneous. There can be no objection, however, to the introduction as studies of chiaro-scuro, or colours of all kinds, which are essential to the understanding and progress of art; and, indeed, in the matter of colour, the French have more of the Roman than of the Pompeian genius, and would be far better if they were refined down by a few degrees. To get rid of this excess would be, in truth, to get rid of the great French fault in art, as perhaps in other things—exaggeration; and yet, as our new teachers ask us, what is more indispensable to the arts of all kinds than light and tints? They were among the blessings of the Pagan heavens—

Et lumine vestit
Purpureo.

Colour, so far, was made more important even than design, regarding this latter as merely a question of outline and form. But the professors of the Institute have not neglected their other functions. They propose an inquiry, full and exhaustive, into what Burke called "the infallible splendours of the sculptor." The sculptor, it must be admitted, is put upon an uncommon ordeal before them. He must, they say, possess a perfect knowledge of dynamics, anatomy, geometry, and perspective. These conditions being satisfied, he must on no account be guided by the same principle as the painter, since their pursuits and the maxims of them are totally different. He has to consider whether his statue is to be placed in a niche or upon a pedestal; far above or near the ground; solitary or in association with

a group or a building; in a Classic, a Gothic, or a "no-character" neighbourhood. A really great artist, said M. Beulé, can make his own perspective; but then he spoke of Paris and Berlin, of Frankfort and Munich, and not of London. But the Practical Institute is not discussing monuments and the architectural adornments of cities alone. It urges that all through the common ways of life a certain idea and spirit of art may be followed, and even forced, if necessary, for a time, in order to banish all familiarity with ugliness, with vulgarity of form, and with those grosser notions which are too apt to be mixed up with our traditions of the popular life. To this end, indeed, the "Applied Æsthetics" of M. Sutter point with a distinct aim. He says that neither in architecture nor in sculpture, neither in painting nor in decoration, neither in pottery for the poor nor in furniture for their households, need anything extravagant be aimed at. Let them teach themselves in their own schools, he adds, and they will soon find out the value of their learning.

The subject is distributed by the new Institute under several heads. The first, as already indicated, includes architecture and sculpture. "Are there any laws with reference to these?" is the question to be tentatively asked all over France, presently. There are magnificent works in existence; there is a lineage of artists belonging to French history; but, say the preliminary investigators upon this commission, in a spirit somewhat new—"may we not turn from the secrets of the dead to discover the possibilities of the future?" This is one among the tasks undertaken, as we understand from documents, by the Parisian Practical Institute. It will be abortive, we fear. The future must discover itself. But, it would be unjust to represent the passing movement as simply a repetition of enterprises, denials, proofs, and experiments. A keen and certain test has been applied, and will be applied again, to those who challenge the verdict of the Parisian Institute. For example, the fidelity of the portrait, in comparison with that suppositiously related to it; the genealogies, as it were, of the two pictures; the translation from the real to the ideal, and thence back again, and, finally, a concourse of criticisms, each or all of which might assist at a middle-age revival, with no absolute results whatever. In the preliminary studies of the Parisian School of Design, now alluded to, it has been shown that the canvases of Léon-Baptista Albert were mistaken for those of Leonardi da Vinci, and that Jean Cousin passed himself off, unconsciously though, twenty times as Albert Dürer. We discover in this a secret. As the fashions of Spanish ladies in dress are the most easy to imitate, because they never change, so the fashions of the Low Countries in art are equally facile of emulation in a mechanical way, because they belong to an unchanging—possibly unimprovable—school. But we must not be led too far out of the way by the enthusiasm of M. Henri Delaborde, who falls through nineteen centuries from the ivory and gold of Phidias to the architect of the Baptistery at Florence, and the preferences, in point of design, accorded to Raphael. There, no doubt, the arts of decoration and design took a new turn. They were not in the style of Rubens; they were not in the style of Holbein; they no more belonged to the manner of Velasquez than they did to that of Claude Lorraine. And yet, through them all the art of design rose as if by imperceptible degrees, until it became a growth visible to the whole artistic world, and the pencil of Ingres became a rival to the brush of Titian. There was another artist at that time who might have made a name, but was prevented by the conceits of a

king. Denner, who could paint a living portrait on his finger-nail, was employed by the Fourteenth Louis to model portraits of his favourites in common sealing-wax; to draw monochromes of the statues in the gardens at Versailles; to model, even, dead bodies in wax. Yet this unfortunate man was, and still is, styled a great master in design! The commission just instituted is intended precisely to examine into these pretensions, especially with reference to Paris—whether, for example, the famous School of Fine Arts is worthy of the admiration it has excited, or the vestibule of the Palace of Justice—a poor Corinthian structure in the most imitative style—the vaulted gallery from the Place Napoleon III. to the New Louvre; the dome of Saint Augustin, or the interior of the Holy Trinity. There is no pretence of picturesque design, of course, in the new Central Markets, though the Parisians claim a great deal on account of their globular roofs and miserable approaches; but, if we would pursue the real topic raised by the Institute, we must leave these barbarous erections out in the cold and the darkness, and enter within the warmer halls of art, whether industrial or not, where the true sense and spirit of intellectual industry are represented, and where another Morshaussen might say:—"I regard my workmen as being artists, artisans, labourers—all in one." The French, however, perhaps even more rapidly than the Germans, are cultivating the taste in workmanship of which their industrial rivals have scarcely, as yet, formed more than an idea.

DESIGNERS AND DRAUGHTSMEN.

IT is quite evident that the designer and the draughtsman are seldom combined in the same individual. Architectural competitions force this conviction more strongly upon us every time there is a combination of plan and artistic draughtsmanship brought together. We seem invariably to detect the plan-designer and the elevation artist as two different individuals, inspired by two opposite qualities, in the same manner as men of knowledge, and men of wit and taste have long been known to be inimical. These separation of the ability and ingenuity required in plan design from the talent for expressing an elevation has indeed become so marked a fact in the practice of architecture that there are few who will dispute it. Even the public—not the most intelligent critics of works of architecture—have come to the conclusion that the "prettiest and showiest" drawings they see on the walls are the work of men not adepts in constructive skill—in fact, not designers of buildings, but designers of pictures—something that cannot be carried out for the estimate. We have often overheard the remark from men who have learnt to know the result of these contests of skill, that "elevations are misleading," or "it may look very well on paper," &c. Even committees are getting a little wiser, and seem to know that in architectural competitions they have to contend against artistic tricksters in colour, and competitors who manufacture their drawings, and they accordingly begin to prohibit coloured drawings, and sometimes perspectives, as delusive. Competing members of the profession, and their number is very large, begin also to understand their own chances and risks; they know their own strength or weakness, and they therefore often fortify themselves by engaging the talent of an expert in competition drawing. It is not surprising that this should be so, as every individual competitor is open to do the same, and enlist on behalf of his design the graces of colour, or the dexterous touch of the artist's pencil. Everything is fair

in love and war, and as our enemies may profit by our latest improvements in the construction of ironclads or breechloaders, competitors think it fair to acquire all the tactics they can. To meet this demand a large number of competition artists or experts have been called into requisition, who, it may be permitted to say, do little else than prepare perspectives or elevations from the rough sketches of their employers, or who, in a large number of cases, prepare—we will not say design—the elevations to meet the caprice of the individual, or the fashion of the hour, or the plans. These men, of whom we have no wish to speak in anything but in respectful terms, become *ipso facto* part-competitors. Hence within the last few years have sprung up a large number of nominal architects, or we would rather say architectural *modistes*, who cater to the popular fancies or styles of the day, who perhaps scarcely or never design a building *ab initio*, and who divide the honours of skill with those who, without their aid, would have been left in the "cold shade." We cannot but regret the results of the system in the true interests of architecture. We do not complain of a division of labour so far as design and draughtsmanship is concerned. It is impossible for an architect of large practice to personally work out the detail of every building he designs, nor do we complain of those architects who, as specialists, devote themselves to the design of elevations, or the decorative portions of architecture, but we protest, in the name of true architecture, against the wholesale "manufacture" of architectural designs—that is to say, the system of "designing" by deputy, by which the architect commissions another to manufacture a design for him—plan, elevation, and all—or so far to design it that the elevation is made the chief consideration, and the plan made to meet it. We could mention a dozen or more architects of standing in their profession who persistently adopt this system, and who virtually forfeit the title to be considered architects at all. They are certainly not architects in the sense that the ancient master-mason or Renaissance designer was: they may call themselves such, as a commercial perfumer or gastronomer calls himself an artist, but in no other sense. Art to them has come to be regarded as a manufacture that can be left to subordinates, and other hands. To their honour and sense of independence it must be said that some of the leaders of the profession set their faces against this system, that their work as a rule, bears the impress of their skill and their taste, and in some instances of their pencil. This wholesale "manufacture"—we can hardly call it design—of our buildings has intensified the public feeling against the honesty of architects; it has widened the breach between the practical builder and the architect, and has led to Government works being designed by their own officials. It has done still more irreparable mischief in the ranks of the profession itself. A class of specialists has arisen who are practically winning works out of the hands of the well-trained architect; the true art-architect is being ousted on one side by engineers, and on the other side by expert draughtsmen. Only the "commercial" architect, who cannot perhaps design at all, and who never gives himself the trouble to do so, obtains the windfalls in public competitions by "doing the right thing"—getting an expert to prepare designs for him, and paying a commission for his brains. Every now and then we hear of an unpleasant though profitable *exposé* of this joint authorship. A disagreement takes place—the artist claims the authorship, and the public profit. Competition, no doubt, has largely contributed to this system of things, and it may be argued that the public get the full value of this

division of labour. But they do not. In manufactures, division of labour is beneficial. In the design of a building, if the plan were prepared by a specialist well versed in the kind of structure, and the elevation designed by some one capable of expressing artistically that plan, the employer would undoubtedly be the gainer; but this combination is rather thwarted than otherwise, from the simple fact that the "designer" is not in this case interested in bestowing thought. The interests are divided, and, as a rule, the commercial architect employs one who can express *ad gustum* and *ad modum*, rather than design well for the purpose. In short, a trashy kind of merit is valued more than honest design. Unfortunately, too, the *prestige* of competition has favoured this kind of art. Dean Stanley the other day, addressing the students at St. Andrew's, expressed a sentiment that admirably represents the popular feeling for architecture, and those who cater to please it. He said, "The very attempt towards pleasing every body discovers a temper always flashy, and often false and insincere." Now, it must be admitted, there is a very strong tendency to do this in competition. Hence, not only the advantage of educated and enlightened juries, but educated committees of selection. Verdicts, as we have lately seen with regard to the now famous Penge case, have been given in almost direct opposition to medical testimony, by the prepossession of the mind, influenced by an able judge, and gifted oratory. Competitions without number have been decided upon wrong premises, and under the influence of trickeries of colour and drawing. But in art matters the fallacies of the *ad captandum* means used by the draughtsman have far more chance of being injurious than a judicial decision, simply because only the trained architect or critic can divest the design before him of the unnecessary forms, and realise the structural effect of the plans and drawings. As the skilled and eloquent advocate can build a superstructure upon certain facts, so the expert draughtsman can throw a charm over a plan utterly bad—a thoughtless and haphazard design—while close by the side of it may be a plan or a few rough elevations divested of every artistic finish that may not captivate the popular mind, but which may transcend the former in every substantial merit as an architectural composition. In one or two recent competitions this disparity has been too evident to be overlooked. To instance the recent Hove School competition, we noticed several plans of merit coupled with elevations that would do discredit to a pupil of two or three years' architectural training. The authors of those plans would have done well to have employed some one to design their elevations. Again, one or two of the best elevations have badly-arranged plans which no committee could accept. If the good plans could have been united to the architectural elevations both the plan and the elevation designer would have stood a better chance; and we may here mention that the selected design displays the combined advantages of skilful plan and elevation to a degree that constitutes it the best in the competition. So rare is the combination of good planning and elevational design that critical visitors to many of our recent exhibitions of drawings—such as those of Leeds and Wakefield, to say nothing of smaller competitions—could not have failed to detect the great divergence between the plan-designer and the elevation draughtsman. We know many men who can sketch an elevation, but who have not the patience or manipulative skill to elaborate it. Only a few of our leading architects are masters of plan and elevation. Mr. Waterhouse, Mr. Street, Sir Gilbert Scott, Mr. Norman Shaw, are architects who can com-

bine the two qualifications necessary to produce satisfactory architecture: on the other hand, there are hundreds of ingenious planners who make bad designers, and many good designers of elevation who cannot plan at all. So manifest is this that we are obliged to confess the two functions are not common, and frequently inimical; in fact, we have noticed that the plan-designer may be quite unskilled as a constructive architect, and may have a very imperfect acquaintance with building. The art-architect as designer very seldom possesses both qualities. This diversity of talent leads us to analogous instances. Addison, Molière, Pope, Hogarth, and Swift were better writers than conversationalists—in fact, the ablest conversationalists and wits have been indifferent writers. The pen is well known to be the extinguisher of oral wit or brilliant conversational qualities. In architectural design it would seem that a similar law prevails.

Our present method of architectural instruction leaves much to be desired. The pupil articted for a term of years is made to copy plans and elevations as if they had no connection farther than that one gave the length and divisions of the other. The draughtsman takes the plan, ticks off the windows and doorways, &c., plots them on his sheet, raises his verticals, and sets off his heights from a sketch; but the idea that the elevation should be made to express the arrangement, to pronounce certain features of the plan and the construction, is completely disregarded. The connection of the two processes to produce an integral whole is never taught systematically, and we consider more architectural reputations are wrecked upon the want of relation between the study of the plan and the external design than upon any other subject in the practice of the profession. The considerations that should determine the setting out of a plan, such as those presented by the programme of the requirements and the nature of the structure, site, &c., we have lately referred to in these pages. The conditions that should regulate the elevation should spring also primarily from these, and the artistic conception while free to exercise unrestricted power should be governed by the axial distribution of the apartments, and by those known and definite characteristics of art-expression which best fulfil the purpose of the building. The separation of plan-design from elevation-design must be considered rather the result of our imperfect system of architectural synthesis than the rational result of a true method or education, though if the proper correlation be established by it, there may yet be some hope for the author of a good plan to be successful in his orthographic design. There are very few plans that do not admit of artistically conceived elevations, but the fault is that they are studied apart. Very often the artist has only the position of the openings and main floors to guide him; he is ignorant of the surrounding buildings, the width of street the façade will face, the point of view from which it will be generally seen, or the leading idea of the plan itself. How, we ask, can a satisfactory result be expected? It is like cutting and fitting the garment to a dummy instead of the wearer. As a consequence, we get stock designs, cut and dried architecture, and inventive skill is sacrificed to stereotyped individualities.

BAHAMA AND TRINIDAD TIMBER.

THERE are many timber trees here which have such valuable properties that it will be worth while to enumerate a few, commencing with Bahama. The cedar of that island is used principally in house-building, for door and window frames, piazza posts, sills, girders, &c. It grows on several of the Bahama islands, but

is found in greater abundance on Andros Island, and its size, when full grown, is from 16 to 20ft. in length, and 1ft. in diameter. It is generally cut 10 to 16ft. in length, and from 5 to 8in. square. The branches are used for boats' timbers. This is one of the most durable of the Bahamian woods. It is a soft, close-grained, rather light wood, possessing the pink hue, and emitting the fragrant odour of the common pencil cedar.

Horseflesh mahogany is sold at fancy prices here, when good specimens are offered; but in Bahama it is principally used in house-building, and the branches and crooked trees for ships' timbers. It is a very durable wood, and grows on several of the Bahama islands, but is found of large size and in greater quantities at Andros Island, where it grows to about 20ft. in length and 2ft. in diameter. It is, however, seldom brought out of the woods of that size, for want of proper means of conveyance. It is a hard, fine-grained wood, and exhibits numerous open cells.

Dogwood.—The principal uses made of this wood are for feloes of wheels, and for ships' timbers. From its toughness and other properties, it is better adapted to the former purpose than any other of the Bahamian woods. The tree does not attain any considerable size, and is generally crooked. A rather soft, open-grained, but very tough wood.

Stopper Wood is principally used for piles and for wheel-spokes. It is a very strong and durable wood, and grows from 12 to 16ft. long, and from 6 to 8in. in diameter. It is found on all the Bahamian islands, and is an exceedingly hard, fine, close-grained, and very heavy wood.

Lignum Vitæ grows on several of the Bahama islands, and is generally exported to Europe and America. The principal use made of it in the Bahamas is for hinges and fastenings for houses situated by the sea-shore, or in the vicinity of salt ponds on the out islands, where, from the quick corrosion of iron hinges, &c., metal is seldom used.

Bahama Satinwood, so well known in the London market, and also called yellow wood, grows abundantly on Andros Island, and others of the Bahamian group, and to a large size. It is a fine, hard, close-grained wood, showing on its polished surface a beautifully-rippled pattern. Bahama mahogany grows abundantly on Andros Island, and others of the Bahama group. It is not exceeded in durability by any of the Bahama woods. It grows to a large size, but is generally cut of small dimensions, owing to the want of proper roads and other means of conveyance. It is principally used for bedsteads, &c., and the crooked trees and branches for ships' timbers. It is a fine, hard, close-grained, moderately heavy wood, of a fine, rich colour, equal to that of Spanish mahogany, although probably too hard to be well adapted for the purposes to which the latter is usually applied.

Crab Wood is mostly used for picture frames, and small ornamented cabinetwork, &c. It seldom grows larger than from three to four inches in diameter, and is a rather hard, fine, close-grained, moderately heavy wood. The heart-wood is of a beautifully-veined Vandyke brown, its external edge bright black, and the albumen of a pure white.

Trinidad.—The balata is a timber extensively used for general purposes, and much esteemed. Its diameter is from 2 to 6ft. The mastic is also held in high estimation, and varies from 2 to 4ft. in diameter. The gru-gru, which is a palm, yields beautiful veneer, as also does the gri-gri. For some of these trees it will be observed that we have no vernacular names, consequently the choice lies between the nature and the botanical name. The heart-wood of the butterwood only is used. The beauty of the wood is well known, but it never attains a large size. Its recent layers are of an uniform yellowish white colour. The carapa bears a considerable resemblance to cedar, and is extensively used, and much esteemed. It is from 2 to 3ft. in diameter. The West Indian cedar of Trinidad is a most useful timber, growing to from 3 to 12ft. in diameter, and is well deserving the attention of consumers, as is also the copai, a beautiful and durable wood. The sepe is a light wood, resembling English elm, impregnated with a bitter principle, which preserves it from

the attacks of insects. It is much valued, and its diameter is from 1 to 2ft. The calabash is very abundant. It is tough, strong, and is used for general purposes. In diameter it ranges from 1 to 2ft.

L'Angelme is a strong, hardy wood, exclusively used for the naves of wheels, &c. Courbaril is a valuable and abundant timber of from 2 to 6ft. in diameter, and may be otherwise described under the name of West India locust. Yorke saran is a very hard and useful wood, and also purple heart, which has the advantage of being very abundant, and runs from 2 to 4ft. in diameter. Aqua-Tapana is a very durable and curious wood, susceptible of high polish, and from 18 to 36in. in diameter. The green, grey, and black poni furnish the favourite timbers of the colony, and furnish the hardest and most durable of wood. Their timber takes a fine polish, has a peculiar odour, and is very abundant. The trees are 3 to 4ft. in diameter, and proportionably lofty.

It will be seen that much valuable wood is produced at places where we do not usually look for it, unless for some particular production which we happen to be acquainted with, such as Bahama satinwood, &c., and for the most part we are content to take the products of the forest, just as they come to our hands, and with few attempts to improve the quality of the wood by cultivation. But the great value of forests, as sanitary agents, and their value as an annual source of revenue, are now beginning to be appreciated, and it may be that another generation will not only find that the supply of building wood is more abundant in proportion to what will, no doubt, be an increased consumption, but also that the durability and beauty of our imported woods have been enhanced by proper cultivation.

ARCHITECTURAL ASSOCIATION.

THE annual conversation, with which the session of the Architectural Association opens, was held on Friday evening last at the society's house, Conduit-street, when, as usual, a large number of visitors were present. The President, Mr. Bowes A. Pace, opened the proceedings by distributing the prizes after having announced the awards made in connection with the several claims of the Association. The list of prizemen is as follows:—

ARCHITECTURAL UNION COMPANY'S PRIZE FOR MEASURED DRAWINGS.—1st prize, motto: "Tis better to have tried and lost than never to have tried at all," Mr. J. E. Hatch; 2nd prize, motto: "Excelsior," Mr. W. J. Lansdell.

ASSOCIATION PRIZE FUND.—DESIGN FOR COUNTY COURT.—1st prize, motto: "Hasti," Mr. G. A. Waters; honourable mention: "Justice," Mr. H. W. Burroughs.

CLASS OF DESIGN.—1st prize, Mr. H. M. Robinson; 2nd prize, Mr. A. W. Hennings; honourable mention, Mr. J. W. Fisher.

ELEMENTARY CLASS OF DESIGN.—1st prize, Mr. F. R. Farrow; 2nd prize, Mr. A. Cawston; honourable mention, Mr. Eden Smith.

COLOUR DECORATION CLASS.—Mr. E. E. Deane. CONSTRUCTION CLASS.—Messrs. H. H. Connall, R. Henry, F. G. Hughes, prizes equally divided; Messrs. H. Griffin, A. S. Gover, honourable mention.

Among the donations made to the library during the recess the presentation of several autograph drawings of the late Owen Jones, by Miss Jones, was referred to, and Mr. H. Stannus, on behalf of the donor, explained that the series of drawings exhibited must be taken as fair examples of the author's work, rather than as exceptional specimens, and that they had been given in accordance with the wish of Mr. Jones, whose loss they all so much regretted. The President then delivered the customary inaugural address from the chair, in the course of which he briefly alluded to the various classes and means of usefulness carried on in connection with the Association, and concluded his speech with a few well-timed remarks on restoration, and on the arts which verge on the practice of architecture, noting the progress made in domestic art, and the increased interest taken by the public in a more reasonable, as well as artistic manner of house-furnishing and decoration. Allusion was also made to art-neddlework, several specimens being shown on the walls. Amongst those who followed the President were Prof. Kerr, T. Roger Smith, William White, and E. C. Robins. Prof. Kerr,

in a rather lengthy but characteristic speech, reviewed the various systems of architectural education employed by the great nations of Europe—viz., England, France, and Germany. The scientific schools of Germany, with their minute and systematic drill, were spoken of in their favourable aspect as producing students thoroughly well grounded in the science of their art, if the soul of architecture as an art was wanting. The academic system employed in France was alluded to by the speaker as well-nigh perfect as far as the study of one school or style of art was concerned, leaving, however, a more comprehensive view of architecture uncared for. The English method of architectural education, though leaving much that could be desired, and yet to be supplied, was unique, and taking all the means available into consideration, was perhaps as satisfactory as any. The term of pupilage was compared to the apprenticeship in the case of a trade. Thus, said the professor, if it were desired to make a boy a carpenter he was placed in a carpenter's shop where he might see how the work was done, and learn his trade from actual contact with the work which was done there; so, in like manner, if it were desired to make a boy an architect he was placed in an architect's shop, there to obtain a knowledge in a similar way. The classes then of the Royal Academy, Architectural Museum, and Association, in one way or another, supplied the teachings of the French and German systems. The Institute had never wished to be considered an educating body, but it was evident that before long a change in this respect must be made; indeed, there would be no choice left in the matter, seeing the rapid strides which education in every branch of life and study was making. The conditional examination required of those who wished to become members of the institute under the new régime, now so soon to come into effect, was but the first indication of the turn things would soon take in the matter of architectural education. Mr. William White briefly alluded to the question of restoration and conservation of ancient buildings, but having undertaken to read a paper during the session on the subject, he reserved his remarks for that more suitable occasion; and Mr. Roger Smith also excused himself from any lengthy remarks, urging that the primary object of a conversazione was conversation. On the walls of the galleries were shown the drawings of the late Owen Jones, already mentioned; these consist chiefly of simple studies in outline, with some photographs of the author's designs for the National Gallery, and for the palace at Muswell-hill. Some autograph drawings by the late Sir M. Digby Wyatt and Fred. C. Deshon were also exhibited, those of the latter attracting considerable attention, although most of them had already been published, some in our own pages. Of other drawings we noted those by Mr. R. Phené Spiers, made this year in Sussex, one or two giving views of the old house at Rye, lately the subject of some correspondence in the BUILDING NEWS. These drawings were in water-colour, as were several by Messrs. P. J. Marvin, W. H. Nash, and others, not to forget the charming drawings of painted glass studies by Mr. W. H. Lonsdale for St. Mary's Church, Whitechapel. Mr. Lonsdale also exhibited photographs of a loving cup of elaborate character, and in severe mediæval design, reminding us of some decanters by Mr. W. Burges, and which we illustrated a few years since.* Mr. W. Talbot Brown exhibited a series of beautiful sketches in pencil outline made in Italy, and Messrs. Fraser and Kirby some full-size drawings of old glass from Chartres, shown, however, in rather crude tints, hardly perhaps quite fair to the old wall. Mr. Thos. Cutler had some very interesting drawings, the work of well-known artists, and we were particularly struck with a simple study of a head by Mr. J. D. Linton. Of art-needlework we must mention the examples shown by the Ladies' Art-Needlework Society, while the ecclesiastical embroidery and domestic hangings lent by Mr. Buckley, of Wigmore-street, exhibited great merit, both of design and execution, though the manner in which the specimens were shown was crowded, and by no means calculated to exhibit the work to advantage. Mr. Buckley had also some carv-

ings from Bruges, which were of interest, as were the wall-paper hangings exhibited by Messrs. Jeffery and Co., of Islington, whose productions are generally the work of well-known architects. The leather-work shown by this firm, however, was not quite to our taste, having a very metallic effect, which would only be intensified when seen in a large piece—indeed, this is the effect of almost all new-stamped leather-work, particularly that having a red ground. Messrs. Gillow and Messrs. Trollope exhibited a few specimens of art-furniture, most of quiet and good design. The latter firm contributed examples of very interesting tiles from their museum, and the matting shown was much admired. Of photographs, those from Portugal, lent by Mr. Horsburgh, were of particular interest, the buildings being less known. Of photographs illustrating English work none were of more interest than those lent by Mr. S. T. Aveling, of Restoration House, Rochester, the fireplace in the drawing-room being of very good design, of Elizabethan date, and in good preservation. The works shown in connection with the classes of the Association seemed of average merit, excepting that of the colour decoration class, which presented a marked advance. The enjoyment of the evening was increased by selections of music by Messrs. Coote and Tinney's band. Refreshments were served in the museum of building appliances, which offers but a very crowded space for the purpose, wholly unsuitable for so large a number, and it is to be regretted, after so many years' endurance of this inconvenience, that better arrangements in this respect are not made.

THE SESSIONAL ARRANGEMENTS OF THE ARCHITECTURAL SOCIETIES FOR 1877-78.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first ordinary meeting of the Session 1877-78 will be held at 8 o'clock on Monday next. The Ashpitel Book Prizes, awarded to the candidates who distinguished themselves most highly in the Architectural Examination of 1877, will be presented by the President. The members' subscription portrait of Sir Gilbert Scott, R.A., Past-President, and a portrait of the late Sir Digby Wyatt, F.S.A. (the gift of Mr. C. C. Nelson, Fellow), will be presented to the meeting. The President, Mr. Charles Barry, F.S.A., will deliver his opening address for the Session 1877-78.

The lectures at University College, on Ancient Architecture as a Fine Art, will be delivered by Professor Lewis every Tuesday, from 7 to 8 p.m., from October 9th to the end of January—fifteen lectures; on Architecture, from the Mediæval to the Renaissance Periods, every Tuesday, 7 to 8 p.m., from February to end of session—fifteen lectures. Lectures on Construction, Materials, Drainage, Foundations, Walls, Timber, &c., every Tuesday, 6 to 7 p.m., from October 17th to the end of January—fifteen lectures. Lectures on Roofing, Masonry, Quarries, Arches, Groining, Iron Construction, &c., every Tuesday, 6 to 7 p.m., from February to the end of the session—fifteen lectures.

Lectures are given on the Arts of Construction, at King's College, by Professor Kerr, on Mondays and Thursdays, at 3.50 p.m. The lectures are in three courses. 1. October Term, on Materials. 2. January Term, on the Mechanics of Construction. 3. Easter Term, on Constructive Design and Practice. A short course of lectures on Architecture is also delivered in the January Term. There are also classes for the Study of Architectural Drawing, Descriptive Geometry, and Surveying and Levelling, on Monday, Tuesday, Thursday, and Friday, from 1 to 4 p.m.; and there is a class for Drawing, on Tuesday and Friday, from 7 to 9 p.m., besides evening classes.

Sessional Papers.—The committee appointed by the council to procure and select papers for reading at ordinary general meetings announce that the following papers have been promised and will be read, as under, during the present session, subject to such alterations in regard to date as circumstances may require:—

"On Middle Class Houses in London and Paris," by William H. White, Fellow, 19th Nov., 1877.
 "Architectural Notes on St. Alban's Abbey," by James Neale, F.S.A., Associate, 3rd Dec., 1877.
 "On the Law of Easements," by Locock Webb, Q.C., 17th Dec., 1877.
 "On the New Metropolitan Markets," by Horace Jones, Fellow, 7th Jan., 1878.
 "On the Architecture of Norway," by E. T'Anson, F.G.S., Fellow, 21st Jan., 1878.
 "On the Rise and Fall of Wages in the Building Trade," by Thomas Brassey, M.P., 4th Feb., 1878.
 "On the Prevention of Corrosion in Iron," by Professor Barff, 18th Feb., 1878.
 "On some Ancient Examples of Japanese Architecture," by Josiah Conder, 18th Mar., 1878.
 "On the Ecclesiastical Architecture of Scotland," by R. Anderson, Fellow, 1st April, 1878.
 "The Chemical Disadvantage of Sulphur Joints in Masonry," by Dr. Alder Wright, 15th April, 1878.
 "The Vexed Question of Oak or Chesnut in Old Roofs," by Thos. Blashill, Associate, 15th April, 1878.
 "Syria: the Cradle of Gothic Architecture," by John Whichcord, F.S.A., Vice-President, 20th May, 1878.
 "Popular Criticism as applied to the Architectural Profession," by T. Chatfield Clarke, Fellow, 3rd June, 1878.

ARCHITECTURAL ASSOCIATION.

THE Session of the Architectural Association commenced on Friday last with the usual conversazione, of which particulars are given elsewhere. The ordinary meetings open on Friday next with the President's address. The list of papers is as follows:—
 Nov. 23, "Notes upon Cornish Churches," F. P. St. Aubyn.
 Dec. 7, "Gothic Architecture," J. J. Stevenson.
 Dec. 21, "On the Revival of the Later Styles of English Gothic," J. D. Sedding.
 Jan. 11, 1878, "On Ornament," Lewis F. Day.
 Jan. 25, "Restoration v. Conservation," William White, F.S.A., and R. E. Pownall.
 Feb. 8, Discussion upon the last Paper, in which Messrs. G. H. Birch, L. W. Ridge, and others are expected to take part.
 Feb. 22, "Architectural Heraldry," F. H. Hummel, M.A.
 Mar. 8, "The Decorative Treatment of Modern Subjects for the Decoration of Modern Buildings," E. Buckman.
 Mar. 22, "The New Model Bye-Laws in relation to Public Safety, Health, and Comfort," F. Douglas Mathews.
 Mar. 22, "The Paris Building Laws," W. H. White.
 April 5, Discussion upon the Papers of March 22, in which Messrs. Blashill, Plumbé, and Robins are expected to take part.
 April 26, Members' Soirée.
 May 10, "On Architectural Ornamentation," Hugh Stannus.
 May 24, "To Burgos and Back," A. Payne.
 June 7, "Prehistoric Art and Rude Stone Monuments," T. Roger Smith.

It is suggested that some memorial be erected at Salisbury, within the next six years, of Massinger, the dramatist and poet, who was born in that city in 1584.

The inaugural ceremony in connection with the gift of the collection of sculpture models belonging to the late sculptor, Mr. Lough, took place in Elswick Hall, Newcastle, on Wednesday week. The models have been presented to the Corporation by Mrs. Lough.

New Board Schools and schoolmaster's house are now being erected at Melbourne, near Pocklington, under the superintendence of Mr. W. G. Penty, architect, of York, at a cost of £1,027. The works are being carried out by Messrs. P. J. and W. Harrison, contractors, York. The schools are to accommodate 110 scholars, and consist of mixed school 42ft. 6in. by 18ft., and infants' school 16ft. by 18ft. They are fitted with Shillito and Shorland's patent Manchester school grates.

The re-opening services in connection with the restoration of the chancel of St. Augustine's Church, Hedon, commenced on Thursday week. The portion of the restoration just completed is part of the scheme which was entered upon some years ago by the renovation of the south transept, since which time the nave, north transept, and chancel have successively been restored, until the entire structure has been redeemed from the state of ruin into which it had almost fallen, though the tower and some other parts still remain to be restored. The work connected with the chancel has been carried out by Messrs. Wilson and Sons, contractors, of Hull, and Mr. Webster, of Hedon, was the architect.

The Cambridge Improvement Commissioners have appointed Mr. William J. Bowyer, as borough surveyor for one year, at a total salary of £208.

Sir Gilbert Scott has just prepared plans for the restoration of Prestbury Church, Gloucestershire, the carrying out of which will cost £5,000.

* BUILDING NEWS, April 17th, 1874.

SCHOOLS OF ART.

COLCHESTER.—The session for 1877-8 of the science and art classes was inaugurated on Wednesday week by the public distribution by the mayor of the prizes and certificates gained at the last examination. It was stated that the work of the classes was progressing well, the percentage of the successes being above the average of the kingdom, but that the town subscriptions only amounted to £25 a year. An address on the method of scientific study was delivered by Dr. Taylor, F.G.S., of Ipswich.

DARLINGTON.—The annual meeting in connection with this school was held in the Mechanics' Hall on Friday evening, when the prizes and certificates were distributed by Mr. David Dale, who mentioned that it was 20 years that night since Mr. Elton took charge of the school, which had since been under his care, and many thousands of pupils had passed through the school. During the past year there had been an increased Government grant earned, concurrently with a small decline in the number of pupils. Mr. Dale also adverted to the growing feeling that, though the money devoted to the cultivation of science and art was considerable, a larger proportion should be expended in the provinces.

HANLEY.—The annual meeting of the Hanley School of Art was held on Friday last. The report of the committee drew attention to the large quantity of work done during the year, and the excellence of the samples shown. This year the Department had made its first experiment in holding examinations of a very advanced nature in provincial schools, and five students of this school had undergone that test. The head-master (Mr. Bradbury) reported that in April upwards of 2,000 works were sent to South Kensington for examination—a number greatly in excess of any previous year. One effect of the changes made by the Department was an enormous decrease in the number of third-grade prizes, and it was noted that the examiners appeared to have become indifferent to the requirements of local manufacture, particularly in regard to modelling, which received but a very insignificant share even of the lower-grade prizes. At the time test examination, in May, 15 students were successful in freehand, 25 in model drawing, 6 in geometry, and 5 in perspective; 15 papers were marked "excellent," and prizes awarded; 5 students had third-grade prizes, one a Queen's prize and three free studentships. A prize had also been obtained for modelling in plaster and foliage in competition open to the students of the United Kingdom. The balance-sheet showed an increase of £649 11s. 6d., and an expenditure of £591 4s. 7d.

KILMARNOCK.—The distribution of science and art prizes, gained during the last session by pupils in Kilmarnock Academy, took place on Tuesday. It was stated that in science the pupils had gained 51 Queen's prizes and one scholarship at South Kensington, besides 141 certificates, and in art (chiefly elementary) there were 76 prizes and 162 certificates.

ST. ALBAN'S.—The annual prize distribution to the students of the St. Alban's School of Art was held last week. This year the school has been open 40 weeks, from September to July. In the month of April, 400 drawings, 3 paintings, and 7 books, containing worked problems, executed by the art students in class, were sent to South Kensington for inspection; the result being a grant of £10 10s. At the May examination for Queen's prizes and certificates, 28 art students and 7 non-students worked 53 papers in model, freehand, geometrical, and perspective drawing. Fourteen certificates were obtained, 3 of which were termed "excellent," and carry with them Queen's prizes of the second grade. During the seven years the classes have been in operation, 416 students have received instruction; of this number 258 have sat for examination and 141 certificates in various subjects have been obtained, besides numerous Queen's prizes.

THE FEMALE SCHOOL OF ART.—The annual exhibition of the works of the pupils of the Female School of Art, was opened last week. The school was established in 1842, being then a Government institution. It now depends on students' fees and on the subscriptions of the

public. It contains 200 pupils. Six of them made a tour in Italy last Easter with the superintendent, Miss Gann, and brought back sketches made in Rome, Milan, Venice, and elsewhere, as a contribution to the exhibition. Three students went up this year for the National Gallery, and at once obtained admission. Two national silver medals, five bronze medals, six Queen's prizes of books, and 15 third-grade prizes were obtained by the pupils at the last South Kensington competition, and the works which gained these distinctions are exhibited. Some valuable prizes are attached to the institution itself, and were adjudged by Mr. S. A. Hart, R.A., Mr. Woolner, R.A., and other well-known artists. The Queen's Scholarship, value £50, was awarded to Rhoda Carleton Holmes for drawings in water-colour of an Egyptian girl, and other sketches. The National Gilchrist Scholarships, given primarily to provide students from the provinces with the best art training which can be obtained in England, were adjudged to Miss Burnay and Miss Newton. Both these ladies exhibit studies of flowers. The Subscribers' Scholarships, value £20, have been awarded to Elizabeth Lovell for crayon heads, to Florence Reason and Catherine Wood for sketches of fruit, flowers, and birds. Angela Mary Marshall obtained the Queen's gold medal for a bust from life of a negro, and she also exhibits a statuette of a fisherwoman, which gained a bronze medal at South Kensington. The silver medals at South Kensington were gained by Alice Hanslip and Anne E. Hopkinson. The first lady's work comprises studies in charcoal from the Laocoon, while among Miss Hopkinson's may be remarked a group of Oriental fruit.

CHURCH BUILDING SOCIETIES.

HANTS DIOCESAN CHURCH ASSOCIATION.—At a meeting of this society held in Winchester chapter-house on the 20th October, the following grants in aid were made:—St. Michael's, Bournemouth, £40, for new school; St. Peter's, Haven-street, Isle of Wight, £15 for new classroom to school; Sandown, Isle of Wight, £150 for new church; St. John's Church, Winchester, £20 for alterations and improvements; Silchester Church, £40 for restoration; and Brockenhurst £100 for new parsonage.

YORK DIOCESAN CHURCH BUILDING AND ENDOWMENT AID SOCIETY.—At the annual meeting of this society, held in the De Grey Rooms, York, on Tuesday, the following grants were made:—New churches—Warmfield, Pontefract, £152 10s.; St. Philip's, Holy Trinity, Hull, £300. Increase of accommodation—Paul-with-Thorgumbald, £48 16s. 6d.; St. Martin's, Scarborough, £150. New parsonage—New Hardwick, Pontefract, £150. Parsonage house buildings' purchase—Christchurch, Sulcoates, Hull, £100 (or £150 conditionally). Site for mission church—St. Paul's, Sulcoates, £50. At the annual meeting, subsequently held, a resolution was passed, thanking Mr. G. E. Street, R.A., for his valuable services as consulting architect for this society, but dispensing with his services owing to the present state of the society's finances. It is proposed to let the old society lapse, and to form a fresh one on a wider basis, and one more suitable to the present times, especially in the way of giving grants to temporary mission-rooms.

ARCHÆOLOGICAL.

DISCOVERY OF ROMAN TEMPLE NEAR ROTHERHAM.—During the past few weeks excavations have been in progress on the site of an old Roman encampment at Templeborough, near Rotherham. The area is 4 acres in extent and rectangular in shape, on each side of the square being a high rampart, supposed to have been raised after the departure of the Romans by the Britons when attacked by the Picts and Scots. The foundations of a building over 70ft. square have been discovered, together with a large quantity of Roman bricks, broken jars, basins, and tiles, the latter bearing the stamp "CIIIG." (*Cohors quartus Gallorum*). In close proximity were found the bases of two circular columns, and the threshold of a portico, in connection with which, soon afterwards, a row of seven columns

11ft. or 12ft. apart, was brought to light. The shafts of the columns are 15in. in diameter. It is believed that this was the site of a Roman temple, thus affording a clue to the origin of the name of the encampment. Public subscriptions have been raised, and it is intended to excavate the burial place adjoining the old fortifications, when further discoveries may be anticipated.

ARCHITECTURAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—The annual conversazione in connection with this association was held on Tuesday evening. Mr. H. R. Yeoville Thomason (president of the association) presided. Mr. Hughes read the committee's report, which stated that the association was to be congratulated on the increased interest manifested by the members, and on the enlarged attendances at the meetings, and in having acquired rooms for its own exclusive use. The various papers read were enumerated by the committee, who added that the classes had been fairly successful, the average attendance being very good. The library had been very well patronised by the majority of the members. During the session sixty volumes had been received from London and circulated among the members. The Saturday afternoon visits to buildings in course of erection are generally well attended. About the middle of the session the committee, considering that it would be an advantage for the association to possess offices for its own exclusive use, took the rooms now occupied by the association in Queen's College. The Chairman briefly addressed the students, pointing out to them the various studies necessary to become good architects. Mr. Reading announced that in the class of construction Mr. M'Connell and Mr. F. J. Hughes had taken prizes; in the class of design Mr. J. N. Fisher had obtained honourable mention, and in the elementary class of design Mr. Eaden Smith obtained a similar honour. In the library and dining-hall a large collection of drawings by the members were exhibited, as also numerous sketches by eminent architects. Messrs. Jones and Willis lent several specimens of carving in oak and brass; casts from ancient sculpture were lent by Mr. J. Roddis, of Aston; and Messrs. Camm Brothers sent a few specimens of stained-glass work.

LEEDS ARCHITECTURAL ASSOCIATION.—The first general meeting of the second session took place the other evening at the Mechanics' Institute, Mr. George Corson, the president, in the chair. There was a good attendance of members. Mr. W. H. Thorp, one of the hon. secretaries, read the annual report. It stated that the association was formed in December last, and now numbered 77 members. Taking into consideration all the circumstances of the past session, the results had been very satisfactory, and the prospects of the future were very encouraging. A number of papers on "Ventilation," "Architecture," and other subjects had been read at stated intervals, and visits had been paid to a number of buildings, both ancient and modern, in Yorkshire and Lancashire, including the town halls at Manchester and Bradford; Leeds Parish Church, Selby Church and Abbey, and the York New Railway Station and the Minster. These visits afforded an opportunity to the members of seeing a variety of examples of building instruction and decoration. During the session several prizes had been offered, and it was intended to distribute them at the conversazione to be held in November. It was hoped that there would be a larger number of competitors in future years. A class for design and construction had been suggested, but the scheme had hardly assumed a definite shape as yet. The balance-sheet showed that the income from subscriptions and entrance fees had been £41 9s., and the expenditure £16 12s., leaving a balance in hand of £24 16s. 11d. The President then delivered a short opening address.

The Abergavenny rural sanitary authority on Friday adopted an amended plan for the drainage of Llanfoist, prepared by Mr. James, surveyor, and adjourned the further consideration of Messrs. Gotto and Besley's report as to the best mode of draining Cantreff and Long Barn.

PRIORY CHURCH OF ST. MARY, GUISBOROUGH, YORKSHIRE—HOUSE AT STOODLEIGH, DEVON—VILLA RESIDENCE, UPPER BATLEY—DETAILS OF HOUSE AT DATCHET—CONGREGATIONAL CHURCH AND SCHOOLS AT BECKENHAM—"BUILDING NEWS" CLUB DESIGNS FOR ORGAN CASE AND MULLIONED WINDOW WITH EXTERNAL SHUTTERS.

OUR LITHOGRAPHIC ILLUSTRATIONS.

THE PRIORY CHURCH OF ST. MARY, GUISBOROUGH, YORKSHIRE.

OF all the buildings which were destroyed at the time of the Reformation, there is none the loss of which is more to be deplored than that of this once most splendid church. Of its original extent we know nothing, as far as I can ascertain, but the fragment which remains shows us that both the design and execution of the work were of the first order. The choir is known to have been burnt down in 1288, and to have been immediately afterwards rebuilt (this is mentioned in Mr. Sharpe's "Window Tracery," where the east window is fully described and illustrated). From this we may infer that the nave and transepts were either Norman or Transitional. There is a restored view in Ord's "History of Cleveland," which shows this choir with the spire of Salisbury and Chapter House of York, and is worth nothing. Mr. Sharpe has given an excellent series of drawings of the choir in his "Architectural Parallels," but he gives no flank elevation, for what reason I know not, as there are data for everything remaining except the clerestory buttresses and windows; but he restores the windows in his longitudinal section, and I have taken the tracery from this. The clerestory buttresses are conjectural. The ruins are well-preserved and cared for by the present owner.—C. C. HODGES.

STOODLEIGH COURT, DEVON.

THIS mansion is proposed to be built on a high slope of ground commanding a view of the Tiverton Vale, and at a distance of one or two hundred yards from the old residence. The principal garden front faces south-east. The perspective drawing engraved shows the opposite or north front, with the principal entrance and drive. The style selected is a simple treatment of the Jacobean or Stuart period, and the materials to be used are the local stone, which is of a dark warm tone, with dressings of "Ham-hill." The roof will be tiled. All the external detail will be simple. The design is by Mr. Lewis Paxton Crace, A.R.I.B.A., of 38, Wigmore-street.

PROPOSED CONGREGATIONAL CHURCH AND SCHOOL, BECKENHAM, KENT.

THE general arrangement consists of a single-span rectangular church, with end gallery, to seat 500, the school for 300 at the rear, and vestries and class-room between. The main entrance to ground-floor of church is by the arched double doorways in front, with the gallery entrance and staircase in the tower. The pulpit end consists of a central arch and two narrow side arches supported on stone pillars, forming a central bay for pulpit and communion space, while the organ is placed on one side, and a few screened seats for invalids occupy the other. The minister's and deacon's vestries are attached, and have a separate entrance. There is also a large ladies' meeting room, with a separate entrance, and infants'

and smaller class-rooms. These are reached from the school entrance, but there is also a direct connection between the school and the church. The walls externally will be faced with red brick, relieved with Bath stone dressings, the spire being wholly stone. The roof will be slated and finished with tile ridges. Internally there will be an inner boarded roof for warmth and to assist the acoustics of the building, but the main timbers of the roof will show. The walls of the church will be of cream-coloured facing bricks, relieved with stone and patterns in coloured bricks. The side walls are arranged in arched bays, so as to obtain greater strength and add to the internal effect. Heating, lighting, and ventilation are all carefully arranged, the latter evidencing itself by the two roof turrets, in each of which a Bayle's extracting ventilator will be placed. Architect, Mr. John Sulman, A.R.I.B.A., of 16, Furnival's-inn, Holborn, London.

VILLA AT BATLEY.

THIS villa is situate in Upper Batley, being a suburb of Batley, restricted specially for this class of villa residence, and has just been completed for Mr. Robt. Talbot, manufacturer. The plan of the house will explain its arrangements. The whole of the house is built of Delph wallstones, and the ashlar from Starthwate, each of which are the best building materials in the north of England. All the walls are 2ft. thick, and in addition are swithed as a preventive against damp. The joiners' work for the principal parts of the house is in pitch-pine varnished. The principal rooms and landings are warmed by wrought-iron hot-water pipes, laid in round the rooms behind a brass ornamental grate in plinth, and all these rooms lighted by Rickett's patent globe ventilating gas-lights. In addition to the house there is suitable stabling, front porter's lodge of a similar character, and the grounds altogether have an area of two acres, which is leasehold. The cost of the whole of the works, including gardens' laying out, is about £7,500, all of which have been carried out by local builders, from designs prepared and under the superintendence of Sheard and Hanstock, of Batley, architects.

DETAILS OF HOUSE AT DATCHET.

LAST week we gave the elevations and plan of this house; we now supplement it with a double-page sheet of details. The gable arches, chimney shaft, strings, and pediments are of red cut brick, and the panels are of concrete enriched with patterns; the sun-dial, drawn to an enlarged scale, is executed in the same material. We give also the mouldings of cut brickwork, the details of verandah balusters to stairs, and the enrichments of dining-room cornice.

"BUILDING NEWS" CLUB DESIGNS.

FOR critiques on the selected and other designs for an organ-case and on the mullioned window, with external shutters, illustrated in photo-litho pages this week, see p. 393 *ante*, in our issue for Oct. 19.

The correspondence as to the neglected detached bell tower of Llandaff Cathedral still continues in the South Wales papers. Mr. John Pritchard, diocesan architect, in a second letter, says the remnant has recently been further mutilated by the removal of a flying arch, but says he possesses a carefully-prepared drawing of the structure by Mr. Frame. He asks whether this fragment of a noble buttressed tower—now so encumbered with a cowhouse on one side and an oven on the other that it is not easy to get an accurate conception of its original form—does not come under the operation of Sir John Lubbock's Act for the Preservation of Ancient Monuments?

New Board Schools for the Carlton and Stillington district of Stockton-on-Tees were opened on Wednesday week. The buildings, which are Gothic in style, comprise a schoolmaster's house, a school-room 57ft. by 20ft., class or infants' room 30ft. by 16ft., and board-room 16ft. by 19ft., and will afford accommodation for 240 children. The schools have been built at a cost of £1,900 by Mr. G. Lazenby, of Stockton, from plans by Messrs. Weatherall and Moses, of the same town.

The foundation stone of the new college of St. Bede, Manchester, was laid on Monday. It will be erected next to the Manchester aquarium, which has been acquired by the Roman Catholic Bishop Vaughan, and will be used as a museum in connection with the college.

COMPETITIONS.

JUDGES' LODGINGS, SWANSEA.—In this competition 41 sets of designs were received. Those forwarded by Mr. Charles Taylor, A.R.I.B.A., of Merthyr Tydfil, were regarded as the best, and he was accordingly awarded the only premium of 50 guineas.

SOUTHPORT.—New covered markets are to be built at Southport, and in response to the invitation issued to architects by the Corporation, 25 sets of designs were received. Of these six have been selected by the markets committee, and the following are the three designs which they recommend to the council:—"Regardez-moi" to be entitled to the first premium of £100; "Sanitas," the second of £50, and "Experientia docet" the third premium of £25. The council met on Wednesday evening last, but we have not yet received the final award, or the names of the authors of the above designs. The six sets of plans are now on view in the council-chamber, Town Hall, Southport.

TOTTINGTON.—A committee meeting, in connection with the proposed new church of St. Mary, Hawkshaw, was held on Thursday week, when the designs submitted in limited competition by Messrs. Maxwell and Luke, of Bury, were accepted. The estimated cost of the building is little over £3,000.

It is intended to form a light railway from Pad-dock-wood Junction, on the South Eastern main line, to Cranbrook, and operations will soon be commenced by the contractors. Trial borings are being made on the proposed route at Horsmonden and Hartley, under the supervision of Mr. Wm. Elliott.

A new organ, built by Messrs. Browne and Co., of Dublin, was opened in the Episcopalian Church, Tullow, county Carlow, on Thursday.

A Local Government Board inquiry was held at Hastings on Wednesday week, with respect to an application from the Town Council for sanction to borrow £21,000 for the purchase of land for a public park, for the construction of Park-road and for sea defences.

Works of drainage have just been completed in Glen-of-the-Dows village, near Kilpedder, county Wicklow, by Mr. J. Saunders, contractor, of Bray.

The Maesteg Local Board of Health have requested Mr. Cousins, of Swansea, to report on the schemes for proposed waterworks for Cwmdu.

A circus is being built for an equestrian company's winter quarters, near Mary-street, Cork, from the designs of Mr. Giuseppe, architect.

Mr. Rivers, surveyor to her Majesty's Board of Works, visited Cardiff on Thursday in last week, to exhibit plans of a block of buildings for new Board of Trade shipping, postal, and telegraph offices for the port. The new premises will be erected on a site at Powell's-place, near the lower end of the West Dock, and will have a frontage of 100ft., and a depth of 150ft. It is hoped that the new buildings, which are greatly needed by the merchants of the port, will be completed within the next twelve months.

Dr. Cameron, of Dublin, in addressing the members and students of the Royal College of Surgeons of Ireland, on Monday, on the "Pathology of Contagion," dwelt on the manner in which foul and infected air is often brought by the insuflation of kitchen fires into dwellings, and in urging that every house should rest on impervious foundation, recommended a mixture of asphalt and sand, as better, from a certain point of view, than a stratum of concrete.

The great Whistler-Ruskin libel case, says the *Examiner*, has been fitted by report with a very peaceful conclusion. It seems, according to the story, that the great art-critic and the great painter happened to be in Venice a few weeks ago, that they were brought together, and that, over a friendly cup of tea, they quietly discussed the *casus belli*, and quietly agreed to let the matter drop.

Mr. Durhan, A.R.A., the well-known sculptor, died on Saturday evening, at his residence, 21, Devonshire-street, Portland-place, London.

The Town Council of Liverpool passed, on Monday, estimates for £22,205 as the probable expenditure of the museum, library, and arts committee during the ensuing municipal year.

The Brighton Corporation opened on Friday a supplementary museum in the eastern block of the Pavilion property, the chief features being a collection of Chinese porcelain, agricultural implements, and instruments of torture, lent by Archdeacon Gray.

At the great palm-house, Kew, an entirely new and improved series of tubular boilers have been introduced for heating purposes. They are the invention of Mr. Edmund George Rivers, one of the Government surveyors of the department, and have been constructed by Messrs. Simpson and Co., engineers, of Pimlico.

REVIEW OF DESIGNS. NO. XVI.

A Street Front.

THE subject of a street front, with ground floor suitable for a wine-merchant's shop, with a mezzanine over, presents one of those every-day problems which the architect is called upon to solve. The response to our invitation has not been so large as we could have wished; and the designs received, though in one or two instances displaying some originality, are below the mark.

"Crowquill" sends a design that may bear away the palm, if not for originality, at least as a common-sense treatment. The shop front and the mezzanine form an elliptical arched opening, the springing, or chord line, being made the horizontal fascia for the name, the lower portion being framed with upright bars, and with two entrances, and the mezzanine treated as a large fan light, divided by radial bars. Above this the superstructure of three stories has a flat canted bay of three lights, springing from massive brick piers or quoins, and surmounted by a pediment with carved tympanum in a sort of Queen Anne style. The design displays decided points of merit; the ornament is simple, and confined to a horizontal cornice of brick, with honeysuckle pattern in the frieze, above the arched mezzanine, and to strings with simple incised patterns. The upper story is set back on the flat, and the windows are divided by fluted brick pilasters. There is, perhaps, a want of agreement between the ornament in the tympanum and that below; the former is a trifle more Roman or florid. The small bits of parapet on each side of the pediment look out of place with the semi-Greek ornament to the piers below. Some of the mouldings of brick and terra-cotta shown are pretty good, as the pediment cornice; others are of a questionable kind, as the upper member of the main cornice over front; and there is the fault of flatness in some of them. The author shows "Henderson's tension girder" behind the fascia forming the tie to the arch. Revolving shutters are shown also. The private entrance is set well back, allowing a side door into the shop. An hydraulic lift, for hogsheads, is shown on the other side. We place "Jag" next. The stories are higher, and there is originality, but want of study and a little more harmonising of the parts. The shop front is of plated glass, framed with two side doors, and a centre sheet of plate glass, the mullions continuing upwards over the transom or mezzanine floor level, and finished as bold bracket heads of Gothic character. The side-lights are made in two heights, with casements at top. The angles of the shop window and doorway fanlights are also cut off by solid brackets, the latter being finished with iron grilles. Above the mezzanine is a projecting bay window, corbelled below, triangular on plan, with two windows in the cants. On each side is another flat window, and the second and third floors are treated with projecting divisional piers of brick, dividing the front into three bays. The windows are segment-headed, with transoms, and leaded coloured glass in upper lights, with rough plate glass sheets below. Bands of well-designed terra-cotta run round the bay window below the sill and at the top. The private entrance is on the left side, recessed so as to give a side light to the shop window. The mouldings shown lack study; the main cornice members are too angular, and the label and other mouldings are poor. "J'Espere" is a cleverly drawn design, displaying considerable artistic merit, but of a class scarcely original. We somehow fancy we have seen many of the features before; they are not new to us. The style is Gothic, of a French florid or flamboyant character, but the ground story, treated with a side open doorway and plain segmental shop window, relieved by labels and crockets, with pinnacles between, lacks scale and proportion in the ornamental detail. The head of doorway is pointed, and is fitted with flamboyant tracery. A recessed porch, with a side shop door, is obtained. The mezzanine story is pleasingly managed as a lower range of three two-light windows; over two of them a balconette on circular moulded corbels is obtained,

the front of which is richly traceried in stone or terra-cotta. The first floor story is composed of three pointed tracery headed and label-crowned windows, with crockets and finials, each divided into two lights. The third floor is of timber and concrete, set within the parapet. There is a piquancy about the design, but it has more of the monumental than commercial type about it. The drawing is effective, and the detail in excellent taste. "Hampton" sends a design late to hand, in which the mezzanine assumes too much the look of a separate story. The shop front and doorways are distinctly treated, which is not desirable. The upper stories consist of a flat curved bay window, resting on brick brackets, and with three lights to each. We like the dormer breaking the roof, but the main piers of bays resting over the side flat-headed doorways is bad architecture. "Omega" in red circle (also late) does not show a mezzanine, but the front displays some character with the carved terra-cotta panels between the first and second floor windows, and in frieze of main cornice. The shop front, with the carved mullions and transom lights, is rich, though scarcely in harmony with the ornamental Queen Anne above. Drawing creditable. "Slingsby" is another design in Queen Anne style; the mezzanine arrangement is more satisfactory than the last, but the upper bay window and the arched balcony above do not well combine with the arched parapet, nor with the side brickwork. "Capio Lumen" is more original, but wanting in proportion and refinement of detail. The author divides his front into three unequal bays, the centre being the widest. Below, occupying the whole centre space, is the shop window, framed with two bars and a transom, the upper light filled with leaded glass. The side entrances are commonplace, and no proper mezzanine range is got. We certainly call the story above the first floor; it has no claim to the meaning of a mezzanine. A balcony on moulded stone brackets runs between. The upper story appears too lofty. There is, however, with these defects, a certain meaning and simplicity of treatment about the design that only required a little more study bestowed. "Spartan's" aspirations are certainly too grandiose and Gothicsque. There is a strong inkling for the muscular Gothic. The shop-window is small, and the superposed windows do not give us a fair idea of a mezzanine arrangement. Why, too, the absurd pointed label mouldings so close under such a luxuriant cornice? The upper stories display labour, but misspent energies and taste; the filled-in heads of the first floor windows, and the pointed arches over them, lack meaning, subordination, and gradation; the effect is crowded, and wanting in refined qualities. There is certainly evidence of skilled labour and some taste thrown away upon this design, arising from a desire to do too much. "Try" certainly possesses more merit in the lower part of the composition. Two brick piers dividing the shop window from the side entrances, are carried up with a straight transom of stone, with joggled points, above which the mezzanine windows follow, and preserve the same openings as below. Well-designed joggled window-heads, or lintels with a bracket cornice over, divide the façade below from the upper stories, which are treated simply; but the cornice and detail spoil the design, and the drawing is scarcely up to the mark. The author has, however, a fair idea, that in more skilled hands would have produced a satisfactory result. "Try, A.," not so good, and without a mezzanine, is hybrid in style. "Intersecting Triangles" is another Gothic attempt, but the author has failed to realise a mezzanine story; the pointed arches of different spans over the shop story are objectionable constructively and æsthetically; the mezzanine, or first floor window, with the terra-cotta diapering in the spandrels, indicate the same weakness and instability, the first, or upper floor windows, circular and pointed together, and the upper dormers have too much of the Yankee or Victorian-Gothic about it. When will would-be-Gothicists be convinced that a façade full of pointed arches, with fancy voussoirs, do not constitute the style, and betrays vulgarity. No plan or section is given, and the elevation is not inked.

A Lych Gate.

This subject is now a comparatively obsolete adjunct to churchyards in England, though in Wales and other mountainous parts the lych-gate may still be seen. We have given it chiefly because it presents a pleasing subject for the architect's pencil, and to elicit thought on a timber structure of simple form. "B" in a circle has caught the right idea. The conception is clever, and the working out of the design sensible. The author shows a low wall or plinths of masonry about 4ft. high, 9ft. 3in. apart, upon which a framed oak sill and standards are erected, consisting of the two centre uprights, with curved intersecting braces, halved together at their crossing. The timbers are cut square, without chamfering or moulding, the simple crossing of the braces being made effective; they are tenoned at the joints with projecting pins of oak. The uprights are framed together with a small head of tracery between, forming a pleasing *bonne bouche*, and are connected with the corresponding standards by plain flat-arched pieces pinned to a head-piece or tie-beam, upon which curved struts support the principals. Each pair of uprights has a truss. The roof is simple pyramidal, without cross or any ornament. The gates are effectively framed with horizontal rails, upright boarding below, and with turned shafts in the upper part; the coffin-rest or settle being at the side, and not in the centre, outside the gate. "Another for Hector," is a composition in a later style, but exhibiting good detail. The lych-gate is 8ft. 6in. between the seats, with a centre coffin-rest framed in wood, placed within the gates, its end being flush with them. The structure is of open framing, resting on low plinths, each side being formed of two standards, framed together with three uprights at the angles, with pierced heads, and connected by a circular arch, with transom and trefoil openings at the top. Plain carved brackets project over the fronts, and the gateway is also bracketed over at the top with spandrel tracery. The roof is brown tiles, with hipped ends. Details are simple, and in good taste. The stone seat on each side is a useful feature. "B" in two circles is another well-conceived idea, with a centre stone rest placed like the last, the side entrances being 3ft. 6in. each, with gates hinged to stone bases. The uprights are simply framed with balustring between at the bottom, the upper part being arched with chamfered braces. Brackets with moulded edges project at the angles to carry the roof, which is tiled, with hips at ends, and with a wood cross in the centre of ridge. At the foot of each upright are two curved spurs, tenoned into sill and upright. The roof is strengthened by longitudinal braces. "Fleur-de-lis" sends a design meritorious in parts, but ill-considered in conception. The circular spurs and the brackets springing from a single upright look weak, and rather displays cunning than good taste. The front elevation, with the curved braces, has a weak effect, and the roof is hardly wide enough. The author makes the rest for corpse, the centre posts, to which are hung some well-designed gates. The plaster panels in roof with bottle ends would have been better omitted. "Bee" in two circles has the defect of being over-roofed, at least, the supports are totally inadequate, and a structure of the kind could not stand a moment in a violent gale—the single uprights 9in. by 5in. would snap off like reeds. The centre gate-post is made the "rest." We like the simple cross on ridge. "Senlac" places his rest for the coffin at the side within the gates, and the structure is one-sided, the framing enclosing the rest on that side. Detail is badly drawn, and the roof heavy. "Laborateur" has a centre stone rest, with side wickets of a character that do not happily harmonise with the framed uprights. The curved spurs—pieces tenoned into the curved brackets has a weak effect, and we should not like to trust to them.

Among other designs, we place in their order of merit, "Vic," weak standards; "Jacobus," no gates shown; "Capio Lumen," rest too high; "Honos alit artes," with movable brackets for rest; "Felix," too like a porch; "J. W. C." in circle, no rest, curved tie and detail below par; "L." in G, poor in detail, with struts too weak.

Designs for Wall-Paper.

The designs for bedroom wall-paper are few. "Bee" in circle contributes by far the best. One is a lattice of cross stems and leaves flatly shaded, and, aesthetically considered, is a legitimate mode of wall decoration. The next pattern, with vertical stems throwing out alternate light and shaded leaves of pointed shape, is also simple, and suitable for a low room. "Fleur-de-lis" sends two patterns. The first shows greenish-brown leaves on pearly-grey ground; and another, variation with light leaves on dark ground, but, although in character with Queen Anne, is rather too naturalistic to please us. No. 2 design is rather more conventional; the interruption of the stems by the flowers is, perhaps, open to question, but the design displays more originality. Colours are a slatish-grey pattern on a vellum ground. "Début" sends two designs in outline. The first, with dado and wall pattern, in conventional leafage and stems, is a little too metal-like. The second is rather too crawly, in a thorough Japanese spirit. Both are original, and indicate invention. We next place "Queen Anne," a closely set conventional pattern of pentagonal-shaped flowers relieved by dark pentagons on a background of lighter colour, with a folial pattern, which is seen through the lozenge-shaped apertures. The pattern is rather too confusing, though clever. "Leizlad" sends two patterns; the first shows a series of commonplace octagon panels, with floral ornaments; and the latter is a large panel with convolvulus flowers—both geometrical and too mechanical. The present taste for Queen Anne has influenced largely the design for wall-papers. These are generally of an intermixed or "Dolly Varden" character, in which naturalistic treatment is found. We desire, however, in this club to encourage correct principles in all art design, irrespective of proclivities for any style.

NOTE.—Owing to some of the designs coming to hand on the week following the specified time, we desire to say that in future we shall not notice any designs that do not reach us within the time named. Such delay seriously inconveniences us in making the award.

LIST OF SUBJECTS.—NO. XVIII.

A. A graveyard monument in Classic taste, to be executed in granite or marble; cost not to exceed £50.

B. Christmas Decorations.—A design for the treatment of an arch and its shafts; one of a series; and for a temporary chancel screen covered with evergreen. The space on the sheet may be filled with devices. Natural treatment preferred.

C. A small railway station, to consist of booking-office, waiting-rooms, luncheon bar, &c. Plan, two elevations, and section; scale, 8ft. to the inch. Estimate not to exceed £1,500.

The village of Eaton Socon, near Bedford, is about to be lighted with Hearsor's patent automatic gas-lamps.

A new bridge has just been completed and opened at Wick, N.B., from designs by Mr. Paterson, C.E. The cost has been £4,000.

The new dock gates and sluices at Ayr have just been satisfactorily tested by the directors of the Glasgow and South-Western of Scotland Railway Company. The contractors were Messrs. J. and A. Taylor, of Townhead Works, Glasgow. The only work needed for the completion of Ayr Dock is the removal of the old worth pier, and this is being proceeded with.

Extensive works of sewer-construction have been carried out at Rutherglen, near Glasgow, by Mr. McGill, contractor.

The Scarborough Town Council have decided to purchase the undertaking of the Waterworks Company, and on Monday night authorised a committee to prepare a bill and deposit the same in Parliament, and to negotiate terms with the directors of the water company.

Works of drainage are about to be carried out at Dalkey, from the plans and specifications of Mr. R. Walsh, C.E.

At a special meeting of the Town Council of Barnsley, held on Tuesday, Mr. J. H. Hanson, of Huddersfield, was elected borough surveyor in the stead of Mr. Kenworthy, resigned, and Mr. R. Woodruff, of Barnsley, who has acted as clerk of works for the new public hall, was appointed to the post of foreman mason. There was a very large number of applications for each of the appointments.

Building Intelligence.

BEDWELTY.—On Wednesday week the new Board Schools were opened at Victoria and Tredegar, near Bedwelly. The Victoria schools have been designed by Mr. Blessley, of Cardiff, and erected by Mr. Piggford, Newport, at a cost of a little over £3,000. Accommodation is provided for 500, in three departments. The Tredegar schools will accommodate 1,500 children. Mr. Blessley, of Cardiff, was the architect, and Messrs Wood and Son, of Worcester, the builders. Mr. Blessley's design was selected in competition as the best and cheapest. It was to cost under £4 per head per child. As a fact it cost £4 2s. 4d., the odd 2s. 4d. being the cost of overcoming the difficulties experienced in building on the site selected.

BOSTON SPA.—The Congregationalists of Boston Spa last week celebrated the opening of their new chapel. It consists of a nave, with small transepts, porch, lobbies, and tower. The total length of the church is 53ft. long by 34ft. across the nave, and 43ft. across the transepts, the whole roofed in by one span with open timbers. The accommodation provided is for about 260 persons. A school has been built behind the church on the same ground level, and on the chapel tower is a slated spire, about 90ft. high to the top of the finial. The architect is Mr. Payton, of Bradford. Including £350 for the site, the total cost of the new chapel has been £2,800.

BRISTOL.—A new block of business premises have just been completed at the corner of High-street, and Mary-le-port, Bristol, from the designs of Mr. Henry Williams, architect, of that city. The fronts are of Bath stone, and supported on polished Aberdeen granite, sunk and moulded piers, with moulded (grey) granite caps and bases. The shop fronts are divided into a series of arches, with elaborate cast-iron columns and spandrels, supplied by Messrs. Macfarlane and Co., of Glasgow. A wrought-iron box girder, upwards of 13 tons in weight, supports the stonework above. At the junctions of High-street and Mary-le-port-street, a circular corner is formed with the principal entrance underneath. The piers support a moulded entablature and cornice, with carved panels underneath. Immediately above the façade is broken up by a series of segment-headed windows, with moulded architraves and ornamental pediments, with carved key-stones. Between the windows are moulded bases and pilasters with carved caps, with projecting panels above. The general contractor for the building is Mr. R. J. Crocker, of Bedminster. The general plumbing work was executed by Mr. Harris, of Bristol.

CLIFFE.—The plans prepared by Mr. Philip Curry, architect, of Moreton-place, W., for the reseating and restoration of the parish church of St. Thomas-à-Becket, at Cliffe, near Lewes, have been accepted by the vestry. The flooring and seats will be renewed, the gallery in the north aisle is to be removed, and the existing windows in the aisle replaced by others of similar character to those in the south aisle, a new vestry built in place of the present inconvenient one, and a new pulpit and communion table in oak, stone font, and deal choir stalls are to be added to the furniture. The present large reredos, which blocks the east window and dwarfs the small chancel, is to be removed and re-set up in the new vestry, and replaced by a much smaller and less pretentious one, executed in Caen stone. If funds permit, a new open roof in deal is to be thrown across the chancel.

HANDSWORTH.—The memorial stone of the new Public Offices and Free Library at Handsworth was laid on Tuesday afternoon. The style of the buildings will be a free treatment of Gothic of the Tudor type; and the premises will comprise a board-room, public offices, free library, stables, fire-engine house, and cart and implement sheds. The elevation will be carried out in red-pressed brick, with Hollington stone dressings; while the roofs will be covered with Staffordshire tiles of improved make. The buildings, which are expected to be completed within twelve months, will cost between £10,000 and £11,000. The architects are Messrs. Alexander and Henman, of Stockton-on-Tees and

Middlesborough; and the builder is Mr. Charles Steel, of Pitsford-street.

LIVERPOOL.—On Tuesday the foundation stone of a new Primitive Methodist chapel and school was laid at Liverpool, in Princes-road. The plan of the chapel is a parallelogram, 75ft. long by 46ft. wide, and the school now stands at the right angle at the back of the chapel, with the entrance facing Beaconsfield-street. The school-room on the ground floor will contain five class-rooms, of various sizes, 28ft. by 13½ft. down to 18ft. by 13½ft. There will also be a minister's and deacon's vestries, &c., and above these there will be a room 70ft. by 33ft. The chapel will have a gallery on two sides, and the ground floor will have seats for 900 persons. The elevations of the schools and sides of chapel will be carried out in brick, with stone dressings. The front of the chapel, tower, &c., will have an octagonal spire of dressed stone 110ft. high. The whole contract has been taken by Messrs. Nicholson and Ayre, for the sum of £6,536, the architect being Mr. Richard Owens.

LWYNPIA.—On Monday the corner-stone of St. Andrew's Church, Llwynpia, Ystradyfodwg, was laid. The style of the new building is Early English, of about 12th and 13th centuries. The estimated cost is £2,100, and the church will accommodate about 500 persons. Mr. White, builder, of Swansea, has undertaken the contract, and the building will be superintended by Mr. W. D. Blessley, Cardiff, the committee's architect. The plan is cruciform, having a simple nave, with centre aisle and transepts. The chancel is not in the present contract, but it is hoped soon to erect it. There will be no tower at present built, but the west front has for one of its chief features a stone bell-cote springing off the gable coping.

LONDON SCHOOL BOARD.—At Wednesday's meeting of this Board the tender of Mr. W. Downs, of Hampton-street, Walworth, amounting to £11,197, was accepted for a school for 1,166 children in Beethoven-street, Queen's-parkestate, Chelsea. The school has been planned, on a freehold plot of 1½ acres in extent, as a one-story building with three departments, the graded schools being arranged around a hall in the centre, 70ft. by 40ft., which is intended for holding pupil teachers' examinations, &c., for the Chelsea division. The total cost of buildings will be only £9 12s. per head—a step, as Mr. Stiff, chairman of the works committee, remarked, in the right direction. An amended tender by Mr. C. N. Wilmot, of High-road, Lower Clapton, amounting to £717 10s., was accepted for the alteration of Upton House, Urswick-road, Homerton, to adapt it as a truant school. From returns as to the removal of temporary iron buildings from one site to another, it appears that the average cost of such removals is about £200, including provision of foundation, drainage and sewerage, and fences. It was decided to schedule, in the next session of Parliament, 36 sites for new schools (ten being alternative sites) and 19 plots of additional land for enlargements of schools or playgrounds.

MANCHESTER.—A shop in Portland-street, Manchester, has been rebuilt for Mr. William Armstrong. The front is of tooled Spinkwell stone; the shop door window frame and bressummer are of English oak, the rest of the woodwork of stained pitch-pine; the roof and sides and front of the dormer are covered with red tiles; the main cornice is cement panels, with stamped and coloured enrichments. The work has been executed by Mr. Josh. Thompson, builder, of Manchester, under the direction of the architect, Mr. G. H. Goldsmith, 63, Faulkner-street, Manchester.—New offices for the *Manchester Courier*, and the *Manchester Evening Mail*, have just been erected for Messrs. Thos. Sowler and Sons, by Mark Foggett, builder, under the superintendence of Messrs. Wolstencroft and Son, architects, of Pall Mall, Manchester. The main portion of the building forms one nearly square block. The style of the principal front which faces Cannon-street belongs to the many modern developments of Classic architecture. It is divided into five bays by stone pilasters, which support a cornice above the second floor windows. The third floor is built as an attic over four of these bays; the portion adjoining Bank Buildings being kept low in order to avoid interference with the

light of property situated on the other side of the street.

METROPOLITAN BOARD OF WORKS.—At Friday's meeting of this Board deputations appeared in support of memorials from the vestries of Bermondsey and Rotherhithe and St. Olave's district board, asking for early improvement of the thoroughfare from London-bridge to Deptford, for which Parliamentary sanction has been obtained. A deputation from the Westminster district board attended to request the board to seek powers, in its next Building Act Amendment Bill, to effectually prevent the use of hoardings and like structures for advertising purposes. It was pointed out that the practice of letting hoardings to bill-stickers was a growing one; that it was unsightly, and productive of inconvenience to the public, and often a source of danger, while the fact that they received substantial rent from these structures induced builders to keep them up longer than was necessary. All the memorials were referred to the works committee. The following applications from local authorities for borrowing money were granted:—Mile End Old Town Vestry, £6,000 for purchase of leasehold wharf, erection of stabling, and supply of necessary plant for carrying out slopping and dusting work (interest 5 per cent.); Plumstead District Board, £850 for sewer, &c., at Charlton (3½ per cent.); St. Pancras Vestry, £1,927 for widening Gordon-house-lane (3½ per cent.); also £6,000 for granite paving (5 per cent.); and £6,750 towards rebuilding canal bridge at Gloucester-gate, Regent's-park (5 per cent.); and Lambeth Vestry, £6,000 for purchase of horses, carts, and plant (5 per cent.). Mr. H. A. Hankey's application for approval of a plan for the construction of the walls of the south wing of Queen Anne's Mansions, Westminster, of greater height than provided for by the Building Act, was not granted. Amended plans submitted by Messrs. Brunlees and McKerrow, showing proposed interference with the sewer and subway in Queen Victoria-street by the works of the Metropolitan Inner Circle Completion Railway, were approved, but the company were referred as to the sewer itself and drains to the City Commissioners of Sewers. The Board approved the preamble of the bill prepared last session to amend the Metropolitan Management Act, 1855, the Metropolitan Building Act, and the Acts amending the same respectively. The new bill is to deal with such matters as roads, foundations of houses, "buildings and erections," and recovery of expenses relating to dangerous structures. Attention was called by Sir F. Truscott to a large stack of timber near Waterloo Station, which he considered would, if it took fire, endanger the small cottage property and Peabody dwellings near by. The architect to the board (Mr. Vulliamy) said he visited the premises some time since, and found that the stack contained a furnished office lit by gas. He gave notice that it was a dangerous structure, when the office was done away with, and he was unable to interfere. A general discussion took place on the peril of fire involved by large timber stacks, and the necessity for a clause enabling the Board to deal with them. Mr. Freeman warned the Board not to attempt to incorporate too many matters into their bill, reminding the members of the manner in which a clause in a former bill relating to timber stacks was defeated by the combined opposition of builders and cabinet-makers. The matter was eventually referred to the Building Act Committee. It was agreed to purchase the rights of Queen's College, Oxford, in Plumstead Common and Shoulder-of-Mutton Green, at a cost of £10,500.

NEWTOWARDS.—On Wednesday week a new Roman Catholic church at Newtownards was dedicated. The style of the building is Late Decorated, and Messrs. Hanson and Son, of London, are the architects. The materials are Scrabo freestone with Dundonald red sandstone dressings. Inside the new church measures 108ft. by 45ft., and will hold over 650. The structure is composed of a sanctuary, with a side altar, on the north side, and sacristy to the south. There are also north and south transepts, nave and aisles, with four bays. At the western extremity of the building is a small

gallery. A porch is situated at the south-west angle of the building. At the intersection of the nave and transepts is a lantern tower, and close behind it a tower for the bell. At the end of the south aisle, immediately over the foundation-stone, is a statue of St. Joseph, another, of St. Patrick, occupying a niche immediately over the door at the south-west corner. Both niches are formed of well-cut Dundonald stone. The cost of the building has been nearly £10,000.

NEW CLEC.—The foundation stone of the new church of St. John, Apostle and Evangelist, was laid on a site in Rutland-street and Cleethorpes-road, New Clec, near Grimsby, on October 25th. The church is designed with a nave, north and south aisles, a chancel with organ chamber and vestry on the north side, and a western narthex. The style is Early English. All the doorways and windows of the church will be of Ancaster stone, and the exterior walling will be of brick, relieved by stone string-courses and ornamental brickwork. The western narthex is approached through an open archway, leading to a large doorway, richly moulded, having columns with moulded caps. It is lighted by a triplet window at the south end. The nave and chancel are of unusual width, and will be covered by an open-timbered roof 30ft. in span, the aisles being somewhat narrow. In the sanctuary on the south side is the sedilia, surmounted by a canopy. An arcade of three arches will form the chief feature of the sanctuary under the east window; the central arch contains the reredos, which is divided into three compartments. The lofty walls of the chancel will be relieved by arcading, which is carried round on the north and south sides below the clerestory. The church will contain 600 sittings. The seating throughout will be of stained deal, and the floors of the passage are to be laid with tiles. The works are being carried out by Mr. J. M. Thompson, builder, of Louth, from the designs of Mr. Jas. Fowler, of the same town.

PRESTON.—The new premises of the Preston Reform Club was opened on Saturday. The building has been adapted according to the plans of Mr. D. Grant, architect, of Preston, at a cost of nearly £1,500. A new stone frontage of Classic design has been erected, and the internal arrangements, comprise, on the ground floor, a vestibule, news and telegram-room, registration office, luncheon-room and bar, and billiard-room; on the first floor, reading and lecture room and smoke-room, and on the second-floor another billiard room. In the basement are the kitchen, store-rooms, &c.

READING.—A new Temperance Club-house is being erected at Reading. The club accommodation comprises a public coffee-room on the ground floor, 20ft. by 18ft.; a reading-room on the first floor, of same dimensions; and a bagatelle-room, 28ft. by 13ft., with the entrance from the landing of the main staircase. In addition there is a kitchen, and other offices, besides bedrooms for the manager. The building is built and faced with red bricks, relieved with the introduction of grey brick patterns and ornamental string-end encaustic tiles in the pillars of the front. The builder who has undertaken the contract is Mr. James Wicks, of Southampton-street, and the works have been executed from the design and under the superintendence of Messrs. Morris and Stallwood, architects, of Friar-street, who give their services gratuitously. The total amount of Mr. Wicks' contract is £525.

ROCK FERRY.—The new Roman Catholic church of St. Anne was opened at Rock Ferry last Sunday. The building is in the Early Decorated style, and contains nave, chancel, transepts, and side chapels, besides baptistery and tower. The materials used are yellow Stourton stone for the dressings, with facings of pierrepoints of a bluish tint. The whole of the interior of the chancel and chapels has an ashlar facing of Stourton stone. The entire length of the building is 124ft. The outside width of nave is 39ft., and the same, including transepts, is 70ft. The height from floor to apex of roof is 40ft. The total cost amounts to upwards of £7,000. The building was designed by the late E. Welby Pugin, and has been carried on by his brothers, Messrs. C. W. and P. Pugin, architects, of Westminster

and Ramsgate. Mr. Woolley, of Chester, was the contractor.

SPALDING.—The foundation stone of a new church dedicated to St. Paul was laid on Thursday, the 18th ultimo, by Miss Charrington, of Spalding, at whose cost the entire of the works are to be erected, that lady having given the munificent sum of £32,000 for the building and endowment of same, including vicarage and schools on the same site. The church will be a fine structure in the Early English style, having a noble tower and spire, disconnected with the nave by several yards. The exterior will be of red brick and Ancaster stone, and from the designs of Sir G. Gilbert Scott. Messrs. J. and W. Pattinson, of Sleaford, are the builders; and Mr. Geo. Hanuaford, clerk of works.

ST. ASAPH.—New grammar schools are being built in this city to accommodate 40 boarders and 60 day scholars, with head master's house of three stories adjoining. The school buildings themselves will cover an area of 118ft. x 60ft. The principal entrance is beneath a tower, in which will be placed the water supply cisterns, leading to vestibule and staircase hall. On the right is the boys' dining-hall, 30ft. x 20ft., and on the left the large school-room, 50ft. long by widths varying from 20ft. to 30ft. On the same floor are the class-rooms and master's study, while a corridor leading to the playground shuts off the lavatory and offices. The dormitories are on the first floor, that for seniors over the dining hall, and that for juniors above the school-room, the under master's sitting and bedrooms and other rooms are planned in the story above. The building is to be of bricks made near the site, with Ruabon pressed bricks for angles, jambs, and arches. The inside of principal rooms on ground level will be faced with white pressed bricks, above a dado 5ft. high, in red pressed bricks. The whole of the joinery will be of pitch-pine varnished; the roofs will be covered with Bangor slates. The heating will be by Gurney's stoves. Mr. R. Lloyd Williams, of Denbigh, is the architect; and Mr. Moses Parry, of Conway, the builder. The total cost will be about £4,000.

TOPSHAM CHURCH, DEVON.—On Saturday, the 27th ult., the rebuilt church of St. Margaret, Topsham, was consecrated. The new building is not a restoration, for nothing good was left in the recent church but the old Perpendicular tower, which has been repaired, and combined with the new work. The church, reconstructed with enlargement, consists of nave 83ft. 3in. x 24ft.; entire width, with aisles, 58ft. 6in.; chancel, to which there are aisles and vestry, 34ft. 6in. x 19ft.; transepts, in length, 91ft. 9in. x 22ft. The style is Early Decorated. The walls are of limestone from Torbay; the dressings of Bath stone. The seating is of red deal, with tracery in the bench-heads, accommodating 848 persons, 449 being free, including children. The roofs are red deal, ceiled between the rafters, excepting that of the chancel, which is boarded, and has mouldings and tracery. There is a reredos of five crocketed canopies, carved by Mr. H. Heus, who has executed the corbels, &c., throughout, and illuminated by Mr. Drake. The organ occupies a chamber north of the chancel, with vestry adjacent. There are three large stained glass windows (memorials): one in the north transept, by Beer and Driffeld; the west and east windows by Drake; the south window of chancel by Hughes. The sacarium is inclosed with a brass rail and standards, and this portion paved with Minton tiles. Adjoining the tower entrance is the Norman font, with a plinth supplied, set on an octagonal step. The entrance is through a deeply-pannelled arch (Perpendicular), and close beside it in the tower was discovered, filled with rubbish and cob, a steep stair, rising about 6ft., and giving access through a small doorway into the body of the church, probably a rood stair. The enlarged church required an extension of the churchyard, and a space about 60ft. x 45ft. has been added on the east side through a clearance of some old houses, and the east end is now visible from the main street. The works have been carried out by Messrs. Stephens and Son, of Exeter, under the direction of Mr. Ashworth, architect; the clerk of works was Mr. Bradford.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 60s. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33l. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—J. K.—C. W.—W. T. W.—A. and Co.—J. W. C.—C. H. and Co.—J. A. S.—A. L. B.—H. G. C.—A. C. Lanyon.—C. Mort.

ERRATA.—We stated on p. 373 that Mr. J. Howcroft had been appointed surveyor to the Kirkleatham Local Board. Our information was incorrect, Mr. L. S. Thompson is the gentleman elected. Last week, in our description of the design for new Spa buildings at Scarborough, the names of the architects should have been given as Hetherington and Oliver, not Hetberington and Ourer.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. Published every Friday, Price 2s. Annual Subscription, Post-free, Eleven Shillings. This week's number contains articles on The Annual Report of the Local Government Board, Household Economy and Health, A Disease Map of Birmingham, Musgrave's Slow Combustion Stoves, The Pathology of Contagion, An Aërating Filter, On the Influence of Climate on Health, Habitual Female Drunkards, A Smokeless Stove, What Chemical Disease does not do, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c.—31, Tavistock-street, Covent-garden, W.C.; and all News-vendors.

Correspondence.

THE MASONS' STRIKE.

To the Editor of the BUILDING NEWS.

SIR,—The letter of "C. B." One of the Deputation of Masons," requires some reply, which, by your leave, I will make as short as possible. "C. B." says that there can be no difficulty in the masons working different hours from bricklayers and others, because plumbers have always worked different hours. I think any person of common sense will at once see there is nothing in such an argument. Plumbers have no work in connection with masons, and the well-known reason of plumbers being allowed shorter hours is the unhealthiness of their employment, they being always constrained to work in a stooping cramped position, and liable to inhale the fumes of molten metal.

The next fallacy of "C. B." arises from his mixing up the trades of carpenters and joiners. Carpenters at work in open buildings must of necessity work the same hours as bricklayers, plasterers, &c. The joiner has, as "C. B." states, a nice warm shop to work in, and so is unaffected by weather or darkness.

"C. B." denies the assertion that a skilful mason is made to eke out his time so as not to surpass the idle and unskilful, and asks, "Can the master builder point out any rule in our book to that effect?" In reply, I say that the book in question is not available for the masters to see, and if it were the chances are that no such rule would be found. But the practice is as I have stated, and many instances can be given of the masons striking because the masters wished to test the amount of a man's work by measuring it.

The last matter referred to is the dissatisfaction of the Masons' Union at the course the master builders have adopted in seeking men from abroad, being unable to get them at home, and to this I reply that the masters had no other reasonable course open to them. "C. B." also deplores the fact of many hundreds of men being compelled to subsist on the strike pay of 18s. per week. In this I heartily agree with him. I know a man with nine children, who is starving on that allowance (his large family having made it impossible to save much), and yet that man might be earning his 10½d. per hour as a fixer if the Union would allow him to work for his old employers.—I am, &c., A MASTER BUILDER.

THEORIES OF RESISTANCE.

SIR,—I observe in your article on the above subject last week that you quote an opinion of Mr. Kent's, from *Van Nostrand's Magazine*, that my theory of "diagonal resistance" in beams, subjected to a transverse stress, "is far from being a correct theory." I should not have minded such a random expression of opinion had you not apparently endorsed it yourself. It would be more to the point to say of the theory that in the form in which it is propounded it is not a universal theory. Let me state that the theory, as propounded, is based on the assumption that the material of the beam is homogeneous, and "that, within elastic limits, extension is equal to compression, under equal stresses, and their strict application is confined to the calculation of stress, strain, and strength within elastic limits. At the same time they are practically applicable for calculating ultimate strength."

I submit that the correctness of the theory, under these conditions, has been fully, in various ways, established in my "Manual of Rules, Tables, and Data," in the cases of iron and of steel, which are practically homogeneous, with a remarkable degree of accuracy. I have there given numerous examples of the application of the theory. In the case of cast iron the theory cannot be expected to apply for the breaking strength of ordinary castings, for the reason that they are not homogeneous. But even for cast-iron bars the theory is applicable within the elastic limits of resistance, as shown at p. 564 of the "Manual."

Let me add, in conclusion, that the elastic strength, or the greatest stress which the material is capable of sustaining within the elastic limit, is of much greater importance than the ultimate or breaking strength. For, in practice, it is necessary, in order to insure the permanency of a structure, that its proportions should be such that, under the maximum stress to which any piece is to be subjected, it should not be strained beyond the elastic limit of its strength.—I am, &c., D. K. CLARK.

S, Buckingham-street, Adelphi, W.C.,
October 29, 1877.

CHURCH OF ST. PETER'S, REGENT-SQUARE.

SIR,—I must thank Mr. William Woodward for his kind remarks in the first paragraph of his letter of last week. I trust that when my design is "carefully worked out" it will be a successful divergence from the "stock interiors of the day." With this object in view I have refrained from entirely obliterating every thought of the "man who designed it" (viz., St. Peter's), because, although I do not know much of the "choragic monument of Lysicrates," I feel sure that he who designed St. Peter's, Regent-square, knew nothing of Gothic, and I determined that none of the sham Gothic so prevalent should metamorphose an essentially Classic church, and I therefore chose a Renaissance style upon which to work; and the characteristics I retain are:—1st, the flat roof; 2nd, the present windows of nave; 3rd, the walls of nave intact; 4th, the portico and steeple; and I intend, where the ornament is good, such as in the present frieze round chancel, to use it up in my proposed restoration. I must utterly differ from Mr. Woodward as to the proportions of St. Peter's. A Classic church is not my beau-ideal, but if we have a parish church built in that style, and even in an inferior way, it is our duty to use the same, and to make a church of it as far as ritual

arrangements for choir, the re-seating of nave and other matters not sufficiently recognised in the early part of this century, are concerned, but that the proportions of many of these so-called Classic churches—St. Peter's included—were necessarily bad, is not, I venture to think, in accordance with facts. It is the un-eclesiastical arrangements, and not the stone shell, which are so painful a feature in these Georgian churches and their successors.

Has Mr. Woodward seen the late Renaissance churches of Bruges, Brussels, Antwerp, Rennes? I think he would find that poor St. Peter's are equally good proportions with them, and were it ecclesiastically furnished, just as it is, it would not look so very inferior by the side of them. With regard to the exterior, I should certainly do nothing but put the fabric in good repair. The "style," which seems so offensive to Mr. Woodward, marks an epoch in the history of the Church of England, and it would be vandalism in the extreme to remodel the outside where no necessities of worship or arrangement are concerned. I have now said my say as a professional man. As vicar of the churchwarden of the parish of St. Peter's for this year, I think if he will visit the church on a Sunday or Saint's Day, that with all its miserable arrangements he will find the Church of St. Peter is far from a "sepulchre," either spiritually or temporally, for we have an ardent ministry and a capital warming apparatus; and I am sure, for my own part, and that of my vicar, if Mr. Woodward will come and help us to carry out some of the sweeping alterations he suggests, by liberally subscribing to the funds of the church, which are very low, he will meet with a very warm welcome.—I am, &c.

WM. SCOTT CHAMPION.

North Petherton, Somerset, Oct. 31.

CAPITAL AND LABOUR ANTAGONISTIC

SIR,—There are two and very separate aspects in which the present strife between master and workman must be viewed. One is the broad question involving the adjustment of capital and labour; the other is the opposition on the part of the men to the importation of foreign hands. Now it is of no use to disguise the fact that capitalists and workmen have at present quite opposite interests. The capitalist really becomes one by profiting or deriving income beyond his expenses. This surplus is really the result of usury—it is, as one writer with whom I agree says, "capitalism." Now the workman contends, and with some fairness, that the spoil should be divided between them, not be taken exclusively by the capitalist. It is quite evident if England is to improve by her industry, if men are to work better than Sir Edmund Beckett says they do, this adjustment or division of the profit arising out of work must be more equal. We are constantly being told that English artists are inferior to foreign; we know that work now has not the same impress of care and thought it had when our mediæval buildings were executed. But the puzzle is quickly solved when we consider that the capitalist—the contractor—is endeavouring to get as much gain as he can—more than fair profit—by the labour of the skilled workman, while the workman, in turn, is attempting to restrict his labour. The contract system, every one knows, has been a cause of decline in British workmanship. It places capital in direct antagonism to labour; it supersedes thinking on the part of the artist, and produces such a disagreement as the recent *émeute* between capitalists and workmen. When we come to look at the skill of the workman and the money of the capitalist, as simply interchangeable products which one gives and the other takes, it is readily seen how absurd is the dictum that the capitalist should buy in the cheapest market and sell in the dearest. It is a fact no one will dispute that the greatest epochs of art were those in which these two necessities were reciprocally employed, and their interests became identical. Unfortunately, the relations between masters and workmen have come to be regarded as thoroughly opposed. The capitalist seeks to get his work done at the lowest price, and the workman either to scamp or to resist. Each strives to obtain a profit—an advantage over

the other. If we look at the matter in this light, it is absurd to argue that the work is performed with less skill, or that the workmen spend their time in idleness. It is the result of the system, and Sir Edmund Beckett's argument falls to the ground.

On the second question it is much to be deplored that the men have placed themselves in the position they have. By trying to influence foreign workmen they have unwittingly shown themselves as greedy of gain as their employers—they have prevented their competitors earning better wages, and have acted the dog-in-the-manger fable. They have no defensible ground to prevent the capitalist buying his labour at the cheapest market any more than it would be fair to prevent the working man. Trade exists for the consumer. But the whole question hinges on the former principle. Why, after receiving a fair return, should an overplus be sought on either side; or why should the capitalist want more than a fair interest on his capital after paying the outgoings? One is as justly entitled to the overplus as the other. If the masters or contractors have taken a contract low, of course it is their own fault, and they alone must be the sufferers in any trade dispute, though of course they are at liberty to get cheaper labour. Labour is wealth, and the more there is of it, and the better it is performed, the better it is for the public weal. Be it observed, however, that the limitation sought to be imposed on labour is the result of the system of making capital. Unfortunately, the just division of the wealth made by labour and capital is not likely to be attained till both masters and men can be elevated out of their personal selfishness and pride—a condition only possible by the exercise of moral strength which neither at present have reached. The *Times* and other papers have argued the question without a clear idea of the principles of political economy. We cannot make the average workman feel "an individual delight in turning out a workmanlike product," when a better example is not set him by his employer. Let it be understood also that the consumer suffers by any over-reaching on either side.—I am, &c.,

G. HUSKISSON GUILLAUME.

KENSINGTON VESTRY-HALL COMPETITION.

SIR,—With reference to the letter of your correspondent in last week's *BUILDING NEWS*, we, as the authors of one of the eight designs selected (by Mr. Whichcord), will be glad to co-operate with him in urging his happy suggestion for a fresh competition, limited to the above eight.—We are, &c.,

WALTER F. LYON, F.R.I.B.A.
J. M. FERGUSON.

CHURCH OF SKIRLAUGH.

SIR,—Will you kindly allow me to make known, through the medium of your excellent paper, that it is proposed to restore the church or chapel of Skirlaugh? Skirlaugh is a village in Holderness, a district of the East Riding of Yorkshire, which, although little known, contains several fine churches, especially Pahrington, Hedon, and that now under notice. In this village of Skirlaugh, from which he probably took his name, Walter Skirlaw, Bishop of Durham, built, towards the close of the reign of Richard II., a chapel universally admired by students of architecture as a specimen of Early Perpendicular work, and which, with the exception of the interior, remains nearly in its pristine state. It was, therefore, with much regret, that I heard, whilst staying at a parsonage in Holderness, a few days since, the subject of its restoration discussed, and grave misgivings expressed as to the result to be anticipated. The architect entrusted with the work is, it appears, a local practitioner, who has had little or no experience in the restoration of old churches, being principally known from the Wesleyan chapels which he has erected in the town of Hull and its neighbourhood. Under these circumstances I think there can be no doubt but that the duty of the committee is to submit the plans to some eminent ecclesiastical architect before proceeding with the work, as these examples of our national architecture are not the property of the few hut of the nation at large. Trusting that others interested in the preservation of our ancient churches may take the matter up and prevent another grievous sacrifice of old work,—I am, &c.,

ECCLESIOLOGIST.

Hull, October 29th, 1877.

Intercommunication.

QUESTIONS.

[5166].—**Stone.**—Is the Mansfield Woodhouse stone suitable for monumental work? If not, what other kind would be best for a head stone 4in. in thickness other than Portland, which I find invariably vegetates after a very short space of time?—F. R.

[5167].—**Tuck Pointing.**—Would one of your numerous readers inform me how to make good black tucking mortar? Please give materials and proportions. By so doing they will greatly oblige—AN ENQUIRER.

[5168].—**Dividing Rooms by Partition.**—Would some reader be kind enough to inform me as to the best method of dividing a dining-room and a drawing-room so that they may be thrown into one room when required? If a partition, is it not better to lower it into the cellar than to take it up into the bedroom over, or is there a better mode than either of these?—INEXPERIENCED.

[5169].—**Ceilings Gilded.**—Will some kind reader kindly inform me how ceilings are "china gilded," and if it is much more expensive than whitened only? Also if cornices may be "china gilded"?—ANXIOUS AMERICAN.

[5170].—**Boundary Wall.**—Must a boundary wall (for a builder's yard in a small village), 6ft. above the level of the ground, be kept to the building line, which is 18ft. set back, or may it be built up to the edge of the street?—BUILDER.

[5171].—**Boundary Wall.**—I should be glad if any of your readers would give me their opinion on this point:—A and B own adjoining land to each other; B builds to the utmost extremity of his land. Has B a right, legal or customary, to trespass on A's land and damage crop for the purpose of erecting his building? Should not B erect his wall, the mason standing in B's land?—FAIRPLAY.

[5172].—**Perspective.**—Would some professional reader kindly inform me of a work suitable for a student who wishes to learn how to delineate architectural elevations, &c., in perspective, the price, and where to obtain the same? Are the works of Dr. Brooke Taylor or Malton, or either of them, suitable?—ANXIOUS.

[5173].—**Architectural and Scientific Books.**—I should feel obliged if any of your readers could inform me if there are any libraries in London from which books on the scientific portions of our profession could be borrowed, and on what terms? I have tried Mudie's without success.—J. P.

[The Architectural Association Library is the only lending library for the books you require. Apply to the hon. sec., 9, Conduit-street, W.—ED.]

[5174].—**Retaining Percentage from Instalments.**—What is the proper understanding of the usual clause retaining a percentage on value of work executed by a contractor? I am told that the legal effect of this is, say, suppose contract to be for £1,000, a balance of one-fifth (or £200) should be retained "till the completion," if payments be made at the rate of 80 per cent. on value during progress. But this is not as most builders understand it, nor according to general custom. Say, for first instalment, if £100 of work be done, I should pay £80, but the £20 balance would be paid up next time, so that on completion there might be only, say, £20, £10, or less. I should like to know what is the proper way of looking at this?—R. B.

REPLIES.

[5160].—**Queen Anne.**—In reply to "Carver," the old brick buildings of the Temple, as Garden and Pump-courts, contain excellent specimens of cut brickwork and woodwork of this period. Bishops-gate-street, Aldersgate-street, and other streets in the City have examples also of "Queen Anne." Bedford-row is another locality full of fine work of this era, and Queen Anne's-gate contains some very choice specimens of the style. There are few of the old streets and suburbs of London that do not furnish some good examples of this kind of work. In the High-street and the Square, Kensington, in Grosvenor and Berkeley-squares may be found some capital old houses, dating from the 17th to the 18th centuries; and a fine example of a country residence, with ornamental gables, windows, doorways, and carved hrickwork, may be seen in the High-street at Putney. The *BUILDING NEWS* has given more examples of this kind of work than any treatise I know of.—G. H. C.

[5163].—**Testimonials.**—I should not advise "A. F. G." to alter the dates of his testimonials. Of course it would be forgery to alter date and the name of town. "A. F. G." had far better not touch up his testimonials to suit them to more recent appointments, but had rather obtain some new ones of later date to add to them. Why should not an old testimonial retain its value?—ARCHITECTUS.

[5164].—**Surveyor's Charges.**—The employer was wrong in paying the surveyor his fees, and he cannot properly deduct the amount from the contract. The receiver having completed the contract, should insist on full payment. It has been held that the liability to the surveyor shifts from the owner to the builder when the former has accepted the latter's tender so as to form a contract.—L.

Our Office Table.

THE brickmaking season is now finished. On the whole it has been a very favourable one both for masters and men. Owing to the number of new schools being erected in all parts of the kingdom, the result of recent legislation and other causes, the demand has been unprecedentedly great, the natural result being that bricks have fetched a capital price. Then the weather has been exceptionally fine; the brick-moulders and their gangs have thus lost but very little time, which, of course, made a considerable difference in their earnings. Brick-moulders, setters, and temperers have earned on an average from 50s. to 60s. per week each, and in some cases even more. In the large brickmaking district, of which Sittingbourne and Faversham are the centres, over 200 millions of bricks have been turned out this season. Of these no less than 60 millions were made by Messrs. Smeed, Dean, and Co., of Murston, near Sittingbourne, who are the largest individual manufacturers in the kingdom. It is remarkable what a quantity of bricks one man can mould in a season. To make a million is regarded as being excellent work, but there are several instances in the district referred to, in which 1,200,000 or 1,300,000 were made at one "stool."

LAST WEEK Mr. Daniel Percival Appleby, a well-known north country contractor, died, at the age of about seventy, at Barnard Castle. Mr. Appleby built many of the stations on the Barnard Castle and Darlington Railway, and also on the Tees Valley Railway. He also erected police stations and courts at Darlington and Barnard Castle, and at the latter town built the militia barracks. The deceased enlarged the county prison at Durham, and erected a large number of houses and shops at Barnard Castle and elsewhere. On the construction of the South Durham and Lancashire Union Railway, Mr. Appleby erected the Percy Viaduct, one of the finest of a series of bridges occurring on the line. He also assisted in the construction of Deepdale Viaduct and the Tees Bridge. In addition to these works Mr. Appleby alone constructed the Haggerleazes Railway, extending from Barnard Castle to Bishop Auckland, an undertaking beset with engineering difficulties, owing to the peculiar conformation of the district. He also doubled the line from Bowes to the Summit on the South Durham and Lancashire Railway. Commencing life as a cabinet-maker, the career of the deceased, although very remarkable, cannot be said to have been successful in a monetary point of view, as he died in comparative penury.

THE trial and sentence of Messrs. Swindlehurst, Langley, and Saffery, for their frauds in connection with the Artizans' Dwellings Company, seems to have taken many people by surprise; and some of the daily papers write about the affair as if a court of law had just established for the first time an entirely new reading of the Eighth Commandment. What the effect may be on the morality of directors of public companies and others in similar positions of trust we do not know; but it ought to sharpen the wits of those who, while honest themselves, are contented to leave things to the mercy of their more clever but less scrupulous colleagues. For the defendants Saffery and Langley we feel something like pity. The first bowed to an immoral and pernicious custom too frequent among members of his profession; and the second, who, while something of a charlatan, has busied himself at considerable pecuniary cost in political matters, was weak enough to be entrapped by the prisoner Swindlehurst, who, we firmly believe, was the originator of the crime. Any time during the past seven years we have expected his name to appear in connection with similar disclosures, though not precisely of the character of those which have lately attracted public attention. Had those who were supposed to look after the servants of the company during the earlier years of its existence awakened sooner to a sense of their responsibilities, and shown a little of the energy since displayed by the committee of investigation, the shareholders of the company would probably at this moment be a good deal better off.

We have received a copy of the first annual report of the "Bricklayers' Technical Educational Classes," which is an institution conducted for the instruction of those working men who appreciate the honour—there are 129 of them—"under the patronage of the Royal Institute of British Architects," "during the pleasure of the Council," with Mr. Frank E. Thicke as its president, and its headquarters at his office. Three classes have been formed—one in London, one at Greenwich, and the other at Chelsea, and the voluntary services of two teachers secured, of whose abilities we know nothing. An examination was held last December, when six prizes and three certificates were awarded—two of the prize-takers and one certificate-holder being on the committee of the institution—a rather uncommon occurrence. The substantial value of the "patronage" of the Royal Institute of British Architects seems to have resolved itself into three donations of two guineas each from members of that body; the mainstay of the funds has been a gift of twenty guineas from the Fishmongers' Company.

The first examination of Surveyors and Inspectors of Nuisances took place on Monday, the 29th October, at the rooms of the Medical Society of London. Eight candidates presented themselves, five of whom were successful in obtaining certificates of competence—namely, Mr. H. M. Robinson, surveyor, Ulverston; Mr. J. Parker, surveyor, Bridgwater; Mr. F. Booker, Inspector of Nuisances, Bradford; Mr. W. S. Prebbles, Inspector of Nuisances, Blackburn; Mr. Thomas Blanchard, Inspector of Nuisances, Evesham. Fifteen candidates have already entered their names for the next examination.

CLEOPATRAS NEEDLE is surpassed in height by a home-made modern obelisk, which has just been erected in the island of Guernsey. The monument has been constructed by public subscription as a memorial to the late Admiral Lord de Saumarez, G.C.B. The site is Delancey-hill, a lofty eminence close to St. Peter's Port, overlooking the roadstead and commanding the coast line of Guernsey for many miles, as well as the entire group of the Channel Islands. The memorial consists of an obelisk built up of finely-axed blocks of Guernsey granite. The shaft or needle is 78ft. high, which is higher than that of Cleopatra's Needle, to the proportions of which it generally conforms. This needle stands upon a pedestal of granite stepped at the base and standing 18ft. above the ground level, thus giving a total altitude of 96ft. to the memorial. On each of the four sides of the pedestal panels are sunk for the reception of bronze tablets with suitable inscriptions, which have yet to be inserted. The De Saumarez memorial was constructed by Mr. James Le Page, contractor, from the designs of Mr. A. C. Andros, M. Inst. C.E.

WATER SUPPLY AND SANITARY MATTERS.

BORNEMOUTH SEWAGE WORKS.—At a special meeting of the Bournemouth Improvement Commissioners, held on Tuesday week, it was decided, by a majority of 9 to 5, to adopt two outfalls for the town sewage instead of one, as originally proposed. It was also resolved that the present outfall sewer-pipe under the pier be replaced by another one to extend 1,370ft. into the sea, and that the second outfall be in a line with the main sewer, running down the Chine, at Boscombe. There were six tenders for the supply of 2ft., 2½ft., and 3ft. iron pipes for the purposes of a sewer outfall. It was decided that both outfalls should be constructed of iron pipes, 2½ft. in diameter, and the lowest tender for 1,370ft. of this size of piping was that of Messrs. Lefevre and Co., of London, amounting to £3,447, which was accepted. The highest tender for the same length and size of piping was that of Mr. T. W. Haynes, of Swindon—£10,000. The accepted tender is for one outfall only, and a similar amount of piping will be necessary for the second outfall just decided on.

RURAL WATER SUPPLY NEAR CHESTERFIELD.—At the fortnightly meeting of the Chesterfield rural sanitary authority, held on Saturday, Mr. Frith, the engineer, reported on the scheme for the proposed new water supply for the 14,000 inhabitants of Holmesfield, Cowley Bar, Dronfield, Woodhouse, Coal Aston, Upper Knowle, Troway, Ridgway, High-lane, Mesborough, Halfway House, Holbrook, Killmarsh, and other places in the neighbourhood. A stream which now flows across the moorlands, near Baslow, could be utilised as a source of supply, and an impounding reservoir could be constructed

at Fox-lane to hold 15,000,000 gallons of water. By this means a supply equal to 12 gallons per head per diem could be provided at an estimated cost of from £20,000 to £22,000. The consideration of the scheme was adjourned till the views of the persons affected shall have been expressed. The clerk to the authority was instructed to communicate with the Eckington Water Company with reference to the suggested purchase of their undertaking.

STATUES, MEMORIALS, &c.

BIRKENHEAD.—The Laird Memorial Statue was unveiled on Wednesday, at Birkenhead. The statue, which is of bronze, weighs about 50cwt., and stands 10ft. high, exclusive of a thin metal base. It is mounted on a pedestal of grey granite, the full height of the monument (with the pedestal) being about 23ft. The sculptor was Mr. A. Bruce Joy, of London. The statue was cast at Chelsea.

THE BLACK MEMORIAL.—The bronze statue of the late Mr. Adam Black, recently completed by Mr. John Hutchinson, R.S.A., was on Monday safely placed on the pedestal prepared for it in East Princes-street-gardens, midway between the Scott monument and the Wilson statue. The pedestal has been designed by the sculptor in a style harmonising with the architecture of the neighbouring monument, and is constructed of Binnie freestone. It has been arranged that Lord Moncreiff shall unveil the statue to-morrow at two o'clock.

CHIPS.

An aquarium is about to be erected for the newly-formed Channel Islands Museum and Institute of Pisciculture Society in St. Clement's-road, St. Heliers, Jersey. The plans and designs have been prepared by Mr. Charles Cole, architect, of St. Heliers, under the direction of Mr. W. Saville Kent, honorary secretary.

The directors of the Great Yarmouth Aquarium Company decided last week to raise capital at once for the erection of the large concert-hall, and the completion of the other buildings as planned by the architects, Messrs. Norton and Masey.

A new Roman Catholic chapel, dedicated to SS. Joseph and Teresa, was opened in Chamberlain-street, Wells city, on Tuesday week. The architect was Mr. Charles Hansom, of Clifton, Bristol.

A bust of the late Admiral Rous is being executed in marble for the memorial committee, by M. Raggi, of Devonshire-place, Portland-place, W. It is to be placed in the Jockey Club-room, Newmarket.

At a recent meeting of the Town Council of Salford held to consider the applications for the appointment of borough engineer, Mr. A. Jacob, M.I.C.E., consulting engineer to the borough of Barrow-in-Furness, was elected to fill the vacant post. There were, as is usual in such cases, a large number of applicants.

The ninth annual report of the Manchester and Salford Building Trades' Institute for Technical Education has just been issued. There are 84 students, and the number of certificates earned by them at the science and art examinations has been 26, including three Queen's prizes. Local prizes have been given by the Society of Architects to Mr. R. J. Bennett, Messrs. Holden and Son, and Mr. J. Murgatroyd. The finances of the Institute are reported as satisfactory.

The foundation stone of a new Free Methodist chapel was laid on Monday at Old Shildon. It is being built from plans prepared by Messrs. Thompson and Garry, Bishop Auckland, and will accommodate about 400 people, at a cost of £1,600.

The first of a series of lectures on art was delivered on Monday night at Paisley School of Art, by Mr. Stewart, the head master of the school. The room was decorated with a selection from the paintings and sketches in oil and water colour, executed by the students during the past year. The works numbered 180, and are said to have exhibited a decided improvement on those shown last year.

The City Council of York, on Monday, accepted revised plans and estimates for erecting an opening bridge of stone and bricks over the river Ouse at Skeldergate Ferry, submitted by Mr. Styan, C.E., the city surveyor, in conjunction with Mr. Page, C.E. Mr. Styan was authorised to proceed with the works of section 1, and to engage a surveying foreman. The estimated cost of the bridge is £38,363 5s. 3d. Messrs. Handyside and Co. are the principal contractors.

In our last issue the name of the contractor for Wakefield New Town Hall is wrongly spelt. It should be Mr. W. Holdsworth, of Bradford. His tender, as accepted, is £13,700, including completion of the tower. The building is to be of Bradford stone, not Huddersfield, as stated.

The 27th annual meeting of the Bristol, West of England, and South Wales Permanent Benefit Building Society was held on Thursday week. The report was of a satisfactory character, and showed that the item of £75,360 advances in the 1876 balance sheet, then regarded as a mere leap, had been followed by steady progress, the total advances or 1877 being £79,490.

The Jersey Chamber of Commerce have decided by a majority of 16 votes to 4 to abandon the harbour works commenced at St. Heliers, according to the plan of Sir John Coode, C.E., as they consider they cannot be completed except at a cost much beyond the means of the island. They propose that the breakwater at the Hermitage be altered and a pier added thereat in place of the larger scheme for a new spur of 400 or 500ft. from the south-west angle of Victoria Pier.

At the Corporation dinner at Stratford-on-Avon, Mr. Graves, of Pall-mall, mentioned that he has left by will all pictures of Shakesperian subjects in his possession at the time of demise to the Shakespeare Memorial Gallery, and offered to subscribe an additional £100 to the Memorial Buildings Completion Fund if 39 other gentlemen will subscribe a like amount so as to enable the nation to avoid itself of Mr. C. E. Flower's offer of £4,000 provided a like sum be subscribed to complete the library and picture gallery.

MEETINGS FOR THE ENSUING WEEK

MONDAY.—Royal Institute of British Architects.—Address by President (Mr. Charles Barry), 8 p.m.
Society of Engineers.—Paper on "Tube Wells." By Mr. Alfred le Grand. 7.30 p.m.
FRIDAY.—Architectural Association.—Address by Mr. Bowes A. Paice, President. 7.30 p.m.

SLATES — SLATES — SLATES.

Banzor, Portmadoc, and Importers of American Blue and Green Slates, a large stock of which can be seen on the premises.

SCAFFOLD POLES, 22ft., 2s. 6d. each; 28ft., 2s. 4d. per foot; 35ft., 2s. 4d. per foot.

DEALS — BATTENS — FLOORING.

Send for price list.—R. MAY & SON, Timber and Slate Merchants, Acorn Wharf, Old Kent-road, London, S.E.

Epps's Cocoa.—Grateful and Comforting.—By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure food and a properly nourished frame.—Civil Service Gazette.—Sold only in Packets labelled "JAMES EPPS & Co., Homoeopathic Chemists, London."

Trade News.

WAGES MOVEMENT.

LONDON.—The difficulty between the London masons and their employers is still unsettled. On Saturday the Strike Committee paid "strike money" to some 700 men—18s. per week, and gave to some of the recently arrived American workmen money to defray the cost of their journeys to different parts of England, Ireland, and Scotland, where they are likely to get employment. Each man was provided with a certificate from the committee stating he had joined the men on strike in London, the Americans who had signed the roll participating in the general payment. Upon the 3,000 masons belonging to the society there is a levy of 2s. per week per member, and in addition, all the metropolitan masons who have gone to work at the 10d. per hour—1,300 in number—pay a levy of 4s. a week each, so that the committee state they do not apprehend that they shall run short of funds, especially as the other trade societies throughout the kingdom are daily sending them money contributions. The cost to the masters of bringing the men from the Continent to London was about £4 10s. each. That of the importation of the American contingent reached close upon £100. The cost of passage by the Elysia was 28 dols. a head, or in the aggregate, £324 16s., and to this have to be added the expenses of advertising in America, of paying the agent there, of drawing up the contract, and for food and lodging a couple of days in London. All this has been virtually lost to the masters. On Monday the Masons' Committee memorialised the First Commissioner of Works against the use of the new Law Courts by the contractors as a common lodging house for the foreign workmen employed there, urging that such use of Government buildings upon which advances had been paid, was illegal. The committee are also considering whether they cannot bring the contractors there under the Truck Act for detaining the foreign workmen's wages on account of food and board. On Tuesday, thirty-nine Canadian masons, on their arrival from Liverpool at the Midland Railway station, Kentish-town, were conveyed to the White Horse Tavern, Fetter-lane, instead of Mr. Dove's works, Islington, as originally intended. During the day they were constantly visited by delegates from the Central Strike Committee, and a large proportion of them were induced to go off with the men on strike to the "Sun" in Mason-street. Very few of them have gone to work. On Wednesday a further contingent of forty-three German masons arrived in London, and were taken to the new Law Courts, where they are to be hoarded and lodged while they remain in the employ of Messrs. Bull and Son. There are now 121 masons at work in the courts, of whom eighty-eight are foreigners.

THE BUILDING NEWS.

LONDON, FRIDAY, NOV. 9, 1877.

BEDFORD PARK ESTATE, TURNHAM GREEN.

AN attractive estate of about 80 acres, known as the Bedford Park Estate, near Turnham-green, has been recently laid out to provide middle-class dwellings of a superior kind. As we have illustrated in our pages many of these buildings, devote a page of our lithos to some this week, and intend to give other examples, it may not be uninteresting to speak of the estate itself, and the character of the residences that have been already erected. Our first impressions on visiting the estate were considerably favoured by its semi-rural character. Its old timber has not been ruthlessly destroyed, as is usual on speculators' estates; there is the absence of that conventional and stereotyped appearance so common on estates let to builders about London, while the proximity of the estate to the new junction at Hammer-smith renders the situation highly advantageous to professional and business men. From the station, the land stretching in a northerly direction still shows traces of its pristine condition, when the old Manor House (still standing) was surrounded by its meadow land and hedgerows. Three roads have been formed, converging to a point near the station. Taking the left road, called the Avenue, we are struck by a diversity of single and semi-detached blocks, each standing in a liberal plot of land, and divided by sufficient intervals to prevent the idea of being cramped for space. The plots are about 75ft. in depth by 50ft. in frontage, and the buildings are set back from the roadway some 15ft. or 20ft. with front turfed gardens. We must not omit to mention that there is a pleasing contour in the line of the roads by which the grouping of the houses is agreeably brought into play; they have also been planted with lime trees. The plots have been built on both sides for a considerable distance from the end, and we come first to two detached villas of red brick, one on each side of the avenue, with tiled roof and gables, the flank of which is exceedingly well treated with a canted bay window, which breaks into the roof and is finished by plain square tiled gables. These are of three stories. As we have already illustrated them (see p. 621, Vol. XXXI.), we may here only refer to the criticism the arrangement provoked in our pages at the beginning of the present year. The elevations, plans, and perspective view we then gave will enable our readers to form a good idea of the kind of house. A dining-room, drawing-room, six bedrooms, and bath-room, besides offices, have been provided at a cost of about £750, the rent being £65. We certainly grumble at the small dining-room, the insignificant entrance, and low hall, and the chance of a visitor stumbling over the first tread of the staircase, which is chiefly of winders; but there is, nevertheless, a genuine feeling displayed in the exterior grouping of the parts. The front canted window, below a gabled hood, has a charm about it. We pass on to notice some semi-detached houses by the same architect, the plan and elevations of which we also illustrated (p. 36) in our first volume of this year. Exteriously we have one of those simple but very piquant treatments which we meet with in the old farmhouses of a hundred years since, with red-tiled double overhanging gables over bay-windows of two stories, tile-hung between the windows. The exterior is of stock brick, with red brick in bands, and tiling,

the roof covered with a pleasing brown tile, the woodwork being grained oak. There is little to find fault with, but when we enter one of the pair we find this exceedingly picturesque exterior but the shell of a very mediocre interior—we do not like to say deceptive. There is little that carries the same spirit of work outside; we appear, when we enter, to lose the architect. The plan is certainly not faultless, and we note some objections that we find have been carefully avoided in the more recent houses; these are that the front door may possibly, when it is opened suddenly, knock down any visitor or guest who may be coming out of the drawing-room at the same time, and who may unintentionally have unobserved that the said doorway is temporarily closed when the front door is opened. To add to this blunder the kitchen door is hinged to open outwards in the same small lobby, insufficient in size for the house, while the four steps down to the kitchen are certainly uncalled for. The break of the lobby into the drawing-room also has been avoided in other houses, while the scullery and pantry are here a little too concentrated. We notice also that the winders of stairs, after passing a mezzanine store and closet, do not give headway for a tall man, and it would be desirable to omit the partition, we think, which now rather spoils both front bedrooms. In other respects the rooms are convenient and of good size, though if the dining-room behind had been made the size of the drawing-room, it would have been better. Six bedrooms and bath-room are provided, and, what is of great concern, there is no underground basement. The rent, we believe, is £45. Having passed two pairs of these houses, we come to two similar blocks of semi-detached pairs, whose exterior elevations show another hand, hardly so happy, rather spotty in effect, and displaying more effort. The fronts are of stock brick, relieved by tiled bays and red brick introduced into the gables, the woodwork being grained. What the value of the white terra-cotta panels is, inserted over the doorways and in the gables, it is difficult to divine; however, the fronts are neat, and not common, and we refer our readers to our illustrations of them, p. 192, Vol. XXXII. There is a roomy hall, with stairs ascending sideways in front of doorway; a large front room with square bay, and a side narrow light, with casements, a centre ceiling flower of rococo design, and marble chimney-piece; and the dining-room behind is smaller, and has sliding sashes; the kitchen behind hall is fitted with dresser, cupboard under stairs, and pantry, and a kitchener, in rear of which is a small scullery, with place for coals, and w.c. in rear. Upstairs there are two large bedrooms, a bath room, and w.c., and two smaller ones. Some useful closets are got under the upper flight, which leads to two other bedrooms obtained in the roof. We may state a side passage is provided between these pairs, with doors leading to back garden, but we do not notice any accessible coal store. The rent is £55, gas and water laid on. These houses are from the designs of Messrs. Coe and Robinson. We next come to a semi-detached block of stock-brick and red-brick dressings in an unpretending, though quaint, simple style, roofed in one straight roof of red tile, with deep cove, but having a pleasing centre dormer in it. The sashes and window-frames are painted white, and the features, though exceedingly plain, have the thorough ring of Queen Anne about them. Nothing protrudes from the front but a small canted bay window to each house, terminating at the ground story with a massive cornice painted white, while the doorways at the sides have red-brick pilaster jambs, worked in a thoroughly homely English fashion, carrying a square flat-gauged arch of cut

brick, with an oval moulding at the inner edge. Between the entrance and bay window is a narrow light, while above it is a carved red-brick panel, set in an antiquated framework of brick, with pediments over. These houses have been designed by Mr. Norman Shaw, A.R.A., whose skill as a renderer of the spirit of Queen Anne is unsurpassed. We note that the stock red bricks are set in white mortar, which gives a cheerful air, that the red brickwork is introduced in the jambs of front door and windows above the arches, window-sills, and dressings; that the high roof is tiled with the Broomhall channelled tiles, pronounced by a bold cove of rough stucco, and that the entrance is protected by a boldly projecting flat hood, with deep edge members, supported on cut wooden brackets—a bold design. There is, perhaps, a weak look to the flat-gauged arches of the doorways. We enter one of the houses, and find ourselves in a spacious lobby, with inner folding doors, glazed with small leaded lights, within which we come to an ample hall, made larger by a clever canting off of the angle of the front parlour or drawing-room. The stairs wind round on the outer and return side; the doors of the front room and back parlour and kitchen are within easy compass, and the rooms are spacious and well-appointed. Entering the front drawing-room we find it lighted by a roomy bay and a side window. The glazing is in the conventional Queen Anne fashion, above the transom being in small panes, while the main lights or casements are in large single sheets. The upper side canted lights open outwards at the bottom, as well as the front lower casements. The chimney-piece, we noticed, consisted of a plain square-shaped stove, with straight bars, with a border of 6in. blue enamel tiles, outside of which was a frame or moulded architrave of unpolished dark-grained wood. Over the top three cut brackets rested, carrying the mantel-shelf of wood, with gilt panels between the brackets, each having a spray of flowers painted in the centre. The back room has a three-light window, the centre part forming casements, with large sheets of glass in the centre of each, the narrower side and upper lights with small squares. A coal-cellar is under the stairs, and the kitchen has a good range (placed rather askew across the angle), a large dresser, and is well lighted. Behind is a scullery with a larder rather small, perhaps, lighted from the side. Ascending the stairs we get three good bedrooms, a bath-room and w.c. over hall, and stairs, the latter lighted and ventilated at the side. There are 3 attics above. We illustrate the plans and elevations of these unique houses in our present issue. On the opposite side of the road we find a similar block to this, and the other blocks have been judiciously made to alternate with those on the other side. Thus we find two of Mr. Godwin's blocks opposite two of Coe and Robinson's, and vice-versâ. Taking up the eastern converging road, called the Woodstock-road, we commence with a single house, at the south entrance to the estate, designed after the previously-noticed single model by Mr. Wilson, with a three-storied tile bay-window breaking into a steep tiled roof on the flank, but having in the rear a railed flat over the offices. This is of red brick, gabled in front, and there are 9 rooms, the stairs being in pitch-pine, and characteristically designed. Messrs. Lloyd are the builders. Beyond these three blocks are in progress from Mr. Norman Shaw's design, while further on we see the same design apparently in a more advanced stage. Entering one of these double-detached blocks we find a variation in the plan: the halls are larger, with front lobbies, the front rooms are about 20ft. by 14ft., and have the addition of a large bay

window, which is made a feature in front. These bays are railed as a balcony to the first floor windows, and are of the whole width of each house, except the entrance. The roofs have hipped ends in some cases, and are gabled with half hips in others. We hope to illustrate these, and one or two of the detached kind shortly. As far as they have gone, we note a decided improvement in the planning and character of the recent houses erected on this estate; errors and crudities of the earlier designs have been rectified, the results of experience seem to have been carefully noted and acted upon, and many of the houses, hardly finished, are let or sold. During the last twelve months the estate has been considerably enlarged by the acquisition of more land, and it now consists of over 80 acres, on which it is intended to erect 900 houses of a similar design to those described. These will be supervised for the freeholder by Mr. Norman Shaw, and the quality of the workmanship is guaranteed by local supervision. It has been the endeavour to secure on the estate a high class of residence, and it is contemplated to erect a subscription reading and billiard room, and a new church commences with the coming year. Messrs. Robertson and Simms have been the builders of some, and Messrs. Lloyd and Co., and Messrs. Curths and Ross of other houses—the latter firm having commenced in the Woodstock-road. We congratulate the freeholder upon what we hope will be a successful venture in supplying the middle classes with residences fitted with every modern appliance, and of an architectural character that takes them out of the commonplace groove of the manufacturing speculator.

THE ARCHITECTURAL SESSION.

THE session, with its customary activity, has come round again, and a survey of the papers to be read may suggest some reflections of practical interest. With the exception of one or two trifling deviations in regard to the order of the programme the Institute's bill of fare for the ensuing term may be pronounced rather above the average in suggestions of value. Archaeology does not engross, and we have no dissertations, alas! on Cleopatra's Needle or obelisks in general. "Middle-class Houses in London," to be read by Mr. W. H. White, Fellow, on the 19th inst., is an important theme, though we must confess we have had enough of the prologue and apologetic already, and ought to look for something less discursive and more practical than we have yet heard. The subject hitherto has been handled more as a new theme of which architects and the public have been presumed to know but little. It has been approached from one side only. It is time some proofs of the practical method of the system of building in "flats" in London were brought forward. Descriptions of Scotch and Parisian models have been copious; the modes of construction have almost become tiring, and we now look for well-authenticated data of the commercial success of a scheme in our own great cities. At present there is a strong presumption that the self-contained houses in our suburbs, inadequate and unsatisfactory as we must confess them to be, yet retain the good opinion of the public. There is a strong national prejudice for isolation and self-contained houses, and we cannot shut our eyes to a disinclination growing in some quarters to the co-operative plan of dwelling. At the same time there is vast room for improvement in existing dwellings of this class; the plan of the ordinary middle-class house is deficient in necessary accommodation, uneconomical in the service and rôle of daily work, and unsanitary to a degree. These are faults we have con-

stantly exposed, but as long as the speculative builder has the sole voice, and architects do not care to set better types before the public, the evil has to be endured. The cost of materials and labour has rather given an impetus to house building, and, despite commercial depression, the manufacture of the conventional house in the suburbs continues with unabated vigour, in utter defiance of progressive ideas of domestic convenience, and of regard to recent utterances of art and social science congresses. It is somewhat remarkable that one class of architects is reviving the features of the old English home, with all its isolated completeness, just at a time when the communal principle is being agitated in another quarter. With a complacency of purpose almost amusing we find every peculiarity of Jacobean times has been introduced, but little consideration has been displayed for modern requirements.

Looking down the list, "Notes on St. Alban's Abbey" will be an acceptable change from the above subject. As to Mr. Locoock Webb's paper on the "Law of Easements," of the great importance of the latter knowledge to the profession our weekly digest of legal intelligence affords ample proof. Passing a paper by Mr. Horace Jones on "The New Metropolitan Markets," and one on "The Architecture of Norway," by Mr. E. P. Anson, F.G.S., both interesting matters, we come to a most important question, which it seems a pity the Institute could not have arranged as an opening subject, or at all events at an earlier day than the date notified (4th February, 1878).—a question now of absorbing interest to the building community. We allude to a paper by Mr. Thomas Brassey, M.P., on "The Rise and Fall of Wages in the Building Trade." We trust the discussion on this subject will be worthy of the importance of it, and its great interest to the profession. No set of men ought to be better able to form an opinion on the question than those who are brought into daily connection with building operatives. The question involves a great deal more than a consideration of the immediate causes of a rise or fall, such as a glut of work or an accession of workmen, and must be traced back to the relations existing between capital and labour. The effect of the present antagonistic aspect of those two great forces in modern workmanship and art presents another but not unimportant point for the consideration of architects and those interested in building.

Professor Barff's paper on "The Prevention of Corrosion in Iron" will be a valuable contribution to the art of iron construction, and will receive the full attention it deserves. There can be no doubt but that one of the greatest reasons for the hesitation of architects to the employment of iron has been the difficulty of protecting it from the corrosive effect of the atmosphere. Professor Barff has placed architects and engineers under a deep obligation to him for having investigated the matter. That gentleman has instituted a number of experiments, and has discovered a means of protecting iron from the injurious action of the atmosphere. His process is the result of a study of the effects produced in which the chemico-magnetic properties have been considered. Some time ago the United States Board instituted inquiries into the corrosion of metals, but the facts investigated have not been collated. Prof. Barff will no doubt be able to inform his hearers of the comparative value of the various processes now in use. The chemical disadvantage of sulphur joints in masonry will be another practical paper of great interest by Dr. Alder Wright; and Mr. Chatfield Clarke's remarks on popular criticism,

as a *finale* of the sessional work, will have special claims on the attention.

The Architectural Association opens with a fair list of papers. We note that Mr. J. J. Stevenson is appearing in another character with a paper on "Gothic Architecture." Are we to have the Strawberry Hill Gothic over again, or the earlier Revival examples eulogised and thrust upon us as a new architectural revelation? We hope that Mr. Stevenson is not going to inflict upon us another sensation on the no-surrender principle, though we are very much afraid his anti-restoration ideas are leading him rather astray as a teacher of the younger members of the profession. Has he tired of "Queen Anne," or is he about to give a fatal and parting blow to Gothicism? Whichever it may be, we hope he will be moderate this time, and that any anti-architectural crusade may be left for a more propitious occasion. Mr. J. D. Sedding, at the next meeting, is to follow suit on the revival of later styles of Gothic. Would not this paper have been better a little farther off, or are the two papers indicative of a revulsion from the earlier forms of Gothic we have lately had so much of to the later styles? From all appearances, from the attitude at present of the Queen Anneites, and from anti-restorationists' predilections, it would appear that we are about to plunge from the twelfth century English and French Gothic into another Perpendicular mania. Recent symptoms have hinted the change, and even the followers of muscular Gothic of the extreme sect are beginning to fall, almost unwarily, into the later spirit. At any rate, two papers—one on Gothic and the other on the revival of later styles—look ominous, and almost like a combined assault. Mr. Lewis F. Day will read a paper on "Ornament," and Mr. Hugh Stannus is to read another on "Architectural Ornamentation." Coming from these gentlemen we may expect something a little in advance of the ordinary treatment of this now almost threadbare subject. But ornament has still to be treated philosophically—a direction marked out by Owen Jones and Digby Wyatt. In the discussion of "Restoration v. Conservation," to be opened by Mr. William White and Mr. R. E. Pownall, we may hope to have the vexed question and views of the Restoration Society placed on a somewhat more practical ground. Not the least useful part of the programme is the paper on the new "Model Bye-laws in Relation to Public Safety, Health, and Comfort," by Mr. F. Douglass Mathews, which will be discussed by Messrs. Blashill, Plumbe, and Robins—gentlemen well able to take their respective sides on such a subject. Of other topics, a paper on "Rude Stone Monuments," by Mr. T. Roger Smith, must not be omitted.

ART IN THE BOARD SCHOOL.

THOSE who may have been interested enough to have inspected the drawings on view a few days ago at the Board School Offices on the Embankment—being the annual results of various metropolitan schools—will be impressed at the growing taste for drawing evinced by the scholars of these public institutions. The fact itself of so large a collection may well be regarded as a sign of the yearning for art exhibited by the younger portion of our industrial population. The variety of the subjects also may be taken as a gauge of the different capacities of the students, and that this talent, like others, may be developed in various ways. The works were generally by pupils from 10 to 18 years of age, of both sexes, Hackney and Lambeth divisions being very largely represented. Those we examined were simple outlines, such as the outline objects given by the Government Schools of Art—maps, perspective delineations,

tions, flowers, drawings from models, landscapes, and some portraits. Even architectural subjects found their youthful aspirants. Thus we saw a number of tracery windows, some very carefully and pains-takingly executed, others indicating want of geometrical knowledge. Regarding these latter subjects we are disposed to doubt the wisdom of giving pupils of no preliminary art-knowledge such objects of study. In scarcely one of them did we discern the correct principle of Gothic window drawing. We repeatedly found the subordinate arcs drawn from the wrong centres, the circles and other parts of the tracery shown without regard to the intersection of the members, and so on. The teachers were evidently entirely ignorant of the value and function of the various lines, or they would never have permitted some of these representations to have passed them. Every line in a technical drawing has, or should have, a meaning, and the teaching of ordinary object-drawing, it must be impressed, is not to be regarded as a due preparation for technical delineation. Of other works we noticed a water-colour, "View of Tintern Abbey," presumably from a copy, but bad alike in perspective and tinting, though the youthful aspirant in this branch of art was described on the ticket prefixed "years 19, months 5." We take it that he was 19 years and 5 months old, though we could understand a boy of 5 years 9 months, turning out such a drawing, as creditably proficient. But let us pass on. We come to a pencil portrait of no less a personage than "Alexandrovitch, grandson of the Emperor of Russia," significantly printed below the drawing. We hope the boy has not got quite such a head. Worse, however, and still more painful as an instance of portraiture, is the head of "A Wounded Soldier." We have seen agonised countenances, but this one really prompts a smile rather than sympathy. "A Girl's Head," too, is sorrowfully out of drawing, and we trust the Haekney schools will a little curb the aspirations of some of their juvenile artists by giving them a few elementary lessons in facial proportions and feature expression before they attempt fully-shaded portraits. It may be suggested also that the fancy for copying prints of royal and illustrious personages—such as Napoleons, Wellingtons, and Kossuths—is not the healthiest sign nor most natural training in art. The Lambeth schools—such as those of Albany-road, James-street, &c.—exhibit a less ostentatious kind of art, and there are some creditable performances of juvenile talent. The City, Greenwich, and Tower Hamlets are also represented by drawings displaying more or less merit. Perhaps the most interesting works are those contributed by the junior pupils—copies from prints, toy-books, domestic animals, &c. Some of these are quaint but characteristic instances of infantile delineation. Geographical maps are, we think, one of the best and most instructive kinds of drawing that can be taught in elementary schools. They may be said to be inartistic, but the faculty required to draw correctly the outlines of countries is really only second to that of drawing outline geometrical or folial forms. The discipline of copying outlines in which both the eye and mind are called into exercise, and the aid such maps afford in the study and recollection of geographical knowledge, cannot be justly undervalued. Exhibits of this art are numerous. After outline the most valuable art training is undoubtedly perspective, either copies from models or from rules, and the principles of this art as taught in our art schools have been followed. We very much question the use of landscape and flower drawing to elementary students, save perhaps as an inducement in girls' schools. Those examples we saw, with very few exceptions,

indicated the lowest knowledge of art: they were rather caricatures or travesties than copies.

While there is every cause for congratulation on the art effort displayed in our Board Schools, we cannot avoid saying there is evident a misdirection of talent and art capacity. It will be argued pupils have been encouraged to use their pencil; it will be said, too, that by leaving them to develop in their own way their love of drawing, they have taken kindly to a source of improvement that would have, in all probability, otherwise been checked. We admit this, but at the same time there is a scientific method of instruction—there is a mode of leading a youth's taste in a direction likely to give him a greater stimulus to exertion. There must be always more satisfaction experienced by the youthful student in letting him feel that his steps are sure, and that he can compass the work he undertakes, than in making it evident that the subject he tackles is too difficult for him to master. Many a boy becomes disheartened by being set a task beyond his ability: he gets disgusted, and throws up the task as irksome; very often he does not care to return to it. But make him believe that he has mastered his lesson, that he can draw an outline correctly, and he begins to feel an unspeakable pleasure in the work, which he resumes with greater confidence. Object models seem to afford the very best initiative. These may be selected from familiar things—household utensils, furniture, &c. By being placed at different heights and positions, the pupil is taught the principles of perspective in the only practical way possible. But object-lessons, we believe, may be made instructive and entertaining if our schools taught other subjects—such as physiology, botany, zoology, mineralogy, and geometry by them. Decorative art could be taught by grouping together models of stems, leaves, and geometric figures—setting the young pupil to draw combinations of them. In the Polytechnic Schools of the Continent—as at Hanover—sets of models designed on anatomical principles are used with great success, and we know the different tastes of the students can be exercised by having a quantity of models in plaster, papier mâché, or some cohesive substance, to illustrate various branches of knowledge. Cubes, pyramids, and spheres, while excellent for the teaching of perspective, are rather too abstract for children, who would be more pleased by representative models or toys, which they might advantageously be set to combine themselves and copy. If art knowledge is to be taught upon rational principles, the pupil should be induced to exercise his taste on familiar objects modelled and coloured. The number of attempts in landscape, animal, and flower drawing in these school exhibitions testify to the necessity of supplying models and representations of every-day life in sufficient variety and gradation to afford interest to the pupil without having recourse to bad copies of pictures and prints.

ILLICIT COMMISSIONS.

"The profits acquired by the servant or agent in the course of, or in connection with, his services or agency, belong to the master or principal."—CHIEF JUSTICE COCKBURN.

"Remember that what is now and then done may get a momentary reputation or applause, but what is done every day will be the basis of character and ultimate reputation."—LORD PALMERSTON.

IN the early part of this year our pages were occupied in somewhat exhaustively discussing the question of "commissions." Many letters upon the subject appeared also about the same time in the *Times*, and in the July number of the *Westminster Review* appeared a paper upon the subject, based to some extent upon the

Times correspondence, and a reprint of this paper, which has been very carefully compiled, has been recently privately circulated. Another letter, from Mr. John S. Storr, appeared in the *Times* of the 5th inst., containing an allusion to the architect insisting on the "contractor giving him 5 per cent. on each certificate, besides the 5 per cent. paid by the client," this letter calling forth an article in the same newspaper upon the subject. All this shows that there is not any intention to allow the matter to sleep, and points unmistakably to the conclusion we urged in these columns, that the practice obtaining in the architectural and kindred professions, of accepting in various ways, and under various guises, money to which the recipients have not any moral or legal right, must sooner or later become a criminal offence, easily recognised and easily punished. Probably few readers of the articles in these pages at the beginning of the year anticipated that before its end a case of great public interest would be determined, bearing strongly upon the subject of illicit commissions, resulting in the ruin and imprisonment of three men, for acts which are said to be similarly committed every day by those who are paid by their clients to protect their interests in every way, and to involve them in no more expenditure than is absolutely right and just, by men flourishing in their iniquity—architects and surveyors who are the first to exhibit warmth because masons are trying to obtain one penny per hour more for their labour, but who at the same time are concocting schemes for acquiring, not an extra penny per hour for work done, but as many pounds as can safely be drawn out of their clients' pockets for work not done. And what is the result of all this? It is public suspicion of the most damaging kind to the architect who endeavours to be honest. It is almost impossible now for architects to recommend to their clients any speciality without being greeted, if not in words certainly in thought, by "Ah, he is after his commission!" We have now before us the printed circular of an artist in stained glass windows for church and domestic decorations, from which we extract the following:—"The prices here quoted will be found upon comparison to be about three-fourths of the usual charge; in fact, as low as can be to be compatible with good work, which is in all cases guaranteed. Notwithstanding, I can allow architects and other professional gentlemen a liberal commission, say of 10 to 15 per cent. (according to amount of order and style of work)." This circular we have only just received, and no doubt it has been circulated in thousands, showing to some extent that the practice is known to be common; and how is it to be dealt with? There must be prompt and decisive action taken if the public suspicion is to be removed; and, as regards the architectural profession, the question arises, Who is to take such action? Who is to endeavour to put a stop to the practice before the profession is still more damaged by a bunch of architects on their defence at the bar of the Old Bailey? Certainly, the indignant protests of the leaders of the Royal Institute of British Architects in the columns of the *Times* will not remedy the evil, because such protests simply show, what every one knows, that there are many architects who are honest, whilst it is also pretty generally known that there are many who are not; and yet, although the Institute as a representative body includes in its lists of members only a proportion of the number of men in practice, still that body is the first which must be looked to to cleanse its name from the imputations which have been cast upon it. The new session has commenced; let it not finish before an attempt at least has been made

to rid its rooms of the black sheep. Until this is done, and done thoroughly, there is not much hope of ultimate improvement, and it may be concluded that the system of accepting bribes has become so entwined round the honest part of the business that separation, unless by criminal procedure, is impossible.

But there is surely a practical method of ascertaining whether or not the Institute is as pure as we believe it to be. The stigma has a foundation or it has not, and we are sure that the members would be glad to rid themselves of that stigma in something like tangible form. What objection could there be, then, to a little sifting and inquiry upon a few points, embodied perhaps in the following form of questions:—

1. Are you aware that it is the almost general custom of houses dealing in, say, gas-fittings, chimney-pieces, stoves and ranges, ornamental tiles, &c., to allow architects selecting the goods a discount at the rate of, say, up to 25 per cent. on all articles ordered through them?

2. Have you at any time had dealings with such discounts, and, if so, how have you arranged them?

3. Give your reasons for such arrangement?

4. Have you ever employed a quantity surveyor? If so, do you consider that the selection of that gentleman is a labour not included in the customary charge of 5 per cent.?

5. Have you in such cases so charged your client?

6. Have you at any time received any part of the commission of the quantity surveyor, you not having participated in the labours for which that commission is charged?

7. If so, in what manner have you disposed of the money—retained it or returned it to your client? In the former case give your reasons for the retention.

The above questions, or others in the same strain, should, accompanied by a letter from the Council, be sent to every individual member of the Institute, with a space left for his reply at the side, the paper to be at once filled up and returned; and, should no reply be received, say within two weeks from the date of the circular, the silence, unless properly accounted for, to be considered an admission that one or more of the discounts have been applied to the uses of the architect himself, and that he is not in a position to explain or justify such application. When the period for the return of the circulars had elapsed the Council to send to the professional journals a copy of the circular and a list of the names of the gentlemen who had, and a list of those who had not, replied thereto, to be published simultaneously and without comment, after which it might be considered how far the rules of the Institute enabled it to deal with the gentlemen who had not thought fit to reply to the circular, or who had admitted the receipt of the discounts and perhaps attempted to justify it.

In this way there would be shown a determination to either rid the Institute of the, say, doubtful members, or to prove as far as possible in a practical manner that the indignation which we have alluded to was quite warranted by the facts of the case, and that whatever might be thought of the architects outside the Institute, those within it are what they are supposed to be—honest professional gentlemen. We are convinced that neither the outside public nor those more intimately connected with the profession will believe in its purity until some really decisive action is taken, and not merely repudiations in a general form, which have no more weight than that which attaches to the opinion of the writer.

We leave the subject for the consideration of the profession, trusting that it will

be taken up in a proper spirit by the Institute, and that the result will be what we anticipate—viz., that its members will be found more honest than some people think, and that the portion of the article in the November number of the *Nineteenth Century*, by Mr. Forbes, on "Russian Corruption," does not apply in the slightest degree to the "corporate representative of professional practice in architecture throughout the kingdom."

COLCHESTER CASTLE.

IT will be remembered that at the meeting of the Royal Archaeological Institute, at Colchester, in August of last year, Mr. George Buckler's view that Colchester Castle is a Roman building was assailed by no less an authority in archaeological matters than Mr. J. H. Parker, C.B., who contended it was a Norman castle. Mr. Buckler has thought fit to publish a further book on the question. Last year we examined a pamphlet written by this gentleman, in which he attempts to prove that the castle is Roman in workmanship, in which various "keeps" are compared, and the writings of archaeologists examined. The evidence brought forward by Mr. Buckler in this pamphlet is such as to create a doubt, if it does not settle the question. We are not prepared to enter fully into the merits of the case. There are few archaeologists who could demonstrably prove the difference between Norman and Roman workmanship of the period referred to. Mr. Parker, in his remarks at the meeting, said that "the archway was a very good specimen of the commencement of the 12th century, with all the ornamentation of the end of that period." He further said, in the quadrangle, it was most distinctly a Norman castle, built at the end of the 11th century; and he asked who ever heard of fireplaces in the Roman period? He also remarked that the ornamentation was added 50 years later, at which time also the grand Norman gateway must have been built, as it was in the 12th century style; that no vestige of Roman work existed, "except the materials of which it was composed, and which were utilised in consequence of their being to hand, and were doubtless the ruins of the Roman wall." Mr. Parker admitted the resemblance of the bricks to Roman, and pointed out one of the 4th century, and undoubtedly Roman; and maintained that the castle was not as supposed a "keep," but "a large Norman castle, intended to assist a small garrison in keeping a large and discontented town in subjection." He referred to Rochester as being in the same style, though of 50 years later date. Mr. Buckler returns to the charge, and replies to several points raised by Mr. Parker. He says:—"Probably Mr. Parker spoke too fast when he said that the large castle was intended to assist a small garrison, that the building showed work of two centuries and ornamentation of two periods, that there was one brick of the 4th century and a buttress of Roman build." The author also reminds Mr. Parker that he accompanied Dr. Bromet to Wheatley in 1846, and found a fireplace about 3ft. high, built of brick in a Roman villa (*Arch. Jour.*, II., 352). He mentions also one found by Mr. Lysons in a Roman villa at Witcombe in 1818 (*"Archæologia,"* XIX., 181; *Arch. Jour.*, XIII., 92). The coldness of this climate compelled the Romans, says the author, to add to the hypocaust system. No doubt, as Mr. Buckler says, the climate of Britain demanded a general modification of architectural arrangements and details of Roman buildings in this country, and between Roman buildings in Rome and Roman buildings in Britain there must have been differences. The author next refers to correspondence on the subject that has appeared in the *Essex Standard* and other papers, and to the Rev. H. Jenkins's controversy with the Rev. E. L. Cutts in 1853, and to a pamphlet written by Mr. Jenkins in the same year, proving the Roman origin of the building, and that it was the templed citadel of Claudius, or the temple which Tacitus describes as raised to Claudius at Camulodunum as a symbol of Roman dominion. We can hardly see the practical value or interest in discussing a matter about which "doctors disagree" so much, and

Mr. Buckler has done more service in collecting the *pro's* and *con's* which he now presents to us in a second pamphlet, than in continuing a controversy that will never, probably, be satisfactorily determined—not, at least, to the satisfaction of both parties. Whether the castle was erected by the Romans or by the Normans with Roman materials, appears a matter beyond present conjecture. The masonry certainly exhibits many indications of Roman workmanship; we have the septariae and tiles of a homogeneous structure rather than that made up of débris; the features, such as the gateway, are simple, and bear a strong resemblance to Roman work. But, on the other hand, we have several details that suggest the Norman style, and upon which archaeologists will continue to rest their opinion.

FASCINE RIVER DAMS.

THE navigation of the Mississippi river has been a source of constant study and watchfulness for generations. Certain obstructions, however, render the passage impossible in many parts. In a paper read before the American Society of Engineers by Mr. Edward P. North, C.E., an account of various constructions is given that may be of interest. The great river is rendered unnavigable in some parts by gravel bars, which prevent the passage of boats at low water. In 1874, 25,000 dollars were voted to the improvement of the river from the Falls of St. Anthony to St. Cloud. Just below the latter place are the so-called Thousand Isles, where the river is spread out by gravel bars, and it was at this part of the river that certain dams were constructed. Stone could not be procured, and gravel could not be easily got. It was, therefore, decided to use brush dams. These were built of fascines secured by stakes and gravel or sand. The average height of the dams were 3-3ft., and 1-62 fascines were used per lineal foot, and these fascines varied in diameter from 9in. to 18in., and in length from 15ft. to 22ft. These were made from willow, swamp maple, black and burr oak brush, nearly all but the first being the tops and trimmings of stake timber. They were usually tied with five bands of spun or lath yarn, each band consisting of two strands wrapped twice round the bundle and tied in a square knot. Five men were employed as a gang of fascine-makers, one cutting brush, one cutting and carrying, and three at the trestles, which were 2in. x 4in. pieces driven into the ground and connected at crossing by a carriage bolt. Regarding the construction of the dams, the fascines were first tied into mats between parallel poles, and rafted into position. "One row was placed across the bottom parallel to the current with the brush end up-stream, and staked back. A single row was then placed lengthwise of the dam, about 3ft. up-stream from the butts, and staked through each bundle under it. Gravel was then filled in to cover the tips of the lower row, and make a plane surface to the transverse fascines. The succeeding courses were placed parallel to the current, except where the dam was unusually high, when another transverse course was placed, care being taken to have at least one course parallel to the current when the dam was finished." The courses were stepped forward 2½ to 3ft. in the usual way; stakes were driven into the bed of stream, and to the surface of water or dam. After completion the stakes were cut off flush with the surface of dam, and the whole covered with gravel, carried horizontally about 6ft. up-stream. The gravel passed through a 2½ ring, and about 40 per cent. was sand. The dams were left about a foot above low water. An improvement followed. About 3ft. of water was found on the bar of one island, and an average gain of over 1ft. below that, due to erosion, and the increased amount of water in the channel. An inspection made after the river was frozen, showed these dams "to be unexpectedly tight," and most of them were covered with thick ice. Only a few showed leaks or injury, but the chief damage, according to Colonel Farquhar, Corps, U.S., who prepared the plans, has been from the log-drivers, who made cuts through them, and nearly all the breaches described have been made in this way, it is

thought. In the portions not touched the dams are described as uninjured and tight. This use of fascines appears to us to present a simple mode of embanking our rivers in flood time, wherever brushwood can be obtained, and those in charge of river works may be informed that brushwood laid in well-compacted courses, and staked, and then covered or filled in with gravel, or faced with stone or rubble, present impregnable barriers to river currents, where earthen or other banks have been known to fail.

SKETCHING CLUB COMPETITION.

ON Wednesday, 31st October, 1877, the fourth annual competition between the sketching clubs of the Schools of Art in the metropolis took place at the Dudley Gallery, Piccadilly, which was kindly lent by the committee for the purposes of the competition. Five sketching clubs engaged this year in the competition—viz., the South Kensington (Male and Female), Lambeth, West London, and the Gilbert (St. Martin's)—and a total of 202 sketches in oil, water-colour, chalk, clay, and plaster, were contributed. The gentlemen who very kindly and considerably undertook the office of adjudicating upon the works this year, were: Sir John Gilbert, R.A.; Mr. W. F. Woodington, A.R.A.; and Mr. A. Legros, who spent some considerable time in examining the sketches, and finally made the following awards:—Award of honour to that club which produced the best aggregate of work, to the Lambeth Club. The prizes of £3 each (the money for which is provided by the different clubs) were awarded as follows, for the best sketch in each of the subjects named:—For Figure: "A Critical Moment"—Mr. H. G. Ghindoni, Gilbert Club. Landscape: "A Grey Day"—Mr. J. W. Wilson, Gilbert Club. Sculpture: "A Critical Moment"—Miss H. Montalba, South Kensington Club. Animals: "On the Look-Out"—Mr. Montefiore, South Kensington Club. Design: "A Decorative Panel"—three prizes of £1 each to Mr. C. Reich, Mr. W. Swain, West London Club; Mr. Pearce, Lambeth Club.

VENTILATION AND SHAFTS.

IT is stated by a writer in *Van Nostrand's Magazine*, that a confined column of air 55ft. high, at 54° temperature, when heated to a temperature of 114°, expands to a height of 61·07ft.—that is to say, if the height of the flue is 55ft., the column of air within it at that temperature becomes lighter than the outside air by the weight of a column of the density of the air within, and 6·07ft. in height. The sectional area of shaft can be found by dividing the quantity discharged per unit of time by the velocity per unit of time, and the general formula for velocity is found by dividing the quantity discharged per unit of time by the sectional area. It is found better in practice not to have the shaft larger than that determined by rule. It is better to have it a little smaller, as the discharge can always be quickened by increasing the heat. When the sectional area of flue is larger than required, a down current of cold air takes place at the corner or on the outside of the hot air current which passes upwards along the axis of flue. These down currents produce eddies of smoky chimneys. Square elbows retard the velocity, and should be avoided. It is also pointed out that the flues leading to the various stories of a building should not be of the same size, but should be regulated according to the horizontal distance from the source of supply. The longer flues should have slides so that a part of their sectional area can be cut off. A certain loss of heat takes place by conduction through walls. Pettenkofer has shown that by diffusion the air of a room may be changed. It was found by experiment that, with a difference of 40° between the outer and inner air, the ventilation through the walls amounted to 7 cubic feet per hour for each square yard of wall. Hence ventilation may be assisted by increasing the amount of exposed wall surface. Mr. Rafter says one way of applying the vacuum method of ventilation is to carry smoke flue from basement furnace up through a shaft, from which openings into rooms are

made. The same results may be produced in suites of apartments by fireplaces or by small flues near the floor, in which gas jets are kept burning. It is also contended that in warming by heated air the current should be introduced at or near the ceiling. Cold air should be introduced in connection with the warm current, in order to regulate temperature, both being under control. Warming by stoves is not recommended except for economy. Perfect ventilation requires an expenditure of force, and is not considered automatic. On this point we join issue with Mr. Rafter, and we think that by adopting the natural method of ventilation—namely, low inlets and high outlets—the expenditure can be considerably reduced, and ventilation made constant, and, in a great measure, self-acting.

SIR PAUL PINDAR'S HOUSE.

ANTIQUARIES and lovers of old London architecture will be grieved to hear that the well-known houses, Nos. 170 and 171, in Bishopsgate-street Without, once the residence of Sir Paul Pindar, are being demolished. The lapse of time, indeed, had rendered their doom irretrievable. For some years they had been used as a printer's workshop, and the interiors had so completely suffered from neglect and alterations that there was scarcely an apartment left in its integrity. We visited the houses just before they were sold for the old materials, and an examination only convinced us that their removal had not been considered with undue haste. Entering a dark passage, and ascending an old staircase that had apparently suffered considerably from botching restoration, we entered a small back room, now called the kitchen, lined with panelling in a very dilapidated state. The ceiling of this room was the *chef d'œuvre*. Its design consisted of a circular pattern, with flat ornament, the centre circular panel containing the subject, "Abraham offering up his son Isaac." Scroll-work patterns, arranged to radiate from the centre, were enclosed in another circular moulding, outside which were intersecting semicircles, the angles of the rectangle being filled up with conventional scrolls of an Elizabethan character. A dentil cornice surrounded it. The design was certainly a most interesting and excellent instance of plaster decoration. Another and smaller room contained a panelled ceiling, divided into coffers by moulded members with decorated soffits. The panels were filled with relief-ornament wreaths and foliage. Another specimen showed a very handsome rectangular pattern, with a centre square, and surrounding panels decorated in Classic taste; while a still more ornamental ceiling was to be seen in a very mutilated condition in one of the rooms in Half-Moon-street, consisting of intersecting soffit mouldings, dividing the ceiling into one centre, four elongated, and four corner panels. These were filled with foliage and wreaths in high relief. We may remark that there was not one of these ceilings entire, owing to the erection of partitions, which had cut off portions of them. The walls of the rooms possessed no remaining features of interest; they had dadoes and upper wooden panels, with plain oval mouldings. No chimney-pieces remained in their entirety, though the marble panels and mantels of one or two indicated old work. We should say that at some time the cornices and carvings of these had been removed or carried away by tenants. With the exception of an old doorway, with a honeysuckle enrichment over the architrave, in the front parlour of first floor, executed in a thoroughly Classical spirit—without question the frieze of an entablature that once existed, though the cornice had been removed—there was little to strike the connoisseur. The staircase had apparently been divested of its interest, except its old balusters of twisted design, for the handrail was certainly modern and out of keeping. One or two bold ovolo architraves struck our attention, thickly coated with layers of whitewash. Indeed, the old woodwork remaining was entirely covered up in this way. The members consisted of the usual forms found in old buildings of the reign of James the First or Queen Anne. A few of the genuine old wooden cornices to the rooms might be seen in parts where not cut away

by modern alterations, with their full quantum of members, but sadly choked up with dirt and whitewash. Externally, at the back, there was a fine deep-cut brick cornice of slight projection, but there is little else remaining of note. A few old iron grates remained. We noticed in the lodge in Half-Moon-street one very bold pattern, with consoles supporting the side hobs, richly cast at the sides. A subterranean passage was found from one of the cellars, leading, it is supposed, to Finsbury, but choked up with rubbish. We do not know if correct drawings or photographs have been taken. The two houses are to give way for the new Metropolitan Free Hospital—a fitting erection to take the place of this fine example of Domestic London architecture.

BOOKS RECEIVED.

Common Sense for Gas Users, by Robert Wilson, C.E. (London: Crosby Lockwood and Co.), is a really useful little work—not for gas companies or engineers, but for gas consumers, gasfitters, and others. The author declares that in 99 per cent. of the cases where the gas companies are blamed for bad light and heavy bills, the mischief is really caused by unscrupulous and ignorant gasfitters. That this is the case in many instances we are firmly of opinion with Mr. Wilson, although hardly to the extent he asserts. Every gas-consumer, however, may soon find out the real criminal by studying this plainly-written and comprehensive catechism. *Temple Bar*, by E. W. Godwin, F.S.A. (London: B. T. Batsford), is a reproduction from a contemporary of an illustrated description of the old City gateway, which before very long will, it is to be hoped, cease to encumber the Strand. *The Church Builder for 1877* (London: Rivingtons) has completed its annual volume for 1877, and is, as usual, interesting and useful. We are glad to note that the enlargement in size, inaugurated at the commencement of the year, has been attended with a considerable increase in circulation. *Partnerships*, by James Ball (London: Butterworths), is No. 5 of the popular and useful series of monthly Law Tracts, edited by the author. *Multurn in Parvo Gardening*, by Samuel Wood (London: Crosby Lockwood and Co.), is a perfect *vade mecum* for the enthusiastic and ambitious horticulturist. If all can be done on an acre of ground that Mr. Wood tells us, the sooner we all betake ourselves back to our primitive occupation the better. *Sheep*, by Joseph Darby (London: Dean and Son), seems an instructive treatise on the varieties, points, and characteristics of sheep, with descriptions of their diseases and modes of cure. As a book for agricultural reference it should have been better bound.

The parish church of All Saints, Langport, was reopened last week, after restoration, at a cost of £2,000, under the superintendence of Messrs. Foster and Wood, of Bristol; Mr. Davis, of Langport, being the contractor.

The foundation stone of a new church has been recently laid at Rattoo, county Kerry. The building has been designed by Mr. J. F. Fuller, F.S.A., Dublin. It is Gothic in design, and will be composed of uncoursed rubble masonry, with Portland dressings in the buttresses, tracery, mullions, &c., of windows.

Mr. D'Eyncourt has given judgment on the summonses whereby the Chelsea Vestry sought to recover from the owners of some property in Smith-street, in that parish, the cost of repairing a road, owing to a steam-roller having broken through the arch of a cellar attached to the defendant's property. He decided that the working of a steam-roller was not ordinary traffic, and that the accident was wholly due to the neglect of the vestry. He dismissed the summonses against both defendants, and allowed their costs.

A new mission church was opened last week at Dirk-hill, Horton. The building, a neat structure, surmounted by a bell-turret, has been built in the half-timbered style, from the designs of Messrs. T. H. and F. Healey, architects, Bradford. The total cost will be about £500.

Mr. George Smith, a well-known Edinburgh architect, died last week at the age of 81. He had been well known locally in the profession for over half a century.

The Hartlepool guardians on Monday instructed Mr. Clayton, their architect, to prepare plans for a series of structural improvements of the union workhouse, including the building of a lying-in ward, a convalescent ward, and nurses' apartments.

ILLUSTRATIONS.

VILLAS AT TURNHAM GREEN—"BUILDING NEWS" CLUB DESIGNS FOR STREET FRONTS—HOUSE AT HALLITHWOOD, BOLTON—WESLEYAN CHURCH, HIGHFIELD—CARDIFF MUNICIPAL BUILDINGS.

OUR LITHOGRAPHIC ILLUSTRATIONS.

TRINITY CHURCH (WESLEYAN), HIGHFIELD, SHEFFIELD.

SOME of the leading friends connected with Brunswick Chapel, Sheffield (to which circuit Trinity Church, Highfield, belongs), determined a year or two ago to erect a new place of worship to meet the necessities of the rapidly growing district. One of our illustrations this week is the result of their efforts, and the work is now in an advanced state. The ground floor is divided into nave, aisles, and transepts. There are three galleries, one over each transept, and one over vestibule, and accommodation is provided for 920 adults. In the basement are class-rooms, board-room, and school-room for over 350 children. The building is of Dunford Bridge wall-stone, and Hollington stone dressings. The tower and spire rise to a height of 140ft. The entire cost, exclusive of site, will be about £8,000. Mr. J. D. Webster, of Sheffield, is the architect.

HALLITHWOOD, NEAR BOLTON-LE-MOORS.

SITUATED on the crest of a wooded hill approached from Astley Bridge, this old hall presents an unusually picturesque appearance. The title of "Hall-i'-th'-Wood" is in our day slightly inappropriate, though there yet remain evidences of its former applicability. In plan Hallithwood seems as ill considered as possible, simply being a conglomeration of rooms, with no proper access to them. This comes of additions made without thought or care apparently. Of the staircase (illustrated) it would be superfluous to remark on its excellence as a bit of antique design, the whole of the turning, moulding, and carving being so thoroughly in harmony with the material—viz., oak. I have not shown the upper flights, as they are much a repetition of the lower. The stair to basement is appropriately screened by balusters closely placed, and the effect of this arrangement is extremely good. I was sorry to note that the stair had shared the fate of the beautiful hall table, having had the usual number of coats of oil paint. This hall table is of a stone colour. Unlike many other halls that occur to me, this is comparatively bare of wainscot panelling, enriched ceilings, and the like. The interiors are consequently disappointing. Of history Hallithwood has little of moment. The building is of two dates, the timbered portion being the earlier, and was probably erected in the latter part of the fifteenth century. The stone south front was the work of a member of the Norreys family, and is dated 1648. Over the south door are the initials "A.A.N." But the chief interest of the place is in its connection with the world-wide name of Crompton, who lived here A.D. 1753, and invented his famous "spinning mule." Hallithwood thus claims to be the very cradle of English spinning manufacture. Notwithstanding the "let alone" policy of non-restorers, I am sure they have here an exception that requires restoring care. The south gable

for some reason is boarded up; some of the windows are bricked up (the effect of Pitt's window-tax), finials are used to "decorate" the garden or orchard, and altogether, although aspect, position, and surroundings are all pleasing and favourable, time and neglect have left indelible traces that mar its appearance as a habitation, and incline one to look upon it rather as a picturesque ruin.—I am, &c., WALTER K. BOOTH.

THE NEW MUNICIPAL BUILDINGS, CARDIFF.

THESE buildings, which consist chiefly of a new council chamber, offices for town clerk, surveyor, and financial clerk, with police station, police-court, and superintendent's residence, are an addition to the existing Town Hall. The plans show the general arrangement of the various rooms, and in the view the council chamber and town clerk's offices occupy the chief story of the high range of buildings, finished by pediments, forming a new superstructure to what is now a two-story block at the rear of the Town Hall. In the design of this part of the front it was necessary to carefully consider and preserve the existing openings; and thus the centre portion only of the façade up to the first cornice line is built up from the ground, the flanks below the pediments up to the same line being old work, at present faced with stucco. In front of this block a large space has been reserved as a police parade ground; all the other buildings to the left, which form the police-court, magistrates' rooms, station-house, and residence, filling the rest of the Westgate-street frontage, being quite new. The elevations towards Westgate-street appeared in the BUILDING NEWS of April 20, 1877. The work is being carried on rapidly by Mr. Jacob Biggs, contractor, Roath, Cardiff, who took the contract for £13,000. The architects are Messrs. James, Seward, and Thomas, Cardiff.

BUILDING NEWS DESIGNING CLUB.

THE designs for a street front illustrated today, were, with others submitted in the same competition, reviewed in our last issue, on p. 445.

VILLAS ON BEDFORD-PARK ESTATE, TURNHAM-GREEN, W.

THE piquant design for villas, illustrated today by elevation and details, is by Mr. R. Norman Shaw, A.R.A., on the Bedford-park Estate. Our remarks upon it will be found on the first page of this week's issue (451 ante).

COMPETITIONS.

HALIFAX SCHOOL BOARD.—This board is about to erect a Board School at Haugh Shaw for 800 children. Ten sets of drawings have been received in competition for the best design for the school. Mr. Adams, the architect to the Leeds School Board, to whom the decision was referred, has decided that those submitted by Messrs. Leeming and Leeming, architects, Northgate-chambers, Halifax, are entitled to the first place. The board meeting in committee on Friday last confirmed the award.

SOUTHPORT.—Considerable dissatisfaction seems to exist with regard to the competition for the new market at Southport. A correspondent of the *Southport Daily News* declares that Alderman Sutton, who is the chairman of the markets committee, and the ruling spirit in the whole of that committee's transactions, is the brother of one of the competing architects and that the plan which has been always at the head of the list is the one prepared by Messrs. Mellor and Sutton. Before any designs were sent in, it is said that some of the local architects had stated that they would not waste their time and money in a competition which was even at that time rumoured to be a foregone conclusion. The same correspondent asks what are the leading features of the No. 2 design, "Sanitas?" The committee would not give this the first prize because, says Alderman Sutton, "some portions of the plan are a mistake." "There are four steps up to the market, and the committee all agreed that steps were objectionable." "The windows are closed instead of open work." "The aisles are narrow and cramped, being only 10ft. wide;" and "too much accommodation is provided for wholesale

purposes." There certainly are proper objections. But why give give such a faulty design a prize at all? It is true that this design was only put upon the list of six at the eleventh hour; and will any one in Southport be astonished if they learn that "Sanitas" was designed by a clerk in the office of the borough surveyor? Perhaps not. The design No. 3, "Experientia docet," is considered unworthy of either the first or the second prize, even although it had "rather a showy elevation," because "it has not a sufficient number of entrances to East Bank-street," and "as to the ground arrangement of the plan it would not answer at all." Let me ask again why should this design be selected for a prize? Alderman Sutton may hoodwink the unpractical gentlemen who have the bad taste to be associated with him in committee. He may even throw dust in the eyes of the other members of the council; but he cannot blind the architectural world to the fact now so patent, that justice has not been done. His own words in respect to the 2nd and 3rd designs prove it, and his own conscience must bear witness that he has done wrong in respect to No. 1. It is all humbug for the committee to say that they did not know which plans were by Mellor and Sutton. If any of them are so defective in architectural skill as to be unable to distinguish a plan they have once seen, simply because the frame and mounting have been added since their last inspection, they displayed little ability for the work they have undertaken to perform at this time for the ratepayers of Southport, and there can in that case be little wonder that the result of their critical research has been such a sad failure. It is well for them, it is well for all of us who have to pay the premiums and pay for the erection of the market, that the council have wisely refused to receive their verdict. If the council were to act fairly to all parties, a competent professional man, such as Barry or Waterhouse, should be employed to give in a report as to the merits of the designs, and if this is done the money spent in this way would be well laid out. If any such gentleman is selected, it would be well perhaps that steps were taken to give him full scope, free from collusion. The authors of "Salus Populi," the design which stood second on the selected list of six, also point out that a first-class local firm is prepared to execute their design for the sum named, and that therefore it was unjust to them for Alderman Sutton to state that in reference to excessive cost "the general opinion of the committee was that all the designs would come under the same category." At a meeting of the council, on Wednesday week, the report of the markets committee was referred back for further consideration.

THE CHADWICK MUSEUM, BOLTON.—Eleven sets of plans have been received by the Town Council of Bolton, in competition, for the new museum to be erected in the Park, through the munificence of the late Dr. Chadwick.

St. Matthew's Church, Harwell, near Dideot, was re-opened last week, after the erection of an organ and other works in the chancel, executed under the direction of Mr. E. Dolby, architect, of Abingdon.

The restoration of the chancel of St. Mary's Parish Church, Chelmsford, is being carried out under the superintendence of Mr. A. Blomfield, M.A.

At Stockton-on-Tees Police-court, on Thursday, the 1st inst., Francis Boyes, builder, was fined £3, and ordered to pay 9s. 6d. costs, for deviating from the approved plans, passed by the Corporation, for new houses in Spring-street. The information was laid under the 82nd section of the Stockton-on-Tees Extension and Improvement Act, and was supported by Mr. George Edwards, borough surveyor.

The prizes and certificates gained by the successful students of Merthyr Tydvil during the past year were distributed on Thursday evening, by Mr. G. T. Clark, of Dowlais.

The Michell Free Library was opened by the Lord Provost and Town Council of Glasgow, on Thursday last week, at the temporary premises in Ingram-street East. It was founded by a bequest of £70,000, left by Mr. Stephen Michell, who died in 1874, and now consists of 16,000 volumes. The premises have been lent, free of charge, by Mr. Neil, until a permanent library shall have been erected. It is proposed to put the Free Libraries' Act in force in Glasgow, in order to increase and improve the undertaking so well founded.

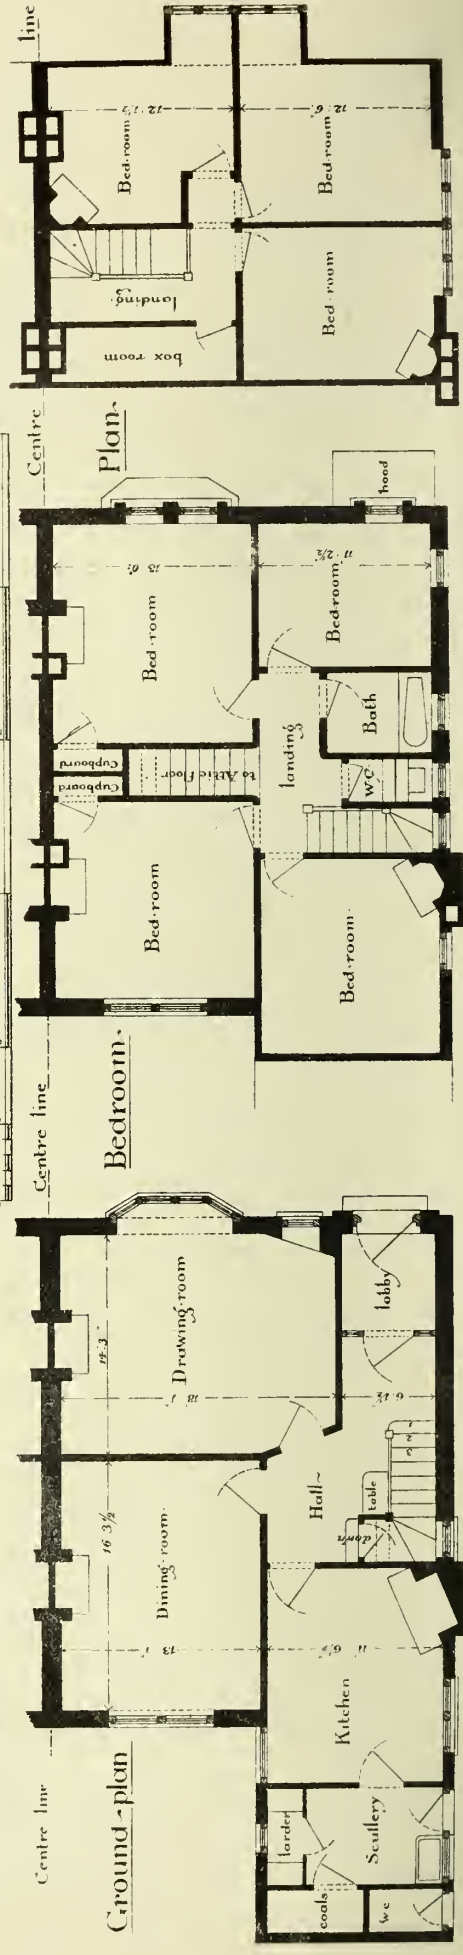

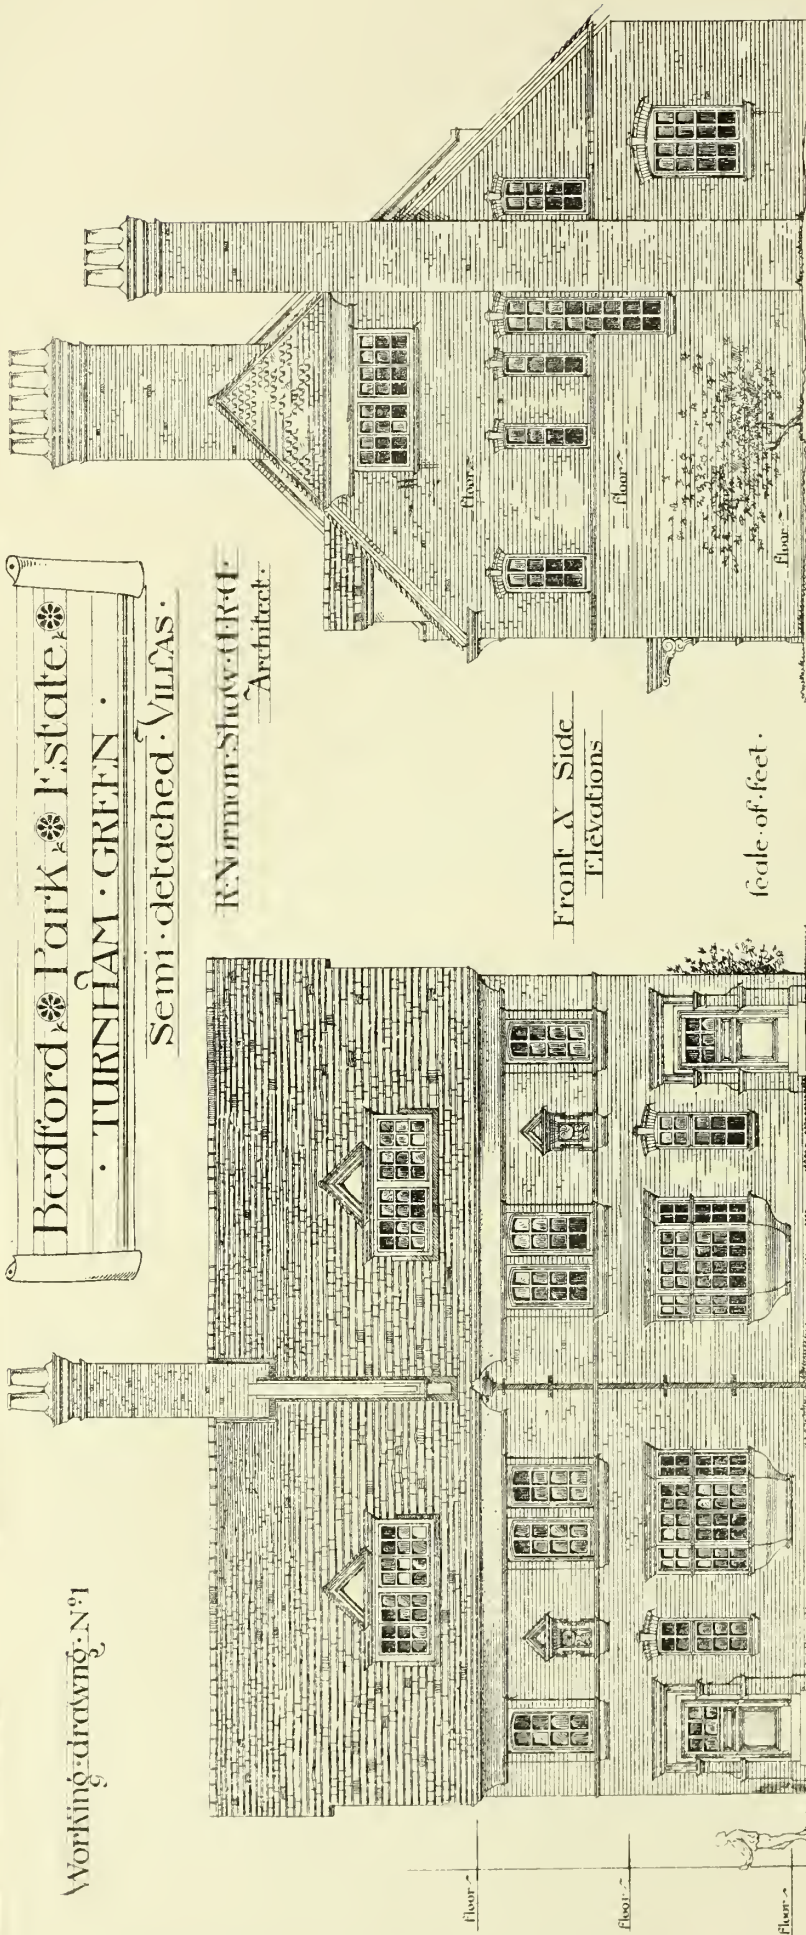

Art classes are about to be started at Dorking, the Working Men's Institute having been secured for that purpose.

"BUILDING NEWS" DESIGNING CLUB

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening of the session 1877-78 of the Institute, on Monday evening last, was marked by a large attendance of members, who manifested their animated interest in the proceedings by frequent bursts of applause. The President, Mr. Charles Barry, F.S.A., occupied the chair.

The following gentlemen were elected to membership:—As Fellows: Thos. Lainson, 170, North-street, Brighton; Richard Phené Spiers, Carlton Chambers, Regent-street; and Thos. H. Watson, 9, Nottingham-place, W.; and as Associates: B. E. Entwistle, Liverpool; E. W. Farebrother, Louth; and H. Hayman, Louth. The President announced the deaths, since the close of the session, of the following members:—Messrs. Raphael Brandon, Gilbert R. Blount, R. L. Roumieu, and Karl Frederick Büsse. Mr. F. P. Cockerell, hon. sec., stated, amid applause and laughter, that during last session he announced the death of M. Henri Révoil, of Nismes, but had since found out it was a mistake, for M. Révoil was alive and well.

THE NEW CLASS OF HONORARY ASSOCIATES.

The PRESIDENT read the following list of names of 41 gentlemen who have expressed a wish to join the new class of honorary associates:—The Right Hon. the Earl of Dartmouth, Right Hon. Lord Houghton, F.R.S.; Right Hon. Lord Crewe, F.S.A.; Right Hon. Lord John Manners, M.P.; Mr. Justice Hannen; Sir Walter Farquhar, Bart.; Sir James M^cGarel Hogg, Bart.; Sir John Hawkshaw, C.E.; Frederick Leighton, R.A.; E. W. Cooke, R.A.; J. Alma Tadema, R.A.; G. B. Richmond, R.A.; Captain Douglas Galton, C.B.; Alfred White, F.S.A.; Locock Webb, Q.C.; Frederick A. Philbrick, Q.C.; J. Evelyn Liardet; Frederick Reade; Professor Erasmus Wilson, F.R.S.; E. Woods, C.E.; J. F. Bateman, C.E.; J. Fowler; G. F. Watts, R.A.; George Grove; Herbert C. Saunders; E. Oldfield; T. Woolner, R.A.; Osgood Field; A. B. Mitford; G. A. Spottiswoode, M.A.; W. Spottiswoode, LL.D., F.R.S.; H. P. Jones; R. H. C. Nevile; John Wolfe Barry, C.E.; W. G. Harrison, Q.C.; Edward Woods, C.E.; Rev. J. Robins, D.D.; E. Harry Woods, C.E.; E. Armitage, R.A.; Thos. Hawkesley, C.E.; Jas. Abernethy, C.E.; E. F. de Kierzkowski. The reading of the list evoked considerable applause at the mention of the most generally known names. The President also read a recommendation for election of Mr. Fred. Ouvry (the hon. solicitor to the Institute) as honorary member, signed by himself and a long list of Fellows. Professor G. Von Neureuther, Royal Academy of Arts, Munich, and Professor Scholander, Royal Academy of Fine Arts, Stockholm, were elected by acclamation as hon. and corresponding members. Donations to the library of volumes and money were announced by the secretaries, and acknowledged by a vote of thanks.

PRESENTATION OF PORTRAITS.

The PRESIDENT said he had, in virtue of his office, the pleasure of presenting to the Institute a very beautiful work, by Mr. Richmond, R.A., which he thought all would consider a striking likeness of their past President, Sir Gilbert Scott. He had to present the portrait on behalf of the subscribers, and would mention that when they went to Mr. Richmond to ascertain if he would undertake the commission he expressed the great pleasure he should, as an artist, feel in painting a fellow-artist's portrait. He hoped they would for many years rejoice in having Sir Gilbert Scott amongst them, and that in years to come, after they all, and their friend himself, were dead and gone, succeeding members of the Institute would feel a pleasure in looking at the portrait. They were rich in one sense that evening, for he now had to call on Mr. Wyatt to present a portrait of his late brother, Sir Digby Wyatt.

Mr. T. H. WYATT (who was visibly affected) said he had a duty of a somewhat melancholy nature to perform—to hand over the portrait of one who had passed away, he was grieved to say, beyond recall. This portrait of his brother was the gift of his friend Mr. C. C. Nelson, who was too unwell to be present. For many years past Mr. Nelson and his brother had

deliberated in that room in the interests and for the advancement of the Institute, and he felt it gratifying to have to hand over this tender mark of Mr. Nelson's regard for his brother. They had been anxious that the portrait should be presented by Mr. Richmond, but he declined to undertake a posthumous portrait based on photographs, and referred them to an Italian artist, Signor Ossiani, whose work was now before the members.

THE ASHPITEL PRIZES.

The PRESIDENT presented the Ashpitel book prizes to Messrs. J. J. Lough, F. Bagallay, and J. Wilson, the candidates who most highly distinguished themselves in the architectural examination of 1877, and the Ashpitel medal to Mr. G. W. Brown. These having been awarded the President delivered his

INAUGURAL ADDRESS.

At the outset he would congratulate the members that during the past year the Institute had gained some internal strength in organisation, and also that it and the profession it so worthily represents have been more appreciated and better regarded by public bodies, and by the public, than has been the case for many years. He should divide his observations broadly into those connected—1. With the inner life of the Institute—*i.e.*, its relation to its members—the progress and opportunities for mutual advancement and good fellowship. 2. With its outer life—comprising its relation, past and present, with the Government and those public bodies with which it may be naturally more or less associated, and with the public generally. 1. As to its inner life, we have, he said, been passing through a year as remarkable and important as that when the Institute was first founded. The members have considered whether their organisation might be made better—more powerful and cordial as between themselves, and more really useful to the public. With this view more than one committee of earnest men have laboured, and the result is the revised bye-laws, which will for some time to come guide and govern our action. Differences of opinion, on details, existed certainly, and proved the vitality of the Institute and the general interest felt in its laws by the profession, but the advice of the committee has been substantially adopted in all essential points. The number of professional members of the Institute in 1877 is larger than at any time in its history, while the new class of honorary associates has already numbered in its ranks not a few distinguished men who are not professional. It had been felt by all that the noble aims and objects of the architectural profession were not always understood, and seldom fully appreciated by the public. If architects are not invariably credited by the public with the double effort to be the “accomplished artist,” and at the same the “trusted agent,” it may be because too little personal intercourse has hitherto existed between practising architects and those outside their ranks, who take a real and earnest interest in their work, and would fain know more of it if opportunity were given. This opportunity will be given by the creation of the new class, and through it our artistic brethren in the other walks of fine arts, of painting, and sculpture—our amateur architects, of whom many are distinguished and entitled to our respect—our Church dignitaries, whose duties in the sustentation, care, and repair of our national cathedrals and churches, lead them so frequently to express their desire to know more of architecture in its practice than they do—our civil engineers, who have such great power, from the magnitude of their works, to create a “nightmare” or a “joy for ever”—our antiquarians and archaeologists—our members of each House of Parliament, who have often to decide questions relating to our art and practice, and who sometimes so piteously confess their inability from lack of knowledge to do so to their own conscientious satisfaction—may, by becoming honorary associates, gain much of the special knowledge they desire—will doubtless learn that architects have nobler aims than are represented by 5 per cent., and, albeit that represents their livelihood, can and do put it in a secondary posi-

tion in relation to their clients, whether they are the public or are private individuals—and we shall see that one of Johnson's definitions of the term “honorary”—*viz.*, “Conferring honour without deriving gain”—*i.e.*, I presume, “pecuniary gain”—is entirely applicable to every gentleman on the list. Our new associates will, I hope, be led to take a livelier interest in architecture, regarded as a fine art no less than a practical science; while, on the other hand, I can promise them a most cordial reception within these walls. I trust that the numbers of the new class will very rapidly increase as its objects and opportunities become known. The more permanent and distinctive constitution of your council must also have a great effect for good in the future of the Institute. For myself I feel that my whole real strength consists in being a unit of the strong and united council you so wisely chose last June. A third measure of much importance is the disregard of the place of domicile in the matter of mutual subscription. I had hoped to have welcomed you in a more commodious meeting-room, but the council felt that, although with the sum already promised they might have begun the alterations, it would be more prudent to ascertain what additional rent the annual income would bear before they committed the Institute to an additional yearly charge. The subject will be taken up, however, without delay. With reference to our numerical strength, an increase of twenty has taken place in the two classes of Fellows and Associates since this time last year. They now number 635, against 615 at that time, exclusive in both cases of honorary fellows and the now abolished class of contributing visitors. The library has increased in value, and is now open continuously throughout the year, from 10 a.m. till 9 p.m. and members of the Architectural Association, the architectural classes of the Royal Academy, and those at King's College and University College, have access, on a proper recommendation, at an annual fee of 5s. It is hardly possible to overstate the value of such a facility as this to the young, poor, but clever student, or how many good architectural reputations of the future shall be due to the opportunities of reference and study thus afforded. Our income (exclusive of trust-funds or special donations) has improved to the extent of nearly £100 a year, now standing at £1,805, against £1,715 last year. During the year the subjects brought under notice have been at least equal in importance and interest to those of former years. The paper by Mr. Stevenson opened up a most interesting question, and one likely to agitate the architectural profession and their clients for some time to come. While there could be no doubt of the talent of the writer in humorous, good-natured satire and well-turned epigrams, yet that will not compensate for the absence of that sort of argument which convinces, and which shall lead the judgment and practice of the hearer to follow the advice of the orator. The line of thought taken by Mr. Stevenson, and those who style themselves the “Preservers of Antient Buildings,” seems to be that though architecture has confessedly, for as many ages as we have record of, been continually changing and adapting itself to the tastes and wants of the people, yet when we approach the particular epoch of Queen Anne's time they tell us we are to stay our hands, acknowledge that an architectural millenium was then at last attained, confess our absolute incapacity as artists, and suffer our old buildings—whether domestic or ecclesiastical—to remain untouched, however unsuitable to our requirements, in order that “a link of history” may not be lost. I do not hesitate to traverse this issue under both heads—the æsthetical and the practical. I will not admit that in an age when, in consequence of the vitality of that “love, reverence, and religion” (which is so pathetically said to have passed away), more study and real learning has actually been given to the production and judicious preservation of old buildings than for several preceding generations, and when more real work is done in one year than in ten years of former times, all that study and all that earnestness and all that work shall lead to no result creditable to our age. We living in it cannot, of course, presume to pronounce defi-

nately on the comparative value of our work with that of those preceding or to succeed us: posterity must do that. But I venture to think that the works of a Scott and a Street, and of my own father, will tell a noble story of our time, and that it will need all the learning and patient study of the young men of the present day, to whose criticisms we have listened, to equal or surpass them. Nor can I, for one, believe that such result will be achieved to the satisfaction of posterity through the medium of that curious mixture of all proportion or no proportion, as it seems to me, called the Queen Anne style, which seems just now to find so much favour. These remarks apply to our domestic and public buildings; but how much stronger does the argument become when applied to our cathedrals and churches throughout the land! Surely in dealing with them we have no right to forget or ignore the original all-important intent with which they were erected, for which they were then well-adapted, but now are often ill-adapted, though equally needed—viz., for the public worship of God. That originally was, and must still be, the primary (almost the exclusive) thought, far before æsthetic considerations or the idea so strongly urged on us that we ought to regard our churches as ruinous records or museums of the artistic ideas (good sometimes, but often very bad and hideous) of generations past. No: let us have some confidence in ourselves, and with all humility, yet without fear, deal with our old buildings, and especially our churches, as our forefathers in architecture uniformly did—adapting them, altering them, and even removing them altogether if thoroughly unsuitable to our needs; preserving their historical features with all loving care when possible, but subject as regards our ecclesiastical buildings to the above primary necessity. It is in consequence of such treatment by past architects that our old buildings have not lost, but largely gained, in interest for students; and so it may be, I hope and believe, with many of the restorations and adaptations of our time, taking them as a whole, to the students of the future.

—The President closed this first part of his address by a series of brief biographical notices of the members deceased during the past year. The professional careers and leading works of Sir Digby Wyatt, and Messrs. Edmund Sharpe, Charles Mayhew, Raphael Braudon, Robert L. Roumieu, and Gilbert R. Blount were reviewed in appreciative terms. We have already made full biographical reference in these columns to most of those included in the list, but quote the President as to the last two:—The late Mr. R. L. Roumieu served his time as an architectural pupil of the late Mr. Benjamin Wyatt, and for many years carried on a successful practice, at first as the partner of the late Mr. A. D. Gough, and afterwards on his own account. His ancestors were of French nationality, and among the Huguenots who settled in England after having been ex-patriated. It was probably due to this circumstance that Mr. Roumieu was intrusted with the design and erection of the French Hospital in Victoria Park, and was appointed surveyor to the French Hospital Estate at St. Luke's. Among his principal works are the Victoria Iron Works, Isle of Dogs; the Prudential Assurance Office, Ludgate-hill; East St. Pancras Schools, and several warehouses and business premises in the City. Among the country mansions which he designed or made additions to are "The Cedars," "Fairfield," and "Hillside," Harrow Weald, and the "Priory"; the last erected for Sir James K. Bruce at Roehampton. He was also commissioned to lay out several estates in and near London. He is succeeded in practice by his son, Mr. Reginald St. Aubyn Roumieu.—Mr. Gilbert R. Blount belonged to an old Roman Catholic family. He started in life as a civil engineer, being one of Brunel's pupils. In this capacity he was engaged in superintending the Thames Tunnel works when one of the floods occurred, and he narrowly escaped with his life. Mr. Blount was for some time in the office of our past vice-president, Mr. Sydney Smirke. He was afterwards appointed architect to Cardinal Wiseman. His practice chiefly consisted of works executed for the community to which he belonged. The Roman Catholic monastery near Dorset-square was erected from

his designs. He was a gentleman of very courteous manners, and much respected among the friends who deplore his death. Of our foreign members I have to record the loss amongst them of Karl Frederich Büsse, Wilhelm Zahn, and T. Stein, of Berlin, and of Axel Nystrom, of Stockholm, the first and last of whom died in 1868. 2. Passing to my second head—the outer life of the Institute during the past year—I naturally allude first to the graceful recognition of the Institute by our royal patron the Prince of Wales (as President of the British Section of the Paris Exhibition) by placing its President on the Royal Commission. It remains for us to show by the character, originality, and excellence of the works to be sent to the architectural portion of the British Fine Arts Exhibition that the confidence has been justified. The Local Government Board recently applied to this Institute to aid them with advice and suggestions on the new code of building regulations, in course of preparation by the Board, with the hope of introducing throughout the kingdom general rules to be observed uniformly, and to take the place of the confused and conflicting codes of regulations now in force, consequent on the absence of intercommunication of the numerous local boards by whom these regulations have been issued; one result whereof is the confusion that exists very generally, to the distraction of architects who, in all good faith and innocence, find themselves often transgressing some local rules. The council appointed a committee, of which Mr. Whichcord is chairman, and their report of advice was eminently practical—endeavouring to give the public all needful protection in the construction of buildings, public and private, without vexatiously hampering the action of professional men. That report has been most gratefully and gracefully acknowledged by the Local Government Board, and many of the emendations and suggestions have been adopted in the tentative "Draft Code of Bye-Laws for regulating Buildings," which the Board have lately issued. Again, the advice of the council has been sought by the committee of the House of Commons, still sitting on the question of "Copyright in Design of Works of Art." The necessity of some kind of recognised law on this subject has long been felt by architects, for the custody of—and property in—their original designs, as embodied in their drawings, has been the subject of frequent painful disputes, which, if contested in the courts of law, would entail on the professional man (who is rarely wealthy) much mental vexation and considerable cost, whether he were or were not successful. The consequence is, a thorough confusion of practice exists. No actual issue has ever been tried out in one of the superior courts. The "Copyright Commission" fully realised how unsatisfactory this is, and admitted that architects had a case for protection. How that was to be afforded, and to what extent limited, is a very difficult subject to settle, but there is every disposition to treat the subject in a manner satisfactory to architects if the members of that commission can possibly see their way to do so. It is hoped that the commission will present their report this year. I must lastly advert to the submission by the Metropolitan Board of Works, under the Act authorising the formation of Northumberland-avenue, of the designs for intended buildings to form its frontages, which had been prepared by the intending lessees. A long and careful correspondence ensued. It was urged by the council that consideration of the permanent appearance of large blocks of buildings in our finely-laid-out new streets should be allowed to have no small weight, even if some pecuniary sacrifice should be made (a result they believed would at least be doubtful), and that the Metropolitan Board of Works should remember the impossibility of correcting an error once made in such materials as stone and marble, however much it might be desired on all hands to do so when too late. In the issue the Metropolitan Board required the lessees of the most important block in the whole avenue to modify their design to meet the views expressed by the council. In this the valuable aid of the superintending architect of the board was readily given, both to the board and to the council, with impartiality and with the best effect.

Finally, although the council could not give an unqualified approval, even of the modified design, they felt that the board at their instance had gone as far as they could be expected to do in requiring alterations which might seriously affect the expenditure by the man who was to pay an enormous ground rent, and expend a very large sum of money on the buildings, and they therefore passed the modified design, receiving an assurance from the Metropolitan Board that they would require that the treatment of the buildings on the adjacent ground not yet let should be consistent with such design. I have the authority of the superintending architect of the board to say that since that time the lessee has frankly recognised the value of the suggestions made to him, and has agreed to some further modifications, likely to be improvements on the design so passed. You will not forget that in the course of last year an animated correspondence took place in the public papers on the subject of "illicit commissions," as they were called, being commonly paid (as was alleged) to professional men by others than their clients, and without their cognizance or consent. The charge was made indiscriminately against men of various professions, and among them architects. I felt it a duty to combat the truth of this charge against us, and especially as regarded the members of the Institute. Some communications have taken place between your council and Sir Edmund Beckett, who has proposed a bill to the House of Commons which shall inflict a small penalty as well as affix a stigma of dishonour on all who might be proven guilty of such practices. That bill was introduced too late to become law last session, but is to be pushed forward this year. It has the full sanction of the law officers of the Crown, to whom it had been referred by the Home Secretary, and the meeting will be glad to hear that so far from making the charge so general as he and others certainly did in their correspondence in the public papers, Sir Edmund Beckett desires it to be understood that so far as he is concerned he does not wish to say or imply that it is common with architects, though he is aware of some instances of those who called themselves by that name having adopted this dishonest practice. Many subjects of great practical interest to architects will no doubt engage attention during the coming year, among them the "Metropolitan Streets Bill" of the Metropolitan Board of Works, and the project for the better supply of drinking water to this huge and still increasing city. The question of the extension and concentration of our public Government offices is likely again to become prominent this year, and I would call attention to the report on the subject by a committee of the House of Commons, and to the evidence as to whether, in the interest of the public, architects of acknowledged experience and with full public responsibility for their works should not be employed on our public works, rather than they should be entrusted to the unknown talent, without any personal responsibility, of some salaried officer of a "department," who, as one witness very pertinently told the committee, would on his discovering his own talent to be of a superior order soon give up his salaried official position for an independent one with all its risks, but also with the incentive to exertion and aid to talent that all feel when a credited result is publicly acknowledged and identified with the man who has achieved it. The committee content themselves with pressing on Parliament very strongly the absolute necessity of something being done at once to remedy the serious inconvenience and risk arising from the present system of housing our public officers in separate private houses, often small, unhealthy, and divided from each other. Let us hope that, should a public competition take place once more (as is not improbable) the subject of which shall be to deal with the question as a whole, the miscarriage and injustice of action which followed a similar competition in 1857, and which I have good personal reasons for remembering, may be avoided. I would also advert to the progress of archaeological discoveries in Greece, and to the completion of the survey of western Palestine. In conclusion, I think it will be well for us in the papers to be read very often to choose subjects of a thoroughly practical character. A

charge is frequently reiterated against architects that they think too exclusively of the artistic effect and external beauty of their buildings, and disregard partly or altogether the important questions relating to the health, comfort, and convenience of those who are to live therein. I recently heard a noble lord in a public address made by him roundly assert that architects were "ignorant" of all these matters, alluding to questions of ventilation, warming, and drainage. Again, the City Librarian said the other day that the banes of libraries were architects and the gas. It was indeed well said in reply by a non-professional defender of the architect, that if those about to build libraries or other buildings really knew their own wants, and could intelligibly explain them, there would be fewer of such complaints. The undeserved blame for all the mistakes of clients—their imperfect perceptions—their non-power of realisation of their requests are heaped on the devoted head of the unfortunate architect. We cannot expect this state of things suddenly to alter, but we may learn from our detractors a lesson of Christian submission to unmerited blame, and also learn how needful it is in these days of extensively diffused scientific knowledge and inquiry to pursue exhaustively our inquiries into these subjects, and to do our best to put ourselves in a position to challenge our accusers to the proof of their assertions from any buildings erected under the care of architects of experience, when they have been treated with due confidence by their clients. Let us welcome, then, the discussion of these matters, and it may be we shall do more thereby to add to the power of the architects of the next generation to carry out large works—beautiful works—and works distinguished by their sanitary excellence, than we ever can by the more exciting discussions whether architecture attained its maximum excellence in the thirteenth century or in the days of Queen Anne.

Sir GILBERT SCOTT moved a vote of thanks to the President for his address, which, while very comprehensive, was, he considered, a marvel of condensation. He would join in the congratulation that had been expressed in it with reference to the changes in the Institute's organisation, although he could not quite concur in all, especially that relating to the equalisation of subscriptions from all members, because it appeared that more work, and equal judgment, were expected from country than from metropolitan members, and fewer advantages afforded. However, he hoped the provincial members would respond with enthusiastic feeling. Referring to the list of deceased members, Sir Gilbert alluded to the regret which they all felt at the loss of such men as Edmund Sharpe, Talbot Bury, and Digby Wyatt, and at the distressing circumstances under which Raphael Brandon—than whom a better-hearted fellow never lived—had ended his career. As to the restoration question—(laughter)—he would not venture to dwell upon the President's remarks on this vexed matter, for of Queen Anne he wished only to say *de mortuis nil nisi bonum*.—Mr. WYATT seconded the motion of thanks, and bore testimony to the personal exertions which the President had bestowed on the improvement of the Institute.—Mr. WHICORD, as chairman of the committee, concurred in this statement, and in a somewhat long speech dilated on the work of reorganisation which has been carried out. The 41 members proposed for the new class of hon. associates had given in their names in response to the personal invitation of three or four members of the council, and if these could bring in such an accession of strength, how many then might, by a rule-of-three equation, be expected to be introduced by the whole 600 members of the Institute? If they might apply such a calculation the result would exceed the number the most optimist could conceive of.

The vote of thanks having been put by the proposer and carried by acclamation, the President briefly responded and announced that at the next general meeting, to be held on the 19th inst., Mr. William H. White will read a paper on "Middle Class Houses in London and Paris."

ENGLISH WORKMEN AND FOREIGN WORKMEN—A NEW PROBLEM.

A SOMEWHAT startling phase in the conduct of business in the building trade, and in building, and even architecture, is now, if not actually going on, at least beginning, or being tried to some extent. It is the systematic employment of foreign workmen as substituted for our own workmen. It would obviously be quite impossible to over-estimate the importance of such a movement, even if it be but at first a small one, for how much must it needs imply in some way or other, or in some direction or other? German workmen, it would seem, are those at present who have thus been taken, or thought most useful, as substitutes. We propose here to look at the matter in a fine-art point of view, and as a development of a new executive power and feeling in art action, as in masons' work and "carving," both in wood and stone. Do not let us be misunderstood, for there is no special novelty in the fact of there being here in London, and at work of some kind—a German, or a Frenchman, or an Italian. There are plenty such at work every day here and there. We are thinking of the principle involved in the fact of its being possible, even in idea, of putting aside—as at the Law Courts—our English art action in an English building; emphatically so, and substituting for it a new energy, and tone of artistic and executive thought and handwork.

It is somewhat difficult to see where to begin so wide a subject, and one going into so many channels of inquiry. We might commence by asking whether, in the length and breadth of this small island, there is yet one single example of a building—e.g., a small church or out-of-the-way chapel—which still shows the handwork of the original workman on it? Is there such a one, and if so, where is it? If there, indeed, by mere chance be one, it must show what the English workman was, and by comparing his work with foreign work of about the same date, we should see what value relatively it had—whether much better or much worse, or about even, as to power of work, differing, of course, as to nationality of expression. No one likely to read this will, we may suppose, refuse to admit that there is a difference, and a wide one too, between the work of a French workman and the work of an English workman. No one hardly but detects it almost at a glance. And if this be so with the Frenchman, it is certainly so with the Italian and the German. If any should pause here to doubt as to this difference, all doubt must cease when the French, German, and Italian Gothic of the middle ages are called to mind. We owe them to the hands and brains of their several nationalities. The architectures and their accessories differed as the nationalities and languages differed.

We can but mention here a somewhat singular instance of this distinctive difference between the work as executed by our own workmen and the same kind of work as executed by the Continental workmen. It is, it is true, not in or about a building, but in "furniture." There is now a vast trade going on in foreign furniture, and very much that is now visible in the London shop windows is of foreign manufacture, though often spoken of as English. We somewhat disturbed the equanimity of an eminent salesman but the other day by pointing out to him what was foreign and what English in his store, for all of it, to the general eye, came under the but commonly too general and universal designation of "home make." But there was no doubt about it, and could be none, if artistically looked at, and this is what we are now doing. A little surprise at this distinctive difference being so readily seen may be felt, and it may be contended that, if well paid, all workmen are upon the whole alike, and that accident, and the character of the design have a good deal to do with it. No doubt, but the difference in the character of the work, when it leaves the hands of the workman, is too marked and evident, when looked at attentively, to be mistaken. We are not here disparaging or commending, but only pointing to a fact, and a vital one, but too little noticed.

We might perhaps, by way of illustration,

and to make a difficult matter the more clear, and to call attention to it the more vividly and intelligibly, ask those who are interested in this problem—and all ought to be—to look at carefully, and to study—we know no better word—French work in almost any material, or in any class of objects, whether on a building or in what are termed "knick-nacks," and fancy goods. No one who does this will deny the fact of the wonderful artistic skill and lightness of hand, and refinement of eye, not only of the French designers and artists, but of the French workmen. It may be somewhat hard to duly account for this, and a good deal of philosophic talk might be expended in the effort to come at a satisfactory conclusion about it. It is not of the hand only, but of mental organisation, and comes of the two jointly, and is always in perpetual and unconscious action and operation. It takes us indeed, commonplace as the subject of it may seem, to the foundations of art action, and to the *rationale* of that power which has produced the finest and most finished art all the world over. That the French have this power in a very high degree there can be no doubt, and so have the Germans, and it is from Germany that most of the art furniture we are speaking of comes. And if this be so in furniture it must needs be so in building and architecture, and in the details of architecture it must needs show itself conspicuously. It might be curious to see in the same building this meeting together of two things so different.

It must needs, therefore, if it should come about, become a fact not a little singular to note this special proposed if not actual substitution of foreign workmen as substitutes for our English art-workmen in such a building, or collection of buildings rather, as the New Law Courts. We may suppose, without going out of the way, the architect of this group of structures to have strong English proclivities, and to aim in the details of these buildings at a special and emphatic English expression. We can hardly ask for a foreign Gothic expression here close to Temple Bar; and most surely there is no need of it, for the English Gothic of the 13th, 14th, or 15th centuries, and we care not which is taken, is or was as good (some will think better) than any Continental phase of it. We may assume, therefore, that English Gothic is intended—a revival or copy of that of the past of Gothic art as once in vogue in this country, when no other style of art existed here to disturb the universal feeling for and constant use of it for all and every building purpose. It is true that here we may see evidences of many sources and precedents from the Gothic of the Continent; but it is an English structures, or rather series of buildings, and British workmen have hitherto put it together. It may be somewhat too curious a thought, but what would a simple-minded Early English Gothic man, with his limited folio of precedent, if he had any at all, have done here, with just the same wants to supply for British lawyers?

We are not here, however, thinking so much of this special building, or of the importation of foreign workmen to help in it, whether masons or carvers, or whatever other trade they may follow, as of the difference it indicates between our modern and to-day's system of work and art action and of that of the past, not only here in this country, but all the world over. We might, for illustration sake, take almost any one of the individualised styles of architecture and art, and follow it to its beginning in the workshop, and watch the workmen as they gradually bring the raw material into form, and could we but actually see this (and we can mentally) we should soon perceive that the style and special feeling guiding the work, its special and individual character, could only be got by and through the very men who invented and brought into form such national and individualised style of art. We doubt whether there ever was an exception to this absolute rule in art. To cite but a single instance—e.g., the Chinese. We might cite, too, all and every style and phase of art and architecture, no matter where practised, and the result would be found the same. It may be proved, too, by the attempts that are made every now and then to imitate or to copy some work, though it be but toy-work of Oriental

origin, as the French have so often done. No one, we may suppose, is or can be for a moment deceived by such work or such designing. It is always "failure."

But what a lesson ought this not to be to our working men? We do not here mean so much as a question of more work or no work, as the fact, startling as it ought to be to the men, of the possibility of substituting at a moment's notice another and a foreign means to do their special work, and to take it all out of their hands, and to substitute other hands and brains—no one seeing anything, perhaps, on the whole, but gain—artistic gain, may be. The principle and idea here involved does not, indeed, depend on the fact of its becoming a reality or no, and the temporary loss of work is but a very small item in the matter. It penetrates far deeper than this, and indicates how little is thought of work as work. All is generalised, and the work itself, and its value and character, disappear all but in the mere matter of convenience or inconvenience. If one man will not do the work, why another will. It is not thought to be a question of power or capacity. We cannot but think that the time will come when the work of carrying out a building executively will come to be regarded, not as a thing for mere accident and chance and the labour market to regulate, but it will come to be thought a mode of expressing the individuality of the art style of the time and the power over the material of the artist workman. What a chance do the Law Courts yet offer for at least a trial of this! C. B. A.

INSTITUTION OF CIVIL ENGINEERS.

THE Council of the Institution of Civil Engineers have awarded the following premiums:—
1. A Watt Medal, and a Telford Premium, to William Worby Beaumont, Assoc. Inst. C.E., for his paper on "The Fracture of Railway Tires."
2. A Watt Medal, and a Telford Premium, to William Cawthorne Unwin (has previously received a Telford Medal), B.Sc., Assoc. Inst. C.E., for his paper on "The Resistance of Boiler Flues to Collapse."
3. A Telford Premium to Robinson Souttar, for his paper on "Street Tramways."
4. A Telford Premium to Isaac John Mann, for his paper on "The Testing of Portland Cement."
5. A Telford Premium to William Anderson, M. Inst. C.E., for his "Experiments and Observations on the Emission of Heat by Hot-water Pipes."
6. A Telford Premium to John Baldry Redman, M. Inst. C.E., for his paper on "The River Thames."
7. A Telford Premium to Henry Robinson, M. Inst. C.E., for his paper on "The Transmission of Power to Distances."
8. A Telford Premium to Alexander McDonnell, M. Inst. C.E., for his paper on "The Repairs and Renewals of Locomotives."
9. A Telford Premium to Richard Henry Brunton, M. Inst. C.E., for his paper on "The Japan Lights."
10. The Manby Premium to Charles Norman Bazalgette, Barrister-at-Law, for his paper on "The Sewage Question." The Council have likewise awarded the following prizes to students of the Institution:—1. The Miller Scholarship to Percy Ruskin Allen, Stud. Inst. C.E., for his paper on "Machine Tools."
2. A Miller Prize to Arthur Cameron Hurtzig, Stud. Inst. C.E., for his paper on "Submarine Foundations."
3. A Miller Prize to Charles Graham Smith (Mr. Graham Smith and Mr. Watts have been elected Associates of the Institution since the date of the presentation and reading of their papers), Stud. Inst. C.E., for his paper on "The South Reserve Piers and Floating Landing Stage at Birkenhead."
4. A Miller Prize to Richard John Gifford Read, Stud. Inst. C.E., for his "Comparison of the Merits of Wrought-iron Plate and Trussed Girders for Single-span Railway Bridges."
5. A Miller Prize to Nicholas Watts, Stud. Inst. C.E., for his paper on "Mechanical Puddling in the Manufacture of Iron."
6. A Miller Prize to William James Chalk, Stud. Inst. C.E., for his paper "On Waves, and on Structures designed to resist their Force."
7. A Miller Prize to John Charles Mackay, Stud. Inst. C.E., for his paper "On Engineering Explosives." The Council invite communications on various subjects under the Telford Fund, the Manby Donation, the Miller Fund, &c. The list includes about 50 subjects. We note the Construction of Warehouses and other Buildings to Resist Fire, and the relative merits of Stone, Brick, Iron, and Timber; the Warming and Ventilation of Buildings; the Storage and Filtration of Water; the Expedients of Irrigation in India; the Different Plans of Opening Bridges; the Management of Underground Waters in Mining Districts; the Design and Construction of Masonry, Dams, Caissons, &c.

A dinner was held one evening last week at the Bull Inn, Chelsfield, West Kent, to celebrate the opening of lime works at Halstead. Mr. Lawrence Brown, the proprietor of the works, occupied the chair.

Building Intelligence.

BRADFORD.—The foundation stone of a new Baptist chapel was laid in Birksland-street, Leeds-road, on Saturday. It has been designed in Classic style, and for architectural effect reliance will be placed more upon proportion and bold treatment than lavish ornament. The Leeds-road elevation is divided into three portions, the centre one being carried higher than the wings, and furnished with a projecting cornice, and divided into two stages vertically, the lower one being a portico of three bays. The wings contain the gallery staircases. The columns and pilasters have Corinthian capitals, and the windows are circular-headed. In plan the chapel is a parallelogram 63ft. 3in. × 49ft. 8in. on the ground floor. At the rear of the building are three vestries, that in the centre being 25ft. × 20ft. 9in. Over this vestry is the organ-chamber, and a choir-room is provided over that to the left. The chapel is to accommodate 784 persons, and the total amount of the contracts is £5,580. Mr. J. P. Kay, of Leeds, is the architect, and the principal contractors are—Messrs. Hindle, Verity, and Co., bricklayers and masons; Toothill and Balmforth, joiners; Nelson, plumber and glazier; Dixon, plasterer; Thornton, slater, and Higginbotham, painter.

BRUTON.—The parish church of Bruton—one of the finest of the Somersetshire examples of 15th century Gothic architecture—was reopened on Thursday, the 1st inst., after restoration, undertaken only just in time to save the fabric from absolute ruin, so far had decay in timber and dilapidations of walls proceeded before professional aid was sought. The work of repair has been one of much difficulty. The whole of the north wall and nave arcade had to be rebuilt, having been thrust considerably out of the perpendicular by the weight of the timber roof. There yet remains to be executed the alteration of the modern incongruous chancel into one which will harmonise with the nave, and for this plans have been prepared. The works were commenced in 1871, under the direction of Messrs. Slater and Carpenter, architects, of London, and, since the death of the senior partner in that firm, have been superintended by Mr. R. Herbert Carpenter. The contractors were Messrs. Clark and Son, of Bruton. The total cost of the restoration, so far as carried out, has been about £4,500.

DAGENHAM.—New schools recently erected at Beacontree-heath, by the School Board for Dagenham, South Essex, were formally opened on Tuesday week. The style is Gothic. The buildings are entered by a covered colonnade, and are divided into three large school-rooms, those for the boys and girls being each 35ft. × 17ft., and that for the infants 33ft. × 17ft., with class-rooms, withdrawing-rooms, lavatories, and closets attached to each. Half an acre of land is enclosed for a playground. The total cost has been £2,100, and accommodation is provided for from 150 to 200 pupils. A teachers' house is being erected on the site. Mr. G. Death, of Dagenham, is the builder, and Mr. E. C. Allam, A.I.C.E., the architect.

DISS.—The great Perpendicular church of St. Mary, Diss, Norfolk, was re-opened on Sunday week, after restoration of the chancel and the erection of a new organ. The works in the chancel are an extension of the scheme proposed by Mr. A. E. Browne, architect, of London, from whose designs a reredos was erected eight years since. The walls have been panelled, the deal pews have been removed, and oak choir stalls erected, divided from the nave at the chancel arch by a low oak screen; another screen separates the chancel from the south aisle, and the northern chapel is entirely occupied by the new organ just opened. This was built by Messrs. J. Rayson and Sons, of Ipswich, and has cost about £400. The chancel floor has been repaired with black and red tiles. The walls above the panelling are to be painted with ornament and texts from Mr. Browne's designs. The removal of the west gallery—a cumbersome structure dating from the period of the early Georges—upon which the old organ stood, has effected great improvement in the lighting and ap-

pearance of the nave, and has opened up a richly-carved fifteenth century door, set into a doorway of the sauc period as the tower above it—1296. Mr. Bishop was builder.

EASTBOURNE.—The foundation stone of a new church, to be dedicated to All Saints, was laid at Silverdale, Eastbourne, on Thursday, the 1st inst. The church will be Early English in style, and is being erected by Messrs. Carruthers and Son, builders, of Reigate, from the designs of Mr. Streetfield, of Great Marlborough-street, London, W. It will consist of a nave, north and south side aisles and porches, chancel, and narthex. Over the latter there is proposed to be added a large tower, on the north side of the chancel an organ chamber, and on the south side a vestry. These three features do not, however, form part of the present contract, and depend on the influx of sufficient funds. The whole of the exterior walls will be of Portland and Forest of Dean stone, used in alternate courses. The roof will be an open timber one covered with tiles. The pulpit, to be of stone, will be placed at the north-west angle of the chancel. The dimensions of the nave are 97ft. 6in. × 31ft. 6in., and those of the chancel 31ft. × 26ft. The church will afford seating accommodation for 874 persons, to be increased to 1,020 when the organ chamber and vestry have been added. The present outlay is £9,500.

GREENGATES.—New Sunday buildings were opened next the Wesleyan Chapel in the Shipley and Bramley-roads, Greengates, on Saturday. The schools are in plan T-shaped, and are arranged on the class-room principle. The upright stroke represents the entrance corridor, on either side of which are the infants' room, and board-room, each 22ft. by 15ft., and a library and class-room. The principal school-room, 50ft. by 30ft., and 22ft. 6in. in height, is placed across the top, and has a second approach from the chapel. This room has a platform, is decorated with stained glass in the end windows, and, like the other rooms, is furnished with red deal fittings. The style adopted by the architect, Mr. J. P. Kay, of Leeds, has been a simple form of Gothic. At the intersecting of the roofs is a bell-turret. Both chapel and school have been fitted with hot-water apparatus by Mr. John Tennant, of Leeds. The contractors were—Masonry, Mr. W. Hargreaves, Rawdon; joinery, Messrs. J. and E. Burke, Calverley; plumbing, painting, and glazing, Mr. A. Higginbotham, Idle; plastering, Mr. A. Weather, Calverley; and slater, Mr. J. Thornton, Eccleshill. Messrs. Powell Bros., of Leeds, supplied the windows. The total outlay has been about £1,500.

IRCHESTER.—The memorial stone was laid last week of a new Primitive Methodist chapel at Irchester. The chapel has been designed by Messrs. J. Kerridge and Sons, architects, Wisbeach, and Mr. Roberts, builder, of Wellingborough, has been commissioned to erect the building. The structure will be of brick, faced with white Whitticks and Wellingborough pressed reds. The structure will form an oblong, measuring 40ft. by 26ft. 2in., having a flat panelled ceiling.

LEEDS.—A new public hall near the Fish Market was opened on Saturday. The architect is Mr. Thomas Ambler, and the cost of the building is £7,000. The style is Gothic, and the building consists of three stories, with basement and attic. On the ground floor there is a large dining and coffee room (41ft. by 36ft.). Adjoining the main apartment are a reading-room, smoke-room, lavatories, &c. On each side of the entrance is a staircase leading up to lecture-hall, measuring 72ft. long by 36ft. in breadth; and, inclusive of a gallery erected at the east end, it will be capable of seating an audience of about 450.

METROPOLITAN BOARD OF WORKS.—On Friday this board accepted the tender of Messrs. Mowlem and Co., amounting to £12,000 (the lowest received) for the formation of carriage and footways, sewers, alteration of roads, and other works in connection therewith, between Farringdon-road and Wilderness-row. Sir J. Bazalgette, as engineer to the Board, submitted a report with reference to the prevention of floodings in Balham and Wandsworth, in which he recommended that the

sewage of Balham be diverted from the low-level system, so that in the coincidence of a heavy shower with a high tide the surface water and sewage may not be locked into the sewer till the outlet is cleared, and further that six railway engines be purchased from the Great Western Company for pumping purposes. The entire cost of the scheme will be £40,000, of which £26,000 will be required for the alterations at Balham. After a full discussion, trenching on the general question of the wisdom of permitting the building upon land below the level of high tide, the recommendations were adopted, with only two dissentients. As to carry out the entire series of improvements under the Artisans' Dwellings Act, in the 22 unhealthy areas in the metropolis, for which Parliamentary sanction was obtained last session, would cost £475,000, and displace 20,000 persons, it has been decided by the board only to undertake at present two schemes, those relating to the areas near Essex-road, Islington, and Bowman's-buildings, Marylebone. For these areas—which have been the first selected because they lie near the line of the proposed new street from Charing-cross to Bloomsbury—schemes were submitted by the works committee, and were generally approved. With reference to that part of the report of the select committee of the House of Commons on the Metropolitan Fire Brigade, which relates to the structural supervision and control of theatres and music-halls, it was agreed to apply to Parliament next session for power to give effect to the recommendations. Six months' leave of absence was granted to Mr. Newall, principal clerk in the superintending architect's office, on account of illness. The Building Act committee reported that they had considered the bill to be brought forward next session to amend the Metropolitan Management Act, 1855, the Metropolitan Building Act, 1855, and the Acts amending the same; and, having regard to the extreme importance of early legislation on these matters, they believed it to be undesirable that further amendments of the law as to buildings and streets should, as had been suggested last week, be introduced into it. This report was adopted, and the bill was referred to the Parliamentary committee to be finally settled and deposited. A report was received from the solicitor to the board as to the Great Wild-street scheme under the Artisans' Dwellings Act, and the Parliamentary committee was directed to give the requisite Parliamentary notice and deposit the scheme.

PRESTON.—New local board offices have been erected at Fulwood, in Preston, by Mr. T. Harrison Myres, A.R.I.B.A., of Preston. The building comprises a board-room, with entrance-hall, which admits to board-room on the right, and to an office or weighing-machine room on the left. On the first floor there are four large bedrooms and one smaller, the whole of the rooms being well lighted, ventilated, and heated, and of good height. The frontage in Garstang-road of the main block is 39ft., and the buildings occupy an area of about 170 superficial yards. The style adopted is modern. The buildings are of brick, with stone dressings and ornamentation. Enclosing the front garden is a strong and effective iron railing. The whole buildings have been successfully carried out by sub-contractors for sums in the aggregate of £937.

RAINFORD.—On Thursday week the memorial stone of a new parish church was laid at Rainford. The building will be in the Gothic style, and will seat 550 persons. Its total length is 113ft. 6in. by 48ft. 2in. wide, the total height of the nave being 46ft. to the pitch of the roof. The church is divided into nave, chancel, and two aisles; the former of which is 77ft. long, the chancel being 31ft. deep by 19ft. wide. On the south side is a small chapel, which is faced on the north side by an organ chamber. In the rear of the organ chamber is the minister's vestry. The church is being built of Runcorn stone, dressed with local wall stone, relieved with red stone bands. At the north-east corner of the building is the tower, which is 18ft. square at the base, but at present will only be carried to the height of 26ft. The architects are Messrs. Aldridge and Deacon, Liverpool; and the contractor, Mr. H. Yates, of Liverpool.

WOLVERHAMPTON.—About a fortnight ago one of the pinnacles to the tower of St. Peter's Church was blown down, doing damage to the extent of about £200. Repairs will be completed as soon as possible. Mr. Christian is the architect who has conducted the recent restoration of this fine old building. The Church of St. Jude is having a stone spire placed on the top of the present square tower, the corner pinnacles having been taken down. St. Mary's Church has just been repaired and renovated at a cost of about £700, the whole of the walls and ceiling having been repainted, all the woodwork varnished, and the organ removed from the end of the church to the gallery in the south transept.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published November 9 contains articles on Hydrophobia, The Sanitary Value of a Dry House, The Yorkshire Association of Medical Officers of Health, Infantile Mortality, The Antiseptic Treatment of Zymotic Diseases, The Quarterly Report of the Registrar-General, The Excessive Infantile Mortality at Macclesfield, Small Pox in the Isle of Man, Books Received, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, The Editor's Table, Cleanings, &c. Price 2s. Annual Subscription, Post-free, Eleven Shillings.—31, Tavistock-street, Covent-garden.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—K. and Co.—C. and H.—E. B.—J. D. W.—W. C.—P. S. S.—A Singed Moth.—J. O. S.

"A. B." writes to us anent our article on "Designers and Draughtsmen," and asks us, in reference to the Hove schools, whether "the Brighton architect got his design from London, and if so the extent of his indebtedness," &c. (We cannot inform our correspondent.)—

"LIVERPOOL." (We cannot possibly find time to give the names and prices of elementary books. Refer to back volumes.)—ALFRED BIRMINGHAM. (An "inch cube" is used in the measurement of timber, and means 12 cubic inches. Your last statement is right.)—J. SULMAN. (We do not know the address. The information was gleaned from a local contemporary.)

"BUILDING NEWS" DESIGNING CLUB.—Drawings received: A. L. B. (Your design did not come to hand.)—"Lubin," Bombay. (Your letter received, and shall be taken into consideration.)—"Marmion."—Medicus.—Fleur-de-Lis.—A. L. B.—RECEIVED: Thos. Stokes. (We have mislaid your letter. Can you repeat request?)—Pupil.

CHURCH AT SKIRLAUGH.—Will "Ecclesiologist," who wrote about this church last week, send his name and address.

Correspondence.

"FREE CHURCH ARCHITECTURE."

To the Editor of the BUILDING NEWS.

SIR,—Although much has been written from time to time, both in the BUILDING NEWS and elsewhere on the subject of church-building for congregations, it still remains an exceedingly interesting topic for inquiry; and, indeed, with all that has been done and said, much remains to be worked out in reality. Among the first who endeavoured to strike out in a

more reasonable form of plan for buildings of this class was Mr. James Cubitt, and his success in this matter is well worthy of note in the large chapel he is now building in Islington for Dr. Allon. Mr. Cubitt has been followed by others with more or less success, and we have several notable examples: for instance, Mr. Newman Hall's chapel and schools, Westminster-bridge-road, by Messrs. Paul and Bickerdike, may be named as among the foremost, as it is probably the most expensive, if not the largest, work of the kind yet erected. There are also many works of less magnitude, but of much merit, and of these Mr. John Sulman is the architect of not a few. Last week, for instance, a view was given of a building proposed to be erected at Beckenham from this architect's designs. The purpose of the building is described, and the title reads "Congregational Church and Schools." The planning seems well adapted for this object; and of this I have nothing to say; neither would I venture to remark upon the design as a whole, architecturally considered; but it would be interesting to inquire why a sanctus bell-turret is made a feature of, in a building erected ostensibly for preaching purposes, and where the doctrine held and taught is quite at variance with that creed which in ages gone by caused the sanctus bell to be used, and furnished the reason for screening the chancel from the main part of our churches. Such an arrangement in a Congregational chapel or church, whichever it may be called, is, to say the least, unnecessary and unmeaning, although it is more than often employed. The reason is perhaps not far to seek, and may be described as a straining after the ecclesiastical, an endeavour to assume a "churchy air." But why, in the interest of all that is good and truthful in architecture, should those who design buildings of this class, persist in so vain an assumption? The external character or plan of buildings built for a purpose at once repudiated, surely ill-befits Congregational or Nonconformist chapels generally; and this is the point to which I wish to draw attention; and it is, to quote Mr. Sulman's own words (see BUILDING NEWS, Nov. 12, 1875), "the useless attempts to adapt the Ritualistic type of church to Congregational worship that I so strongly condemn."

"Free churches" are, of course, erected for a recognised purpose, which, as every one knows, is for preaching—in plain language, they are "preaching houses"—then why not treat them as such? If Gothic architecture be thought more suitable than a Classical treatment, by all means use it, only let it be in the true spirit of the style. I am content to use Mr. Sulman's terms when writing to the *English Independent*, in 1875:—"If we do but seek to increase our culture and appreciation of the beautiful, and take our stand on common sense, avoiding all deceptions, shams, and fripperies of mere prettiness, and endeavour to express in our buildings the great principles of our Church life—freedom, simplicity, and truth—there is a future of great promise opening out for Free Church architecture."

Now, I venture to suggest that it is scarcely in the spirit either of good art, or of the above prophecy, to use a sanctus bell-turret on a Congregational chapel—even though it concealed a patent ventilator—as I believe it is proposed to do in the case before us. If it be found necessary to employ a ventilator, use it just where it is most wanted and can best do its work—only let it be a ventilator and nothing else. I have already had the good fortune, in the course of some private correspondence on other matters, to be favoured with the opinion of my friend, Mr. Sulman, on the question of "Free Church architecture;" but it would certainly be a further advantage, now that he has given the world his design in question, if he would tell us why the particular feature already referred to was used as shown in the illustration of the building published last week?—I am, &c., MAURICE B. ADAMS.

COMMISSIONS.

SIR,—I am in receipt of a circular from a stained glass manufacturer, in which he says that he allows "architects and other professional gentlemen a liberal commission, say of

10 to 15 per cent." What his past experience may be I don't know to warrant his making this insulting announcement. I can tell him that this statement of his will assuredly prevent his getting any work from me, and I have no doubt it will so influence many. His declaration of intention to cheat his paymasters—for that is what it amounts to—proves him to be dishonest, and he is bent on corrupting others—the villain! It is said there is an Act to be introduced into Parliament purposely to meet such breaches of trust, and a good thing, too. But, Sir, the fault is not all one side. Doubtless there are professional gentlemen (!) who habitually take bribes. I hear from tradespeople frequently of such things. Those who are guilty of these mean, rascally practices are deceived if they think that what they do in secret is not afterwards published—not publicly certainly, for the over-tender law of libel prevents that—but it gets abroad from mouth to mouth, and their characters are estimated accordingly. What is wanted, however, is a thorough exposure, and then perhaps the thing will be checked.

But even architects who are too honourable themselves to accept a *douceur*, yet are not careful to see that their managers or assistants are not transgressing. This is not uncommon, and the architect, through his carelessness, may sometimes get the discredit of its being supposed that the money goes to him. And in many cases, it is not that money is offered by the tradesman, but it is actually extorted from them, and by those who call themselves gentlemen. I know a glaring case of this kind, the which, on becoming known, resulted in the "professional gentleman" giving his unfortunate victim—a foreign artist—a blow in the face. Afraid of injuring his prospects that blow the artist did not resent, but the person referred to—the aggressor—may be sure that there are English hands which are waiting opportunity to pay him back for his cowardice.

Unhappily the innocent have to suffer for the guilty. The whole architectural profession is at the present time in ill odour, and those who are honest have to pocket sneers and innuendoes, the which are not more agreeable from being wholly undeserved.—I am, &c., M.

"DEPOSIT" COMMISSIONS.

SIR,—Make what use you like of this; it speaks for itself.—I am, &c., J. F. F.
Dublin, Nov. 6, 1877.

"DEAR SIR,—Adverting to ours of October 8th last, we shall be glad of an opportunity to tender for the heating of . . . If a deposit is required for a copy of the plans, we shall be happy to remit.—Yours truly,
"Liverpool, Nov. 5."

THE CHURCH OF ST. PETER, REGENT-SQUARE.

SIR,—One asks for a fish, and receives a serpent. I ask Mr. Wm. Scott Champion to indicate the position of "the vast amount of good design," which he states is to be found in this church, and all I can gather from his letter of last week, as a reply to that inquiry, is, that "where the ornament is good, such as in the present frieze round the chancel," he intends to use it up in the proposed restoration; but where is the "vast amount of good design?" Well, Sir, on Mr. Champion's kind invitation, I, last Sunday, visited the church, and almost breathlessly sought the "ornament in the frieze round the chancel;" by dint of some exertion, in consequence of the rays of light proceeding in the wrong direction, I found it; and, if I am not mistaken, it is composition or plaster ornament of the pattern well known about the time it was put up, and I estimate its value when new at 1s. per foot lineal.

As regards the proportion of the interior, I should say that, supposing the galleries absent, it is depressive; with the galleries, which have too much width for the height from the ground to the soffit, it is very depressive. The Ionic columns, which carry the galleries, are in themselves tolerably right in proportion, but they are too small. There must be scale about columns if they are to be successful. There is a little playfulness about the flutings, or rather beadings, of the shafts, and also in the caps, which is not charming. The roof is flat, and being of large span, shows skill in trussing.

I have seen some of the late Renaissance churches in Bruges, Brussels, and Antwerp, but not Rennes, and I never expect to find unadorned Classic proportions in a Renaissance church, particularly in French or Belgian Renaissance; but this St. Peter's Church is intended to be a very strict following of Greek design, and yet it is bad, in my opinion, because the worst profiles have been adopted, because semicircular arches have been introduced

when straight heads would have been more in accordance with the style, and, therefore, in harmony with the surroundings; because the whole of the ornament is too small for its position; because there is no affinity whatever between the steeple and the church—no growth, a simple sticking in of a feature apparently intended to give the idea of crushing the roof, and yet not doing so; because all the oversailing members and projections are too flat; and because there is a gloomy cadaverous look about the whole, which is not to be found in the glorious Greek architecture which the designer of St. Peter's attempted to take as his model.

I should like Mr. Champion to understand that it is not the "style" which I think offensive—it is the want of style; and when, at a comparatively trifling cost, such an exterior as St. Peter's can be converted into a style in harmony with that of a proposed new interior, I think it "Vandalism" not to so convert it. And now, having had my say, as Mr. Champion puts it, as a professional man, I must admit that the service struck me as showing much more vitality than it did some time ago; but good music is impossible when the choir is at the east end of the church, and the organ at the west, and when that organ is as thoroughly worn out as I trust the "style" is in which the church has been designed; and, in reply to the final part of Mr. Champion's letter, I have the pleasure to inform him that I "subscribed to the funds of the church" last Sunday.—I am, &c., Wm. WOODWARD.

TWO QUESTIONS.

SIR,—Allow me to ask your readers two questions:—Firstly, is it really the practice of architects to take commissions? I have received two circulars offering various rates of commission for the introduction of business. One of these I have lost, but the other is now before me. It came from the neighbourhood of Edgware-road, and called attention to the low charges for "plain and stained-glass windows," adding the following paragraph:—"Notwithstanding, I can allow architects and other professional gentlemen a liberal commission of 10 to 15 per cent." Secondly, is it known to the officials of the London School Board that the schools built in London are much more expensive than they ought to be? I ask this because such care is taken to explain that if the schools were on the 9ft. basis the cost would be so much per head—never less than £9 odd—while provincial schools are being built at £5 and £6 per head; indeed, your columns contain a notice of a school at Bedwelty (page 443) by Mr. Blessley, architect, erected at a cost of £4 per head.—I am, &c., OBSERVER.

BARROW-IN-FURNESS TOWN-HALL COMPETITION.

SIR,—Can any of your readers say what steps are being taken in this matter, the designs for which were sent in on the 15th of October? "An architect of standing" was to be appointed as assessor to advise the committee. It is to be hoped the long list of competitors in which local influence has been the chief assessor will not be increased by the addition of another "frightful example" in this case.—I am, &c., FAIR PLAY.

Two stained-glass windows have just been erected in the chancel of Christchurch, Eaton, near Norwich, in memory of the Rev. F. Weston, at whose expense the chancel was erected. Mr. Augustus E. Brownes, architect, of London, designed the windows, which have been executed by Messrs. Heaton, Butler, and Bayne.

Memorial stones were laid on Saturday of Sunday-school buildings next the Wesleyan chapel, at Low Moor, near Bradford. On the ground floor are to be provided 7 class-rooms, and above these an assembly hall, fitted up for seating 500 children. The cost will be about £2,100. Messrs. Andrews and Pepper are the architects.

The annual exhibition of works of the students in Leeds School of Art is being held this week in the Mechanics' Institution. The display is a selection from the 2,596 works produced in the school during the year ending April last, and includes a number of original designs and of sketches from nature, the latter being a new feature. The Department and local prizes are to be distributed in the Albert Hall this (Friday) evening.

At a special meeting of Oxford Town Council, held on Monday, it was resolved to establish a first-class grammar-school, the Corporation granting a site in the centre of the city of nearly an acre, as well as £3,000 towards the building, and £1,000 a year towards maintenance.

The School Board for London decided on Wednesday that in the future preparation of plans for new schools, it is advisable, wherever practicable, that there shall be one class-room for each 60 children, together with provisions for the occasional assembly of an entire department of scholars.

In celebration of the completion of the Finches mansion, near Lindfield, Sussex, the workmen, numbering about 140, were entertained at dinner on evening last week. The architect, Mr. Thomas Lainson, F.R.I.B.A., of North-street, Brighton, presided, and the builder, Mr. Mark Deacon, of Norwood, Surrey, occupied one of the vice-chairs.

Intercommunication.

QUESTIONS.

[5175].—Powers of Local Boards.—A regular reader of your "Intercommunication" column since its first appearance, I have never asked to write in it till now, when I should be obliged by your permitting me to invite opinions on the following:—1. A local board in a provincial town refuses me permission to have a trap or stepway or rolling way of any sort from my basement story, to hoist goods through, because it would be in the public footpath although this is situated in a by-street, and where there is absolutely no thoroughfare, and though offer to adopt any suggestions they may make for security. It would only have projected about 3ft. 6in. I have put the same thing frequently in London. To what extent are they justified in this refusal? If not, nothing about the matter in their bye-laws, but of course they have discretionary powers to any extent. 2. I understand they also refuse to sanction even a fixed iron grating or dead light or aperture of any sort in the same position—namely, in the footpath to light basement. Can they have any right to do so, and should I be justified and safe in defining them? I have no doubt that the opinions and advice of your various correspondents will be of use to others, as well as to—DILEMMA.

[5176].—Quantities—Surveyors' Charges.—A rural sanitary authority employ an engineer to prepare plans for sewage works; these are duly adopted, and advertisements issued, and intending contractors are informed by the advertisement that bills of quantities may be obtained from the engineer. The lowest tender was accepted, and the contractor officially informed of such acceptance; but instead of proceeding with the works at once, they have been delayed by the authority for twelve months and will probably not be carried out at all. If the work had been proceeded with, the contractor would have been liable for surveyor's charges; but who is liable under the circumstances detailed above? Recent legal decisions (if any) would oblige.—W.

[5177].—Modelling Wax.—I am anxious to do some modelling. Will any reader kindly give me any information with regard to the use of modelling wax, or other material equally good, and where it can be obtained?—INQUIREE.

[5178].—Surveyors and Inspectors of Nuisances.—In your columns of last week you report on the first examination of surveyors and inspectors of nuisances. Would you inform me what examination is required to pass before gaining a certificate or from whom I could gain this information? An answer through your intercommunication column or by note would greatly oblige—T. S.

[5179].—Binding "Building News" Plates.—Probably many of your readers have had the valuable illustrations which accompany your paper bound for reference. I should be obliged for any suggestions as to the best way of doing it. Two ways suggest themselves:—To have books of suitable size, with guards to which to paste the sheets, or to bind them up in books. I am doubtful whether the margin is in all cases sufficient for the latter course. A third course is possible—to keep them in portfolios classed according to their different subjects; but think that in this way they would be very liable to be lost. I should be glad if those who have had their bound in books would say what number they have found convenient to include in one volume; also under what heads they have classed them? In the case of the same drawing extending over two pages, the guard-book or portfolio seems the only possible course.—A. C.

[5180].—Ink-Papers.—Can any one tell me whether the ink-papers, which produce ink by merely infusing them in water, are still sold? They were to be obtained a very few years ago.—L. C. R.

[5181].—Clearing Pieces.—I have asked more than one joiner what these are, but without success, and shall feel obliged by a reply in these columns. The term is used in connection with some part of shutter boxing.—S. A.

[5182].—Joists Laid Rounding.—If care is taken to prevent settlement in a building by laying the joists rounding, what is considered the most scientific method of giving common joists this kind of camber, and how is it carried out in practice?—S. A.

[5183].—Board School Space.—I observe in the BUILDING NEWS of the 19th of October that there are tenders for two Board Schools for the London School Board—Mr. E. R. Robson, architect—viz one at Deptford for 792 children (the accommodation on the nine and eight basis being for 84 children). Will any of your readers (through your medium for intercommunication) kindly inform me what is the principle to be understood by nine and eight basis, as I have always understood that the Council of Education required 10 superficial feet per child?—PUPIL.

[5184].—Hydraulic Pressed Tiles.—Would any of the numerous readers of the BUILDING NEWS kindly inform where I can obtain hydraulic pressed marble tiles, and about the price per yard, and oblige—A. B. C.

[5185].—Payment for Quantities.—Will some reader inform me at what stago of a building's pro-

gress are the quantities generally paid for? Some three months ago a builder commenced a contract under my supervision, for which the quantities had been supplied, though unfortunately they were not ordered by the proprietor. I have every reason to believe the builder to be a dishonest man, and I have applied several times for payment, but get only evasive answers. What is my best course to take? Can I withhold the final certificate until they are paid for?—YOUNG ARCHITECT.

[5186.]—Archæological.—Will any of your correspondents kindly inform me as to where and from whom I may obtain the *Transactions* of the Royal Archæological Institute of Great Britain of their annual excursions.—B. PRIESTLEY SHIRES, Leeds.

[5187.]—Board of Health and Building Line.—I should like to ask, through the medium of your paper, whether a board of health can compel a person building upon a corner plot of land, not only to set the front of the building back to building line, but the flank wall also, to the building line of the side street, and, if so, under what Act they obtain their authority?—ALPHA.

[5188.]—Crown of Large Oven.—I should be glad if some of your readers of "Intercommunication," would oblige by stating their experience as to the best material for grouting the crown of a large oven built entirely of fire-bricks.—W. HURST.

[5189.]—Corporation and Private Interests.—A corporation erects a wall and promenade at their own expense, on land belonging to, and by permission of, the proprietor; after being in use six months, "for the convenience of the public," charges the said proprietor a promenade rate. Would it be legal to erect a building on the said wall without special permission of corporation? A remark on the above will oblige.—STUDENT.

[5190.]—Velocity of Discharge from Sewer.—Will any of your numerous correspondents kindly give a solution to the following:—What is the velocity and discharge from an egg-shaped sewer 5ft. in depth by 3ft. 4in. in width at top when running half full and a fall of 6ft. in the mile?—NEMO.

[5191.]—Inaccessible Heights.—Will some reader kindly inform me what is the rule for ascertaining the height of a tower, &c., whose height is inaccessible?—ANXIOUS.

REPLIES.

[5164.]—Surveyors' Charges.—I should say the surveyor who prepared the quantities was in the position of a creditor of the builder as much as any of those who supplied him with materials, &c., and, consequently that the receiver is entitled to the amount, as he has completed the contract.—ARCHITECT.

[5164.]—Surveyors' Charges.—Can "L." kindly furnish particulars of the cases to support his theory, as it seems absurd that an insolvent builder can obtain a contract for a large amount, and obtain, perhaps, £100 or more for the benefit of his creditors? H. L.

[5165.]—Girders.—In reply to Mr. Langham's question, the term "fixed" at ends, as applied to a girder, means a perfectly rigid fixing, which is practically impossible, and, therefore, in making calculations, the only safe plan is to neglect this element, and consider the girder as supported only. It is manifestly impossible, unless the bearing ends are of considerable length in comparison with the girder, to fix the ends; and unless a considerable weight of wall is above them, the ends do not even approach that condition.—G. H. G.

[5166.]—Stone.—I should recommend "F. R." to use the Hopton Wood stone instead of Mansfield. It can be polished or otherwise. If he prefers Portland, give it a coat or two of lime-water to prevent vegetation.—LEVERSHA.

[5168.]—Dividing Rooms by Partitions.—There are two ordinary modes of dividing rooms—one is by folding doors, and the other by sliding doors, hung either above or made to run in a groove in the floor. Both these plans require, of course, side space for the doors, when thrown open. If a partition be adopted, the best plan would be to allow it to drop into the cellar below or a casing made for it; the partition being counterweighted by chains or cord-pulleys at the sides. The partition may be made in two or three parts, and let down. But, perhaps, the simplest kind of partition would be a revolving one, the roller being fixed in the floor, either above or below. In fact, a revolving wooden shutter might be made to answer the purpose. Another expedient occurs to me that may be even more architectural in appearance. Erect in the position required hollow casings or plasterers on such side of the room, with opening lids, and fix in such a revolving shutter or partition. These could be worked by means of a handle giving motion to a cog-wheel.—G. H. G.

[5168.]—Dividing Rooms by Partitions.—In reply to "Inexperienced," the best movable partition that I have seen is one invented by Mr. D. J. Williams, of 57, New-street, Birmingham, in whose office I saw one in work a short time ago. Mr. Williams would, no doubt, furnish him with all particulars respecting it. It neither takes up into the bedroom, nor lowers into the cellar, the floor being perfectly free from any obstruction when not in use.—G. E.

[5170.]—Boundary Wall.—If "Builder" will apply to the surveyor of the local board of the district no doubt he will obtain the information he requires.—HENRY G.

[5170.]—Boundary Wall.—I have recently had to deal with two similar cases. One a builder's yard wall, the other a garden wall, both of which have been allowed to be built up to the footpath.—J. P. O.

[5171.]—Boundary Wall.—B has no right, "legal, or customary," to trespass on the land of A for the purpose stated. B should build "overhand" from his own side.—L.

[5171.]—Boundary Wall.—In my opinion, B is bound to build the wall from his own side; but in such cases an arrangement is usually made, either by compensating the adjoining owner for damage done to crops, or by executing the work at a suitable time of the year.—H. L.

[5172.]—Perspective.—Burchett's "Linear Perspective" (price 6s., Batsford, 52, High Holborn) is the best work on the subject that I have seen. If "Anxious" studied this book, and got some friend to explain the method of starting an architectural perspective, he would soon be able to draw a simple building—the rest comes by practice.—H. L.

[5174.]—Retaining Percentage from Installments.—"R. B." has been wrongly informed as to general custom. The conditions of contract usually state that "payments shall be made at the rate of 80 per cent. as the work proceeds," so that in a contract of £1,000 a balance of £200 would be due to the contractor, just as stated by "R. B." in the first part of his communication.—H. L.

[5174.]—Retaining Percentage from Installments.—"R. B." should have set out in the question the exact terms of the contract. If they bear his suggested interpretation they must be of a very extraordinary nature. The usual system is to pay by instalments 80 per cent. of the contract sum as the works proceed, and the balance of 20 per cent. within a specified time after completion.—L.

[5174.]—Retaining Percentage from Installments.—"R. B." will find that the course he mentions is "not as most builders understand it, nor according to general custom." In the case referred to a balance of £200 would be retained until the completion.—J. P. O.

The re-building of St. Nicholas Church, Colchester, from Sir Gilbert Scott's designs, by Mr. Dobson, contractor, having been almost completed, a faculty for the demolition of the church of St. Runwald—the last remnant of the Middle-row which formerly blocked the centre of Colchester High-street—has been applied for. The removal of St. Runwald will be a matter of but little regret, for it is small, inconvenient, and out of repair, seems to possess no features earlier than the 16th century, and all internal details have long been hidden under successive coats of paint and whitewash.

An inquest was held at Chorley, Lancashire, last week, on the bodies of two men killed by the falling in of the roof of Messrs. Smethurst's mill, which ought to suggest to owners of factories the dangers of attaching apparatus to roofs without calculating if the extra strain thereby involved has been allowed for by the designer. At the inquiry, Mr. Saville, contractor, of Chorley, gave evidence as to the construction of the roof in question. It was a slated iron framework, and had been loaded with spinning appliances to rather more than half the calculated breaking weight, without allowing for the centre belt-holes in the rafters. The roof was both badly constructed and badly tied, and the rafters should not have been loaded more than a fourth of the breaking weight. Mr. Wood, of Bolton, a member of the firm who erected the roof, attributed the collapse to the hanging of pickers upon the rafters, for which strain the roof had not been calculated, and a verdict of "Accidental death" was recorded by the jury.

An iron drinking fountain has just been despatched from Glasgow to Ceylon, to be erected in Kandy, the coffee capital of the island, as a memorial of the visit of the Prince of Wales. The ground basin is 14ft. in diameter, and is octagonal in form. On the outer dwarf wall are four iron figures of boys bearing water-jars, and around the centre column are disposed four similar figures, holding dragon-heads, which likewise emit water. Groups of dolphins and storks complete the ornamentation. The work has been executed by Messrs. George Smith and Co., of the Sun Foundry, Glasgow.

At a public meeting, held at Sutton, Surrey, on Wednesday week, it was resolved to take steps for erecting a public hall in a leading thoroughfare, for the use of the inhabitants, and that for this purpose a joint-stock company be formed, with 4,000 shares, at £1 each. Two alternative sites were suggested for the hall, and a committee was nominated to take further preliminary measures, and report back.

The interior of the Alexandra Opera House, Sheffield, has just been renovated and redecorated. The ceiling is divided into 15 medallions, and 33 others ornament the walls. Each shows a bright ground of green or pink within geometrical designs of darker tints, with figures of goddesses, battle-pieces, and landscapes. No two are alike, and all were executed by hand by Parisian artists. Messrs. Smith, Ward, and Williams, of Sheffield, were the general contractors for the decoration.

Our Office Table.

ACCORDING to the London correspondent of the *Scotsman*, Mr. Layard, famous of old for his Assyrian researches, has succeeded in obtaining for the British Museum some interesting antiquities from the neighbourhood of Lake Van, which, it is hoped, will tend to throw light upon the ancient kingdom of Van, the people of which are known to have been consistent and formidable opponents to Assyrian rule, and to have contributed to accomplish, with the Medes and Cimmerians as allies, the overthrow of Nineveh in B.C. 609. The incoming of Oriental antiquities seems to know little solution of continuity, and it is only recently that the trustees of the British Museum received a valuable series of antiquities from the site of the ancient city of Zergul, in Babylonia, where they were unearthed by a party of Arab excavators working in the employ of a Hebrew dealer in antiquities at Bagdad. A torso in black basalt, of a figure of large size, is perhaps the most important object of the whole series, which includes a large number of bricks and sepulchral cones inscribed with the legends of several early monarchs. The torso in question bears the inscription of a king called Hammurabi, who reigned in the seventeenth century before Christ. This inscription is bilingual, and is one of the very earliest of the kind extant, and the occurrence in it of several new words and phrases renders it an object of much philological significance, as well as of much value in the way of illustrating the earlier history of the Babylonian empire.

The annual meeting of the Birmingham Builders' Association was held on Monday; the Vice-President (Mr. E. Davies) in the chair. The annual report of the committee, with the statement of accounts, was taken as read. In the report reference was made to the satisfactory settlement, by the standing committees, of various private disputes between employers and operatives.—The Secretary reported that a notice for the alteration of working rules had been received from the stonemasons, but from no other branch of the trade. The stonemasons asked for extra mess-room accommodation, and an attendant to assist in the preparation of their meals; also for alterations with regard to overtime and apprentices. The matter was referred to the committee. The following officers were elected for the ensuing year:—Mr. J. Garlick, president; Mr. J. Webb, treasurer; and Messrs. J. Barnsley and W. J. Whittall, auditors. The following gentlemen were elected as a committee:—Messrs. E. Davies, B. N. Smith, C. Jones, jun., J. Horsley, J. Jeffery, W. Partridge, C. Barker, T. Surman, J. Moffat, W. H. Parton, W. Bloore, W. Brooks, W. Sapcote, G. Lidzey, J. Preece, W. George, W. T. Bennett, and T. Dibble.—After votes of thanks had been accorded to the officers of the past year, the chairman presented to Mr. J. Webb, the treasurer, a testimonial, in the shape of a very handsome massive bronze timepiece and a pair of vases. The gift was accompanied by an illuminated address, expressing appreciation of Mr. Webb's long and valuable services to the association.—Mr. Webb suitably acknowledged the presentation and the meeting terminated. The fourteenth annual dinner of the association was given in the evening, in the Great Western Hotel.

WE have received from Messrs. W. Sutherland and Sons, of Manchester, one of their new patent door-handles, which we have fixed with some satisfaction to a door in our own office, the handle of which had long plagued us, as similar handles torment other people, by repeatedly becoming loose. We cannot see how the new handle can by any possibility get out of order; the only screws used in fitting it on are hidden inside the handle itself when the job is complete; and, in fact, to any one not in the secret, the appearance of the door-handle presents somewhat that of a magical puzzle—the difficulty being to guess how it can possibly be secured. One of the handles is really in two pieces, the hindmost part or cap screwing into the other. When this is removed a cylinder nut will be seen, which is exactly adjusted on the spindle to the width of the door, and then

fastened to the neck of the knob with two small screws. Replace the cap, and screw it tightly in, and the job is finished. The whole affair can be completed in less time than it takes to tell the way in which it is done, and the simplicity and safety of the handle are admirable.

The "Mayer Collection considered as an Educational Possession" is the title of a paper sent us, read before the Liverpool Art Club last Monday, by Mr. Charles T. Gatty, assistant curator of the collection. From our glance at the paper we should say the Mayer Museum—which contains a variety of precious relics from Egyptian tombs, and of our British, Roman, and Saxon ancestors, besides a valuable collection of ceramics, ivories of late Roman period or the 3rd century after Christ, personal ornaments, coins, bronzes, mediæval armour, and plate—must indeed be an inestimable boon to Liverpool. Mr. Gatty enters into the value of this and similar collections in the right spirit, and shows how they help to realise history by means of objects, how they encourage moral truths, and tend to elevate the tastes of the age. He advocates the classification of the archaeological specimens as much as possible, and explanatory catalogues with introduction.

The opening meeting of the ensuing session of the Institution of Civil Engineers is fixed for Tuesday, November 13th, when a paper will be read on "The Progress of Steam Shipping during the last Quarter of a Century," by Mr. Alfred Holt, M.I.C.E., of Liverpool. With a view to direct the attention of members to the obligation voluntarily incurred of doing all in their power to further the interests of the society by presenting good papers, the council have issued, under the title of "List of Subjects for Papers," a tractate which gives some interesting information respecting the funds under their control for the award of premiums. From this it appears that between £400 and £500 is available annually for rewarding the authors of "approved original communications." The awards take the shape of Telford and Watt medals (which are the most highly prized), instruments, and richly-bound books. There will also be adjudged this year the quinquennial Howard prize, of the value of about £80, "to the author of a treatise on any of the uses or properties of iron, or to the inventor of some new and valuable process relating thereto," such author or inventor being a member or an associate of the Institution.

We have more than once noticed the wall-papers manufactured by Messrs. W. Woollams and Co., of Marylebone, and have now pleasure in drawing attention to their new patterns of embossed flock papers, some of which have been sent to us for inspection. As a rule the patterns of flock paper are in very low relief, or if raised, as they sometimes are for painting, present but one plane to the eye. In those made by the new process the design is raised much higher above the groundwork, and is afterwards embossed or modelled by pressure, so that any effects can be reproduced with truthfulness of expression. The raised surfaces differ entirely from those of the imitation leather papers already in the market in that they are perfectly solid, and cannot be rolled out or destroyed by a careless paper-hanger. They are prepared in coloured flock, with or without gold, ready for use in every variety of tint, and also in white or undyed flock, for painting over if required. One pattern sent to us, ready for use in its present state without painting, especially deserves commendation. The groundwork is of a quiet green tint, with a surface like distemper, upon which are raised square panels bearing alternately conventionalised representations of birds and foliage. The others are buff or fawn colour—one with a lighted ground of the same tint, and the other with a gold setting—the former bearing leaves and foliage and the latter a geometrical pattern. These may be used as supplied, or may be painted over.

STONEFERRY, BY HULL.—Mr. Wellsted, surveyor to the Sculcoates rural sanitary authority, has prepared a scheme for the drainage of this district. Pits are proposed to be constructed for the purification of the sewage, either by precipitation or intermittent filtration, prior to its discharge into the river. The board have asked for amended plans, not including the Maxwell estate.

CHIPS.

The foundation stone of Silverdale Mission Church, St. Mary's-in-the-Wall, Hastings, was laid on Wednesday week by Mr. T. Brassey, M.P., who mentioned that during the past twelve months 500 additional houses have been built in the borough. The church, when completed, will contain two rooms, seated respectively for 300 and 150 persons, and in the basement, boys' and girls' school-rooms, &c. Mr. G. Stubberfield, of Hollington, is the builder.

The Town Council of Aberdeen, on Friday, accepted the tender of Mr. Fyfe for the erection of Ferry Bridge, subject to approval of the plans by the Board of Trade, and to any alteration that may be made in the southern accesses by Mr. Blyth, C.E., to whom the question has been referred.

New Board Schools were opened at Gaywood, near Lynn, on Monday week. They are Domestic Gothic in style, of red brick, with stone facings. The architects are Messrs. Adams and Sons, of Lynn; and the contractor is Mr. H. Farron, of Wisbech. The total cost has been between £1,000 and £1,100.

A ward for infectious cases is about to be added to the West Norfolk and Lynn Hospital, from the designs of Mr. Adams, architect.

It appears that the Chief Commissioner of Works has not abandoned the idea of the suitability of Parliament-square as a site for Cleopatra's Needle, and that, in order to judge what would be the effect of a greater elevation, the wooden structure in the centre of the square is to be raised several feet higher.

The Town Council of Bolton have raised the salary of Mr. Jonas Proctor, borough surveyor, from £300 to £400.

New Board Schools are in course of completion in the Cabrach-road, Rhymie, Aberdeenshire, from the designs of Mr. Anderson, architect, of Hartley.

A paper on "Roman Remains at Ramsgate" was read last week before the Ramsgate Scientific Association by Mr. Robert Hicks. He showed that while many isolated examples of pottery and vases of Roman workmanship have been found, together with bones in digging upon the West and Granville cliffs, there is no trace of a regular burial place, and all the finds are accidents. He suggested that Roman camps existed on each cliff in connection with the authenticated stations at Richborough and Reculvers, and urged the members to watch for relics of the occupation, wherever ground is broken for new buildings, as it is only by the preservation and comparison of patterns and vases that we can hope for further light on the subject.

It is proposed to construct a railway from Clarboston-road to the city of St. David's, by which a new and shorter route will be afforded to the Irish coast, and the city will no longer be the only one unconnected with the railway systems of the United Kingdom. Surveys are being carried out prior to depositing a bill.

The ancient parish church of St. Cuttbert, Elsdon, in Northumberland, has been reopened this week after restoration. It is a large cruciform structure, with north and south transepts, and is situated at the foot of the Cheviot Hills.

The new town clock and chimies in the parish church of Ware were finally set going on Saturday last, at 12 o'clock, the entire work having been carried out by Messrs. Gillett and Bland, Steam Clock Factory, Croydon.

The Exeter Town Council, on Tuesday, took their first action under the Artisans' Dwellings Act by determining on the removal of a number of houses in the lower part of their city, which now afford accommodation to about 300 persons. The cost of the purchase will be £8,000. The council will themselves become the purchasers, and the buildings will be erected by an artisans' dwellings company, who will undertake the work in consideration of the ground being leased to them in perpetuity at a nominal rent.

After a careful investigation of the various known systems of ventilation, Mr. G. Eastlake Thomas, the borough engineer and surveyor, has recommended the system introduced by the Sanitary Engineering and Ventilation Company for the ventilation of the Wolverhampton Town Hall.

The Foresters of Reading have decided to erect a hall in Urst-street for their meetings, &c., the frontage to be occupied by shops on each side of entrance to hall. Messrs. Brown and Albury are the architects engaged. The cost will be about £4,000.

NOTICE OF REMOVAL.

CHUBB AND SON,
LOCK, SAFE, AND IRON DOOR MAKERS,
Have REMOVED their SAFE and LOCK BUSINESS to new and extensive Premises,
128, QUEEN VICTORIA STREET, ST. PAUL'S, E.C.
Illustrated Price Lists gratis and post-free.
Makers to the QUEEN, H.R.H. the PRINCE OF WALES,
and the Bank of England.

Throat Irritation.—Soreness and dryness tickling and irritation, inducing cough and affecting the voice. For these symptoms use Epps's Glycerine Jujubes. Glycerine, in these agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes actively healing. Sold only in 6d. and 1s. boxes, labelled "JAMES EPPS & Co., Homoeopathic Chemist, 48, Threadneedle-street, and 179, Piccadilly, London."

WAGES MOVEMENT.

LONDON.—The wearisome struggle between the London masons and their employers have now reached its fifteenth week, and no signs of compromise or reconciliation are visible. The amount disbursed last week in strike pay was about £600. In addition to this there were payments of arrears and travelling expenses, bringing the total expenditure up to about £800. The receipts for the week exceeded £1,100, and the balance in hand leaves the committee worth a good sum to go on with. The masons of London in the society number 2,500, of whom only 1,700 are out on strike, the masters having conceded in the case of the others at once. Of these 1,700, 400 are known to have left London, 700 are employed in the metropolis, and the remaining 600 are supposed to be in receipt of strike pay, and are unemployed. This does not, however, represent all the men whom the strike committee has now to provide for. Besides Americans, there have been about 74 Germans, Italians, and Dutchmen sent home by the strike committee, or kept in London on strike pay, while special delegates and interpreters have been sent to different parts of the Continent to try to stop the importation of foreign labour. When the question was first talked of by the masters a guarantee fund was formed, to which £2,000 was readily subscribed. It is quite clear that, although it may have cost the masters a good round sum to bring these men over to England, it has also cost the strike committee a large sum to keep the imported men, or send them back. Up to the beginning of the week the masters have imported 239 men, of whom 87 only are at work in this country, and the remainder have been dealt with by the strike committee. The principal incident of the week has been the detaining of the tools of some of the American workmen, who having been brought to this country under a contract with Mr. Bird, declined to work for Mr. Booth. A summons was issued on behalf of the men. Mr. Flowers, the presiding magistrate, dismissed the summons, on the preliminary objection that the tools, being at the Temple, were not within his jurisdiction. An action at law is now threatened. More men from America have arrived during the week, but the strike committee seem to have gained over many of them.

MANCHESTER.—At a meeting, on Wednesday, of the Manchester and Salford joiners' strike committee it was announced that the executive council of the Amalgamated Society of Carpenters and Joiners had decided to levy a contribution of 10s. per man in aid of the strike fund. The number of members being 16,428, the amount of this levy would exceed £8,000; so that, including the contributions from their own society, and from other sources, the committee would be put in possession of about £16,000.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered) apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—ADVT.]

Holloway's Ointment is not only useful and certain of effecting a cure in outward diseases—it may be employed with like benefit in diphtheria, sore throat, hoarseness, bronchitis, pleurisy, influenza, asthmatical complications, and chronic coughs. The Ointment must be well rubbed into the skin adjacent to the disordered or diseased parts.

READING.—The Foresters of Reading have decided to erect a hall in the West-street for their meetings, &c. The frontage to be occupied by shops on each side of entrance to hall. Messrs. Brown and Albury are the architect engaged. The cost will be about £4,000.

THE BUILDING NEWS.

LONDON, FRIDAY, NOV. 16, 1877.

ARCHITECTURAL TRANSITIONS.*

THERE is a sense in which the whole history of architecture is a history of transition. Every style, from its origin to its decay, was in a perpetual state of change: something in it was always ceasing to be—something else was always beginning. This was the case even amongst those Eastern nations whose tastes and habits are the most permanent, and amongst whom a style of architecture had a life, not of centuries, but rather of millenniums. It is in virtue of this continual transition that it is possible, on internal evidence, to class even Egyptian works with some approximation to their actual date—Greek and Roman works with a closer approximation, and post-Roman works with a closer approximation still. In art, as in nature, there is no rest: to cease to move is to cease to be. But there are times when this movement is exceptionally rapid, when architecture changes as much in fifty years as it usually does in five hundred, and it is these times that are specially known as the great periods of Transition. The forces which produce architectural movement are then at the strongest, and there seems then to be the greatest chance of finding what they are and how they operate. Such periods have a natural fascination for those who, like the late Mr. Sharpe, concern themselves with the scientific analysis of art, and who hope, as he hoped, by learning something of the secrets of its growth, to do something towards making it grow again.

As we write the words we feel with a jarring recollection how far away all this is from the thoughts and feelings of a multitude of so-called architects. How many, or how few, of them care anything about making art grow again? How many, or how few, care anything about art at all, or seek to do anything beyond getting hold of as many buildings as they can, and despatching them as rapidly as possible, with a single eye to the profits of the transaction? One of the greatest marvels in old work is that we find so few traces of men of this sort; and it is this fact that makes perhaps the most vital difference between ancient and modern architecture. In walking through London streets one sees at a glance that a majority of the buildings have been turned, out as a matter of business, by designers who vividly realised that time is money, and who would think themselves fools if they spent a week on an elevation when they could satisfy their clients in a day. They build in haste, and those who employ them repent at leisure; and the result of their repentance is that newspapers, reviews, and public speakers abuse the whole profession because so many of its members debase it to the level of a trade. Somehow or other these tradesman-like architects did not flourish in ancient times. Probably they were sent back to their proper sphere, amongst the butchers and bakers and candlestick-makers. At present no one who likes to call himself an architect can be prevented from practising as such; and, no matter how ignorant or how indifferent he may be to art, the architectural societies will not exclude him on that ground. Possibly they have good reasons for their policy, and they may serve a variety of useful ends, but they will never as societies do much for true architectural progress, nor effect such an architectural

triumph as the Transition of the twelfth century. A dozen men, whom every one could name, if they would act together and unite their art-power for progress in one agreed direction, might change the face of the art-world as by a new creation. They, and the school of younger men who would group around them, might soon be known as the genuine architects of the day, and the world would learn to distinguish between the real and the sham. It is not that art-power has died out of this generation, though artists may be to pseudo-artists as less than one to ten: it is that they are scattered and separated, and that when they have sought to unite they have let themselves be swamped and outnumbered by the mere tradesmen of the profession. That is one reason why architectural progress, and especially that most rapid form of progress which we call "Transition," manifests itself so very feebly under present circumstances.

We turn, however, to Mr. Sharpe's collection of examples illustrating the Transitional epoch in Germany, which may suggest some other lessons as we examine it in detail. The drawings now published were made more than forty years ago, in the pre-restoration era, and therefore may in all likelihood show many interesting details that have since been improved away. The whole of them belong to the later stage of the epoch—to the end of the twelfth, and even to the early part of the thirteenth century. Thus, we find that the German masons were still building in a semi-Romanesque style, while the English and French ones had perfected the purest and noblest type of Pointed architecture. The Lanct period, Mr. Sharpe tells us, has left hardly any traces in Germany. There was a sudden leap in that country from the interesting but unripened art of the Transitional time, to the beautiful but already declining forms of the Geometrical German Gothic, in short, was to a great extent an importation—a sudden breaking off with the past, an abandonment of the native style, and a fresh start in imitation of what was being done abroad. Roughly speaking, the German Transitional style lasted through a great part of our Early English era, and then, instead of going on naturally through an Early German Gothic into a Middle Gothic one, it took an artificial bond, and passed over the former period altogether. Of course, this is only a general description of what happened, and the rule was not without exceptions. But, on the whole, it appears that the Germans did not like to part with that Romanesque style in which they distinguished themselves more, perhaps, than any other European race, and certainly more than they have done in any later style; and now that we can look back on all the results, we may find some reason to regret that they ever definitely abandoned it at all. Their Romanesque and Transitional buildings are, at any rate, picturesque and interesting; their Gothic ones are apt to be lifeless, wearisome, and mechanical.

The first building Mr. Sharpe illustrates is the church of the Cistercian Monastery of Ebrach, between Bamberg and Wurzburg. The date is pretty satisfactorily fixed at A.D. 1200. We notice first the general rule of the Transitional period everywhere, that most of the arches of construction are pointed, while most of the arches of decoration are round. Amongst the former are, of course, the arches of the nave arcades and the transverse ribs of the vaulting; amongst the latter are some of the blank wall arcades, and most of the arches to windows and other narrow openings. The diagonal ribs of the vaulting are semi-circular, as they are in many of the best Early Gothic examples everywhere. On the other hand, some of the decorative arches are trefoiled, all the mouldings fol-

lowing the curve of the foils, with no round or pointed arch above them. The shafts have a heavily moulded abacus, or sometimes a carved one, square on plan. The longer shafts are banded at intervals, with triple roll mouldings. Here and there is a moulded cap, with circular necking and bell, overhung by a square abacus. Externally the details are very plain. The doors and windows have square reveals, or mere splays, continued round the arches without impost or dripstones. The buttress is well developed, and there is no sign of the Romanesque pier from which it springs. There are several round windows—one evidently of later date; one with a sort of plate tracery, having a 12-foiled circle in the middle, and a border of quatrefoils around it; and one—perhaps the only original one—forming a sexfoil, in which each foil is itself trefoiled. The Early German love for cusping also shows itself in the west door of a side chapel, the outer arch of which resembles, on a very small scale, those to the west doorway at Amiens. Mr. Sharpe gives many details of carving from the interior. Some of them are very graceful; others, with their strap-shaped foliage and their ogee profile, remind us of certain Eastern types, and suggest that more than one kind of ornament may have been borrowed by mediæval church-builders from the unbelieving Saracen. There is a certain clumsiness about most of the details which is characteristic of all but the most refined class of Romanesque, and specially characteristic of it in Germany.

Mr. Sharpe next takes us to Kloster Hailsbronn, a Cistercian convent in Bavaria, on the high road from Anspach to Nuremberg. Of the period we are dealing with nothing here remains but the refectory. It stands, as usual, at right angles to the north walk of the cloisters; but, as is less usual, it is vaulted in one span from wall to wall, instead of having the customary row of columns down the middle. The most interesting feature is the entrance door from the cloisters. This has a trefoiled opening, surmounted by a circular arch of five orders. The three inner orders are well moulded, chiefly with round rolls, many of them scooped. One order has a pointed roll, and the jamb has several scooped rolls, with a side fillet. The Romanesque ogee is freely used. None of the arch mouldings run down to the impost. They terminate about a foot above it, with very gracefully carved stops. The fourth order is a boldly twisted cable moulding; and the fifth, or outer one, an ogee and chamfer. There are four jamb-shafts only; the inner one circular, the two next octagonal with very beautiful surface ornament, and the last eabled almost like the arch-mould above it. Each shaft has a rather clumsy moulded band midway between cap and base. The capitals have somewhat of the "cushion" profile, with a deep and elaborately moulded abacus, square on plan, and a kind of sunk dentil ornament on its lower member. There is a quantity of surface ornament, singularly resembling some of that in the half-Romanesque, half-Saracenic work of Southern Italy, round the trefoiled head of the actual door; and the carving of the capitals has a good deal of the same character about it. The type is not common in this country, but there is some approach to it at Sherborne and St. Cross. In Germany it seems to be the characteristic foliage of late Romanesque and Transitional times. Some of the moulded capitals have the peculiarity of a double necking, the additional one being placed about halfway up the smooth surface of the bell. The interior of the Kloster Hailsbronn refectory has some curious carved work in the shape of bosses and corbels. The former have an interlacing pattern of snake-like animals, which reminds us both of Japanese orna-

* Illustrated Papers on Church Architecture. By EDmund SHARPE, M.A., F.R.I.B.A. No. III. The Ornamentation of the Transitional Period in Germany. London: E. and F. N. Spon, 48, Charing-cross. November, 1876.

ment and of ancient Norwegian wood-carving. The corbels have the Saracenic-looking foliage we noted in the door—suggested by Byzantine work, no doubt, but derived, to all appearance, through an Oriental medium. One of the corbels has two tapering shafts, and we also find diminished columns in the chapel of St. Eucharius, at Nuremberg, and in the west doorway of St. Burchardt's church at Wurzburg. Other examples of German Transitional foliage are given—from St. Sebald's, Nuremberg; from Aschaffenburg Cathedral, from Naumburg, Arnstadt, and Maulbronn. At the first of these churches it is very Oriental-looking; in the next it begins to have a little more life and growth about it; while in the third we find one pier cap which looks almost Early English in its scroll-work, and which might almost pass muster amongst the carving of that period at Oakham Castle and elsewhere. We must not omit to notice, before leaving this book, the very odd and yet interesting chapel of St. Walderig at Murrhardt. It is square on plan, has a cross vault with no columns, and on the outside a great deal of curious and even elegant detail; but its external shape generally is so odd that hardly anybody but a mediæval German would ever have ventured to build it. An English or a French architect would have laughed the idea out of existence had it ever occurred to him: the German one carried it out in all seriousness, and never dreamed that he was perpetrating a practical joke six centuries long.

It was Mr. Sharpe's intention, as we learn from the introduction to this volume, to supplement it by some examples of the Transitional period in the north and west of France. We earnestly hope that any materials left for this purpose may by some means or other be made available for publication. They would probably be the most interesting of the whole series, and would throw the most light on the origin and early growth of the Gothic style. The most inexplicable thing about this origin and growth is the regularity with which they took place all over Western Europe. The change was not like any human revolution: it reminds us rather of some mighty movement in nature—such as the retreat towards the Pole of the European ice-sheet at the close of the last glacial epoch. It happened to every country, but not to every country at once. France was the first to break out from the winter of post-Roman decrepitude into the magnificent spring of Pointed art. England followed next, and last of all came Germany. Each went through a parallel phase, yet not the same. The Transitional style of England is different from that of France, and that of Germany is different from both. It was not a fashion that one land copied from another; it was a principle, by which each transformed its own fashions. We can understand perfectly well what it is for Mr. A. to travel and sketch in Italy, and to bring home an Italian-Gothic fashion; and for Mr. B. to travel and sketch in France, and bring home a French-Gothic fashion; but what happened towards the end of the twelfth century was nothing like this. The characteristic of the foreign style-importer is that he brings home bits of foreign detail and sticks them—often rather crudely and inappropriately—on to English buildings; but foreign detail is just what the twelfth century builders never did import. When that great transition, first felt in France, passed on to England, it did not bring a mass of French details with it. Across the Channel it had developed special types of moulding, special types of carving, special forms of door and window and buttress: but we do not find them copied here. We find, not these things repeated or imitated, but something parallel and analogous to

them; something with the same spirit, but with quite a different form. So it was, again, in Germany, when the Transitional earthquake wave reached that country, last of the three we have been comparing. German work is recognisable as German, French as French, and English as English, quite as much during the Transitional era as before it. No one even moderately acquainted with the architecture of these three countries can ever mistake the First Pointed style of one for that of another. Put side by side a capital from Laon, a capital from Lincoln, and a capital from Nuremberg, and the merest tyro can tell which is which—much more if you put doors or windows. Put side by side a piece of foreign detail, and the modern imitation of that detail, and they are not distinguishable save by the inevitable feebleness of a copy when compared with an original. An architectural transition and a copying of foreign fashions are two utterly different things, even when it happens, as it did in the twelfth century, that the transition spreads from one land to another.

This is another wonderful thing—that the transition should have spread in this way. There is a thousand times more traffic between country and country now than then, and yet there is far less real unity in style. Contemporary work in France influences us in England far less now than it influenced our ancestors in the time of King John. Somebody copies a bit of it now and then, with no great success and no brilliant result; but as a whole it does not affect us much more than if it had never been. The truth is, it is only new principles that really and permanently modify the architecture of a nation; not the importation of foreign forms and details. We may go to Italy and bring home oleanders and myrtles, we may plant them carefully in sheltered places, and by coddling them in summer, and matting them up in winter, we may keep them alive for a time; but myrtles and oleanders will never get a permanent place in the British flora. Suppose, however, that a discoverer, in Italy or anywhere else, should light on a new principle in gardening: suppose he shows us, for instance, how by intercrossing to get stronger plants or new varieties—we have now got something that will bear carriage. It is not a plant, but a principle which we can apply to all plants, and we naturally apply it to our own. We shall get new types by means of it, and healthy ones, and they will live and grow and flourish. Our gardens will be transformed and filled with novel beauties: so will foreign gardens if the same process is applied to them; and yet the English flora will remain English, and the foreign ones foreign. It was something like this that happened during the great Transitional period; it is something like this that we want to happen now. We have had Greek plants bedded out in Bloomsbury, and Roman plants in the City; Italian-Gothic plants in Westminster, and Parisian plants in Piccadilly; but the climate does not suit them—we cannot make them grow. It is enough to make one sick of importing plants at all: suppose we leave it off, and try if we cannot improve our native ones? The misfortune is, that to improve them we must think, and study, and discover principles, and this is what few people have the talent to do, while anybody can bring home a myrtle or an oleander.

PORTLAND CEMENT.*

MR. HENRY REID, C.E., well known as an authority on the subject of cement, a patentee of a process, and the

* The Science and Art of the Manufacture of Portland Cement, and some of its Constructive Applications. By HENRY REID, C.E. London: E. and F. N. Spon, Charing-cross.

author of a "Practical Treatise on its Manufacture," has just published another very exhaustive treatise upon the question. In a preliminary chapter the author traces the progress of the improvements that have been made since the time of Smeaton, whose Eddystone Lighthouse was the foundation of all subsequent knowledge of hydraulic mortars. Smeaton, as our readers may know, first showed the hydraulic value of combining carbonate of lime with clay—a fact which a simple analysis discovered to exist in all natural limestones. Before his time it was believed that the hardening property of lime consisted in the limestone. The investigation of the subject was followed by Higgins, in 1780; Parker, who converted the nodules found in the London clay; Dobbs, Aspdin, Vicat, Treussart, Pasley, and others, all of whom succeeded in producing an artificial hydraulic lime of various mixtures. Wren understood the value of shell lime, but it was generally thought before Smeaton's time that the hardness of the limestone was the cause of the mortar hardening. Mr. Reid in his work exposes the fallacy that Portland cement can only be produced by a combination of the chalks and clays found on the banks of rivers, such as the Thames and Medway, and shows that cement may be made from various other materials by proper machinery and processes. Cement manufacture has for years been a monopoly with a few who have not cared to extend their acquaintance with the properties of other ingredients and new machinery. Mr. Reid defines Portland cement as "a chemical product obtained by a preliminary mechanical combination of carbonate of lime with silica and alumina, which, after passing through the succeeding chemical stage of manufacture, may be described as a double silicate of lime and alumina." Generally its name has been associated with the Island of Portland. Many have supposed it to have been the product of the oolitic limestone of that place. Vicat was the first who conceived the plan of making rich common limes hydraulic by an admixture, both in their carbonate and hydrate states, with clays in various proportions. After a long chemical discussion of the nature of the change thus effected, it was conceded that silica chiefly imparts the hydraulic quality to rich limes. This discovery, no doubt, was the first great step attained in the manufacture, and we think that to Higgins's and Vicat's researches we owe more than even Mr. Reid contemplates. Before Vicat's time the hardening and hydraulic qualities were thought to depend on the oxide of manganese, and even Smeaton himself had not sufficient chemical knowledge to account for the change. The author says that considerable difference exists in the natural limes and cements, owing to the variable character of the mineral deposits, and it is seldom that they can withstand the ordinary tests applied to artificial Portland cement. Unless they are exceptionally good, he says "they may be regarded of less constructive value than the hydraulic limes of the blue lias and analogous formations." They require also to be freshly burnt and finely ground. Vast quantities of Portland cement are exported from this country. This is not from the want of facilities of production abroad, so much as from the reputation our Portland cement has gained, for both in France and Germany large manufactories exist. Mr. Reid says the home consumption, though large, is exceeded largely by the quantities exported to all parts of the world, including Australia and New Zealand. In a following chapter we have a valuable *résumé* of the natural sources from which the ingredients required in the manufacture of this cement can be obtained. These are carbonate of lime, silica, and alumina. But

we may leave this field of the subject to speak of the manufacture and other practical points. If London afforded every facility for manufacture it was favourably situated for the supply of the raw materials in the river Thames. Fuel could easily be had from the eoke which the gasworks supplied, while as a commercial centre and shipping port it was unrivalled. Hence, London is at this moment the head of the seat of manufacture, and foreign countries consider that Portland cement must come from London to be good. It is, however, a great mistake to imagine that only the Thames and Medway supply the necessary ingredients of this cement. Many rivers and creeks afford raw material of equal excellence. The clays generally combined with the chalk are called "alluvial," though, as the author says, a more accurate term would be marine clays. These are locally associated with the chalks, and contain, in the Thames and Medway deposits, from 64 to 70 per cent. of silica, 11 to 25 of alumina, oxide of iron, and other elements. Deposits of pit clays are to be found in different conditions of purity, ranging from the best porcelain clay to the most common kinds of earth, and the author gives valuable tables of analysis from different authorities. The gault deposit affords a good source. Describing other sources from whence silica and alumina can be obtained, Mr. Reid mentions flints as a valuable auxiliary to the cement-maker as containing nearly all pure silica. Flints are found in abundance in the upper beds of chalk formation, and when of the right kind, says Frühlhing, they are a good substitute for dear cements. He prefers fresh-dug flints from their original bed, reduced to a fine powder. One part of slaked lime, a quarter-part of powdered flints, and three parts of sand is said to produce a good hydraulic mortar. This flint cement is called "chalcedony cement." Mixtures of burnt flint or chalcedony cement, with lime in proper proportions, make a valuable cement for wall decorations in exposed situations. For this purpose the proportions are 1 part of lime paste, 1 volume of flint cement, and 2 parts of white sand. A whitening plaster of extreme hardness is the result. Ingredients may be found in the mixed deposits of silica, alumina, and lime in the lias districts. In Warwickshire, Northamptonshire, Derbyshire, Somersetshire, &c., there are clays or shales of a valuable kind suitable for cement-making. A large part of the lias shales consists of iron pyrites, which might be extracted for sulphur, leaving the finer shales for cement. The author refers to an excellent cement he has made from the toadstone and mountain limestone of Derbyshire. We may here mention that by Mr. Reid's patent a large quantity of cement is manufactured by the dry process. He observes, "the conjunction of the basaltic, or silica, and alumina-bearing rocks, with the crystalline chalk, render the manufacture of Portland cement in the locality of the Giants' Causeway a matter of easy attainment," and the analyses given show a large percentage of the requisite ingredients. The difficulty of fusing basalt is well known, but has now been overcome, and two processes are noticed by the author. A slate deposit of the carboniferous limestone formation, near Kendal, is mentioned as a cement-making material; so, too, in North Wales, the intersection of the limestone formation in the Vale of Llangollen, by the river Dee, affords facilities for manufacture. Lavas and puzzolanas are next mentioned as sources of supply, granites are discussed, and careful analyses given, and a favourable opinion is passed on Dr. Julius Aron's baryta cement, which exceeds the best Portland in its highest qualities. Baryta

was used instead of limestone, mixed with clay from the Oder, at Stettin. One sample broke with a tensile strain of 50,220 kilos. per square centimetre—a resistance never reached from lime cements. The proportions were 369 parts of baryta to 100 of clay; this strength was after four days' hardening. Gneiss is favourably considered as a cement-making source. Of artificial sources, we have slags of iron-making, waste lime heaps, gas and soap alkali, and alum wastes, which, as our author judiciously observes, can be profitably utilised for cement and concrete making. In the mining and coal districts the accumulated wastes are immense. Various analyses of the South Wales and other slags are given which show a large proportion of lime, silica, and alumina. Into the details of this question we will not follow the author, but we strongly recommend his remarks to manufacturers, architects, and engineers and others connected with building operations in those districts. Passing on to another part of the work before us, some useful hints are given to manufacturers on the selection of the ingredients. The impurities in chalk are harmless, and the best test is to examine its physical characteristics "by reducing a small quantity in water and decanting it until a residuum can be estimated;" but the insoluble part is not objectionable. In fact, chalk is not to be regarded with suspicion, though the smoothest and most soluble is best. More care is needed as to the mud or clay, and any used under the wet system should not have more sand than 5 per cent. when dug. As regards the limestones and shales of the lias deposits, it is stated their chemical value is so fluctuating that accurate analysis of each layer is necessary. Iron pyrites are dangerous properties when found to a large extent. In determining the proportion of raw materials accuracy is necessary, the ingredients are required to be fined down to meet the kiln agency, and an impalpable pulverisation is very important. In estimating the physical qualities of clays, Schöne's apparatus is recommended for testing the presence of coarse sand. The less sand a clay contains the better it is for cement, but very fine sand is comparatively harmless. The carbonate of lime value can be readily determined by Dr. Scheibler's apparatus, which is also illustrated and described minutely. As our readers know, three methods, known as the "wet method," the "semi-wet method," and the "dry method," are used for thoroughly combining the ingredients. It is shown that the first method, though perfect theoretically, and the least costly, is not always practically so, on account of the different specific gravities of the chalk and clay. The dry method consists of a mechanical reduction of the materials by machinery; but when slovenly done, or when the ingredients are too coarse, the process is defective. The powder can never be too fine. Another chapter describes the method adopted in the manufacture of cement, which is too well known to require mention. The different systems are mentioned in the manufacture, from the chalk and clay, the lias materials, and from the carboniferous limestones, after which the machinery required for reduction is considered—this, of course, depending on the system or method used. The New York, the Blake, Hall's, Broadbent's, Gray and Co.'s, "Excelsior," Archer's, Goodman's, and other stone-breaking and pulverising machines, are noticed and illustrated. The wash mill, millstones, kilns, and mode of burning are treated of in separate chapters. Brick-forming machinery is also discussed, and the modes of testing will be found thoroughly explained and interesting. Among

the appliances spoken of we find notice made of Professor Thurston's machine, and a machine made by the author in 1870, and used at the Rugby cement works, for testing briquettes under tensile strain, the most desirable test, in our opinion, for cement. The construction which is illustrated p. 288 consists of lever arms, which can be weighted. In speaking of cement testing, the author thinks that the duty of proving cement should belong to the producer, and not to the consumer, and we think this would be the fairer plan, seeing the difficulties and preliminary training required in testing accurately the very fluctuating qualities of cement, owing to chemical combination, &c. Mr. Reid proposes first a "thorough chemical examination by analysis of the cement, after exposure for a reasonable time to the atmosphere." Such a duty would necessarily require to be performed by one versed in chemical science. A standard analysis would be demanded by these means, and the limits of conformity to it should be prescribed. Fineness of powder can be tested by the sieve. "Secure," says the author, "the chemical accuracy of the cement, and your future path in its use will be an easy and comfortable one for the succeeding treatment after it has left the kiln is one entirely mechanical in its character. Should such an ideal paradise for the engineer and those under his authority ever be realised, the use of Portland cement would reach a point which, under existing circumstances, is impossible, for all distrust would then be removed." The author's method of testing, adopted by the Metropolitan Board of Works, may here be alluded to. He was consulted by Mr. Grant, in 1858, on behalf of himself and Mr. Bazalgette, to advise them; and he improved on the wasteful French system by devising a kind of moulding press which moulds the briquettes to any shape, and prevents fracture, as was the case by cutting the briquette for the clips. Mr. Reid replies to the objections urged to the form of the existing compound test adopted by the board at his suggestion. The bushel measure became the test because it was the best known one of capacity in the earlier contracts. Mr. Reid says:—"A considerable amount of adulteration was practised by the addition of various slags of high specific gravity to the cement, such addition enabling the mixture to pass the weight test, which in many cases is the only one capable of application. Under such circumstances a measure of capacity test would have been of little value if it had not been succeeded by a tensile one; and, again, even the adoption of that twofold test was dangerous unless completed by the hydraulic one." Light or under-burnt cement, containing a large percentage of free lime, is practised by some manufacturers, which the water test would easily detect. The mode of filling the bushel was never meant to be a faithful one—it was to be filled by a shovel from the heap, "stroked," not "heaped." The measure was not to be beaten or shaken while filling. Mr. Mann's test of specific gravity is described at length, Mr. Grant's experiments, &c., but we have no space to examine the author's conclusions further here. We have every confidence in recommending Mr. Reid's work to the attentive study of all manufacturers and consumers of this important building material. There is a practical ring and thoroughness about the work, showing that the author is perfectly *au fait* in his subject.

We cannot conclude without remarking the unfortunate disagreement evinced between the author of this work and another authority on cement testing—Mr. Grant—which has rather disfigured Mr. Reid's labours. The author refers disparagingly to the result of Mr. Grant's recent

experiments; points to their discrepancies, and the impossibility of establishing any fixed or reliable rules or formulae through their aid, and alludes to that gentleman's tests as evincing on his and his assistants' part a want of technical and chemical knowledge. Allusion is also made to the experiments made by Mr. Grant at the public expense, as "settling nothing, except that the Council of the Institute of Engineers considered their recorder worthy of reward and honour," &c. Mr. Reid, too, with doubtful taste, reminds his readers of a passage, and quotes it, wherein Mr. Grant admitted his indebtedness to him "whose early education and experience as an engineer led him to appreciate the value of Portland cement for engineering works, and whose aid was most valuable in the first stages of his inquiry." It would have looked rather more dignified if Mr. Reid had omitted this allusion, which is more acrimonious than called for, and which will in no way add to the value of his work.

ARCHITECTURAL ASSOCIATION.

THE Session 1877-8 of the Association was opened on Friday evening; the President, Mr. Bowes A. Paice, in the chair. The under-named 28 gentlemen were elected as members:—Messrs. Cecil H. Stock, A. H. Gansden, A. Robb Scott, H. G. Nixon, F. H. Gandin, E. C. Pinks, W. E. Clifton, J. S. Scott, A. G. Ellison, Philip Childs, jun., C. A. Ewing, J. C. Woods, A. B. Plummer, R. Bulkeley Whitaker, W. H. Duffield, E. H. Lloyd, A. G. Laxton, R. J. Beale, J. L. Houston, T. C. Cunningham, E. D. Hoyland, R. A. Briggs, P. E. Ridge, S. Bury, Clarence T. Coggin, A. H. Molesworth, and R. H. Kerr; nearly 30 other names were nominated for election at the next meeting, amid applause. Mr. PAGE, jun. hon. secretary, read a communication from Mr. C. L. Eastlake, secretary to the Royal Institute of British Architects, stating that the council had decided to place the library at the members' disposal on payment of a 5s. fee; and, on the motion of the PRESIDENT, seconded by Mr. J. DOUGLASS MATHEWS, a vote of thanks was passed to the Council of the Institute for the facilities for study thus afforded.

Mr. HAYES, hon. sec., proposed votes of thanks to the Institute for the use of their rooms on the occasion of the *conversazione* a fortnight previously; to those who lent objects of interest; and to the sub-committee, especially to their secretary, Mr. Stannus.

These were carried by acclamation, as was another proposed by the PRESIDENT, and seconded by Mr. POWNALL, to Miss Catharine Jones, for the series of drawings by her brother, the late Owen Jones. Votes of thanks were also proposed to donors of books to the library, on the motion of Mr. POWNALL. The PRESIDENT moved the adoption of the annual report, which was taken as read, and called upon Mr. DOUGLASS MATHEWS, as treasurer, to read the annual balance-sheet. This was of a highly satisfactory nature, showing a balance to the credit of the Association of about £88; and Mr. MATHEWS suggested that it would be well to depart from the usual plan of spending their funds as quickly as received, and to invest, say, £50 of the balance against any occasion of extraordinary expenditure. Mr. BIDDELL seconded the adoption of the report, and commended the suggested investment of funds. The report was adopted, and it was referred to the committee to report as to the advisability of investing a portion of the surplus. Mr. POWNALL read the annual report of the library, which was generally satisfactory; 1,239 volumes were issued or renewed, besides many parcels sent to the Birmingham branch. A balance of 14 guineas was carried forward, after purchase of new works. The reports of the various classes were then read and adopted. On the whole they were not quite so satisfactory as those of the last few years, a falling off in attendance being noted in several of the classes; especially was this the case in the classes of design. On the motion of Mr. PAGE the report of the Birmingham branch of the Association was taken as read, and adopted.

The preliminary business concluded, the PRESIDENT delivered his Inaugural Address. Having suitably acknowledged the compliment that had been paid him by election to the chair, the President proceeded to consider

THE WORK OF LAST SESSION

Within the Association; and congratulated the members that by the revision of their rules they had now a clear, complete, and concise code, and that so satisfactory a balance-sheet had been presented by the treasurer. By a curious coincidence both the senior and junior societies had been setting their house in order at the same time. The revision of the by-laws of the Institute had special interest for the members of the Association in (1) the new relations of the Institute to kindred societies; (2) facilities for study; and (3) conditions of membership. 1. Both the Institute and the Association were agreed that amalgamation was neither practicable nor desirable, and that each society had and should keep to its own special sphere of usefulness. The Institute had therefore abandoned any attempt at being an educating body by abolishing the "students' class." 2. The Institute had granted the members special facilities for study by allowing access on easy conditions to one of the finest art libraries in the kingdom, and by extending the hours during which it was open. 3. For membership as an associate of the Institute, the nomination paper might now be signed by one fellow of the Institute and the President and at least three members of the committee of the Association, instead of by three fellows as hitherto.

OPPORTUNITIES FOR STUDY.

As to their own classes, the reports had shown that, while well attended during the session, there had been a tendency in members to neglect to interest themselves in their management. He urged every young member not to delay entering one or more classes; the knowledge thus gained would be of inestimable advantage later on in life; but the longer joining was put off the more difficult would it become, and lost opportunities could not be regained. While on this subject he would strongly recommend attendance at a course of lectures on the anatomy of the human form: a knowledge of this subject, especially of the proportions of the body, was of great assistance to the architect. A most valuable course of lectures was given at South Kensington by Dr. Bellamy every Thursday evening during the winter months, admission being gained at a merely nominal fee. But it would indeed be an omission on his part did he not also mention amongst opportunities for study the Architectural Museum at Westminster, where the student, in Sir Gilbert Scott's words, "would find himself surrounded by innumerable models from the most famous buildings, forming a complete illustration of the carving and other arts of the middle ages, and, in a less degree, of those of classic antiquity. The more the student examined the contents of this simple building, the more would he appreciate, and the more surprise would he feel at their number, variety, and beauty." It would be difficult to over-estimate the benefit arising from a systematic study of architectural details arranged in chronological order; and with a view of increasing the interest of students in the valuable and extensive collection of casts and examples a sketching club had recently been formed in connection with the museum. A prize of five guineas had been offered by the council for the best series of sketches shown at the annual exhibition; to be executed from objects in the museum in pen and ink, so that if successful the young student might have the additional pleasure of seeing his sketches reproduced by photolithography. And now, borrowing terms from the President of the Institute, he would say a few words on the "outer life" of the profession, rather than the "inner life" of the Association; and here he could hardly doubt that his remarks would not meet with unanimous approval; nor could he hardly wish it otherwise, for were all agreed discussion would cease, and reform might be hastened on which would eventually prove a mistake. First, then, in respect to

ARTICLES AND PREMIUMS.

He thought the present system of binding a young man for four or five years, and paying a large premium at the outset, was the bane of the architectural profession. It was entered by many with too much of the mercantile spirit; it was regarded as a sort of "paying concern;" whereas the majority of those who have been in the profession for some time know that it requires years of unceasing but loving toil to become the fortunate possessor of even a moderate income. He would ask, then, should there not be some means whereby a young man's capabilities and fitness for study could be tested previously, not only to his being bound for a series of years, but also to the payment of a premium? A boy might be made to learn carpentry without either real feeling or devotion; but he doubted if a boy or a man without such qualities could be taught the practice and study of architecture. Granted that a young man was desirous of entering the profession, and had the preliminary qualifications of an ordinary education; was thoroughly acquainted with those books of Euclid usually read, had attended courses of lectures in natural philosophy, had an acquaintance with the modern languages, and, above all, had a taste for drawing and a knowledge of the use of mathematical drawing instruments—it would yet, he imagined, be desirable that such a one should enter an architect's office as a probationer for one year, rather than at once be bound for a much longer period. If at the close of the year—having seen the ordinary routine of business, attended lectures at University or King's College, and the Association's elementary class of design—the student were satisfied that he could follow the profession with earnestness of heart, then and not till then should he be articleed. He would make entering the profession as an articleed pupil conditional on passing a preliminary examination at the Institute. He did not, however, in these remarks intend to cast any insinuation upon those whom he addressed, nor upon architectural students in general. He believed they were now more earnest and active, and more anxious for opportunities of study than at any previous time; but he wished to improve their position, firstly in relation to senior members of the profession, and eventually in the eyes of the public. As to the mode in which reform could be carried out, he then would suggest that the premium should be paid annually as a college fee rather than in a lump sum, and that the student should not be articleed to the architect with whom he served his probationship, as by a change he would have opportunity for seeing another class of work, thereby assisting his education, and guarding against loss of individuality. Another subject of great interest to the younger members of the profession was that of

COMPETITIONS.

And he referred to it, because it was from the young men just starting in life that the ranks of the army of competitors was largely recruited; for by this means those acting as assistants, or just commencing for themselves, hoped to get "a connection." He would not anticipate the report of the sub-committee recently appointed to consider whether it was desirable that the Association should, as a body, take any action as to competitions, except to express *en passant* his own view, that it should be left in the hands of individual members to uphold the honour and dignity of their own profession. On the broad question of the system of open competitions as mismanaged at the present time, he would boldly assert it to be not only—like the modern mode of articleing—a bane to the architectural profession, but to the art of architecture. Competitions were, it was argued, a means whereby a talented young man might attain a position which want of influential friends would otherwise prevent his reaching. Was such the case? Were not the promoters of these open competitions in a majority of cases unable to estimate the advantages of a well-considered plan over the disadvantages of another which a professional eye would alone detect? Was it not the experience of most that vulgarity rather than refinement in design won the day? The best designs were not as a rule selected, and the

talented young man was doomed to disappointment after disappointment, with bad effect to his mind. Let the young architect but have patience, and he would be sought after without having to go through the throes of a competition. Let him be thoroughly earnest in his work, let him make the most of his time during his term of pupilage, let him act for a few years as an assistant, and then let him take an engagement for three days a week, admitting of his making and keeping appointments, and he believed work would come to the architect sooner or later, and he would feel a pride in having attained a position simply through his own earnestness, patience, and love and devotion for his art. Another argument in favour of the competition system was, that for public works it was calculated to insure an erection more perfect for its purpose than an ordinary course of appointments would be likely to do. He was not prepared to accept this, for an architect would take a much greater interest in his work if he felt that he was entrusted with a public building without competition, not only in consequence of the confidence placed in him, but also because he would remember that his reputation and future success were at stake. Let his plans be submitted to a consulting architect, or to the Council of the Institute, and the architect would doubtless gladly modify his design in accordance with the suggestions of the referees, so as to thoroughly satisfy his clients before the works were commenced. Again, it was better to work out a scheme calmly and quietly, and without hurry, than under the "high pressure" system and bustle of a competition. Farther than this, the competitor embarked in ignorance, not knowing fully the requirements of the promoter, his preference, if any, for style, or the building materials of the neighbourhood at his disposal, and their prices. He might spend many hours over the conception of some wonderful dream of the Queen Anne period, to find, when the designs were submitted, that this was the only style distasteful to the promoter. Once more, the system itself, unless based upon a somewhat Utopian ideal, necessitated a vast expenditure of time and trouble, not to say skill, by a number of persons, all of whom could not possibly receive any adequate return. In support of this he would take a by no means exaggerated example of the ordinary competition advertisements:—To architects and others.—Designs are invited for such-and-such a building, in such-and-such a town. And these are the conditions: The site being at the corner of a street, two elevations are required. Plans of six floors, two sections, a block plan of site, showing the drainage, &c., and a perspective view (which if the competitor choose, he may take an extra day or two over by finishing it in pen-and-ink instead of colour). Premiums of £30, £20, and £10 respectively, will be given for the three selected designs, which will become the property of the promoters, who do not bind themselves to employ the architect whose design may be considered best; but in the event of their doing so, the premium will merge in the commission. Now, this bait of premiums really meant that at least thirty competitors would be beguiled, and that, therefore, twenty-seven of them would receive no remuneration whatever. The other three competitors would receive £60—an average of £20. It might be assumed that each set of drawings, including working out the preliminary sketches, would take one man at least thirty days; consequently his remuneration would be at the rate of 13s. 4d. per day. Thus even, the successful competitors would be out of pocket. Yet this was by no means an uncommon example of the indignity so frequently offered to architects. Let them look at the same example in another light. Eleven drawings were required, and there were thirty competitors; consequently 330 drawings were submitted. He would assume that this number of drawings would take one man at least two years to complete. What would be his remuneration? £30 a year, without board and lodging. Were his hearers going to be so dishonest as to assist in supporting such a system—were they going on wasting time, thought, and energy on drawings which, however well-thought and artistic, would eventually be consigned to the

lumber-room? Were they going to cast their pearls before—those who could not appreciate them? No; he was sure that all present would rather do all in their power to check such a scandal to the profession. The system had been tried and had failed notably, in the professions most allied to architecture—those of sculpture and painting, notwithstanding the fact that the sketches or models of a painter or sculptor had an intrinsic value of their own, whereas those of an architect had practically none. If, however, it were found that competition must in some cases be resorted to, it should be on the principle of submitting preliminary pencil sketches, and a selection of competitors, made on the merits of such sketches, should be instructed to prepare a second set, to be finished drawings, each of whom should receive an honorarium towards defraying his expenses. It should be considered below professional dignity to enter upon a competition without such a recognition of services rendered; and no competition should be entered upon except under proper precautions, and a guarantee for a fair adjudication.

SUGGESTED PUBLICATION OF TRANSACTIONS.

By a glance through the syllabus for the ensuing session he thought they might fairly anticipate some most interesting and profitable evenings, and he thought, notwithstanding the careful manner in which their proceedings would no doubt be reported in the professional journals, it would be a great gain to the members of the Association were they published in a more convenient form. The form which suggested itself would be in the shape of an "Architectural Association Magazine," to be edited by a sub-committee appointed for the purpose. He believed such a magazine, if successful, would be self-supporting. In conclusion, the President addressed himself to the younger members by way of encouraging them not only to stick to their work, and to take every opportunity of advancing themselves in the knowledge of their profession, but by no means to neglect recreation, healthy exercise, and amusement.

Mr. J. D. MATHEWS proposed a vote of thanks to the President for his address, which had dealt with questions in which all were practically interested. A return to the old system of apprenticeship had been advocated, in preference to articling; but the whole system of apprenticeship and articling seemed to be falling to the ground, not only in the profession, but throughout the building trade, as architects knew to their cost; for to this decay of apprenticeship was due one-half the difficulties and nine-tenths of the anxieties of architects at the present time. He could not follow the President's ideas as to a probationary system, and removing the young man at the end of his year of probation to another office; very few architects would care to take youths into their offices on such conditions. At the expiration of his term of articling it was doubtless the best thing for the young man to engage himself as assistant at another office. The plan of a partial engagement in an office for some days a week after setting up in practice was one that worked well in practice, both for the young beginner and his employer. The plan carried out a theory he had suggested some years since, that young men should associate themselves, when practicable, with older ones—a partnership of designing and supervising architects. He did not think a magazine was needed, or would be very successful.

Mr. STATHAM, in seconding the vote of thanks, remarked that the very general tone of melancholy in the class reports was perhaps one of the most hopeful signs of progress.

Mr. CLARKSON did not think it desirable that their transactions should be published; it would be a very good thing indeed if the amount of architectural pabulum could be condensed; they were rather overburdened with transactions and reports. As to the President's architectural pupilage scheme, it might be practicable if architects and pupils would take the necessary trouble involved. A great difficulty was that parents, guardians, and youths to be articulated knew so little of what was expected in an architect's office; a text-book, giving concisely a complete explanation of what

an architect wanted from the pupil, was greatly needed.

The vote of thanks having been put to the meeting, and carried by acclamation, the President briefly replied, and the proceedings terminated.

BUILDERS' BENEVOLENT INSTITUTION.

THE 30th annual dinner in aid of the funds of this charity was held on the 8th inst., at Willis's Rooms, King-street, St. James's; the President, Mr. William Higgs, in the chair.

The CHAIRMAN, in proposing the toast of the evening—"Prosperity to the Builders' Benevolent Institution"—said he must congratulate all concerned on the continued progress of the institution, which had now been in existence thirty years. During that time they had spent upwards of £20,000 in payment of annuities to pensioners, and the funded capital of the charity had now reached the like noble sum of £20,000. Now that this point had been attained, many important alterations had been made in the rules of the institution during the past year. It had been decided to spend all future donations, as well as subscriptions, in furtherance of the objects of the institution, instead of funding them as heretofore. Legacies would continue to be funded as hitherto, and perhaps some of those present might remember the institution when making their wills; but he should recommend them to aid the institution while alive, to see the good that could be done by their help. It had been agreed to increase the amount of the pensions to £30 instead of £24, for the men, and to £24 instead of £20 for the women. It had also been decided that, on the death of a male pensioner, his widow should have a man's pension. Under the former arrangement it must have been a very great hardship for the widow of a pensioner to find herself, not only bereft of her husband, but penniless in the world. This was a change, then, that would commend itself to the approval of the supporters of the institution. A pleasing incident in the report was that one who was until recently a pensioner on the fund of the institution, had been able, through altered circumstances, to withdraw from receiving the pension, and to present the institution with a donation of five guineas as a token of gratitude. During the time the institution had been in existence great good had been done to members of the trade, who, in the decline of life, were unable to help themselves, owing to misfortune. One hundred and two pensioners had received the charity of the institution to the amount already named, and had died at a good old age, averaging 77 years. Three candidates were proposed for the next ensuing election—one man and two women—of whom the committee had at first only proposed to elect one man and one woman. But which of the two females to reject it was difficult to choose. Both were widows of gentlemen at one time in good circumstances, and subscribers to the institution. One was a widow of an old friend of his, Mr. Ebbs, of Aberdeen-place, Maida-hill, who was a subscriber to the institution from its commencement, and continued to be a subscriber for something like 24 years. He (the chairman) had persuaded the committee to elect all three candidates, and they had consented, provided the donations and subscriptions obtained that evening amounted to £500. He would, therefore, strongly urge all present to do their utmost, so that the two widows should not be placed in competition, and one of them rejected. He was willing to do his part in the matter, and in commending the toast to their notice, he would only say that "there is that scattereth and yet increaseth, and there is that withholdeth more than is meet, but it tendeth to poverty." The toast was drunk with all the honours.

A little later in the evening the lists of subscriptions and donations were read by the secretary, Major Brutton. The total amount obtained was rather more than £600. The President's list amounted to £290 17s., including his own handsome donation of £105.

The Dover Town Council have accepted the tender of Mr. Jabez Hall, of Queenborough, for the erection of sea defences at East Cliff.

ALL SOULS CHURCH, HARLESDEN—PROPOSED STAINED GLASS WINDOW FOR ST. PAUL'S CATHEDRAL—"BUILDING NEWS" CLUB DESIGNS FOR Lych GATE—VILLAS AT BEDFORD-PARK, TURNHAM-GREEN—NEW BOAT AND CLUB HOUSE, PUTNEY.

OUR LITHOGRAPHIC ILLUSTRATIONS.

DESIGN FOR MEMORIAL WINDOW IN ST. PAUL'S.

AMONG our illustrations will be found a design for a stained glass window, which appeared in this year's Royal Academy Exhibition, and the history of this is not without interest. It appears that the Society of Arts, wishing to commemorate the recovery of the Prince of Wales, and thinking that a stained glass window in the church which was the scene of the public thanksgiving would be the most appropriate memorial, applied to the Dean of St. Paul's, who cordially accepted their proposal, and granted the window of the north transept as the site. Mr. Moody, of the South Kensington Museum, was asked to make a design. In due course this was submitted to the Queen, and also to the Prince of Wales, and, with certain modifications, had the honour of their approval, as well as that of the Dean, and there seemed every prospect of its being carried out; but at that time the whole control of the proposed decoration of the Cathedral had just been made over to a committee, who employed Mr. Burges to produce a design, and he objected to one subject as not being of a character suitable for filling so important a window as that in the north transept. Thus the very laudable scheme of the Society of Arts was put on one side, and though their proposal has from time to time been renewed, nothing has been definitely settled as to its execution. As will be seen from the drawing the subject chosen is the very appropriate one of the raising of the widow's son. Round the figure of our Lord, who is represented as touching the bier, are grouped the Apostles, who show by their varied attitudes their astonishment and awe; the widow, in a transport of joy, stretches out her arms to embrace her son, who throwing off his shroud gazes at his Saviour with an expression of wonder and devotion; the bearers and followers round the bier exhibit every gradation of gratitude and joy, while one near our Lord seems to direct his attention to the group below. The Queen and the Prince of Wales are represented as kneeling at a fald-stool; behind the Prince is the Princess of Wales with her children, while the Queen is supported by a group which is intended to represent every rank and class of her subjects. The background is a rich architectural composition after the manner of Holheim—by a considerable effort of imagination we may take it for the "gate of the city." Part of this is somewhat too florid—but with this modification—the design is not unworthy of the occasion and the site. We are glad to see the use of plenty of white glass, the want of which in the windows at the east end of St. Paul's is so fatal to the beauty of the architecture. The Germans may, perhaps, excel us in drawing, but they are too apt to cover the glass with stippling, which destroys its transparency. Owing to this, as well as the want of white, especially in the margins, not only is the whole east end wrapt in gloom, but the deep jaubs of the windows, which used to give

such character to the architecture, are so scantily illuminated that they can scarcely be seen.

CHURCH OF ALL SOULS, HARLESDEN.

THIS interesting new church is about to be erected at Harlesden, from the designs of Mr. Edward J. Tarver, architect, who has endeavoured to produce a cheap church, well suited for the requirements of a large and poor parish. The chief feature in the plan, as will be seen by the illustrations we give to-day, is the octagonal nave, by which arrangement nearly all, if not all, the congregation obtain a clear view of the altar and pulpit. The construction of the roof which covers the octagon is clearly shown by the sections we give, while the interior effect is shown by the view published in the BUILDING NEWS of July 6th last. The exterior given to-day is from that which was exhibited at the Royal Academy this year. For detailed particulars of the building we refer our readers to those which accompany the interior view, mentioned above.

"BUILDING NEWS" DESIGNING CLUB.

THE designs for a lych gate, illustrated to-day, were reviewed in these columns a fortnight since (page 445).

VILLAS, BEDFORD-PARK, TURNHAM-GREEN.

THE illustration which will be found among our plates to-day forms the second of the series, commenced last week, of designs by Mr. R. Norman Shaw, A.R.A., for the artistic houses now being built on the Bedford-park Estate, Turnham-green. The materials are red brick and tiles, the woodwork being painted white. For further details see the article published on Friday last (p. 451).

NEW BOAT AND CLUB HOUSE, PUTNEY.

A few weeks since* we gave a critical review of all the designs submitted in competition for the New Club and Boat-house, about to be erected at Putney by the Thames Boat-house Company. To-day we publish the selected design, which was submitted by Mr. H. Townley Sugden, architect, of Buckingham-street, Strand, under the motto of "Stroke." We also give a second perspective, showing the author's alternative design. The architect, in his report, is of opinion that the building can be erected for £2,000. The boat-house, covering the main area, is 72ft. long by 62ft. wide. The club-room is 45ft. long and 22ft. wide, and commands a view of the river, as also does the committee-room, which is 22ft. long by 14ft. wide. The materials proposed are stock brick for the upper part of the walls, and concrete for the work below the ground-line. The floor of the boat-house is to be finished in asphalt. The windows of the club and committee-rooms are to be fitted with patent casements. The several arrangements are clearly shown by the two plans which we publish. We propose to give another of the designs submitted at an early date.

NATURE GRAINING.

FROM a number of notes on "The World's Work" we take the annexed account of nature-printing in graining:—

"Copies from the natural grain of woods are now used in place of the generally inartistic patterns employed where graining is done by hand. Graining, as commonly done, is, in an artistic sense, vicious, because false, and by copying directly from nature the work will at least have the merit of truthful design. A slab of wood of fine grain is selected, planned, sand-papered, and then rubbed with a stiff brush to clean the pores of the wood. A single coat of raw oil is then applied, and at once cleaned off with benzine. The graining colour, mixed with boiled oil to the consistency of cream, is then brushed over the wood, and at once scraped off with a piece of stiff leather. This leaves the pores of the wood filled with the colour and the surface clean, after the manner of some kinds of engraving. A clean printer's roller is then passed over the wood for a distance equal to its circumference, or one revolution. The elastic roller thus takes up the colour from the pores of the wood, and, on moving the wet

roller over wood or paper, an exact copy or transfer of the natural grain is reproduced. This copy, if heavy, will give another to paper laid over it while it is still wet. The roller, when carefully cleaned, may be used again, and perhaps a number of times, till the colour lodged in the pores of the wood is exhausted. For graining panels, skirtings for walls and wainscots, transfer rollers of various forms may be used, as the character of the surface to be grained suggests."

SCHOOLS OF ART.

LEEDS.—The annual meeting of the Leeds School of Art was held on Friday last. From the report it appeared that during the year there had entered a total of 660 students. The number of works sent for examination at South Kensington was 2,596, produced by 443 students, or an increase of 435 drawings and 41 students. Out of the 443 students, 221 were of an advanced class; of these 13 were selected to compete in the national competition, in which they had been more than usually successful; one student having had the honour of carrying off a silver medal, whilst two others took Queen's prizes. This is the first year the Leeds School has achieved so high a reward.

WATERFORD.—The annual meeting in connection with the School of Art and Design was held on Wednesday week. The report showed that the school has continued in good working order throughout the year, and that the attendance of pupils has been good. Six prizes were awarded by the Science and Art Department in the April competition—three for shading from flat, and three for drawing from cast. Several prizes and certificates were also awarded for freehand, model, perspective, and geometry in the May examinations. Addresses on the progress of art in England were delivered by Alderman Freeman, who distributed the prizes, and Dr. Scott.

WINCHESTER.—The annual meeting of the Winchester School of Art was held on Tuesday week. The committee report that the school has been attended by 118 students, of whom 61 belonged to the morning, and 57 to the evening classes. The usual examination took place on April 30th and May 1st. 26 students sat for freehand drawing, 15 for model drawing, 7 for geometry, 2 for perspective, 1 for advanced perspective, and 1 for anatomy. The treasurer's account showed a balance in hand of £327 10s. 2d.

ARCHÆOLOGICAL.

ST. ALBAN'S.—Last week, while a labourer was ploughing in a field at St. Alban's belonging to Mr. C. Woollam, immediately to the east of the fosse outside the eastern wall of Verulam, he came upon a grave composed of Roman brick. The structure, which stood on a slope, was rectangular, with its long axis north and south, the lowest course of bricks being hollow, of the hypocaust kind, the remainder, for the most part, ordinary tile-shaped ones. The sides were built up to the height of about 1ft. with bricks and mortar, and the tomb was covered in by an arrangement of bricks, having the upper courses overlapping the lower, so as to form a sloping roof; outside these, the roof was coped by similar bricks laid slanting, and in place of a ridge-piece was a course of flanged or channeled bricks, surmounted by the upper edge of the slanting ones. The interior measurement was 6ft. 10in. in length by 1ft. 9in. in width, and the same in depth. Within was found the skeleton of an adult male, in fairly good preservation; on the right side of the skull were the bones of a bird, and near the right hip the broken fragments of a small vessel of baked clay, to which bits of burnt matter were found adhering. Numerous iron nails and one or two small pieces of wood were also discovered. The floor was formed of a bed of mortar, having under it one of chalk. The interment seems likely to have been that of a Roman not earlier than the year 400 A.D.

Drainage works are about to be carried out by the Folkestone Town Council in the district of Foord, under the supervision of the borough surveyor, Mr. W. G. Springall.

REVIEW OF DESIGNS.—NO. XVII.

Cottage Hospital.

A COTTAGE HOSPITAL for twelve patients has been variously interpreted by competitors. The plans we have received are more or less defective in the requisites of hospital arrangement, and we cannot accept one as being quite satisfactory. "B," in two circles, sends a design that, taken as a whole, recommends itself to us as the nearest approach to the requirements. The wards are placed with their axes at right angles at the extreme ends of the building, the male having a south-west aspect, and the female a south-east one, the north and south points of compass ranging in an angular direction to the main structure. The male ward is 23ft. 6in. by 18ft. 6in., and contains six beds, lighted at the end and one side, and warmed by a stove. A lavatory and linen closet is at the entrance end, and a w.c. at the other. The female ward at the east extremity is 21ft. 6in. × 20ft., is lighted on three sides, and contains five beds; it has a bath-room, a requirement not shown, for the male patients, though for what reason is not clear. Each bed has a fair allowance of superficial area—about 8ft. wall space; the kitchen is placed centrally between the wards in the inner angle of the plan, but the offices are not economically disposed. The convalescent room is not made the feature it might have been, and is only on the female side. The operating room in front is certainly not the best, and has an awkward approach; it ought to have been more retired. A part of the plan is carried up two stories, one of the female beds being provided for special treatment; the nurse and matron have also a room, but there is no attendants' room to either of the wards. We see no advantage in the verandah in front of bath-room—it is too small. Exterially the author has displayed considerable taste in the half-timber treatment of elevation; the external design of ward is appropriate, and the section of ward with iron-tie roof ceiled to collar, and the proposed mode of ventilation by air-flues opening into ward above heads of beds, with central air-trunk, are satisfactory. The drawings are creditable. "Omega" displays a similar general arrangement: the wards are placed at right angles to each other at the ends, and the angle is filled up by the administrative department. No compass is shown, but the plan presents a reversal of the former idea. The wards are each 28ft. × 27ft., with bay window ends and verandahs—very useful adjuncts for convalescent patients. Each ward has six beds in rows on each side, with windows on both sides and ends, and with a lavatory, w.c., and bath-room arrangement at the corner, partly breaking into the ward. The beds are not placed close to the wall, a space of about 2ft. 6in. intervening from heads of beds to the wall. Stoves and open fireplace are shown in each ward—the former for hot air; ventilation being obtained "by openings in ceilings in communication with louvres and gables," but this is not shown clearly. The author gets a convenient nurse's room in the inner angle between the two wards, with angular oriel and a door into each ward. The matron's room forms the outer angle, with an operating-room adjoining, close to entrance—not desirable. But the good points of the plan are spoilt by the ridiculously narrow entrance, pinched up between the projection of the male ward and the operating-room—the doorway of which is scarcely more than 3ft. In fact, looking at the elevation, we should certainly mistake the gabled entrance to the dead-house on the left side for the entrance porch. The latter is infinitely more important, while the real entrance looks like a back door. Why, too, thrust the dead-house in front, and make it adjoin the matron's room? Why could not its door have been placed behind out of sight? As it is, every dead body will have to be carried out of the front doorway, and round in front of the matron's sitting-room window—a very cheerful reminiscence of "poor mortality." There is a very jumbled look about the side elevation, though the verandah ends of wards and the timbered gables are pleasingly designed. We do not think the gabled window to ward a correct or truthful expression for flank win-

dows. "B," in circle, goes in for a symmetrical plan, L-shape—the wards forming end cross wings to the front range, and the administrative offices being in centre and in the rear wing. The centre entrance, leading to a longitudinal corridor connecting the wards, is rather wasteful for a cottage hospital. We note also that the w.c.'s, bath-rooms, and lavatories are separated from their wards by the said corridor, and the patients would have to cross it to use them. This is unsatisfactory. Each ward is 27ft. × 16ft., and four beds are ranged against the outer wall, and one on the inner, the fireplace and entrance taking up the other space. The windows are scantily provided, though there are front bay windows at the front end. A special ward for one bed is placed at the rear of each main ward, but the attendants' room on the male side is not close enough, and on the female side there is no communication or window between it and the ward. The operating-room in front is an objection, and the verandah is rather useless in front. Ventilation is effected by square extracting shafts, running along ward ceilings, connected with upcast shaft round kitchen flue. The building is shown of one story, and is treated simply with end gables to wards. "Hampton" shows a right-angled arrangement, the wards being at the ends, one placed transversely, and the other in line with front building. Each is 27ft. × 18ft., and has five beds, with bay window ends, the lavatory, w.c., and bath-room being planned as an adjunct at ends. The entrance behind is objectionable, and the administrative offices in the rear of west wing too far away from the male ward. If these had been placed centrally behind, and the entrance made in the front, a far better plan would have resulted. There are no attendants' rooms. Externally the elevation is pleasingly managed, though the verandah out of convalescent room is too small. The author shows the sanitary arrangements, but the ventilation of wards is not indicated. "Pret" has a wasteful plan, L-shaped, the administrative offices and one ward being located in the rear wing, while the convalescent and the remaining ward are placed in the front. The kitchen is too far away from the latter ward; the w.c.'s and lavatories are placed on the other side of corridor, so that patients have to cross it; there are no attendants' rooms close to wards; the wards are ill-lighted, and without a cross-current, and the corridor is long and wasteful. Ventilation is shown by cold air flues and vertical pipes at the four corners of ward, where the beds are placed. It would have been better to have put the beds endways to wall, not close in the corners, as the patient can then be attended to on either side, and a better circulation of air is insured. The elevation shows a neat one-story building, with gabled windows to wards and a small verandah in front of convalescent room, but we cannot understand the lanky chimney shafts of wards. Why not have carried the main roof up to them? "Raven" sends a careful study of requirements. The wards forming wings at each end, with their bath-room and lavatory adjuncts outside, are cleverly managed. The kitchen and administrative block forms the centre, but there are no attendants' rooms, and the centre arrangement is scarcely up to the mark. In the rear the author gets a separate block for contagious cases, detached by yards, and only communicating with the front by a covered way. Wards for male and female patients are here provided, with a disinfecting chamber on one side and the dead-house on the other. The arrangement is meritorious, and deserves a better elevation. The ventilation is by a series of inlets for cold air communicating with a vertical-valved flue or pipe, by which the air is discharged over the beds. Under the beds are other inlets for clearing lower part of wards. The foul air is taken off by outlet tubes over each bed, extracting power being maintained by a screw cowl carried above roof. Warming is effected by open fireplaces with warm air chambers and hot-water pipes from boiler, which surround each ward, and are covered with gratings. Walls are shown hollow, and the author has carefully attended to the sanitary details. "Noah" has not a bad notion; the wards are on each side, and form projecting

wings—they would have been better kept farther back; and the matron and nurse in the centre on each side of a centre entrance, the offices being behind in a separate block, reached by a covered lobby. This is an excellent feature, as the cooking is away from the sick. The convalescent wards, for two beds each, with their verandahs, and the lavatory and bath-room accessories, are well conceived, but the plan wants working out. The ventilation and lighting of wards are defective, and the elevation is not up to the mark. "Truth," who sends three sheets, has also a plan in some respects commendable, the wards and their appurtenances are complete—but it is spoilt by the projections behind, and mainly by the absurd notion of making the mortuary the climax of the central vista or main entrance corridor. The elevations are poor; the centre, with the small gable in centre, is extremely disagreeable, and no sanitary details are shown or described, "Trefoil," in circle, sends an ill-conceived idea; the male and female wards are superposed, and the administration is on one side, and rather confusedly planned. The fresh air is admitted by tubes from hot-water pipe chambers on ground floor, and the foul air is extracted by tubes on each side, and by dormers. The wards are of good size, 24ft. × 18ft., with adjoining pavilion for adjuncts, but the elevations have a remarkably jumbled effect.

An Oriel Window.

The designs we have received for this subject display some variety, though there is nothing particularly original in any of them. "Debut" leads off with a very pleasing sketch. The window has a front and two cant side lights, the carts starting abruptly without a square return from the wall. Pilasters, fluted to half their height, carry square-headed stilted mouldings, which enclose panels with relieve or carved ornaments. The windows have flat heads level with the caps of pilasters. Above the mouldings a plain cornice, flat-topped, finishes the oriel. The base is piquantly managed. It rests on two curvilinear trusses, fluted on the face with Ionic caps; these corbels being placed below the front side of oriel, and in a line with its angles. Details shown are in good taste, and Classical in spirit. The windows are sash. The key sketch is rather out of perspective. "Josephus Orange Blossom" sends a similar kind of oriel, the cant sides springing out of wall abruptly. The angle piers or pilasters are supported on a moulded corbelled base, and carry an entablature surmounted by a stone roof of ogee form, which dies away in the manner usual with Gothic oriels. The windows are made as casements, with a transom and upper light filled with plate glass. The design, though not original, is pleasing and simple. "J'espère" sends a more original design in a late German kind of Gothic. It is square in plan, about 9ft. on the face, and about 2ft. projection from wall. There is only a front window, flat pointed, of two lights, divided by a mullion and transom, and the sides or piers are solid, and treated with panelling in the front and return sides. The window is set back about 6in. from the sides, and a corbel table, with carved leaf ornament in hollow, is formed between at the top. The side piers are supported on carved corbels of hybrid character, and the roof is a plain steep lean-to, with the triangular ends filled in with late tracery. The corbels and panels are proposed to be executed in Greenmoor stone, and the upper parts in Darley Dale. A section is shown. The addition of the inside cornice to a bay, of such slight projection from wall, is almost superfluous. The drawings are admirably executed and shaded, but the details are poor. "Fleur-de-lis" sends a design of a too-ordinary type of Late Gothic to need description. It has the usual moulded corbelling below, a canted oriel of four equal lights, with transom and leadwork lights above, surmounted by a curvilinear hood or capping. The details, as usual with this competitor, show a practised hand, and are in good taste, but we think the oriel has a rather lumpy effect. Dowelled joints are shown. "A. L. B." has greatly improved in his work. This design shows careful drawing of a Late Gothic character, with corbel base and transomed win-

dows, with canted sides. Above the transom the lights are subdivided by cinquefoiled arches. The faults, we may mention, are chiefly of an elementary kind. Thus the mitring of the square angle pinnacles on the cornice weathering is shown wrong in elevation—the lions would have been better omitted, and so would the angle masks in cornice. The details show the want of a little more study, and we may inform "A. L. B." that the projection of the mouldings at the angles of corbelling should be less than where they die away against the wall. The same remark applies to the string. A knowledge of projection would have obviated this error. Of other designs we may mention "Marmion," a Gothic three-light oriel, with detail lacking study; "Torpedo," a Late Gothic oriel, but lacking knowledge of detail; "A Shield," with cross and L, a neat Late Gothic attempt, but with bad mouldings; "Nil Desperandum," a Florid Gothic oriel, displaying several faults of construction, a misdirected aim, and an inordinate love of ornament—that rock upon which most young architectural aspirants get wrecked; "Medicus," an effort to which the same remarks apply. To these few last we would say, be less ambitious, avoid that signal snare ornament till you have made yourselves master of common-sense principles of design, and, above all, have honesty of purpose. We do not like to discourage, but it is evident that a little more elementary knowledge would be advantageous to these competitors.

Architect's Drawing Desk.

We have only received one design for this subject. "Fleur-de-lis" sends a sketch—the result apparently of an off-hand idea, but not considered with due attention. It is a sloped desk, with a nest of drawers on one side, and sitting space on the other. The hinged let-down flap as shown, is of little use for large drawings or perspectives, and forms merely a side table. At the back of slope is a shelf for books railed off. We cannot discover the object of the framing below the desk in the side elevation, and the hinged brackets are certainly too small to support the flap shown. Material is pine, stained with logwood and coppers.

LIST OF SUBJECTS.—NO. XIX.

A. A hall fireplace, with a hood over it, in stone; plan, elevation, and details; scale, $\frac{1}{2}$ in. to the foot.

B. A coal-scuttle, fender, and fire-irons; sketch and details.

C. A lectern in wood, suitable for a town parish church; elevations and details; scale, $\frac{1}{2}$ in. to a foot, and a $\frac{1}{4}$ full size.

ART AT HOME—THE DRAWING ROOM.*

THIS treatise forms another volume of the "Art at Home" series issued by Messrs. Macmillan and Co. Mrs. Orrinsmith has endeavoured to give more particular directions as to the furnishing and adornment of the drawing-room than was possible in the Misses Garrett's volume treating of the whole subject of house decoration. In some important respects she has gone farther than the Misses Garrett. She has not confined herself to "Queen Anne" furniture, but has arrived at reciting and applying the universal rules of taste which govern all styles. She has, moreover, paid some attention to the cost of the decoration she recommends—a matter of no small importance to humble amateurs—and has furnished directions which in many cases will smooth their path towards the attainment of a comfortably appointed room, in which taste and art education shall be visibly predominant. After a severe denunciation of the average Victorian drawing-room furniture as summarised in an advertisement of the usual "magnificent suite," Mrs. Orrinsmith commences her encouragement to attempt something better by some directions as to the choice of wall-papers and other surface decorations, draperies, and the treatment of ceilings. A capital chapter on fireplaces and chimney-pieces is followed by another on floors and carpets, after which the windows, doors, and carpets are considered. We

*The Drawing Room; its Decorations and Furniture. By Mrs. ORRINSMITH. London: Macmillan and Co.

then come to the furniture, properly so-called, in the selection of which the rule is laid down that first fitness should be aimed at and then beauty—a very proper distinction being drawn between beauty and mere elegance.

The fact is recognised that all cannot hope to secure the comparatively few remaining good specimens of old furniture, and some plain and sensible hints are thrown out to guide those who have to make the best of modern work. For the benefit of those who are able to work themselves, directions are given as to staining and painting, and it is pointed out how many things such as brackets, hanging shelves, and cabinets may be managed with the aid of the illustrations and a local cabinet-maker. On the matter of lighting the room—one of the most necessary, but as things stand at present, one of the most unsatisfactory points of domestic economy—Mrs. Orrinsmith has something to say. She, of course, would exclude gas, and she laments the unsatisfactory character of lamps, remarking that it is difficult to understand why candles have been so universally superseded. We agree with her that no light is so charming as that of many candles, but are not so sure that the advantages attaching to the use of lamps are not underrated. If half the attention had been devoted to the external appearances of lamps that has been directed lately to their mechanical construction and the improvement of the oils burned in them, some more satisfactory result would by this time have been arrived at. In the concluding chapters the best means of disposing of books and the arrangement of pictures, mirrors, and odds and ends, are dealt with. Here, as well as throughout the book, there is a plainness of purpose and an absence of fussiness that is very satisfactory. The woodcuts are numerous and well executed—except the figures. Whether the drawings are original generally we know not; but one—a fireplace with open grate—is taken bodily from the BUILDING NEWS of July 3, 1874, and inserted with the addition of a left-handed young woman putting coals on a fire as if she were applying a match to a cannon, which is not an improvement.

MANCHESTER NEW BATHS AND WASH-HOUSES.

THE *Manchester Guardian* gives a brief description of the three designs for which premiums have been awarded in the above competition. The first prize of £200 was secured by Mr. John Johnson, of 9, Queen Victoria-street, London, who had adopted the motto "Economy Well Considered." The ground plan shows the public hall at the corner of New Islington and Baker-street, the reason for that position being that it is better lighted and more accessible for public purposes. So that the floor area may be unencumbered, Mr. Johnson proposes using for carrying the floor, strong wrought-iron girders with cast-iron brackets at the end. The entrances to swimming-baths are in Baker-street, with recessed porch, one side being for the first-class and the other for second-class. The first-class entrance hall leads direct to the waiting-room, and then the bath, which has a water surface of 89ft. by 25ft. There are 60 dressing-boxes, diving board, and other appurtenances. The second-class entrance hall is similar to the first-class, with an additional waiting-room, useful for Saturday nights and other crowded occasions. This bath has a water surface of 106ft. by 29ft. There are 68 dressing-boxes and other accommodation. On the first floor is a public hall, 72ft. by 36ft. over the one on ground floor, approached by two flights of spacious stone stairs. As this upper hall would perhaps be used for concerts, &c., the architect suggests that a gallery should be erected around three sides. Retiring rooms, with lavatories, are provided for each hall. The 32 first-class private baths, approached by well-lighted stone stairs from the entrance-hall, are placed on a gallery around the swimming bath, and supported by rolled iron joists, built in the wall. Ladies' private baths, 18 in number, are placed on the first floor, so as to give as much space as possible to laundry purposes on the ground-floor. The exterior design, principally of brick, is of a very plain and simple Italian character, Mr. Johnson "trusting only to the architectural

proportions and grouping of the structure for effect." The interior is equally plain and simple. The warming of the building would be by means of steam pipes. The estimated cost of the building generally is £15,300, and for the engineering work and fittings £4,300.

The design marked "Experience," to which has been awarded the second premium of £100, is prepared by Messrs. Mangnall and Littlewood, architects, of Brown-street, Manchester. In the arrangement of this plan the baths, as the most important, are placed to front New Islington; the public room is situated at the corner of Baker-street and Horne-street; and the wash-house and laundry will front Horne-street. The entrance to the baths has three semi-circular arched doorways, one being appropriated to women, and two to men. The men's first-class swimming bath is approached from the vestibule by a glazed corridor to the left side of the entrance. The net size of the bath is 60ft. by 22ft. 6in., with a depth of 6ft. at the deepest, and 3ft. at the shallowest end, the sides to be lined with white glazed bricks, and the bottom formed of polished light-coloured concrete. Forty dressing-closets are provided, each 3ft. 9in. by 3ft. 6in., formed with polished slate slabs secured to cast-iron frames. Shower baths and the necessary offices are placed at each angle of the bath-room. The water will be warmed by means of a copper steam pipe, brought from the steam boilers under the laundry, communicating at four different positions, into the bottom of the bath, covered with perforated grids. The roof is to be supported by wooden principals secured with wrought-iron tie-rods, with ample provision for light and ventilation. The men's second-class swimming bath is approached from the vestibule by a corridor separate and distinct from the first-class. The net size of the bath is 80ft. in length by 20ft. in width, the depth and finishing being similar to those of the first-class. Ninety dressing-rooms are provided, each 3ft. 6in. by 2ft. 3in. Provision is made in the plans for two public-rooms, for meetings, balls or concerts, and election purposes. Each room is 72ft. in length, by 36ft. in width, well-lighted, warmed, and ventilated, and having commodious ingress and egress. Upon the approximate estimate of one of the principal city builders, the cost of the whole of the buildings and fittings can be carried out for £20,000, with an additional £2,800 for boilers, engine, washing and wringing machines, troughs, and other fittings, and all other machinery and plant connected with the engineering department.

The designs which secured the third premium were furnished by Mr. John Lowe, 22, Mansfield Chambers, St. Ann's-square, Manchester. "Concilio et Labore" was the motto adopted. The principal entrance in the plans is placed in Baker-street, and is intended to afford access to the first and second-class swimming baths. Adjacent to this vestibule is an office, which is arranged to afford supervision over the entrances to and exits from all parts of the building. Another entrance in the same street, also with an office, serves the dual purpose of public wash-house and women's private baths. The New Islington entrance is for the especial use of the public rooms. The lower public room has two separate entrances, and the upper one is similarly treated. The private wash-house and laundry is laid in the basement, and entirely separate from the public wash-house. The size of the first-class swimming bath is 55ft. by 27ft.; that of the second-class bath being 81ft. by 28ft. 6in. In designing this portion of the building special attention has been devoted to the construction of the roof, in order that top light may be introduced at an angle to afford the most pleasing effect upon the surface of the water. Each public room is 72ft. by 36ft. The estimated cost of the building is £20,887, and of the engineering work and fittings £4,100, making a total of £24,987. There will be, according to Mr. Lowe's arrangement, 44 first-class baths, 50 second-class, 4 vapour and shower, 9 women's, and 1 Turkish bath; making a total of 108.

A memorial tablet—the work of Messrs. Gilliam and Sons, sculptors, of Dorking—has just been put up in Graffham parish church, stating that the edifice was rebuilt in memory of Samuel Wilberforce, Bishop of Winchester.

Building Intelligence.

ALL SAINTS, CASTLE-FIELDS, SHREWSBURY.—The chancel and north chancel aisle of this church were opened on Wednesday, 7th inst., by the Bishop of Lichfield. The chancel, which is 40ft. long internally by 25ft. wide, and 52ft. high to the ridge, is raised three steps above the nave, and furnished with oak stalls. There is a further ascent of six steps to the altar. The north chancel aisle, or choir vestry, opens on the chancel by two arches, and is screened off from the north nave aisle. The pulpit is of stone. Maw's tiles are used for the floor. Red-hill stone has been used for the walling, Grinshill and Shelvoke for dressings, and blue Pennant for shafts. Mr. R. L. Boulton executed the stone carvings. The organ-chamber and first stage of the tower, or second vestry, are contracted for. Mr. E. Haycock, of Shrewsbury, is the architect; the builder is Mr. W. Bowdler. The total cost of the chancel will be about £2,400.

BLEWBURY.—The chancel of the parish church of Blewbury was reopened on the 31st ult., after restoration under the care of Mr. E. Dolby, of Abingdon. The church is one of the most interesting in the county. Some portions are apparently of Saxon origin. The present chancel and central tower were probably built in the 11th century, the nave, side aisles, and western tower have been added and enlarged at various periods down to the 14th century. About two years and a-half ago the restoration of the nave was commenced. The roof was renewed, the floor lowered to the ancient level, the pews and galleries removed, and the floor paved with encaustic tiles. The restoration of the chancel was commenced in March last, the contract being taken by Mr. Martin, of Hereford. The original floor lines have been regained, and the chancel is paved with encaustic tiles of a rich pattern, supplied by Mr. Godwin, of Lugwardine. The north and south aisles remain in a very dilapidated condition. The sum already spent is about £1,600.

CARLISLE.—A new Roman Catholic church is about to be erected at Carlisle, from designs by Messrs. Dunn and Hansom, of Newcastle-on-Tyne, at a cost of nearly £12,000. The plan will be cruciform. The style adopted is Early Decorated. In plan the arrangement is to provide a very large nave, in which the whole of the sittings are placed, the aisles being narrow. The nave and chancel are the same width, 35ft., and of the total length of 141ft. (inside measurements), and on the exterior form an unbroken line of roof. North and south transepts open from the sides of the chancel, and will be used as chapels. The Lady chapel will be placed at the east end of the church, and project externally. The transepts and aisles are separated from the chancel and nave by an arcade, and above this rises a large clerestory. At the south-west corner is the tower, 200ft. high, at the corners of which are four turrets, with single lights and angle shafts, culminating in four octagonal pinnacles, each surmounted by a cross. From the centre of the tower, and flanked by these pinnacles, rises a spire of similar shape, also having at its apex a cross and weather-vane. The baptistery is at the west end of the north aisle, and joins the north porch. There are two sacristies, and above them is a large room for guild or other meetings, with separate entrance from the street. The presbytery is situated to the south of the church, next to the sacristies and chancel.

CWM SCHOOLS.—The erection of these schools for the Swansea School Board have been commenced by Mr. Thos. Rees, builder, of George-street, Swansea. One acre of ground is taken for the site, and to be enclosed by walls 7ft. high for playgrounds. The total amount of estimate, including the desks and benches, and interior finishings, is £2,084. It is to be a mixed school, and accommodation is provided for about 400 children. The whole of the buildings will be of local stone and blue brick dressings, from the designs of Mr. Geo. Harman, architect, Swansea.

KING'S LANGLEY.—An interesting ceremony took place on Wednesday last, at King's

Langley, Herts, in the parish church, where a new chapel has been erected at the east end of the north aisle to receive the beautiful tomb of Edmund de Langley. The ceremony consisted of removing this tomb from its old position to the new chapel. The church is an interesting example, having Late Decorated features chiefly, and the new work, which also includes a sculptured reredos, is quite in accord with the building. An elaborate screen of carved oak divides the new chapel from the church. The work has been designed and superintended by the diocesan architect, Mr. Joseph Clarke, F.S.A.

LANGTHORNE.—On Tuesday a new church for this hamlet was consecrated by the Bishop of Ripon. The church was built almost at the sole cost of the Rev. T. Milville Raven, vicar of Crakeball and Langthorne, from designs by Mr. C. Noel Armfield, of the firm of Messrs. Armfield and Bottomley, architects, of Whitby and Middlesbro'. The whole church is decorated with colour, and furnished with embroideries, all from special designs by the architect. The altar frontal is the gift of Mrs. J. Raven, widow of the late well-known landscape artist, John Raven (brother of the munificent builder of the church), whose sudden death upon the shore at Harlech was reported in our columns some short time ago.

LEICESTER.—The new church of St. Leonard, Leicester, was consecrated on Tuesday week. The church is built in the 14th century style, and is calculated to afford accommodation for 500 worshippers. The nave is 86ft. long by 31ft. 6in. wide, by 52ft. to the internal ridge. The south aisle is 62ft. by 12ft. 9in. The temporary north aisle is 6ft. wide, but it is intended that there should be in that part of the church future enlargement. The tower is at present built only to the height of the south aisle, but the walls and foundations are of sufficient strength to admit of the addition of a spire. The chancel is 50ft. long by 27ft. wide, with blank arches on the north side, with the view to contemplated enlargement in connection with the north aisle. The ambulatory is 7ft. wide on the south side of the chancel, with outer entrance. The roof is covered with Broseley tiles. The walls of the exterior are composed of stones coming from various districts, but those from Mountsorrel largely predominate. The exterior dressings are of red Alton stone, and the interior dressings of Bath and Derbyshire stone; the pillars in the interior being of the same kind. The architects are Messrs. Ordish and Traylen, of Leicester; and the builders Messrs. Edmund Roberts and Son, of Weedon. The edifice, as far as it has been completed, has cost £7,000.

LEYTONSTONE.—On Thursday week the foundation stone of a new Baptist chapel was laid at Leytonstone. The scheme includes a chapel to hold 400, and a temporary school-room for 120 children. The estimated cost of the chapel and temporary school is over £3,500. The builders are Messrs. Hill, Higgs and Hill, of South Lambeth, and the architect is Mr. James Cubitt, of Loughton and Finsbury. The size of the building will be 80ft. by 53ft., and the height 52ft. The material is to be of red-brick facings, with stone dressings, and the style Gothic. It will be surmounted by a turret in the centre, and will have two transepts and a nave, with three entrances.

LONDON SCHOOL BOARD.—On Wednesday this Board accepted several tenders, including the amended one sent in by Mr. E. Lawrance, of Wharf-road, City-road, for a school for 756 children; that of Messrs. Hill, Higgs, and Hill, of Crown Works, South Lambeth, for a school-keeper's house at the school site in Portman-place, Globe-road, E.; that of Mr. S. J. Jerrard, of Loampit-vale, Lewisham, for similar work at Chequer-alley, St. Luke's, and that of Mr. G. Vavasser, of Beckenham, S.E., for the erection of a school-house for 350 children, on land near Berger-road, Homerton. In the case of the Gillespie-road tenders these first sent in, nine in number, ranged from £10,413 to £11,169, equal to an average cost per head of from £13 15s. 5½d. to £14 15s. 5½d. The works committee thought these estimates too high, and accordingly cut down the plans so as to enable £840 to be struck off the lowest tender, the ultimate cost

being £12 13s. 3d. for the complete structure. For furniture and fittings to three new schools the following expenditures were authorised:—Marlborough-road, Chelsea (828 school-places), £610 6s. 8d.; D.-street, Queen's-park estate (1,104 school-places), £769 19s. 3d., and Vere-street, Clare-market (559 school-places), £450 11s. 6d. Application was directed to be made to the Education Department with reference to the proposed erection of two more schools in Finsbury, and one near the Waterloo-road, S.E., and the enlargement of schools in Winchester-street, Finsbury, and Bellender-road, Lambeth.

METROPOLITAN BOARD OF WORKS.—On Friday, at the meeting of this board, the works committee reported on a letter from Mr. H. W. Reach, inquiring whether claimants in respect of properties required for street improvements cannot deal with the board direct, without the intervention of agents, and recommended that Mr. Reach be informed that there is no necessity for the employment of agents by claimants. Mr. Roche, the chairman of the committee, said it had come to the knowledge of the members that certain agents pressed their services on those whose properties were required for public improvements, and in one instance, at least, the agent represented that he had great facilities for insuring a favourable consideration of claims by the board. They were therefore pleased to have the opportunity of making it public that claimants were quite as likely to be dealt with in a fair and liberal spirit if they applied personally, and that no claimants, whether of the same name as officials in the board's service or otherwise, have greater facilities than claimants themselves. Statements had been made by these people which were absolutely devoid of truth. The board decided to enter the letter and the reply upon the minutes. With reference to the memorial recently presented by the Bermondsey, St. Olave's, and Rotherhithe local authorities, asking for the improvement from London Bridge to Deptford-road, the works committee has decided to undertake the following street-widenings sanctioned by the Act of last session first, and in this order: That near the Angel at Islington, then Mare-street, Hackney, Deptford Bridge approaches, Camberwell and Peckham High-streets, and then the thoroughfare between London Bridge and Deptford. A reply was ordered to be sent to the several memorialists to this effect. £150, being a moiety of the estimated cost, was voted towards the expense of widening a further portion of Brockley-lane, about to be undertaken by the Lewisham District Board. Applications for permission to borrow money—from Bethnal-green Vestry, for £20,000 for paving works, and from Lewisham District Board for £900, a proportion of cost of certain sewerage works in Penge and Beckenham—were referred to the finance committee to report on. Under the provisions of the Artisans' Dwellings Improvement Act, 1875, it was decided to take action in three instances—that of the area in Essex-road, Islington, concerning which an official representation of unhealthiness had been made by Dr. Tidy, medical officer of health; that of Bowman's-buildings, Marylebone, reported upon in like manner by Dr. Whitmore; and that of Great Wild-street, Drury-lane, reported on by Dr. Lovett. In each case a formal resolution was passed approving a scheme to which the board's seal was affixed. A letter was received from the vestry of Camberwell, calling attention to the erection by a builder of certain new model lodging-houses in Choumert-road, Peckham, which in the judgment of the vestry are defective in construction, especially regarding their want of sanitary appliances, and requesting that an officer from the board may be instructed to examine the buildings and report thereon, the vestry being of opinion that it is not desirable that the buildings should be allowed to proceed towards completion if any step can be taken to stop their further progress. Mr. Vulliamy, architect to the board, read a report to the board, in which he expressed an opinion that several features of the houses—especially the absence of party walls, and the erection of a lath-and-plaster-fronted attic, which the builder called a roof, but which he regarded as part of the wall—were infringements of the Metropolitan Building Act. Mr. Dresse,

Rogers, in moving that the letter and report be referred to the works committee, and that the solicitor to the board be requested to report on the legal bearings of the case, said this was a very important matter. The 48 houses in question were being built in a back garden, had no proper party walls, and the upper parts were only lath-and-plaster. The builder was particularly clever in evading the Building Act, and the district surveyor was unable to stop him. The board was pulling down old rookeries at vast expense to the ratepayers, and it would be most objectionable if equally bad ones should be allowed to be created. Mr. Selway, in seconding the motion, added a rider that the district surveyor be instructed to attend the committee meeting, to afford opportunity for making an explanation, and the amended motion was agreed to.

STANSTEAD.—On Tuesday week the parish church of Stanstead, near Long Melford, was reopened after restoration. The building is mainly in the Perpendicular style, and consists of a nave with a south porch, chancel with vestry on the north side, and a western tower. The work now completed consists of the strengthening of the tower, the restoration of the belfry window, buttresses, &c., the insertion of a new west window, the opening of the tower to the church by the removal of the eastern wall, and the erection of a massive arch in lieu thereof. In the chancel new flooring and altar rails have been fixed, and suitable stone steps now occupy the place formerly filled with wood. The south porch has been almost entirely rebuilt. The work has been executed by Mr. Hawkins, builder, of Monks Eleigh, from the designs of Mr. J. Fowler, architect, of Louth, Lincolnshire. The total cost has been about £900.

STOW-ON-THE-WOLD.—The foundation stone of a new town hall has been laid in the Market-square, Stow-on-the-Wold. The building will cost over £4,000, given by three residents in the neighbourhood, all clerks in holy orders. It will consist, on the ground floor, of a library, 25ft. by 18ft., and reading-room, 31ft. by 17ft., gentlemen's cloak-room, porch, hall, staircase, and custodian's apartments. On the first floor will be a lofty assembly-room, 50ft. by 26ft., having musicians' gallery and bay windows to Market-square, and committee and ante-rooms, and ladies' cloak-room. The town hall will be Late Gothic in style, harmonising with the Tudor buildings of the district. It will be built of Harrington stone, and roofed with Kington Hall stone tiles. Mr. Saunders is the architect.

THORPE MALSOR.—On Tuesday week, Thorpe Malsor church was reopened after restoration, from the designs of Mr. Clapton Rolfe, of Reading, at a cost of £5,000. Mr. John Gee, of Daventry, was the contractor. The body of the church is mainly built of sandstone, and is in good preservation. The chancel has been entirely re-built, and many of the old features re-introduced. The roof is groined very elaborately with oak, the beams springing from corbels representing winged angels, carved in stone. Three sedilia have been set in the south wall of the sanctuary. The floor is laid with encaustic tiles, supplied by Mr. Godwin, of Hereford. The altar is new, the front being of carved oak, gilt, having in the centre panel a representation of the *Agnus Dei*, in basso relievo. The carving is by Mr. Hems, of Exeter. On the north side of the sacred building a private chapel has been formed out of the Maunsell vault, and an Early English arch, which was closed, has been opened on the west. A piscina is cut into the wall of this chapel. The pulpit is formed of Caen stone, resting upon a pedestal of Ketton stone. A new Gothic porch has been constructed on the south side of the nave.

Banff parish church was reopened on Sunday after restoration, including the removal of galleries and the addition of a memorial stained glass window. The latter was supplied by Messrs. Ballantine and Son, of Edinburgh.

The memorial stone of a new Sunday school and lecture-room, about to be added to the Baptist chapel at Tunbridge, was laid on Tuesday week. The buildings will cost about £720, and will be built by Mr. T. Wickham, of Tunbridge, from designs by Mr. W. J. Brooker, of London.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published November 16 contains articles on Unsound Meat Prosecutions, Bristol and the Artisans' Dwellings Act, The Drainage of Oxford, The Mechanics of Ventilation, Sewage, Sewerage and Town Refuse, The American Public Health Association, Treatment of Typhoid with Nitrate of Silver, Discolouration of Water, Herbs and Simples, Notices of Books, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c. Price 2s. Annual Subscription, Post-free, Eleven Shillings per annum.—31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

To OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India (and Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—C. and G.—C. A. M.—J. T. C.—H. and Co.—G. A. W.—E. J. P.—H. J. M.—W. M. and Co.—E. F. G.—J. D. H.—H. S. and Son.—G. L. W.—W. P.—W. T.—B. B.—J. S. and Co.—A. S.—J. H.—R. F. and Co.—J. E. PARKER. (The "Architectural Society's Dictionary" gives some particulars of malt-houses.)—THOMAS PORTEN. (We thank you for your idea, which shall receive consideration.)—W. G. (Next week.)—J. F. MACKENZIE. (We have not received the book.)

"BUILDING NEWS" DESIGNING CLUB.—Received:—Fred. W. Leverstra. (Have sent you particulars.)—A. L. B. (We will make inquiries.)—Pupil (Points out there is no window shown to the kitchen of design for mixed school by "B." in circle. This is an omission, apparently, though there is ample space for one. As to the chimney shaft of kitchen, perhaps "B." in circle, will explain his intention.) Drawings received:—Naiocotee.—Fleur-de-lis.—Magnat.

Correspondence.

ENGLISH WORKMEN AND FOREIGN WORKMEN.

To the Editor of the BUILDING NEWS.

SIR,—The intelligent paper on this subject which appeared in your last week's journal gives me hope that there are yet a few men amongst artists who are thoughtful enough to look ahead, and read the signs of the times.

The opening meetings of the senior and junior architectural societies have come and gone, and not a single word has been said by either of the presidents to indicate the feeling and help in the formation of public opinion on the all-absorbing topic of the building world—"the labour question," and that its outcome, "the masons' strike." If the public should be led by any class of men before another, surely it is the architect who stands between capital and labour, and is the authorised arbiter between them.

Is the subject of political and social economy so foreign to the tastes and acquirements of architects that they shall allow themselves to be drifted by the course of events without making a single effort to lead or guide them? Trusting, therefore, that the subject may be further discussed by men of experience in the profession, I proceed to notice some of the more remarkable statements in the admirable paper already referred to.

Speaking of the Law Courts "C. B. A." says, "We may suppose, without going out of the way, the architect of this group of structures to have strong English proclivities, and to aim, in the details of these buildings, at a special and emphatic English expression. We can hardly ask for a foreign Gothic expression here close to Temple-bar, and most surely there is no need of it, for the English Gothic of the 13th, 14th, or 15th centuries—and we care not which is taken—is or was as good (some will think better) than any Continental phase of it. We may assume, therefore, that English Gothic is intended—a revival or copy of that of the past of Gothic art as once in vogue in this country when no other style of art existed here to disturb the universal feeling for and constant use of it for all and every building purpose." This is an acknowledgment of the existence of true artistic workmanship prior to the Reformation and Renaissance period.

Speaking of the French workman of to-day, he says: "No one will deny the fact of the wonderful artistic skill and lightness of hand and refinement of eye, not only of the French designers and artists, but of the French workmen. It may be somewhat hard to duly account for this, and a good deal of philosophic talk might be expended in the effort to come at a satisfactory conclusion about it. It is not of the hand only, but of mental organisation, and comes of the two jointly, and is always in perpetual and unconscious action and operation. It takes us, indeed, commonplace as the subject of it may seem, to the foundations of art-action, and to the *rationale* of that power which has produced the finest and most finished art all the world over." Without attempting to darken counsel by "philosophic talk," I venture to assert that it is not so hard to account for the permanence of artistic power and excellence of workmanship in French handicraft, nor is it difficult to account for the absence of it in England. Both countries give the natural effects of their respective provocative causes. Since learning revived technical education has never ceased in France: it has still to begin in England, and the inevitable consequences have followed; but we have had its likeness in our ancient trade guilds. It was for the protection of trade, and the arts generally, that the City Companies of London and similar associations were first established in mediæval times. They were entrusted with arbitrary powers, and were authorised to inflict penalties upon evildoers. Upon them depended the maintenance of a high standard of excellence, and the use of good materials and workmanship, by whose providence the public were preserved from fraudulent imitations. However, in course of time, these good ends were frustrated by the monopolies that resulted, and the fetters that were thus created for independent action and progress, and so their usefulness ceased. Free trade led to the rivalry which now exists, and soon extinguished the trade mysteries and privileges of the once famous City Companies. But their former usefulness may be regained if we accept the new conditions under which we live, and endeavour to re-create an army of efficient workers in all trades, who may by their skill hope to resist the aggressive influence of foreign competitors, who, by their technical educational advantages, are yearly becoming more independent of British aid, and gradually but surely undermining our export trade.

The necessity for some such organised effort as that proposed by the Clothworkers' Company, under the title of the "City Guilds Industrial University," is daily becoming more apparent. Look at the building trade: there is a double tyranny sapping the well-being of the artisan. First, there is the great contractor whose capital absorbs all lesser masterpieces and for many masters of specific trades there is substituted one, who works through inferior agencies under the control of overlookers, none of whom may act independently of his will, and all of whom are more or less dependent on his desire to do work well or ill, to none of whom glory comes for well-doing or shame for ill-doing, but only a change of masters—no interest or fellowship existing between masters and men.

Secondly, there is the tyranny of the trades

ons, by which the labour market is controlled, hat all men shall be regarded as equal in ie, and no man shall be allowed to better his dition by his greater aptitude or more severing and continued exertion. The price mited to a uniform rate, the time is also ited to a set number of hours, more than hich is regarded as an injury to trade by its valence to the introduction of more hands to the work to be done. Piecework is not roved, and the artisan is taught to trust to society, which, by strikes and other dis- anising influences, strives to keep up the es and diminish the hours of work at one e the same time.

ow, since Mr. Potter has declared that out six million artisans only one million are iety men, it is evident that a vast number eady and waiting to improve their position soon as any organisation shall appear erful enough to give them an independent tus. This status can only be obtained by ved excellence, which can only be acquired he intelligent exercise of every faculty and xperimental acquaintance with every ch of trade.

The establishment of technical colleges for s after leaving school, and for young men eady at work or learning their business as y can pick it up in the workshops from ow-workmen jealous of their improvement, he only plan by which excellence can be ained that shall at all compete with that hich is the result of the complete system of hical instruction obtainable everywhere on tinent.

Certificates and diplomas from the colleges e established would give a young man a racter that would make him independent of fellows, and enable him to give his services he highest bidder in spite of trade union- s. As M. Havrez told the students of the rriers Professional School:—"The advan- es," said he, "which the overlookers and rkmn can obtain from these diplomas are so dent that I need scarcely dwell on them. en the dull season for industry comes it is e worst workmen—that is to say, the most orant—who are first discharged; besides hich, the instruction which you must receive e enable you to obtain the diplomas will ease your wages, because your labour will mand higher prices than the ignorant rkmn's. Already, in Charleroi," continued Havrez, "the situations of foremen in leries, furnaces, and mechanics' shops are y given to those overlookers who have ained a diploma of the Professional School Charleroi."

Now, one of the results of the better culture he foreign workman is, that strikes are of e occurrence on the Continent. Our duty, efore, as it seems to me, is to aid in the blishment of centres of practical workshops, ere the mode of doing everything in the best y and on the soundest principles may be ight and honourably mentioned, so that the establishment of masters of each trade may e accomplished by the skill guaranteed by the oloma, and independence of either of the eat tyrannies may result from the incom- icable power of self-culture.

In the future separate contracts might be en for each branch of trade, as in outlying tricts is still the case, instead of by a repre- atative of all trades, but a master of none. hting but excellence can overcome the rldom into which skilled labour is now rown. Nothing will cut at the root of what injurious in trade-unionism so much as the uscitation of the just independence of rsonal capability. It is the want of it that ds men to lean upon societies to secure for em what their own intelligence fails to umand.

In conclusion, let me state what the objects he City Guilds Industrial University are, d I trust I may anticipate the moral counte- nance and aid of the artists, architects, engi- ners, and others, in favour of so good a scheme, t grudgingly given, but enthusiastically stowed for the good of our common country y the encouragement and development of tional individuality in art workmanship. he two-fold object intended by the promoters e the establishment of a National Industrial niversity of Scientific and Technical Educa-

tion, under the auspices of the livery com- panies of the City of London, are:—

1st. To form a central university, with affi- liated schools of technical instruction, in con- nection with the various industries carried on in the suburbs of London, and the manufac- turing districts of the country generally.

2nd. To establish a system of technological examinations and degree certificates of various grades and denominations, to be granted in connection with the science and technology of the several arts and manufactures of the country. Such examinations to be conducted on behalf of the Central University by examiners capable of testing the practical knowledge and skill required in the application of the scientific principles involved in each art or manufacture, as well as the theoretic principles of those branches of science which are requisite as a foundation for technical instruction in any particular industry, the Society of Arts being asked to merge their tentative organisation in that behalf.

Prizes, exhibitions, and other rewards, as well as incentives and aids to further educational progress, would be given by the Central Technical University.

"It is further proposed to erect a building as the Central Hall of the City Guilds' Industrial University (on a plot of ground between the Temple and Keyser's Hotel, if available) on the Thames Embankment, consisting of a large amphitheatre; a smaller amphitheatre, or lecture-room; a council-room (with library); a museum of trade examples; a room for the models, &c., of the professors and lecturers; a room for the treasurer; office for the secretary, &c.

"It is held that to begin the movement on a scale commensurate with the necessities of the times, and the wealth and intelligence of the Associated Livery Companies, not less than £10,000 per annum should be guaranteed over and above the provision for a building fund; and although Government might be expected to subsidise the local organisations indirectly through the medium of the Science and Art Department, no Government subsidy should be accepted for the central institution, the progressive needs whereof would not increase, it is hoped, more rapidly than the capabilities and desires of the companies to meet them."

This extract from the first prospectus issued by the City companies evinces the right spirit, and I heartily wish them "God speed!"—I am, &c., E. C. R.

ARCHITECTS AND COMMISSIONS.

SIR,—The stained-glass dealer's offer of com- mission to architects seems to have aroused the indignation of one or two London folks. Why, bless my soul! up here it's quite the correct thing—10 per cent. is "the usual." Those architects who do much in the stained-glass line have special rates. The glass is only one item; hot-air apparatus, hot-water ditto, cold ditto, chapel decorations, gas-fittings, and any- thing else that the architect can cook through lump sums, is looked upon as a source of profit. What's the use of making a stir about things that are so beneficial? You can't mend them, and, if you try, somebody will throw mud at you. Let architects grow fat and rich quietly; they'll make fine manure for the land some day. Don't disturb them, for many give their services as chapel stewards, church- wardens, and other gratuitous offices, and surely you can't speak bad of them. What a fine cargo of provisions we could send out to the famine if architects would give all the geese, turkeys, &c., that will be found flying about their offices next month!—I am, &c.,

50 PER CENT.

Liverpool, November 10th, 1877.

FREE CHURCH ARCHITECTURE.

SIR.—In your last issue I notice a letter by Mr. Maurice B. Adams under the above head- ing, in which he criticises one particular feature of my design for a Congregational church at Beckenham—viz., the *flèche* on the main roof—and asks the reason of the particu- lar position it therein occupies. In reply I would say that in designing the building it did not occur to me the *flèche* occupied a somewhat similar position to the sanctus bell-turret in

Anglican or Roman Catholic churches, and I was certainly not influenced by any desire, in so doing, to give the building a churchy air. My reason for placing it there is the desirability of keeping it as far away as practicable from the crushing influence of the tower and spire. Practically it does not matter much where it is fixed, as an internal longitudinal trough is the connecting medium with the interior of the church, and, therefore, I place it in each build- ing just where it will look best—at the rear, in the centre, or towards the front.

Then, also, it appears to me quite as admis- sible to fix a ventilator in a *flèche* as a bell—the structure in both cases being purely ornamental—for if one is to be condemned to reveal itself in naked simplicity, why not the other? Mr. Adams's objection, if carried to its logical consequences, would certainly preclude us from erecting towers or spires, or even adopting the Gothic style itself. It must not, however, be thought that I cling to the style as the *ne plus ultra* of design, because at present but little progres has been made, but rather regard it as a basis for future development, its great advantage being that the association of ideas distinctly marks out a building of that character as a place for the "worship of God" as well as the "preaching of the Word."

Just a word in explanation of the short sentence of mine quoted by Mr. Adams, re- probating "useless attempts to adapt the Ritualistic *type* of church to Congregational worship." This refers, as will be seen by the context, to the ordinary form of nave and aisles, with obstructing columns, and not to an individual detail.—I am, &c., JOHN SULMAN.

CHURCH OF ST. PETER, REGENT-SQUARE.

SIR,—I do not think this subject need be carried further. Mr. Woodward and myself appear to agree that much requires to be done to the interior, and that, if I have given my predecessor, who built the church, credit for a "vast amount of good design," I have simply followed out the maxim of "De mortuis nihil nisi bonum," when, perhaps, he might not have deserved so much; that I quite agree with Mr. Woodward, a western gallery and a chancel choir is a mistake, but lack of funds at present prevent any alterations being carried out; that I am much obliged to Mr. Woodward for his subscription to the funds of the church, and that I regret he should have taken my answer to his first letter as a "serpent," when I really considered it a "big fish."—I am, &c., WM. SCOTT CHAMPION.

P.S.—With regard to the music on the Sunday in the Octave of All Saints it was not so good as usual, owing to new tunes and the loss of one of the best boys; besides Mr. Woodward may perhaps remem- ber that if you want dogs and children to do any- thing particularly well on certain occasions they invariably leave a sense of failure.

The tower of the new Free Church at Greenock has just been completed in accordance with the design of the architects, Messrs. Bruce and Sturrock, of Glasgow. A chime of bells, cast in the foundry of Messrs. J. and C. Wilson, of Glasgow, have been placed in the tower, and were rung for the first time on Sunday. The large bell weighs 15cwt., and gives the note G.

The Blairstown School Board met on the 7th inst., and adopted the plans of their architect, Mr. W. W. Blessley, for new schools at the Cwm. The Education Department signified their sanction to the erection of new schools for Nantyglo on a site in the Ffosmain-road.

The parish church of Penegoi, Montgomeryshire, was re-opened on the 25th ult., after restoration from the designs of Mr. Pritchard, diocesan architect, Llandaff. The church has been rebuilt in 14th century Gothic style, and consists of nave, south porch, a chancel with vestry on north side, a central tower over choir, and transepts. Sittings are provided for 175 persons. Some very good woodwork of the 14th century has been replaced in the roof of the chancel.

The Southend-on-Sea Local Board have requested Mr. Angell to prepare plans for the construction of a substantial concert-hall and offices to be built on the pier, at a cost of about £1,200 or £1,500, and also for a new loading pier or jetty with a T-head.

At the instance of the Marquis of Salisbury the Queen's Bench has directed a mandamus to be issued to the Metropolitan Board of Works, under the following circumstances:—The Board had under- taken to construct a street, 25ft. wide, through the Marquis's estate, from opposite Exeter Hall to the Embankment; and they contend that they are entitled to take footpaths out of the prescribed width. The Marquis of Salisbury contends that the footpaths must be additional to the 25ft.

Intercommunication.

QUESTIONS.

[5192].—**Hoop-iron Bond.**—Is it essential for the soundness of the walls of a church, built of rubble masonry on a good foundation, to have layers of hoop-iron bond inserted at intervals? In a couple of the specifications for churches in Donaldson's work on Specifications there is no mention of hoop-iron bond for the walls.—ENGINEER.

[5193].—**Concrete.**—Answers to the following from my fellow-readers will oblige:—1. What should be the thickness for the walls of an ordinary two-storied villa? 2. How is the framework formed that the walls are carried up between? 3. Is shale or other slaty material, together with sand and cement, suitable for concrete, and would blue lias or any other lime answer instead of cement? 4. What quantity of each material would there be to a given quantity of walling? I want to find the cost as against brick walls. 5. Is one coat of plastering, externally and internally, sufficient, or must the walls be battened on the inside?—J. M. S.

[5194].—**Compensation for Deficient Quantities.**—In your paper of the 28th September a correspondent (in reply No. 5132) states that in the case of Croker v. Young, it was decided by the Court that compensation for deficient quantities cannot be granted. Will you or your correspondent kindly inform me where I can see a detailed account of the decision and its grounds?—WILLIAM GRAHAM.

[5195].—**Block and Start.**—Can any one tell me what block and start hammer-dressed quoins with drafted margins are?—SC. AND A.

[5196].—**Heating by Hot Water.**—Will one of our numerous and practical correspondents kindly answer the following questions relating to heating by hot water? 1. After ascertaining the cubical capacity of a building, what is next done? bearing in mind the use or nature of that building—i.e., whether church, greenhouse, or dwelling-house. 2. To what temperature is it requisite to raise the air in these buildings, including in the term "greenhouse,"inery, forcing-house, stove, &c.? 3. After the capacity and temperature required are ascertained, how do you proceed to calculate the quantity of pipe required to insure a given temperature? 4. What guides you in deciding upon the size of pipe to be used, whether 2in., 3in., or 4in.? 5. In practice, what rise is given to the flow, and what fall per foot or yard to the return? 6. What distance below the level of flow-pipe should the crown of boiler be to insure certain action? 7. How is the size or capacity of boiler and area of fire-grate determined when the quantity of pipe to be heated is known? 8. Is a circulating cistern always necessary, or only in special cases, and what height should it be placed above boiler? 9. What number of air-pipes are necessary, say, in a church with three aisles, with pipes in each, and to what height outside the edifice should they be carried? 10. What quantity of cement and hemp (if any) is necessary for each joint in 2in., 3in., and 4in. pipe? 11. Are dips in the pipe, such, for instance, as in passing a doorway, objectionable—if so, how are they to be avoided? Answers to the foregoing will be, I doubt not, of great use to many besides.—IGNORAMUS.

[5197].—**Trap.**—Is it advisable to have a 12in. trap for a 9in. drain? An answer will oblige.—C. F. M.

[5198].—**Drying Plaster Work.**—What means are employed to hasten the drying of plaster work? Are coke fires injurious to it? If so, please say in what respect? What is the best substitute for plaster?—A YOUNG PLASTERER.

[5199].—**Safe Load for Girder.**—Will some reader kindly inform me what would be the maximum safe load for each of the following girders, the stronger one being 72ft., hollow, and the other, 42ft.? One, the longest, is 4ft. deep, including flanges, which are 1ft. 6in. wide; and the other is shown 3ft. 9½in. deep, and 1ft. flanges. The following are the particulars:—Flanges, 1ft. 6in. × 2½in.; web, 3ft. 7in. × ¾in.; angle iron, 5in. × 5in. × ¾in.; T-iron stiffeners, 5in. × 3in. × ½in.; angle iron outside top flange, 3in. × 3in. × ½in.; and the second—Flanges, 1ft. × 1 3-16in.; web, 3ft. 7in. × 5-16in.; angle iron, 4in. × 4in. × ¾in.; T-iron stiffeners, 5in. × 3in. × ½in.; angle iron outside top flange, 3in. × 2in. × ½in. The girders to be of wrought iron.—ANXIOUS.

REPLIES.

[5164].—**Surveyor's Charges.**—In reply to "H. L.'s" further question, there are no reported cases in which the facts are exactly on "all fours" with his case. But the matter is perfectly plain. The debt for quantities is a debt due by the builder (and not by the owner) to the quantity surveyor. This is well settled by the cases; the owner has no more right to discharge this debt and deduct the amount from the sum due to the receiver than he has to pay and deduct the accounts of the builder's timber-merchant, or brick-dealer, for goods supplied to the building. The quantity surveyor is the builder's servant. "H. L." says, "It is absurd that an insolvent builder can obtain a contract for a large amount, and obtain perhaps £100, or more, for the benefit of his creditors." But it is no more

absurd than obtaining £100 worth of bricks on credit, the value of which ensures to the benefit of the creditors precisely the same as does the value of the services of the insolvent builder's surveyor.—L.

[5172].—**Perspective.**—"Anxious" will find J. R. Dicksee's "School Perspective: A Progressive Course of Instruction in Linear Perspective," 8vo., cloth, 5s., published by Virtue and Co., or "The Practical Guide to Perspective," by J. P. Knight, head master of the Cheltenham School of Art, price 1s., equally suitable, and easy to understand the subject thoroughly, and not half so difficult as Burchett's "Linear Perspective," and will be found equally well adapted for self-instruction. To make a perspective of a building, &c., the student must study J. R. Dicksee's work. Shall he glad to hear of the result.—WILLIAM BELL.

[5175].—**Powers of Local Boards.**—"Dilemma" would not be justified or safe in defying the board, which is the authority vested by law, with the discretion to grant or refuse applications for the use of public footways for such private purposes as mentioned in the question.—L.

[5175].—**Powers of Local Boards.**—Under the recent bye-laws public footpaths have to be kept clear, and the Local Board can prohibit stepways or trap in the pavement of any projection. I am not aware they can refuse pavement lights in similar positions. In London and other towns it is of frequent occurrence. I should think "Dilemma" may safely insert such a light if it is securely fixed.—G. H. G.

[5176].—**Quantities—Surveyor's Charges.**—The sanitary authority is merely liable for the fee of the surveyor in the case related, as the bills of quantities were prepared with their sanction. Of course the contractors cannot be called upon under the circumstances, as the work has not been proceeded with.—G. H. G.

[5176].—**Quantities—Surveyor's Charges.**—If the acceptance of the tender by the sanitary authority amounts to a contract, then the builder is liable to the surveyor, and can recover from the authority.—L.

[5179].—**Binding "Building News" Plates.**—I was thinking of having them bound separately from the letterpress in folio, so that the plates would not have to be doubled. I should think in that way three or four volumes could be bound together.—C. F. M.

[5179].—**Binding "Building News" Plates.**—In reply to "A. C." I have had the plates of the BUILDING NEWS for 1873-4 and 5 bound up in three volumes. First vol., "Domestic," including all designs for dwelling houses; second vol., "Ecclesiastical," including churches, chapels, schools, &c.; third volume, "Public Buildings and Miscellaneous Sketches." The second and third volumes are rather bulky, and could easily be divided into two volumes each. I find it much easier to find the design of any particular building, or to obtain any information, than by going through the indices of some two or three volumes, if bound up as issued. I may add that I have had a few leaves of ruled paper inserted in each volume for special index and remarks.—T. E. O.

[5180].—**Ink Papers.**—These can be obtained of almost any stationer in the city of London. They are sold wholesale by Perry, Cheapside; Ward, and Co., Chandos-street.—L.

[5185].—**Payment for Quantities.**—I infer from the question of "Young Architect" that he being the architect of the work has also supplied the builder with quantities. The non-payment by the builder is not a proper ground for refusal of certificate. Quantities are usually paid for on receipt of first payment on account from the owner, but the money for them is due from the builder as soon as the building contract is made. "Young Architect" should sue the builder.—L.

[5185].—**Payment for Quantities.**—"Young Architect's" best course would be to withhold the contractor's final certificate, or, rather, retain the amount of fee for the quantities supplied. They should have been paid for as the certificates were given, and as the work proceeded. The best plan is to make the builder pay the commission on receipt of the first instalment, which the architect can always do by deducting it from the certificate amount. Some builders give a great deal of trouble in this way if they are fully paid.—G. H. G.

[5187].—**Board of Health and Building Line.**—The Local Board can compel the setting back of all buildings to a building line, no matter whether it be in a main or side street. The Public Health Act enables them to enforce this rule. Section 155 enables the urban authority to prescribe the line, if only the front of a house is taken down. Plans also, by section 158, have to be approved by the authority in writing.—G. H. G.

[5188].—**Crown of Large Oven.**—My experience is that fire-clay is the only material for grouting, bedding, and jointing the bricks in large ovens. W. Hurst will make a mistake if he uses fire-bricks for the crown—they scorch the top of the loaf before it is properly baked. The best bricks for the sides and crown are grey Staffordshire bricks, hard burnt, and no wet allowed to touch them until they are used. The bricks in the crown should be buttered—i.e., set with a thin bed on end, and grouted, the height at side 9in., and centre of crown 17in.—JAMES THORNELOE.

WATER SUPPLY AND SANITARY MATTERS.

MERE.—An inquiry was held last week before Hector Tulloch, R.E., Inspector to the Local Government Board, with reference to the proposal to drain the town proper of Mere, Wilts, at a cost of £2,500. The need for a system of drainage brought forward, and confirmed by the inspector who, however, said the Local Government Board would never sanction such a scheme as that proposed, for the cost of draining the suggested sub-district—on which alone all the expenses would be incurred—would exceed the total rateable value of all property in it; whereas if the whole parish were rendered liable the burden would not be very heavy.

NEW ELGIN.—Dr. Macadam having reported on the water supply of this village is quite unfit for domestic use, a meeting of the parochial board was recently held, at which it was determined to form New Elgin into a special drainage and water supply district, and to apply to the Elgin Police Commissioners for the terms on which, if able, they would be willing to furnish a supply from their water main.

WATER SUPPLY OF THE METROPOLIS.—A special meeting of the Metropolitan Board of Works was held on Wednesday, to consider a report from the works committee on the suggested transfer of control of the water supply of the metropolis to the board. The committee stated that they had before them a report from their engineer, in conjunction with Messrs. Bramwell and Easton, on the present supply of water for extinguishing fires, and had received a proposition to provide by wells in water-bearing strata of the country around London a supply of 16,000,000 gallons a day. This suggestion they recommended for adoption, as it would effect a saving of £70,000 a year, and provide a more pure supply. It would, however, be impossible to provide adequately for fire extinction, as the pressure fittings were not strong enough to bear the necessary pressure. The committee further recommended that a bill be introduced, simply providing for the purchase of the companies' interest by agreement or arbitration, and that the board be authorised to stand in the position of the companies both within and without the Metropolitan area, the undertakings are acquired, and that it be left to a subsequent measure to remedy the existing anomalies in the supply. The report was adopted by a majority of the board, and was referred back to the committee with instructions to prepare a bill to transfer under their control the Metropolitan water supply to purchase existing interests, and to extend over the metropolis. The committee were authorised to confer with the Government on the subject.

LEGAL INTELLIGENCE.

"YARD" OR "LOAD."—Action for Cartage and Excavator's Work.—Weaver v. Johnston.—Whitchapel County Court.—The plaintiff is a cartman and the defendant is a builder of Limehouse. The claim was for £37 5s. 9d. From the evidence appeared that plaintiff had for some time been employed to cart away rubbish from houses in course of demolition. He was paid in some instances 1s. 6d. per load, sometimes 2s., but never more than half a crown. The defendant had a contract to build a house in Wapping, and plaintiff, in addition to the mere cartage of the rubbish from the old building made arrangements for excavating, it being understood between him and the defendant that he should receive 4s. per load of earth or rubbish that was dug from a cubic yard. He performed the work and set it in his accounts, which were paid, but the defendant refused to pay the balance now sued for.—For the defendant it was contended that these payments were made in error, and that the arrangement between the parties was that plaintiff should undertake the excavation and cartage of a cubic yard of earth at 4s. Several witnesses were called on either side, the question in dispute being whether plaintiff was to be paid by the load or cubic yard.—Defendant stated also that the earth dug from a cubic yard would make about a load and a half; therefore the rate the plaintiff was suing for 6s. per cubic yard.—His Honour held that the sum of £2 3s. 1d. paid by the defendant into court in satisfaction of plaintiff's claim was sufficient.

NOT ACCORDING TO THE SPECIFICATIONS.—Greenock Sheriff's Court the other day an interdict asked by the Greenock Parochial Board against Messrs. Coghill and Son, to prohibit them from using red sandstone shivers, or red shiver sand to mix with the lime used in the construction of the new parochial buildings at Smithstone, was debated by Mr. McDonald, on behalf of Messrs. Coghill and Son, said his clients had ceased using sandstone shivers pending the decision of Mr. Starforth, the architect for the buildings, but that they held the building by using the red shivers they were not breaking the stipulations of the contract, and further that Mr. Starforth had given his consent to the use of the material, and knew that they were erecting walls for mixing red sand with the lime. Mr. King, for the parochial board, contended that the original contract had been infringed by the use of this sand which was dangerous to the building. It would be an undesirable precedent to permit contractors to construe specifications to suit their own interest. The sheriff granted the interdict asked for.

PARTY WALL, CLAIM FOR.—*Nagle v. Lucas and Jean.*—Shoreditch County Court, before Mr. Jasent.—This was a claim for £15 for the use of a wall standing on plaintiff's land, which was incorporated by the defendants, who are builders in the lawley-road, Hackney, as a boundary wall to some houses erected by them on adjoining ground.—Mr. Boulter, barrister, appeared for plaintiff; Mr. Ward, barrister, for defendants.—The plaintiff, as well as the defendants, is the lessee of her Majesty's Lands and Forests Commissioners, his property being bounded by the wall in question. Some three years ago the defendants purchased the land on the other side, extending as far as this wall, and subsequently built houses upon it, making the plaintiff's wall serve the purpose of a party-wall. The defendants, however, went further: they knocked down a portion of the wall to the extent of 26ft., and used materials in a new wall, which was built exactly on the site of the old one. In this process the plaintiff contends that he has suffered injury, inasmuch as the defendants have converted the wall into a part and parcel of the dwellings which they have constructed. The defendants reply that they first of the permission of the plaintiff to use the wall in the manner they had done; that nothing had been said about compensation; that the wall was a party-wall, and, further, that the amount claimed as compensation was unreasonable and excessive.—The plaintiff's counsel retorted that the claim was not large enough, the property being held for 90 years, and that there was a distinct promise of compensation.—His Honour objected to try the case, and considered that the parties had better refer the matter to the Commissioners of Land and Forests, they being their common landlord.—Several times the counsel on both sides endeavoured to come to an arrangement, but in vain. Finally, on witnesses being heard, an understanding was arrived at that £10 should be paid into court in settlement of the claim.—This his honour agreed to, and an order was made accordingly.

REDEDOS, ST. ETHELBURGA, BISHOPSGATE.—Consistory Court, Oct. 30.—Dr. Tristram, the Chancellor of the diocese of London, held a court at the Dean and Chapter House, St. Paul's.—This application was by the Rev. J. M. Rodwell, the rector of St. Ethelburga, for a confirmatory faculty as to reredos placed in the church, and for an order on the churchwardens to replace the Communion-table, which had been removed.—Dr. Middleton, on the part of the rector, informed the court that the churchwardens had been personally served with the citation, and had not entered an appearance. He, therefore, prayed that the faculty might be granted.—The learned Chancellor wished to know the grounds of the present prayer.—Dr. Middleton said there was a faculty granted in 1862, and since then beautiful carved reredos had been erected, and the new holy table which had been placed in the church had been removed. He believed there was no objection made by Bishop Cloughton, who, as Archbishop, had written to the Bishop of London on the subject. An old table had been placed in the church.—Mr. G. W. Brooks, proctor, for the applicant, read a letter from Bishop Cloughton, in which he spoke of the reredos as a work of art, and thought there might be some objection as to the doors by which the same could be closed. Mr. Brooks added that the doors could be kept open if covering were allowed to preserve a most beautiful carving of the agony of our Saviour from being injured by the smoke of the City of London. He had had an interview with the proctor for the churchwardens, and understood there was no objection to the application, provided the reredos had a covering.—Dr. Tristram directed the faculty to be granted, calling on the churchwardens to replace the table removed, and after hearing some evidence to the construction of the reredos and the representations carved thereon, he said he would visit the church before he made the order as to the reredos.—The learned Chancellor visited the church, and gave directions as to the faculty.

A BUILDER FINED FOR DESTROYING A HOARDING.—A singular case, arising out of an attempt to prevent the acquiring of an easement to a right of light, came on for hearing at the Hastings Police-court on Saturday. Henry Hughes, builder, and town councillor, was summoned for wilful damage to a hoarding, and from the evidence in the prosecution it appeared that the prosecutor, Mr. Birkett, owning the freehold of 12, Maze-hill, wished to prevent a right to light to certain windows overlooking his garden. Under the supervision of Mr. Archibald Smith, architect, a hoarding was set up—the neighbouring owners having refused to recognise prosecutor's right. A week later two policemen, passing the premises at 1 a.m., heard sawing going on, and found defendant directing two men, who were sawing through the posts; they declined to stop their work, and eventually the hoarding fell. In the defence it was contended that the case was before a county-court, but the magistrates decided they had jurisdiction, and, after hearing the case, ordered defendant to pay a fine of £1, £2 4s. damages, and the costs.

HARRIS' WINDOW SASHES.—A case of importance occupied the attention of the County-court Judge at Bristol for three days last week. The plaintiff was Thur Warner Ifter, an engineer, of London, and a defendant, Mr. Joseph Thomas Harris, engineer, founder, and patent wrought-iron sash manufacturer, of Bristol and London. The claim was for

£21, for a month's wages in lieu of notice, and damages which plaintiff alleged he had sustained by breach of contract. The defendant had filed a counter claim, in which he alleged that he had sustained loss to the amount of £40, with regard to some window-sashes, in consequence of plaintiff's negligence, and he also claimed damages on the ground that the plaintiff had not opened the doors of his works in time to admit the workmen. The terms upon which the plaintiff was engaged were that his wages were to be £2 12s. 6d. per week; that there should be a commission, the amount of which was to be afterwards agreed upon; that there was to be a month's notice; and that after the first month there was to be an increase of salary. On the 7th of August the plaintiff went down to Bristol, and entered upon his duties; shortly afterwards the defendant became ill, and was absent from his works. Things went on until the 8th of September, when plaintiff was summarily dismissed; and, from the correspondence which had passed, the learned counsel said he thought that defendant had acted as unjustifiably as any person could have done. In those letters three grounds were alleged for the dismissal of the plaintiff, the first being that certain window-sashes would not fit, owing, it was said, to Ifter's negligence. The second ground of justification was that the plaintiff kept the men waiting one morning, having the keys in his pocket. A third ground was that the plaintiff did not keep a diary of his daily engagements. Defendant, who was examined at some length, declared that no sane man would have performed his duties in such a way as the plaintiff. Witness produced one of the sashes as a fair sample of those produced under plaintiff's supervision, and showed that the centre-bar was 1½ in. out of the perpendicular. Mr. Gingell, architect of Messrs. E. S. and A. Robinson's new premises, proved that the first lot of sashes which he obtained from the defendant were very good. His Honour gave judgment for the defendant, on the ground that the plaintiff was not competent for the work which he undertook to do, as evidenced by the numerous sashes turned out under his supervision, the rejection of them entailing on the defendant a loss which was a sufficient ground for the dismissal.

Mr. George Fenn, borough surveyor of Beccles, died on the 9th inst.—an important day with the body with which he had been connected during the greater part of his life, as councillor, twice as mayor, and finally as borough surveyor, an office he had held for many years.

The new studio of the Dover School of Art, in Northampton-street, was opened by Earl Granville on Saturday, the 3rd inst. The building was till recently used as a racket court, and has been altered to suit its present purpose by Mr. W. J. Adecock, builder, acting under the direction of Major Scott. The seventh annual report of the school, read during the proceedings, showed that there had been a great increase in the number of students during the past year, and that they now numbered 196; 90 were examined in May last, of whom 24 passed, and 9 received prizes. A new master, Mr. East, from South Kensington, had been appointed. An exhibition of paintings, lent by local owners and the South Kensington authorities, has been on exhibition throughout the week.

The Town Council of Hythe, Kent, have accepted the tender of Mr. Mark Pexton—the lowest sent in—for work in connection with the new drain to the south of the Military Canal.

The new military brigade depôts at Caterham and Reading have just been completed for the War Department—the former by Messrs. Higgs and Hill, and the latter by Messrs. Cooke and Green. Messrs. Higgs and Hill have also supplied about 400 locks for Caterham depôt, with keys differing throughout, and a similar quantity for Reading, together with a large quantity of latches, door furniture, and general ironmongery.

At a meeting of the debenture-holders of the New Opera House last week, it was resolved that—in default of sufficient means—the project should lapse, and that the site should be made available for an hotel or some such purpose.

The church of St. Michael and All Angels, Leamington, was opened on Thursday week, after completion, by the addition of nave aisles and western porches. The present contract has been executed by Mr. John Fell, from the designs of Mr. John Cundall.

A new Baptist chapel at Grimsby was opened on Tuesday week. The style adopted is Romanesque, and the principal features of the exterior are steep slated roofs, angle turrets, and pinnacles. Internally the ceiling, which is ornamented by enriched panelled ribs, is supported on light iron columns, the centre portion being raised and covered. The side benches on the ground floor are placed so as to converge the sight of the congregation on the pulpit, and an organ gallery is recessed behind a large, well-moulded arch in the back wall of the chapel. The chapel is 66ft. by 50ft. 6in., by 36ft. high, and will accommodate 1,000 persons. Mr. Morton M. Glover, of London, was the architect, and Mr. John Brown, of Grimsby, the builder.

Our Office Table.

THE General Post-office has long outgrown its premises, and it was rumoured some time ago that, in the event of Christ's Hospital being removed to the country, it was not unlikely that a building large enough to accommodate the chief office and some of its branches would be erected on the site. This idea, however, seems to be abandoned, and it is now stated that the authorities contemplate purchasing from the City the vacant plot of ground, consisting of about eight acres, which stretches along the Embankment from Blackfriars to the Temple.

AMONG recent German inventions is a simple process, depending on the use of acetate of lead, by which every kind of colour is applicable to sheets of zinc. By mixing black lead, for instance, with the salt a very agreeable light brown hue is obtained. It is by this process the cupola of the synagogue at Nuremberg has been painted. A sufficient length of time has already elapsed, it is said, to show that the atmosphere has no influence on the zinc sheeting of the roof, thus showing the practical value of the process in such cases. By the addition of other colouring matters, light or dark shades of yellow or grey may be produced.

THIRTEENTH-CENTURY and nineteenth-century tunnelling can be advantageously compared in the rock beneath Morlais Castle. When the castle was reared, 600 years since, on the borders of the Brecon territory, the builder intended to excavate a trench out of solid rock on three sides, so that, with a precipice on the fourth side, the castle might be rendered impregnable; the project, however, was abandoned when half completed. Immediately to the north of the old castle a tunnel is being pierced through the rock, in order to link the town of Merthyr Tydfil with the London and North-Western Railway system. The tunnel is over 1,000 yards in length, and goes through solid limestone and millstone grit. The agencies are the Ingersoll drill, worked by compressed air, and dynamite, the latter under the direction of Mr. Cross, of Cardiff. Mr. Mackay is the contractor for the undertaking.

A CONCESSION has been made to those who have persistently urged that on the proposed site at Westminster Cleopatra's needle would there be dwarfed by its surroundings. The supports on which the model obelisk rests have been so modified in dimensions and form as considerably to raise the apex. The pedestal is now 10ft. 4½ in. in height. It has been made slightly tapering, being 10ft. 3in. at the base and but 9ft. 5in. at the summit. Dr. Birch, in his "Notes on Obelisks," distinctly states that the Egyptians always made the pedestals of these monuments taper slightly upwards, like the shafts. Between the Parliament-square pedestal and the steps, three in number as before, there is now seen a stylobate 11ft. 6in. square and 3½ ft. high. The height of each of the steps is 1ft. 10½ in., or 5ft. 7½ in. for the whole. The topmost step is 14ft. 4in., the next 17ft., and the lowest 20ft. square. At each of its corners would be a pediment 4ft. high, on which a sphinx might be placed, and the platform is ascended by three steps opposite each side of the obelisk. With the platform the total elevation of the supports would be 22½ ft., which, added to the height of the shaft from base to apex, which is 68ft. 5½ in., gives within half an inch of 91ft. in all—an addition of 10ft. to the former total elevation.

AT the annual dinner of the Operative Bricklayers' Union, at the Queen's Hotel, Cobridge, last week, Mr. William Woodall said it had been his privilege recently to visit a country where he had been greatly impressed with the capabilities of brickwork. The grandest and most enduring remains—the temples, aqueducts and theatres of ancient Rome—were largely of brick and imperishable mortar. In other parts of Italy, in the most beautiful monuments of early Christian times, and of the middle ages, brickwork held its own with marble, and in combination gave delightful beauty of form and colour. In the friezes and cornices, in the chimney tops of the humblest as well as the grandest buildings, there was abundant evi-

dence of the artistic ingenuity by which the workmen worthily supplemented the conception of the architect. He thought it would not be disputed that there had been a serious declension in their trade, so far as its artistic character was concerned, although mighty works would endure to testify to the railway and engineering enterprise of the age. But in the revival of what was called "Queen Anne" architecture in their own day, there was much to be hoped for, since its merit lay in the fact that it professed to be dependent wholly or mainly upon honest brickwork. He felt assured that what was wanted for the maintenance of their industrial supremacy was skilled rather than cheap labour, and he hoped that the practical question of technical education would commend itself to their attention.

The programme of the arrangements for the coming session of the Society of Arts has just been issued. The opening meeting will be held on the 21st inst. At the second meeting, on the 28th, a paper will be read on "The Telephone," by Prof. Bell, the inventor, and among the other papers to be read before Christmas is one on "Freedom in the Growth and Sale of the Crops of the Farm considered in its bearings upon the Interest of Landowners and Tenant Farmers," by J. B. Lawes, Esq., F.R.S. Three courses of "Cantor Lectures" are announced—First course, on "The Manufacture of Paper," by William Arnott, Esq., F.C.S.; second course, on "The Application of Photography to the Production of Printing Surfaces and Pictures in Pigment," by Thomas Bolas, Esq., F.C.S.; third course, on "Some Researches on Putrefactive Changes, and their Results in relation to the Preservation of Animal Substances," by B. W. Richardson, Esq., M.D., F.R.S. The second and third courses do not commence till after Christmas, as is also the case with the first meetings of the Chemical, African, and Indian Sections. An additional course of three lectures, on "Explosion in Coal Mines," is to be delivered by T. Wills, Esq., F.C.S., on three evenings in January and February. It is stated that the conference on "Health and Sewage of Towns" is to be repeated, and that a second "Congress on Domestic Economy" will be held this year at Manchester.

We have received the report of the Council of the Liverpool Architectural Society upon the model bye-laws issued by the Local Government Board. The council's report seems to be thoroughly condemnatory of the new regulations upon various grounds, some of which are valid and some appear rather frivolous. Thus the definition of buildings into three classes, is objected to inasmuch as it omits all reference to composite buildings, which combine the characteristics of all three, or of any two; the bye-law as to party-walls is criticised with some force, for as we have pointed out there are instances which would give rise to serious litigation, if the party-wall definition was stringently adhered to. Bye-laws 19 and 20 as to thickness are discussed. The restriction as to boarded floors is pronounced arbitrary. Between bye-laws No. 56 and 17, a "glaring inconsistency" is pointed out as to the relative levels of joists, and the bed of concrete or asphalt. The drainage bye-laws are pronounced unworkable; the requisition for a complete set of plans and sections is considered "inquisitorial without serving any good purpose," and it is thought, not without reason, that members of Local Boards and their surveyors who may be practising architects, will enjoy the advantage of studying all the designs and specifications submitted to the sanitary authority, and thereby be placed in an unfair position as regards their competitors. We do not endorse all the objections, especially the opinion that the health of a community depends as much on food and personal habits as upon the dwellings inhabited. It is true we may convert a palace into a fever den, but if we do not provide healthful dwellings, we make the largest part of them such.

At the meeting of the Court of Common Council yesterday it was stated that the City Lands Company had for some months been considering the vexed question of Temple Bar, and they had been trying to obtain concessions, which they thought the public might fairly demand. On the south side they had been met

in the most liberal manner by Messrs. Childs, the bankers, who had thrown into the public way a depth of 4ft. 6in. along the whole of their frontage. At present the pavement east and west of the Bar was 10ft. wide, and it was contemplated to make the pavement a uniform width. They also recommend a roadway of 17ft., so as to enable two carriages to pass abreast from east to west, a column or obelisk in the centre to mark the site of the Bar, a 5ft. rest and a roadway of 17ft. to enable two carriages to pass abreast from west to east. There would then be a pavement on the north side of 12ft. Mr. Street, to whom the committee had been referred by the Government, and who was the architect of the New Law Courts, insisted on a pavement of 14ft. outside the law courts. It is hoped, however, that public opinion will not enforce this. It is true that the New Law Courts were set back 11ft. 11in. from the original frontage, but in an improvement of such vast importance this further concession might well be made.

CHIPS.

A new Board school was opened in Summer-lane, Birmingham, on Monday. The building, which will accommodate 1,351 children, has been erected by Messrs. Horsley Bros., from designs by Messrs. Martin and Chamberslain, architects, of Birmingham.

On Tuesday a new Board school was opened on a site purchased from the Artisans, Labourers, and General Dwellings Company on the Queen's Park Estate, Harrow-road. This school, which is built after the Queen Anne style, is to accommodate 854 children, girls, boys, and infants. The site has cost £2,967, and the building £8,938.

A new church is about to be erected at Bear Park, on a site near Auton Stile, on Ushaw College-road, given by the Dean and Chapter of Durham. The tender of Mr. George Gradon, contractor, of Durham, amounting to £2,415, has been accepted, and the foundation stone is about to be laid and the building proceeded with.

The rebuilding of the parish church of St. Martin, Dorking, is approaching completion, and the committee have issued an appeal for £600 for gas-fittings, seating the side aisles, and placing screen in the tower arch. The new peal of bells will soon be hung by Messrs. Gillett and Bland, of Croydon, who will then put a clock in the tower.

The Ipswich Dock Commission have requested Mr. J. F. Bateman, C.E., consulting engineer, to prepare plans and specifications for a new entrance lock at the south end of the dock, the estimated cost of the execution of which is about £39,000.

New works of water supply for the borough of Kirriemuir, N.B., were opened on Thursday week. They have been constructed at a cost of £4,500, from the plans of Mr. Lamond, a local engineer, and provide a supply by gravitation, the water being procured from about 900 acres of ground on the estate of Pearisic.

Mr. Scott, of Scarborough, has been elected surveyor to the Whitby Local Board of Health in the stead of Mr. Walker, resigned. There were nearly fifty applicants for the appointment.

The plans for the new workhouse for Christchurch Union, Hants, were submitted to the guardians by Mr. Barton, architect, of Bourne-mouth, on Monday week, and were adopted after providing that the schools shall be detached from the main building. The buildings will be proceeded with at once. They are designed to house about 200 persons, including officials, and the cost is estimated at £15,000.

Canton Bridge, Cardiff, was opened on Friday by the mayor and corporation, after having been rebuilt on a wider basis. Mr. J. A. B. Williams was the engineer. The contract for the masonry was taken by Mr. Samuel Shepton, builder, of Cardiff.

The town commissioners of Newry decided on Friday to apply to Parliament for the necessary power to purchase the undertaking and property of the existing local gas works.

Mr. William Smith writes from Morley to protest against the contemplated spoliation of the ruins of Richmond Castle. He says that the Government are arranging to rent the same of the Duke of Richmond and Gordon, and to build a row of cottages on the east side of the Castle-green, in front of Robin Hood's Tower and the Priest's Chapel, in order to accommodate the staff sergeants of a militia battalion. He adds that representations have been made to the Duke on the subject, but without result, and suggests that the protest should be backed by county influence. The alleged intention of the Government to deface an historical ruin by blocking it in with soldiers' cottages looks like a characteristic piece of Conservative policy.

MEETINGS FOR THE ENSUING WEEK
 MONDAY.—Royal Institution of British Architects. Paper by H. White, Fellow, on "Middle-class House, Paris and Central London," 8 p.m.
 TUESDAY.—Institution of Civil Engineers. Discussion on "Progress of Steam Shipping," 8 p.m.
 WEDNESDAY.—British Archaeological Association. Paper by Birch, LL.D., Keeper of Oriental Antiquities, British Museum, on "The Obelisk known as Cleopatra's Needle," 8 p.m.
 FRIDAY.—Architectural Association. Paper by F. P. St. Aubin, on "Notes on Cornish Churches," 7.30 p.m.

SLATES — SLATES — SLATES.
 Bangor, Portmadoc, and Importers of American Blue Green Slates, a large stock of which can be seen on the premises.

SCAFFOLD POLES, 22ft., 2s. 6d. each
 28ft., 2d. per foot; 35ft., 2d. per foot.

DEALS — BATTENS — FLOORING
 Send for price list.—R. MAY & SON, Timber and Sash Merchants, Acorn Wharf, Old Kent-road, London, S.E.

Trade News.

WAGES MOVEMENT.

LONDON.—No change in the condition of affairs between the masons and their employers is to be reported. The strike committee again paid strikers pay, at the rate of 18s. per week, last Saturday, and still assert their confidence in the ultimate result of the dispute. On the other hand, the masters, at a meeting held on Tuesday, expressed equal confidence so no chance of a reconciliation is at present apparent. The men have expressed a wish to meet their masters in conference, but this has been declined. The importation of foreign labour continues.

WHITLAND ABBEY GREEN SLATES

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. Further particulars (with a list of important buildings covered by the slates) apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire. ADVT.]

Holloway's Pills are the snrest preventives of the many maladies begot by wet, damp, cold foggy weather. Under the influence of this purifying medicine the blood is pure and the lungs free. An occasional dose during the winter months proves salutary to all exposed to vicissitudes of temperature.

CHURCH METAL WORK

Altar Rails, Alms' Dishes, Coronas, Candlesticks, Communion Plate, Medival Gas Standards, Lecterns, Screens, Trowels, Vanes, Gates.
 SOLE AGENTS for Powell Brothers' Stained Glass, &c. Doulton Ware, and Architectural Terra-cotta, Ornamental Lintel, Façade, &c.
 Estimates Furnished for Special Designs.

CHUBB and SON,
 57, ST. PAUL'S CHURCHYARD, E.C.
 LOCK and SAFE WAREHOUSE, 125, Queen Victoria-st.

TENDERS.

BAYSWATER.—For new sheds for the Patent Straw Limited. Mr. E. W. D'Avigdoe, engineer:—
 For iron shed:

Whiteley	£1,723
Dixon and Co.	1,690
Handyside and Co.	1,650
Young and Co.	1,600
Cocking	1,328
Brittle	1,241
Wrightson & Co. (ironwork only)	690
Whiteley (all bnt ironwork)	531

For wooden shed:
 Elford 817
 Whiteley 800

BRISTOL.—For the erection of the David Thom Memorial church and schools at Bishopston. Mr. St. Colman, Bristol, architect; quantities by Mr. Deane
 William Veals £7,660 0
 Eastbrook and Sons 7,584 0
 Baker and Son 7,332 0
 Hill and Prior 7,285 6
 Davis, J. E. 6,990 0
 Wilkins and Hill 6,726 0
 Banner, W. 6,678 0
 Stepheus and Bastow 6,676 0
 Lewis and Edbrook 6,611 10
 Hatherley, E. J. 6,283 0
 Cowlin and Son 6,237 8
 Howell, E. C. (accepted) 5,863 0

BRISTOL.—For erection of new offices, Black Horse yard, West-street, and heating same, for Joseph Henney, Esq. Mr. W. Cloutman, surveyor; quantities supplied:—

Wilkins and Son	£410 16 0
Cunningham	390 0 0
Lewis and Edbrook	359 0 0
Hill, T.	333 0 0
Wilkins and Hill	329 5 0
James, J.	315 0 0
Caldor (without heating)	308 3 4
Hatherley, E. J.	308 0 0
Eastbrook and Son	307 0 0
Davis, J. E.	289 0 0
Phillips, Geo. (accepted)	286 10 0
Banner (ditto)	280 0 0
Hayes, C. A. (ditto)	253 0 0

[Surveyor's estimate (whole) £310]

FELIXSTOWE.—For the erection of schoolrooms, w master's residence, for the School Board for Walton T. Felixstowe. Mr. Brightwen Binyon, Princes-street, Felixstowe, architect:—
 Saunders, Dedham £2,465
 Bennett, Ipswich 2,410
 Gibbons, Ipswich, 2,350
 Thurman, Walton 2,133
 Ward, Felixstowe, (accepted) 1,969

THE BUILDING NEWS.

LONDON, FRIDAY, NOV. 23, 1877.

THE DECAY OF MÆDIEVAL MONUMENTS.

THE French Institute, amid its other learned labours, has been engaged upon an inquiry into the causes which led to the decadence and ultimate downfall, for a time, of the art which belonged to the middle ages, and the neglect of its monuments at the present time. The subject is one of high interest, and might have been rendered even more so, had it been borne in mind that an almost precisely similar phenomenon was witnessed in the Classic period, or towards its close, of European history. The second crisis of art, however, though identical in its aspects, was a contrast, in so far as its origin was concerned, with that which, by some centuries, preceded it. From the 11th to the 14th century Europe enjoyed an art of its own, new and creative, as those terms were then understood, and contemporaneous with a certain revival in philosophy, poetry, and architecture. Suddenly a downward tendency was manifested. With the progress of human liberty came, strangely enough, the enslavement of the arts, and the epoch of geographical discovery proved, in more than one respect, the epoch of barbarism. Yet the soil of Italy was then yielding up harvests of antiques; Grecian and Roman relics were turned up by the plough of almost every peasant; and museums were filled while students were wanting. The art world was in confusion, and the anti-Gothic maledictions of Vasari were anticipated by the anti-pagan denunciations of his predecessors in criticism. There were others—Montalembert, Viollet-le-Duc, and Lessus among them in our time—who thought a mediæval restoration in the 19th century possible; but they found it a hard task to re-unite the broken traditions of 400 years. The professors of the Institute, at any rate, declare that the effort was a failure, that the sole result of this neo-Gothic movement was the publication of some admirable archaeological literature; and that, as to practical fruits, they amount only to casts and copies from the past. The Institute, however, is not discouraged. It proposes a series of questions to be answered, which, *being* answered, may, we are told, restore the secrets of the past for the advantage of the future. Among them three are insisted upon as of cardinal importance. How did this great Gothic genius originate? What was the state of society amid which it flourished? Why could it not transmit itself through a succession of noble schools, like those of Italy?—though here, it may be suggested, the fortunes of Italian art in modern days have been even less prosperous. There is another problem started: Why did France never have a "Middle-Age," as that term is commonly applied? The epoch so full of brilliance, of boldness, and of invention in other countries, left her with a multitude of mediocre artists, without name or character; and yet Villard de Honnecourt was all the while working upon his marvellous productions, outlining the old cathedrals of Vaucelles and Courtrai, the rose windows of Chartres, the cloisters of Meaux and Lausanne. More than this, he studied Madonnas in Hungary, and, when the Dutch, German, and Italian genius had begun to fade, this patriotic painter imagined that he had discovered a hope for France. But the fragments we possess of him—his gladiators, dice-players, lions, wild boars, swans, and dogs—tell us, only too emphatically, how hopeless was the paralysis which had

smitten the art-life of Europe. The grotesques of the earliest and most infantile schools were reproduced, and Villard himself painted "a Saracen" in a Grecian tunic. Wandering away from sacred subjects, the artists of that degenerate time floundered in the universal ignorance, until they represented Alexander the Great in the costume of an ancient Briton. But, we are reminded, the painter was never so vitally Gothic as the architect, and even he forgot his true inspiration when rearing the roofs of St. Denis, of Chartres, of Noyons, Senlis, and Fécamp; though, in the last instance, the barbarising of the abbey, as seen in ruin, is so slight as to be almost imperceptible. While lamenting, however, the decline of a sumptuous style, our Academicians deny that the North has any right to be regarded as the creator of it. We will not re-enter upon a controversy which has been exhausted a hundredfold, because the present point of interest lies in the assertion, on the part of the Institute, that a great art has fallen away, and that the endeavours to re-inspire it have been failures. Certainly, the later examples in Brittany, Normandy, Lorraine, and Flanders are represented in the living schools more richly than the more antique monuments in the Isle of France, Veroy, Valois, Le Beauvoisis, and some districts of Champagne—"old France," in fact, over which the Capetonne dynasty ruled. The archaeological aspect of that region, indeed, is a written history in itself. We tread at every step upon the traces of Gothic tradition. The Institute is right—they are all, more or less, mouldering from the surface of the earth, and sinking beneath it; as, besides others already mentioned, Saint Remi de Reims, Notre Dame de Chalons, and the Church of Saint Leu d'Eperons. Not one of these is perfectly pure as a representative of any particular style, for the Roman arch interferes here and there in all with the Gothic plan. Much the same may be said of St. Etienne de Beauvais, St. Martin de Léon, St. Evremont de Creil, and many other edifices of which the Gothic character has been almost obliterated by the predominance of a barbarous taste. Yet it is claimed by French architects, and by the Professors of the Institute above all, that these were among the first purely Gothic edifices in Europe, and that their defacements were due to the corrupting influences of a later time, at which such architects as those of the Isle of France and Picardy—Jean de Chelles and Villard de Honnecourt—would have stood aghast.

It follows, according to the history and reasoning adopted by the French Institute, that the Gothic is essentially and exclusively a French form of art, and that France therefore, while deploring its decay, has the best right to champion on its behalf a new Renaissance. The hopes, even of the enthusiasts, however, are not very exuberant. They point to the many ruins on the banks of the Rhine; but where is French Gothic in that valley? They celebrate the Frenchmen who reared "Cantorbery" Cathedral, and lament that they are no longer called upon to keep it in repair, and they quote the record of their builders who spread themselves over Europe, carrying their style with them, and impressing with it a character upon the architecture of centuries. It is curious to read, however, the complaints in which their modern critics indulge. The builders of Strasbourg and Cologne, they say, working upon French models, claimed them as their own; the Italians borrowed, but paid their debt to the Tudors. All this is exceedingly little to the purpose in the second half of the nineteenth century, especially when the question is, not to whom we owe our Gothic monuments, but how they may be preserved,

and whether there is any possibility of that genius—which may almost be termed mysterious—being revived. So far from this last hope promising its own fulfilment, it is pointed out that, wherever new churches are being erected in France—in Auvergne, Provence, and Languedoc more particularly—the tendency is to abandon the Gothic altogether, or to mingle with it other elements in, as the writers say, with unnecessary emphasis, "frightful proportions." Colour is usurping the place of form; pillars are multiplied, more for ornament than use; the nineteenth century is once more overwhelming the middle ages, and again is art threatened with a disgraceful shipwreck. We do but re-echo the prophecies of evil which come to us from the left bank of the Seine. The Gothic is blending with the Arab, and the Arab with the Italian, and a Renaissance or ruin must be near. What are those towers of exaggerated height, pinnacles resembling lacework, open galleries, canopied images, plethora of detail, and stone embroideries that look as if cut out of cardboard? Then, to what are we to ascribe this decadence, decay, and neglect? The reply is ready. Gothic was born of enthusiasm; genuine enthusiasm exists no longer. Therefore, the vitality of Gothic has ceased. That is the explanation which we receive from a distinguished section of the Institute, and with it, perhaps, we must be contented. It is true that there was a certain degree of romance about the rearing of the old cathedrals—voluntary labour, gifts of charity, the free-will offerings of penitents, and so forth. They had nothing in common with the Parthenon, Pæstum, or Baalbek: they breathed the inspiration of the age, and are now, it is said, perishing for want of it. Says M. Ernest Renan, the Gothic contained within itself the germ of its own decay; it was an accident, not a principle; a defiance of principle rather, and doomed accordingly; a paradox destined to an ephemeral existence, and no more. Yet France assumes it as her own, and the wise men of the Institute tell us:—"It is true we never had a Giotto, but we have artists by far his superior." It might be said, were the controversy worth insisting upon, that the celebrated "pictures of Avignon" were all by Italian masters; that the "Roman basilicas" of the South were not French at all, and had nothing to do with Gothic; that the canvases and panels of Saint Severin came, for the most part, from Germany; and that the earliest Gothic porticoes executed in France were wrought in what was not French territory or regarded as belonging to the French nationality at the time. But this would be beside the subject, although it is forced into connection with it by what we may call, perhaps, a corporate spirit of egotism. Passing on, it is certain that, while the venerable monuments of Gothic art were mouldering, no endeavours, during a long course of years, were made, either to preserve or to multiply them, and the enamels of Limoges were prized more highly than the spires of Beauvais or St. Front de Perigueux. It was during this interval that a vast amount of dilapidation took place, which no catholicity of sentiment can ever now redeem. The Fifth Charles, with the aid of those accomplished artists, Raymond du Temple and Jean St. Roman, tried the experiment, and failed. Gothic was dead in France. So much, at all events, is avowed by those who never fail to insist upon the pre-eminence of her intellectual charters. Then, like a second growth, we perceive the grand grey edifices of time overflowered, as it were, with ornament; luxury within the edifice, instead of without; gilding, painting, tapestry, decorated mansions, ginger-bread chapels; and contemptible imitations from Florence, Bologna, and Milan—though in

all these three a similar lassitude had succeeded to the former enthusiasm, and their noblest fanes remained unfinished. Few cared to undertake the works, fewer still to pay the cost of completing them. The rare additions made to the great structure at Reims were servile reproductions from the antique, or from semi-barbarous Byzantine shrines, and copies from Giunta and Cimabue flamed above the altars of edifices whose artists and builders had deserted their labours. The Golden Legend of Art was lost, and France was no longer in the mood to attempt its recovery. Such is the story—a somewhat lugubrious one—told to the Institute of France, and the conclusion of the Lamentation is characteristic. It was through no fault of the sixteenth century that its genius was not transmitted to after ages—it never completed itself; it was not the creator of Gothic, but for awhile its conservator; it neither inherited nor bequeathed a perfect art, for the Gothic, belonging to other epochs as well as to that, was never more than a fragment—a mighty one, no doubt—yet one of which the relics are decaying before the final stone was set in its place to crown the fabric. These are the Academical conclusions of Paris in 1877.

THE GOTHIC SECESSIONISTS AND "QUEEN ANNE."

IT has been urged by some of the devotees of "Queen Anne" that it is the offspring of the Gothic—that its revival among us owes its origin to the spirit of that style, and that it fulfils all the conditions of modern wants. They tell us that so far from being the revival of the Classicist, it partakes, in its essence, of every advantage Gothicism has claimed as its legitimate property. It is very natural these claims should be made now on behalf of those who have assumed a new character after following a style like the Mediæval to the letter. It is very reasonable that the claims so unhesitatingly put forth a few years ago on behalf of the universality of Gothicism, and its elasticity to meet all wants, from a domestic building to a City bank, a civic structure, or a warehouse, should now be transferred to the new revival; but it is equally singular that the claimants should have transferred their allegiance to a style in which the detail is so thoroughly opposed to the spirit and meaning of Gothic. For if there be any reasonable ground for adhering to one style, it is that of preserving in its purity the *motif* of certain well-defined characters, such, for example, as the pointed or arched form of opening, the consensus of vertical over horizontal features, the *raison d'être* of mouldings, and such like. If we can conscientiously say these symbols or expressive features are capable of such extreme variation as we find them to be in Queen Anne, then we must confess that the principles upon which the partisans of Gothic swore had no real claim to the attributes imputed to them; and, in short, that the style has been tried and found wanting. We cannot possibly see how the uncompromising sticklers for Mediævalism can refute this argument. They may say we "design in Queen Anne because it is the nearest approach to the versatility of Gothic, because it admits of a free and unrestricted treatment, and because it lends itself to picturesque grouping, high roofs, and so on;" but this is plainly "begging the question"—it is like asserting Classicism is un-English, and therefore ought to be rejected. Far stronger are the reasons which assign domestic convenience and comfort as the proximate causes of the reign of 17th century architecture, once more among us. People were beginning to tire of Gothic villas, and pseudo-mediæval castles

—the partisans of that style, like most other partisans, were bigoted men, and would not allow any other views but their own to predominate. Common-sense reasons and conventional ideas were looked upon, only ten years ago, as vulgar, and as indicating a low taste; and the nearer the domestic planning and details approached the ecclesiastical idea or taste the better. It is extremely amusing to see how the spirit of the dream has changed. We are now deluged with the most stereotyped of the features committed during that reign of common sense and national independence, which the Mediævalist once unhesitatingly branded as unchurchmanlike—the era of whitewash, vandalism, and churchwardens. The very things that he denounced as sacrilegious and tasteless—the church galleries and high pews, and three-decker pulpits—so long as they retain a trace of the old mouldings or carved work, are now gloried in; it is held to be desecration even to touch or restore them, while the sash window and the vernacular fanlight have passed from the region of contempt into favour. We can understand the new Education Act, which gave so much umbrage to one section of the Church, should have brought with it a revival of those features associated with the progress of Protestantism in this and other countries, and we can appreciate the motive which prompted the Loudon School Board to clothe its new school buildings in a dress of that ultra-Protestant reign of Queen Anne; but we cannot fathom the motives which prompt Mediævalists of extreme views to take to it rapturously on purely artistic grounds. We repeat it there must be something deeper than the mere reaction of fashion.

It may be urged, with a great deal more fairness, that "Queen Anne" is a compromise between Gothicism and a recurrence to Classical types. It possesses more flexibility than either of the purer styles; it lends itself easily to modern ideas of domestic comfort, wide and roomy halls and staircases; it avoids unnecessary nooks and corners, and it deals in a commonsense way with woodwork, and above all acknowledges the "sash window." Moreover it is a brick style, the associations that surround it are thoroughly English, and more akin to our own tastes than the Mediæval style. In every one of these tests Gothic has been tried and found wanting. No Gothicist will deny that as a rule Gothic houses and villas are costly mistakes. We can point to a very few that are quite satisfactory as residences. Mr. Waterhouse, out of a large number of architects, has succeeded beyond many in bending and adapting the style to domestic and commercial purposes; but even these works show such a clipping and modification of feature that we can scarcely recognise in them the character of mediæval Gothicism. Again, take the interior finishings and woodwork of houses. Few architects will deny that they are extremely costly and unsatisfactory in this style. On the contrary, the vernacular requirements of the modern conventional house suggest to us many of the features in the Queen Anne of the moderate school; indeed, the plainest back elevation of discoloured brickwork, if only it has a parapet, square stacks, chimney-pots, and white pointed sash windows, has a lively interest, and to some an indescribable charm just now, despite the abhorrence the self-same men entertained of it but a very few years ago. Then the hole-in-the-wall or sash-window theory was decried as beneath the notice of architects, and worthy only of the most prosaic dabster in bricks and mortar. But, now, common-sense things as they are, it is none the less a truth that one or two of our fashionable architects swear by the flat-gauged arch and the sash-window—those sadly-abused members in the years of

our youth. Pedantry, conceit, and mancrism have done their best to wrap them up in a dress of pilasters and classical members, so much as almost to stifle their meaning in some hands, and this habilitation has been carried so far as to make the style depend upon it. It is very necessary for the admirers of the style to distinguish clearly between the real features and spirit of seventeenth-century Classic and the hybrid mixture of conceits termed "Queen Anne," to enable them to judge of the true merits of the style they are following. We would distinguish first the moderate common-sense "Classicism" of the seventeenth and eighteenth centuries, of the time of James I. and the early Georges, in which high-pitched roofs, sensible windows, and plain brick ornamentation existed, such as the style known in Johnson's time, and of which we find numerous instances in the Temple, Bedford-row, Queen Anne's-gate, &c. Secondly, we would mark that perversion of taste which was followed during the same period, or partially so, when the then imported Dutch fashion was combined promiscuously with Late Gothic features—a phase, or rather heterogeneous compound, of conceits and grotesque whims. It is right that these two developments of the same general movement be discriminated; it is right also to remember that Gothicism had died out in all but the name, and that a Classical school of thought was established. As typical of the more moderate combinations of the vernacular and Palladianism we may cite the historical examples of Hatfield, Audley End, and Charlton House, Wilts, in which we find the spirit of the vernacular still maintaining supremacy under a garb of foreign and semi-Classic detail. It is for the admirers of "Queen Anneism" to say which of these two phases they are bent upon reproducing or adapting. Much of the work called after this name has no more affinity to it than to Greek. They are really Gothic houses, dabbled up with sash windows, pilasters, and pediments, and may be designated Queen-Annesque-Gothic, if they are worthy of any name. There is neither the motive nor the breadth and simplicity of the style they mimic. About London there are heaps of this rubbishy kind of stuff, with no pretensions to Gothic, and with details of Classic that would make a tyro blush. But a composition as that of Merrist Wood, Surrey, by Mr. Norman Shaw, is thoroughly Gothic in spirit, at the same time devoid of senseless ornamentation. If the admirers of the style would first become architects of plan, and then workers-out of the detail upon either Gothic or commonsense principles, they would do much towards taking away the reproach we constantly feel when we look at one of these inflated attempts—that architects who try to be artists first always and signally fail. It seems, also, natural for a man of Gothic predilection to work in his own way, rather than to try to do something in a totally opposite spirit. If he does the latter he nearly always fails, or shows the result of pedantry or of rashness. He falls into numberless conceits, his work looks affected or operose, and there is a painful evidence of effort that completely destroys the unity of the work. If success is to be achieved in the style, it must be by honestly studying the plan, and not by the feverish desire to do something grotesque or quaint, as we see in some attempts at Kensington and the West-end. It is far better for the architect, if not a Classicist, to abstain from mimicking Classical features on the one hand, or to attempt to give variety and picturesqueness by an *omnium gatherum* on the other. Another consideration that is lost sight of appears to be the essentially Domestic character of the style. For schools, houses, hospitals, and residential buildings generally, it is admirably adapted,

but for civic and monumental structures—such as town halls—it scarcely seems dignified and eurythmic enough. From what we have said, it is evident that the claims set up for the style have been over-rated, and that to suppose Queen Anneism will take the place of either Gothic or pure Classic for the higher purposes of architectural design is to imagine that the aims of high art have retrograded. At the same time, we must admit that the requirements of our day demand a flexible architecture, that the style in question in some hands is capable of fulfilling all that is required of it, and that the chief consideration to promote this end must be attained by a careful avoidance of extremes.

PARIS AND LONDON HOUSES CONTRASTED.

IN another part of our impression we give an abstract of a paper, read by Mr. William H. White, Fellow, before the Institute of Architects, last Monday evening. We need hardly say the subject has been alluded to at various times in these pages. In Vol. XXIX., page 638, we gave an abstract of a similar paper, read by the author before the members of the Association, and in Vol. XXX., page 315, the subject was further illustrated. Mr. White's treatment of this theme last Monday was more fully developed, and was accompanied by plans of Paris and London houses, with suggestions for the application of the system to central London. The author succeeded in drawing a lucid contrast between the *maison-à-loyer* of Paris of the Second Empire, and the London middle-class house as we see it in the Bedford Estate and other residential parts of the metropolis. The picture was perhaps a little too highly coloured—we will not say "fanciful," as the President observed—though it must be observed there were many points dilated upon that will afford a profitable evening's discussion at the next meeting of the Institute. Mr. White, while tracing the development of the Roman *insula* or "island" of shops and superposed dwellings at the close of the first century, to the blocks of Old Edinburgh of the 16th and 17th centuries, and to the *maison-à-loyer* of the reign of Louis XIV., in Paris, urged the idea of this evolution as an argument in favour of the system in this country—doubtless without taking into account the fatal divergence from the system exemplified by ourselves. It may perhaps be retorted we have fallen back in our ideas of house organisation. We here simply note the fact: it is a point open to discussion, in which a great many social disparities and antipathies must enter. The plans illustrating the peculiarities of the model of the Pierre le Muet *maison* give us some clue to the ideas of the 17th century house-building, and as Mr. White remarked, it is highly instructive as the type of the London house after the Great Fire and the Paris house of to-day. We trace here the germ of after-modification. In one of these we find a large plot of about 40ft. by 100ft., divided in depth into four almost equal parts or two-roofed blocks, one being in front, alternating with open areas for light and air. The covered portions are connected by passages on one side containing the stairs and entrance, while the front block is pierced by a centre passage-way or entrance opening into the first courtyard. In front we have a stable, and a kitchen on either side of entrance. The second block contains two sitting-rooms. On the first and second floor, we have sets of rooms approached by the same stairs at the angle of courtyard. These are bedchambers and dressing-rooms, and each floor could be thus occupied by the head of a family and

his married sons and daughters, or let separately. We certainly trace in this not very felicitous arrangement the type of the modern *maison-à-loyer*; we also trace in it the arrangement of our old London houses, of which few now remain with the open courtyard. The plans exhibited by Mr. White, of the Paris dwelling-house, as it is now seen, were typical of the modified arrangement. One example in the Boulevard Malesherbes was interesting—of triangular shape surrounded by shops on the ground floor on two sides, with courtyard and entrance leading to the sets of apartments above; in general, however, the plan consists of a shop or shops on the ground level, a courtyard or area for light and entrance in the centre, approached through a passage in which is the entrance-staircase and lobby, a caretaker's or *conciierge's* lodging overlooking the entrance, while each floor above forms a suite of apartments or a single house of about eight or more rooms.

Let us turn, however, to the more practical part of the subject, and examine one or two of the propositions that were put forward by the author of the paper. The question resolves itself under three heads—the social, sanitary, and architectural, and it is under these we must consider the solution of the problem. We will not here inquire whether it is desirable to house our families between horizontal rather than between vertical division walls—that is a matter that will be looked at differently—but will content ourselves with examining the schemes proposed on more practical and commercial grounds. After all, the matter reduces itself to one of areas. One question is, whether we can house more families on the horizontal system than on the vertical; another, the cost of construction. Mr. White showed an imaginary scheme for converting a block or island of buildings in Regent-street after the Paris fashion. Here we have a block of 28 houses, some of which have amalgamated. They are, as usual, back to back, with frontages towards four streets. The proposed re-division gives five blocks of shops and houses, separated by two party-walls, and the total number of shops on the proposed floor plan is 21, some with mezzanine over for shopkeeper, and with basements. The only difficulty we see here are the necessary points of support for the superposed houses, though these may be regulated with a little ingenuity. The lighting is good from front and central courts. Turning to the houses, this plan provides 19 houses in the superposed structure of the "island," 3 distinct houses of 14 rooms, 3 of 10 rooms, another 3 of 9 rooms, and 10 of 5 rooms each, making a total of 149 rooms, plus the 33 rooms obtained over the shops, to place against 182 rooms, which the author estimates to be the number in the superstructure as it is. This plan also reduces the frontage devoted to private entrances; in the plan proposed, the frontage given up to private entrances to the houses or superstructure of the suggested island is 60ft., as against 80ft. of the existing plan. This is manifestly a great point of economy in favour of the scheme. But let us look at the houses. Mr. White's plans of course we take as merely types of what may be done; the reception-rooms are divided from the offices and bedrooms by divisional walls, which are carried up; each has its own corridor and conveniences; the courtyards are open at top, and into them are lighted the smaller apartments, bath-rooms, and closets. It will not be claimed for these plans that they are all the middle-class occupant in England requires; exception may be taken to the smallness of the rooms, the long and in some cases narrow passages required, and the want of open yard or garden. The main question is, however, whether the same size of rooms can be obtained in this

system as the old one offers. Let us look at the question of areas in another light. Suppose we take an ordinary dwelling-house of, say, 8 rooms, letting for from £40 to £50 in the suburbs. Taking the area of one floor we get a usual frontage of 18ft., and a depth of, say, 30ft., or about 540ft. superficial area. Multiply this by 4 times the number of stories, we get 2,160 square feet, or, say, in round numbers, 2,000ft. Now let us see what area of ground must be obtained on one floor by the proposed system to equal this. We find that we must get a plot of at least 20ft. frontage, by 100ft. deep, or just about double the quantity of the suburban house plot. If we try a middle-class house on the Bedford Estate the disproportion is still greater. Taking the figures of Mr. White as very usual—namely, a frontage of 18ft., and a depth of 36ft.—we get a superficies of 648ft. for one floor, and say we multiply this by 4, though there are generally more stories, we get 2,592ft. as the required area, or more than half again as much as the land upon which these houses are generally built. In the neighbourhood of Southampton-row and Tavistock-square houses with 8 to 10 rooms; besides the offices, let for from £200 to £150 per annum; the rooms are large, two going to each floor as a rule, and to many of them there is back garden about the depth of the house. The revenue return given in Mr. White's paper, for two houses on the Bedford Estate, shows a total return annually of £920, though we believe this to be a little in excess; while the probable revenue on the improved plan is put at £1,420 per annum; and estimating the cost of the latter at £2,000 more than the two houses, a profit of £300 in favour of the houses as they might be, is made. These figures show for the first-floor residences a rental of £70 each, for the second-floor a rental of £60 each, and the third £50 each—rather high rents, it must be confessed, when set against rents for some houses in that locality upon the isolated or vertical plan. However, we leave the question here. Much is due to Mr. White for his able and elaborate paper, and the Institute, we trust, will do their part towards the discussion of a scheme admirable in many respects, and which would be well suited for many parts of London—for bachelorhood especially. Into the question of construction we will not enter now. The mode adopted in Paris of fire-resisting floors mentioned in the paper is excellent, in which the rolled joists are embedded, or rather immersed, in plaster, and we must assure people first of their safety against fire before we expect them to inhabit third or fourth-floor sets over blazing shops; however this can be done. The merits and demerits of the system as a whole we leave; but there is the architectural part of the problem that will not be overlooked by some of the more aspirative members of the profession. It should not be lost sight of that the horizontal system, whatever merits it may possess—will not favour Gothicism. The very pronouncement of the system lends countenance to Renaissance or Classical design, and that only.

NEW SCULPTURE IN THE NORTH.

MR. WARRINGTON WOOD is at the present time the ablest of the English sculptors located in Rome, but his work has hitherto been little seen by the general English public. But quite recently some important and ambitious works from his studio have been erected in the North of England, and in the present dearth of great masters in English sculpture these additions are worthy of notice. The town of Liverpool possesses three figures—one an allegorical figure of Liverpool placed on the

top of the new Art Gallery. It is, however, so far from the spectator's view that anything like minute criticism of it is impossible. Liverpool is represented by a female figure seated on a bale of cotton. In one hand she holds a trident, whilst the other rests on a screw-propeller, to signify that the greatness of the town is founded on commerce and navigation. The idea is fairly happy, and the causes of the prosperity of the town are not so conspicuous as to make the mixture of ancient and modern ideas absurd, which is too often the case in allegorical sculpture of this kind. The other works are Raphael and Michael Angelo, in marble, placed at the entrance to the same gallery. These figures are more than life-size, and are evidently intended to represent the arts of Painting and Sculpture, as well as the two great masters themselves. For Raphael holds in one hand a pencil, and in the other a picture of a Madonna; whilst Michael Angelo is represented with a chisel. Praise must certainly be given to the sculptor for endeavouring to produce a work of really high art, so different from most of the commonplace and vulgar attempts which are conspicuous in the exhibitions of the Royal Academy. Raphael is a young and effeminate-looking man, as far as his face and long curls are concerned, but his lower limbs are so large as to be out of proportion to the girlish face above. The painter is seated with his back partially towards the gallery, and his face towards the square. But Mr. Wood, in endeavouring to be natural, has gone below what Gibson called the true "dignity of sculpture." For the attitude of Raphael, with one leg comfortably crossed over the other, reminds one far too much of the arm-chair postures of the smoking-room. The drapery, too, is decidedly stiff. Michael Angelo, on the other hand, is a more successful work. He is an old man with a stern, worn face. But there is, altogether, more general harmony apparent in the work; and the attitude, though still too *negligé*, is not so utterly without grace as that of Raphael. But when these well-meaning attempts to unite dignity and ease are compared with such a work as Flaxman's admirable statue of Burns, at Edinburgh, it is apparent that Mr. Wood is yet a long way behind some of his celebrated predecessors in art. The right arm, too, of Michael Angelo, resting on the wrist, is at once conspicuous, unnatural, and ugly. Still, this figure does possess a certain amount of truth and naturalness about it, and a certain rough harmony and power, which makes it, on the whole, not an entirely unsatisfactory work. But there are no signs of genius in its execution or conception, and it is only evidence of praiseworthy seeking after truth and naturalness, together with some high aims. But this is more than can be said for most of the sculpture of the present day.

The remaining work stands in the Fine Art Gallery which has just been opened at Warrington, and has been purchased by the Corporation of that town, with an unusual amount of public spirit, for the sum of one thousand pounds. The group is entitled "Michael overcoming Satan," and is, undoubtedly, a noticeable work, which cannot fail to enlarge Mr. Wood's reputation as a sculptor. The artist has chosen his subject from "Paradise Lost," and the moment fixed upon has been thus described by Milton in the Sixth Book:—

They ended parle, and both addressed for fight,
Unspeaking
Now waved their fiery swords. The sword
Of Michael from the armoury of God
Was given him, tempered so that neither keen
Nor solid might resist that edge.

The conception is high, but the execution is scarcely equal to the thought. The figures are of life-size. The archangel, with extended wings, raises his right arm high

above his head, grasping the sword with which he prepares to strike his foe. This sword is apparently meant to represent small flames, according to Milton's epithet of "fiery," but it looks much more as if covered with small feathers, and is quite contrary to the idea of the succeeding epithet "tempered," and is also out of harmony with the contest which is being waged. Michael is a young man with fine features, and a mass of curling hair, and his left hand extended presses back the head of Satan. The latter, also winged, is in the act of being overcome by the calm and resistless might of the archangel; his right hand vainly grasps the arm of Michael, and his left seizes him by the leg. He is beaten to one knee, and he looks up at his conqueror with head bent back, and unavailingly struggling with great bodily strength against a celestial power. This is clearly the contrast which Mr. Wood has endeavoured to depict, and which he has not been unsuccessful in doing. But the forms of Michael and Satan do not attain to the degree of ideal beauty which, united with the ease of Nature, is required to produce a work of the highest art. Again, by the very subject a comparison is inevitably challenged with Flaxman's great work, executed in the maturity of his power and based on the same idea, and Mr. Wood's work must be criticised accordingly. The form of Michael is inclined to be lean, and the left arm of Satan upon examination will be found square and stiff. On the other hand Michael's wings may be fairly pointed out as being admirably modelled, the soft feathers on the inside being smoothly life-like. But the want of complete bodily perfection in the archangel takes away that appearance of irresistible but unearthly power which is the central idea of this group. Yet, in spite of these defects, this work is one which must give Mr. Wood a distinguished place among contemporary sculptors. The conception is a grand one and worthy of the finest artistic treatment, and if the thought has not been carried out with that completeness of idea and manual power which the splendour of the subject demands, yet the high aims displayed and the standard actually reached show that time may do much to give the author of this work a distinguished and permanent place among English sculptors. In the same gallery two or three smaller works by Mr. Wood are exhibited by the owners, which, though spoilt by some affectation, show considerable technical power. The two best are a statuette of Rebecca—chiefly a study of drapery—and a bust of Apollo. With the temporary collection of pictures—though creditable for a local exhibition—we are not now concerned.

THE ARCHITECTURAL STUDENT, AND THE MEANS OF SELF-IMPROVEMENT AT HIS DISPOSAL.

IT is somewhat surprising that, with all the facilities just now open to the architectural student, he is so slow to take advantage of them. The season of lectures, papers, and discussions has recommenced, the architectural societies have started into fresh activity, the results of the autumnal recess in the shape of sketches and measured drawings will soon be laid before the student, but we may ask, judging from the past, to what extent is he likely to benefit from them? We ask this in no captious spirit, and at the same time to point out the unexampled advantages which the young architect of the present day enjoys. Compared, indeed, to his predecessors, whose works, the President of the Institute reminded his hearers the other evening, "will need all the learning and patient study of the young men of the present day to equal or surpass," the young man of the profes-

sion has a hundredfold the opportunities they possessed. It is a fact to be deplored that those who are most happily circumstanced are frequently the least willing to learn. We may refer to the younger members of the profession in London as an instance of this remissness. At the present moment there are two or three admirable libraries free to those who can attend them. There is, first, the Institute library, the most comprehensive of the kind in this country; yet we hear very few students ever take advantage of its shelves. Now the regulations for admission are less irksome, and the hours are less restricted, the members of the Association are to blame if they do not take advantage of it. Every year the contributions are valuable in varied departments of professional study, yet the attendance is so meagre that it may be pronounced a wasted source of power. If we turn to the library of the Royal Academy we hear similar complaints. No one ever uses it, though it contains some of the rarest and most valuable treasures of artistic literature. There is a splendid library, too, at the South Kensington Museum that is little resorted to by young architects. The same tale comes to us from every quarter—the young art-student does not avail himself of the abundance thrown open to him. There is the Architectural Museum at Westminster, which has been languishing for years, and is purely sustained by a few amateurs and energetic members of the profession. Here we have a very fine collection of chronologically-arranged and classified mediæval examples, and we understand classes for instruction in art-drawing have lately been inaugurated in connection. With all these advantages it lacks support—it does not receive the encouragement from the art-workman and student it deserves. It may be said it is too restricted in its examples; that Classic and Renaissance art examples are not represented; still, for all this, such a collection of casts from the actual masterpieces of middle-age art must be invaluable. If we turn to the Soane Museum, in Lincoln's-inn-fields, we shall find also a munificent bequest well-nigh deserted by the student for whose especial benefit it was left, supported only by a miscellaneous public and open for a few months in each year. An amalgamation of these two collections has, we believe, been contemplated, and we have reason to think their union would be strength, as they are each imperfect. We might mention other instances of this indifference—the Museum of Economic Geology, Jermyn-street, &c.—but we point to the few to show how badly they are supported by the younger members of the profession. We can only attribute this apathy to that kind of unconcern with which a Londoner will often tell a visitor that he has never been curious enough to enter the British Museum or to scan the interiors of Westminster Abbey or St. Paul's. The pupil in London, surrounded by these libraries and museums, hardly seems to trouble himself about them; he procrastinates till the value of their knowledge is lost, or becomes of indifference to him by the lapse of time. We can only account for this singular unconcern, even among the *alumni* of the Institute and the Academy, by reflecting that a prodigality of resources and materials has not always been an unmixed advantage, and that the *embarras de richesses*, whether in the materials at command of the student or the artist, is sometimes unprovocative. In contrast with the London pupil we may remark that the country student, with far less resources, and without that plethora of artistic and intellectual agencies at his command, not unfrequently puts his London cousin to the blush. To refer again to the classes of the Association, it was remarked not long ago by an ex-president that very few London

students entered them. We need only corroborate this by our own experience in the classes we have opened in connection with this journal. Out of nearly fifty students the bulk of those who have entered the competition, both in the science class and our designing club, belong to the provinces, and those who received prizes and honourable mention have been, with two exceptions, country students. One gentleman, referring to the falling-off at the Association classes of design, said the BUILDING NEWS Club had interfered with the Association class. Be this as it may, out of the hundreds who are engaged in the metropolis it is singular so little interest is taken in these voluntary means of self-improvement. Is it because the London pupil is harder worked, and has fewer opportunities of joining societies? We think not. Provincial hours of office work are longer than metropolitan ones, besides which there are very few provincial offices that give the Saturday afternoon to their pupils.

Mr. Bowes A. Paice, in his opening address at the Architectural Association, adverted to the subject of artied pupils, in some very judicious remarks. It is an old and rather worn-out theme, but none the less important than formerly, as every pupil has to pass through the same ordeal again and again. Mr. Paice re-echoed our own sentiments when he said that "the present system of binding a young man for four or five years, and paying a large premium at the outset, is the bane of the architectural profession." It binds him to something he has had no opportunity of understanding, far less liking; it makes a contract into which one of the contracting parties must necessarily enter without sufficient knowledge, and from which he cannot escape till four or five years of valuable time have passed. Mr. Paice proposes what was mentioned some time ago in these pages—a preliminary test, a probationary term of one year, during which the youth would have an opportunity of seeing the ordinary routine of the architect's work, attend the University lectures, the classes of design, or other means of ascertaining the work of the profession. If, after this term, the pupil liked the vocation, he might be artied, but it is suggested that the premium should be paid annually as a college fee, and not as a lump sum. Before entering the state of pupilage the student should pass a preliminary examination at the Institute. These proposals are reasonable enough, and it would be well if the Institute and Association drew up some recommendations to the profession generally, embodying them. Pupilage is an ever-erying grievance: where it turns out one architect, it manufactures a dozen crude apprentices, raw and inexperienced young men, who are glad to turn their hands to any other more lucrative business they find themselves more capable of fulfilling. To this system, probably, we owe much of the apparent apathy and indifference displayed, the frivolity and questionable tastes we find some young members of the profession following, and their preference for the music hall rather than the library. If those in practice were not so commercial in their requirements, and made the honour and position of the profession their first thought, we should have fewer of the disappointed and discontented Chuzzlewits, who affect to sneer at the work of more earnest and intellectually-minded pupils. Much may be accomplished by both the Institute and Association in exposing the traditional abuses of the pupil system, in checking the Pecksniffian propensities of architects, and in establishing a standard of ability for the young student. But far more will be done by the younger members themselves in taking advantage of the opportunity open to them, and in making

themselves more competent to judge of their own aptitude for the profession. One additional reason to urge the young architect to prosecute his studies with unremitting attention is the fact that the Civil Service examinations, the engineering and other colleges, are bringing forward a number of highly-qualified young men to fill positions of responsibility in connection with the Government works both at home and abroad. The education they are receiving is of a superior order, in which science and technical instruction are largely represented. The young architect has, it is true, the classes of King's College, the lectures on science and art given at Kensington, and other places open to him; but, as we have said, he does not choose to use them. He seems to repose too much upon one faculty; he may possess that of being able to draw and sketch freely; but, as we have hinted before, this quality must not be overrated by the aspirant to the profession. Though a great aid, it does not furnish the mind with original materials, and without a well-stored mind the artist is little better than a mimic. The faculty of drawing is seldom accompanied with that of invention, and it is, perhaps, to be regretted that the future destiny of a youth is so often predetermined by this penchant. The student of architecture must, if he wants to succeed in his profession, overcome the exclusiveness of the pencil. He must try and bring himself to understand that architecture is a concrete art, requires an omnific intelligence, and that, in fact, the most opposite qualifications and tastes must be conquered and brought into reconciliation. If he can look kindly on both high art and mechanical skill so much the better. In proportion as the student is many-sided, he will advance in his work, and we may instance some of our most successful architects as examples of the omnivorous mind. It may be questioned at what point the practical or workshop training should begin. We think that during the probationary stage the pupil should be brought face to face with practical work—not in a regular way, perhaps, but so that he may comprehend the nature of the study he is entering upon. Office instruction and workshop practice should be prosecuted *pari passu*. Now, the architectural societies might supplement their classes by the technical school. The Association has well done this in one way—that of the Saturday inspections of buildings in process of construction. But the artied pupil should prosecute this, or have facilities for enabling him to do so afforded him by his master. Attending the workshops—the masons', carpenters' and joiners', ironfounders', &c.—should be made a part of every curriculum. Drawing and technical instruction would thus be taught together, and with the inestimable advantage of throwing light upon each other. No amount of learning or simple draughtsmanship can give the eye-education acquired in the workshop, and which makes every good workman an artist as well. Hence the pupilage system at present is defective, mainly inasmuch as it is not a school of practice as it ought to be. The novice has to pick all this up as best he can. It seems to us, therefore, the reform required to improve the architectural status rests with the architectural societies to supply the needful pabulum. Their classes are admirable, though they do not fill; their visits to works are valuable, though insufficient and unorganised; but there is still a link missing—it is the technical school or workshop, by the agency of which the student may see the raw material converted into the finished structure.

The Arts Club is about to be enlarged, the application for membership in the club being in excess of the accommodation.

NEW WORKHOUSE FOR SHEFFIELD.

SINGULAR PROCEEDINGS.

THE Sheffield Board of Guardians some time ago issued advertisements for tenders to build a new workhouse for Pitsmoor, in that town. The guardians met to receive the tenders, and they were assisted in their examination of them by the architect, Mr. James Hall. Some of the contracts were entire—that is, they included the whole of the work necessary to be done in the erection and completion of the buildings, while others were for only a portion of the work. The following are the contracts for the whole of the buildings:—W. Bissett, Sheffield, £149,400; B. Bottomley, Bradford, £145,736; Briers and Co., Dewsbury, £157,585; G. Carr, Sheffield, £144,000; Mr. Garlick, Birmingham, £136,740; H. Thorpe, Leeds, £159,769; J. Tomlinson and Son, Leeds, £124,136; S. Warburton, Manchester, £144,700; T. Whiteley, Leeds, £157,000. From these tenders it will be observed that that of Messrs. Tomlinson and Son was very much the lowest, being £20,000 less than the tender next to it in amount, and about £33,000 below the highest. Before accepting it, however, the guardians went through the tenders for portions of the work, and picked out the lowest tender in each department. Adding these together they found that the total was £125,085 3s. 4d., being £994 8s. 4d. more than Messrs. Tomlinson's tender. This being so, it was considered unwise to divide the contracts, so that Messrs. Tomlinson and Son's was accepted in its entirety.

At the next meeting of the guardians it was announced that Messrs. Tomlinson, who had already given references, could not proceed with the contract on the ground that several tradesmen had misled them in their estimates. It was stated that on Messrs. Tomlinson finding their tender so much lower than the others, they would have liked to amend it to the extent of £10,000, which would still have brought it beneath any other. The guardians, however, decided that fresh advertisements should be issued for entirely new tenders, and accordingly a special meeting took place last Thursday evening to consider the new tenders. The lowest tender for the whole of the work was that of Mr. J. Garlick, of Birmingham, which amounted to £134,800. The amended tender of Messrs. Tomlinson and Son was just £100 more, being £134,900. The total of the lowest contracts for the various kinds of work necessary in the formation of the building was £134,187, or about £600 less than the tender for the whole of the work sent in by Mr. Garlick. Under these circumstances, therefore, it was proposed that Mr. Garlick's tender should be accepted, subject to his references and sureties being considered satisfactory. After some discussion, in which a good deal of unpleasantness was shown, the proposition was carried. The works will occupy more than two years.

In Ardfert diocese, and under the supervision of Mr. J. F. Fuller, F.S.A., diocesan architect, the new glebe-houses of Ardfert and Valencia have recently been completed; one at Killynny is in progress, also one in Mill-street. Mr. Fuller has also alterations going on at Tarbert and Ballyheigue churches, the contractor for the former being Mr. Crosbie, of Tralee. Ballyseedy church is being enlarged by the same builder and architect, and works are in contemplation at Ballymacelligot church, for which also Mr. Fuller is architect.

The annual dinner of the Liverpool Master Builders' Association was held last week, under the presidency of Mr. William Tomkinson, jun.

The foundation stone of a new Roman Catholic church was laid last week at Wath-upon-Dearne. The style of the building will be Perpendicular, and the architects are Messrs. Hadfield and Sons, of Sheffield.

The memorial stone of a new Congregational chapel at Coatbridge, N.B., was laid last week. The chapel, which is from designs prepared by Mr. J. W. Small, architect, Edinburgh, is in the Gothic style, and will accommodate about 500 persons. Underneath the chapel there is a large hall and other conveniences. The cost of the whole is estimated at £2,500.

The Gravesend Corporation has adopted a new code of bye-laws with respect to the erection and alteration of buildings, and last week it was decided to issue notices to all builders and contractors in the district, calling attention to them, and announcing that they will be strictly enforced.

PARK—PROPOSED BOAT AND CLUB HOUSE, PUTNEY—
CHURCH OF OUR LADY AND ST. JOSEPH, CARLISLE—THE
LITTLE NAG'S HEAD COCOA HOUSE, CHESTER.

OUR LITHOGRAPHIC ILLUSTRATIONS.

PUTNEY BOAT-HOUSE.

TO-DAY we give an illustration, as promised in our last number, of one of the drawings sent in for the Putney Rowing Club Boat-house competition. It was sent in under motto, "De mieux je pense en mieux." It was proposed to build it of red brick, with Bath stone dressings, and in some of the gables half-timber with plaster between, and a device scratched on the plaster, and in the rest of the gables half-timber and ornamental brickwork between. In our review it was stated the entire cost was not to exceed £1,500, which was a mistake, as in the second conditions received there was not any limit to the cost but that cheapness was to be considered. The club-room has the ceiling formed in the roof, divided in panels by moulded ribs for decoration. A pavilion was formed at one end of balcony, which was to be glazed so as to form a resort in wet weather. The proposed cost was £3,500. The architect is Mr. J. Martin Brooks, the Grange, Park-lane, Stcke Newton, N.

THE LITTLE NAG'S HEAD COCOA-HOUSE,
CHESTER.

THIS building, which was formerly known as "The Little Nag's Head Inn," has recently undergone extensive alterations to adapt it to the requirements of a working men's coffee-house, and was opened on Saturday last by his Grace the Duke of Westminster, K.G., to whom the property belongs. The ground floor now contains a restaurant, with smoking-room, kitchen, &c., in connection therewith, and two staircases to first floor. On this floor there is a large club or refreshment room, extending the whole width of front, and a separate room for women in the rear, with convenient offices. The attic floor is occupied by a club-room overlooking the street, a manager's room, and bedrooms at back. The frontage of the old building was in a line with the adjoining houses, but the new front has been set back on the ground story to allow greater width of pavement, the upper stories being projected to increase area of rooms and carry out bay windows, from which a good view is obtained up and down this busy street. The timber-framing is executed in English oak, filled in with thin bricks on the first floor and sgraffito work above, the latter being carried out by Messrs. Trollope and Son, London. The upper windows are glazed with plain lead lights. The old sign has been purchased of the former occupant, and will be fixed with wrought iron supports. Messrs. F. T. Farrimond and Co., of Chester, were the general contractors for the work, which they have carried out in a very satisfactory manner, from the designs of Mr. John Douglas, architect, Chester.

TREGUIER CATHEDRAL.

TREGUIER is situated in the department of Côtes du Nord, on the north coast of Brittany, and the cathedral, said to have been begun in the 13th century by St. Yves, consists of a lofty nave with fine western doorway, aisles with side chapels, central tower, transepts, and a well proportioned choir which is surrounded by an ambulatory, with several small chapels. There are some remains of the choir stalls which are elaborately carved and of good design. All the roofs are beautifully vaulted. The tower which terminates the south transept has an uninteresting spire, pierced all over with square and ohlong-shaped openings, and over the end of the north transept is a massive tower with semi-circular headed windows and circular staircase at the north-east angle, being the only part left of the early building. Adjoining this and the northern side of choir is the cloister, which appears to be the latest addition to the church. According to "Joanne's Dictionnaire Géographique de la France," the dates of the leading features are:—Nave, rebuilt by St. Yves in 1206, choir re-erected in 1339, the Duke's chapel on north side in 1420. The finely-proportioned tower over the south transept, which forms the principal feature in our view, was added in 1432. Prior to 1785 it was crowned by a leaden flèche, but in that year the flèche was replaced by the stone spire already referred to, but which is not shown in our illustration. The total height of the tower and spire is about 212 English feet. Our view is a reproduction of the drawing exhibited by Mr. John Medland in the Royal Academy this year.

NEW ROMAN CATHOLIC CHURCH AT CARLISLE.

WE give to-day a perspective view from the south-west of the new Roman Catholic Church of Our Lady and St. Joseph, and the adjacent presbytery, about to be erected in the centre of Warwick-square, Carlisle, from the designs of Messrs. Dunn and Hanson, architects, of Eldon-square, Newcastle-on-Tyne. A general description of the church, which will, when completed, cost about £12,000, appeared last week in our Building Intelligence, p. 497. We may add that in general design the church will be cruciform. The style adopted, is the pure type of Early Decorated work, with which we are made familiar at Lincoln, Tintern, &c. The Lady Chapel will be a handsome and prominent feature in the design, being placed at the east-end of the church, projecting, as in mediæval cathedrals; it will probably be set apart as a "chantry," in memory of the benefactress, Miss Lowry. At the south-west corner is to be the tower and spire, 200ft. high. The presbytery contains on the ground floor library and dining-room, the rector's private room, and a waiting-room, also complete kitchen offices; above which are sitting and bedrooms for three priests, the spare-room, and hath-room. The buildings in their complete state will cost nearly twice the amount of the fund now available, but there is sufficient in hand to allow of as much being erected as will admit of service being conducted within the walls of the new edifice. The old church will then be devoted, probably, to educational purposes, and the new one will be proceeded with by degrees.

DETACHED VILLA, BEDFORD PARK ESTATE.

CONTINUING our series of illustrations of the houses now building on the Bedford-park Estate, Turnham-green, from the designs of Mr. R. Norman Shaw, A.R.A., we publish today detailed drawings of the detached villas now in course of erection. The several rooms and offices are clearly shown by the plans, while the piquant architecture of the design, at once characteristic of the author, is illustrated by the elevations. The materials employed are red brick, with red tile hanging to the upper part and roofs. For further particulars see an article in the BUILDING NEWS, November 9th. We shall give further illustrations in an early number.

"BUILDING NEWS" DESIGNING CLUB.

IN the wall-paper competition we give the sets, of two designs each, which we rank as first, second, and third in order of merit. For critical review see p. 446, in our issue of the 2nd inst.

LIFTING A RAILWAY STATION.

CHEPSTOW Railway Station was lifted bodily a height of 22in., last week. Passengers have long experienced much inconvenience arising from the difficulty and danger of descending from, or climbing into, the carriages. This arose from the fact that the platform was but a few inches above the level of the rails. Some time back Mr. Lancaster Owen, engineer of the Great Western Railway, suggested by way of a remedy for the evil, the feasibility of lifting the station bodily, and building it up from below. Chepstow station comprises two stone buildings, one on either side of the line, built of native freestone, with dressings of Tintern Ahhey stone, and its estimated weight about 150 tons. Each building is 56ft. long, by 18ft. 6in. wide, and 12ft. 7in. high, with an overhanging roof of corrugated iron, on the platform side stretching out 7ft. or 8ft., and is divided into the usual waiting-room and offices. Tenders were advertised for, and that of Messrs. Whalley and Pearse was ultimately accepted. The "lifting" process was commenced on Monday week. The building on the down platform has been first operated upon. The floor was taken up to facilitate the working of the jacks, but all the sashes and doors were left in their places, each opening having been securely strutted. Then holes were made through the building, about 2ft. under the string course, and in these holes were inserted haulks of timber, called "needles," to the number of eleven, their ends standing out a few feet on either side of the building. Fastened on the ends of these "needles" were half pieces of haulks, called "cills," which were tightly keyed all around the bottom of the building; whilst half-way up the building were similar pieces, resting on supports on the baulks, called "walings," with hars of iron running through the building, bolted all firmly together. Similar hars ran lengthways of the building. Having thus firmly braced the building together, the lifting commenced. A trench for the men to work in having first been dug, a powerful lifting jack was placed under the end of each "needle," at which a man was stationed, and there were two others under the centre part of the end "needles," and others inside the building, making 31 jacks in all. At a given signal from Mr. Whalley, each man gave a turn to his jack, and as turn after turn was made the building slowly but surely rose, without a crack or flaw, or even a pane of glass breaking; and when the men left work on Monday night they had lifted the whole building 3½in. (22 inches was the total amount to which the building had to be raised). On Tuesday morning, having secured the building at the point reached, another succession of turns were taken, and 3¼in. more were accomplished by 8.30. The same process was repeated, and by one o'clock the height reached was 12in. The afternoon work proceeded without the least hitch, and on leaving off at 5.30 on Tuesday evening, 19½in. had been reached; and the remaining 2½in. were subsequently accomplished. The walling was filled in, and the platform raised in the usual way.

The district of Widmore is being sewered for the local board of Bromley, Kent, by Mr. Pfeill, contractor. Mr. A. Williams, C.E., is the engineer.

A vestry meeting has been held at Bungay, Suffolk, to consider a report as to St. Mary's parish church made by Mr. R. M. Phipson, diocesan architect and surveyor. Mr. Phipson considers the tower to be unsafe, and that the porches, roof, and windows are in urgent need of repair. These works would cost about £1,000. The renovations and improvements required internally include the removal of galleries, re-benching throughout, and removing organ to ground floor, involving the outlay of another £1,000. Plans and specifications were submitted in the report, and were adopted by the meeting, subject to alterations in details. It is also proposed to build a new chancel, should funds be forthcoming.

The imposing monument to Bishop Montague in the nave of Bath Abbey is about to be restored and re-decorated, under the superintendence of Mr. Davis, city architect.

The Wesleyan chapel at South Willingham, Lincolnshire, was reopened on Friday, after enlargement and improvements, carried out by Mr. John Thompson, of Louth. The foundation stone of a Wesleyan chapel, to cost £1,100, was laid on the previous day at Binstead, in the same county.

BUILDING IN THE WEST OF BRIGHTON.

WE are sorry to see the West Brighton Estate—a site with few equals—bids fair to fall a prey to speculative builders' architecture. Last year we noted that new roads or avenues had been formed, and that a few houses of pretension had been erected. Since that time we find the north portion of the estate is being rapidly covered. Three or four rows of houses have been built abutting on the Western road or main thoroughfare to Hove, but all in a debased kind of stucco architecture, modelled after a stereotyped pattern. Of course the bay window, that favourite feature in Brighton architecture, is made to do service. This is carried up two or three stories in some cases, but nothing fresh or piquant has been attempted. The ornamentation, too, is often of the most trashy kind. We saw some houses building along the main thoroughfare of white stocks of good colour, but spoilt by the introduction of a fancy nail-head or "dog-tooth" kind of brick, which is used as a dressing round windows and doors, and even over the arches as a label. We are obliged to ask if any architectural supervision exists, or if builders are allowed to do anything that pleases them? It is a pity the elevations of these roads are not under some control, and that the vulgar and bizarre kind of ornament one sees is not condemned. On the fourth side better houses have been built. Mr. Spreadborough has completed some large contracts, and Mr. E. W. Hudson has been the architect in many instances. We may ask, however, whether the supply of new houses is not in excess of the present demand. In the Hove district we hear of houses from £100 to £600 rental, and on the West Brighton Estate plots of land realise, we are informed, prices varying from £2,000 to £6,000 per acre. These prices, one would imagine, would be sufficient to command some attempt at architectural design, and a few new residences have been erected that show the work of the architect. Thus, on the Stanford Estate some of the new houses have pretensions to architectural display. Mr. Galsworthy Davie is now completing a rather successful attempt to adapt Gothic to prevailing ideas in respect to plate glass, stock bricks being used with terra cotta dressings. The treatment of gables, loggia over bay, giving view of the sea, is noticeable. We hope to illustrate the design. There are a few blocks in a sort of Lombardic Gothic of Gault bricks and stone dressings, the interiors being finished in a costly manner in pitch pine. In some of them lifts are provided. We should say the cost of these residences amounted to from £4,000 to £6,000 each. Half timbering has been adopted in some cases, but without the solidity and simplicity of character necessary to produce the effect desired. It is strange to us architects will reproduce a style whose beauty and meaning depend solely on its being the natural outgrowth of a wooded country where timber was plentiful. Unless stud-work is solid and massive it is nothing. To produce the effect of timbering by surface battens, not of the same thickness as the wall, and to which they render no support or substance, is as reprehensible a sham as we know of. Architects who adopt such counterfeit means of effect cannot fairly say a word against stucco, marbling, and imitation graining. But the half-timber style is manifestly out of place in such a *locale* as Brighton. Divested of wooded scenery, and near the sea, the only appropriate style of building is that which, *par excellence*, Brighton claims as its own—a palatial kind of stucco architecture, impervious to damp

and the action of sea air. We know that few kinds of stone stand well, and the only kind that has resisted with any success the sea air is Tisbury stone, which has been largely used in the new buildings in the west of the town. As for Bath stone, we have only to refer to the Church of St. Paul's, in North-street, as an instance of rapid decay. Another and more traditional style observed in the new suburbs is the Italian. Facing the sea blocks of buildings have been erected from the designs of Mr. Knowles; Mr. Chappell being the builder. Their fronts are relieved by balconies of stone, supported on colonnades. Gault bricks have been used. The rents, we understand, are from £250 to £450 per annum. At the corner of Queen's-gardens, on the Stanford Estate, a club—a branch of Prince's Club—is located. The interior of the houses that have been converted (originally Baron Grant's) is finished with every convenience. The internal fittings are said to be sumptuous of their kind, and lifts are provided; while a portion of the building is residential for the use of members. A sea-water service is provided in many of these terrace houses; while a winter garden and palace is in contemplation. At present, however, there is little of the rural element to entice us; the only contrast to the lines of stucco and white brick frontages is the blue sea, and we should rejoice to see more colour, even if it be in a variation of tint in the building material. The balconied fronts certainly give us play of light and shade, but the eye seeks a rest in some oasis of green. If the esplanade was planted, and the avenues fringed with verdure, great relief would be afforded, and the tedium of the architectural lines broken.

Now, what we think is, that some higher class of ornamentation might have been introduced on this brand-new estate. It had no old buildings to study or to keep in countenance; its residents are comparatively young, and of the present generation; and there was an admirable opportunity for some new building materials to be applied—we will not say new-fangled "fads" of manufacturing firms. The use of concrete applied in panels, and ornamented with parge-work, would have been one means of rendering the architecture attractive—at least, it would have been out of the common. Relieved with red brick, the contrast would be pleasing in this neighbourhood, and some enterprising architect might try his hand. Then, it is singular so little invention has been evinced in the treatment of the bay window, instead of the production, *ad nauseam*, of stereotyped forms. We have nothing fresh or original, no attempt even to Queen-Anne-ise the estate, no Gothic work of any character, but a repetition of the manufacturing builder's or surveyor's "eligible and delightful villa." In the design of the semi-detached houses a variation in the plan and elevation might have been tolerated with advantage, and in some cases an artistic grouping of three or more villas might have been attempted. Instead of the hackneyed repetition of two gables, with central or side entrances, blocks of residences, with ample squares and spaces in front of them, might have been planned, making these new districts worthy of the architecture of Kemp-town, Adelaide-crescent, or Palmeira-square. On the Goldstone estate, at West Hove, builder's stucco repetition in semi-detached blocks is well-nigh nauseating. Here we find houses from three to more stories in height with crude projections and badly proportioned bays. We should say it would be a good speculation to build some houses in another style, and to import some of the elements of 17th century architecture in the midst of this modern wilderness of the speculative builder. There is certainly a

dearth of invention and an unenviable casting of features in this western suburb that does not happily compare with the buildings of old Brighton of a generation ago, when the last of the Georges made it a residence.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of the Institute was held on Monday evening; the President, Mr. Charles Barry, in the chair. The following nominations of gentlemen proposed as hon. associates were read, amidst applause:—Alfred Morrison, Ponthill; J. Gascoigne Lynde, Manchester; P. H. Anderson, R.A.; Charles Neate, C.E.; Charles Manby, C.E., F.R.S.; and Wm. H. Barry. Donations of books were acknowledged with thanks, on the motion of the President, who remarked with reference to one item in the list—copies of a reprinted article on "Illicit Commissions," presented by Mr. Cates—that it referred to a matter in which all had a very deep interest, and architects were very much obliged to authors, even anonymous—much as he disliked anonymous writing—who pointed out their shortcomings, real or supposed: real ones to be condoned for, supposed ones to be exposed. Mr. Hyman H. Collins, of Old Broad-street, E.C., was elected as fellow. The Secretary announced that an interesting series of drawings, illustrating Japanese architecture, had been received from Mr. Josiah Conder, in 1876 a Soane medallist of the Institute, and now of the Imperial Engineering College of Tokio, Japan.

MIDDLE CLASS HOUSES IN PARIS AND CENTRAL LONDON.

A full and almost exhaustive paper on this subject was read by Mr. William H. White, Fellow, who remarked that he had enjoyed unusual opportunities for study during a ten consecutive years' residence in middle-class Paris, of the method there employed to house groups of people of different denominations upon the same restricted area of ground; to combine in a single block shops complete in themselves, and distinct houses each complete in itself; to enable the lower stories of a building to be occupied by business people who reside away from their shops and offices, and the upper stories to be inhabited by families without confounding them with the tradespeople, or confounding one family with the other; but housing all the tenants in distinct groups, and in a manner conducive to their mutual advantage. The author then traced the origin of the modern Paris house to Pierre le Muet's designs, published in 1663, and greatly improved, chiefly in the arrangement of plan, in the period just prior to the Great Revolution. That progressive development has continued in Paris from the close of the last century to the present hour, in spite of the worst disasters; and the architect experienced in French domestic buildings can trace through the reigns of Napoleon, Louis Philippe, and the late Emperor the ameliorations introduced into the house of the middle class. Having described, with the aid of plans, the *maison-à-loyer* of the Second Empire, consisting of a shop and five superposed flats, the lecturer gave a sketch of Parisian domestic life in one of these houses let out in suites, dwelling on the important functions sustained by the house porter, and on the perfect isolation of each dwelling from its neighbours. Recent improvements have tended to increase the comfort rather than the elegance of a Parisian home. Water is now laid on to the topmost house, and a heating apparatus is often maintained by the landlord, which is lighted during winter in the basement, and the warm air conveyed by flues into the hall of every house, and also to a hot closet attached to each dining-room. The servants' stairs are improved in size, shape, and lighting, but the principal stairs are scarcely so commodious and easy as in the older houses. Even in the best houses the kitchen accommodation, which in London would be subdivided into kitchen, scullery, servants' hall, housekeeper's room, and butler's pantry, is compressed into a single room, and although the cooking range is fitted with every improve-

ment, cupboards provided, and plenty of light given, no attempt is made to increase the kitchen space. The servants are often abominably housed in a roof; but none are ever condemned to inhabit below the level of the soil. This kind of residence, reduced to a set of three rooms, or developed to one of fifteen, is the Parisian system of habitation. Some of the sets let for £1,000 per annum, exclusive of taxes, others for as low as £40. The strangest fact is that the older and cheaper houses lose their tenants, and the new ones are eagerly sought and taken. This he attributed to the elegance and refinement with which they are endowed. To the character of the construction, richness, and excellence of the materials, the security afforded by a practically fire-resisting house, is due the extraordinary success of private building in the French capital. At the same time noblemen and gentlemen are still building hôtels for themselves—and intended for the exclusive use of one family—outside the main lines of traffic and business. Like the great mansions of the last century, there is little in them of outward show—at least, towards the street, for between that and the courtyard is often a high stone wall pierced with a huge archway closed by polished oak doors. Yet some of them, only recently erected, surpass for size and beauty the majority of patrician homes in London as much as the earlier hotels of the Faubourg St. Antoine surpassed the palaces of the Strand and Westminster in Evelyn's or even Lister's days. Turning now to consider the advantages of London, Mr. White pointed out that no fortifications have impeded its spread, that railways pierce to its centre, and bind compact suburbs to its heart, disgorging every morning trainfuls of travellers who regard town simply as a place of toil. Hence the demand for office room has extended to the uppermost stories of new buildings; interminable lines of houses, the vast majority of which are inhabited by one family only, stretch away from central London in every direction. Such a system which gives to each family not only the superficial area of a plot of land, but also the whole cube of space above it, must be a right one. Any one conversant with habitual phases of life in Paris and London will freely admit the advantages of a system that grants to the head of a household the partly poetical licence of breathing his native air on his own ground. But in the survey he made, he had passed over the nondescript mass of central London, neither purely commercial nor official, neither residential nor monopolised by trade or manufactures. Here, within a certain radius of Temple-bar, and even of Regent-circus, the great mass of the residents are lodgers, who occupy a story, a set of rooms, or a single apartment in a house planned as a single residence. When a lease runs out the house is rebuilt on a strip of frontage so restricted that by no possibility can the upper portions of the premises be made to yield a profit on the money invested, they being only reached by a narrow and steep stair, which by night is pitch dark, and by day is totally unguarded. In order to explain the inconvenience and unhealthiness occasioned by the London practice of leasing each narrow strip of land separately, the lecturer showed a typical block in the midst of fashionable trade, bounded by Regent, Warwick, and Beak-streets, and Regent's-place, where, to meet the necessity for lateral extension, the breathing space in the centre of the block has been gradually encroached upon, and the party walls of the houses have been pierced with holes, large and small. The lecturer next dealt with the laws and restrictions by which construction is governed in Paris, with especial reference to the rule by which the height of façade is made dependent on the width of street. Having shown that the architect alone makes all contracts with the tradesmen in each branch of work, and is solely responsible to the client, and thus is indispensable to people about to build, the lecturer proceeded to describe in detail the process of building a first-class *maison-à-loyer* in Paris. In substance, this was nearly the same as his lectures before the Architectural Association (reported and illustrated by plans in the BUILDING NEWS, Vol. XXI., p. 633, published Dec. 10, 1875),

and the Society of Arts (see Vol. XXX., p. 315, published March 15th, 1876). The progress of the building was traced from the digging out of the cavities for the cesspools to the covering in of the mansards and roofs, and the construction of the principal staircase, and the completion of the several residences sketched out. The island of London buildings and shops in Regent-street was then contrasted on diagrams, with the treatment of a similar block of premises in a similar position in Paris, and the lecturer contended that by the suggested arrangement this island might, under the Parisian system of plan, be rendered healthy and comfortable; that a few of the shops might have the means of extension at the same level larger than the largest shop now on the island; that all the shops might be distinct from the residences erected over them; that instead of sham party walls pierced and mutilated, there need be only two solid vertical divisions; that from the necessary connection of the internal courtyards with the external streets the gradual filling up of those courtyards with even low buildings would be impossible; that forty shops and houses of different sizes might be made to occupy less space of ground than the twenty shops and houses of different sizes which now crowd the island—and without increasing the average height of the front walls. He proposed to do away with the numerous and narrow private entrances in each façade, substituting for them three archways, of 10ft. each, and on the other side of the courtyard carriageways, open to the sky, of 15ft. each, throwing the others into the shop-window spaces. This would allow of setting back each of the frontages without taking more than 10ft. from the total extent of shop windows and fronts of supports. On the space he would construct 21 ordinary shops, which, without the removal of one support, could be turned into 5 extraordinary shops; or by the addition of a few brick partitions, removable at will, could be converted into 23, and even 30 shops. Of the suggested 21 shops, 17 would possess three stories—a basement, a ground floor level with the street pavement, and a mezzanine floor over. The four others had only two stories—a basement, and a ground floor. Only 17 had a story over, intended exclusively for the shop-keeper—as an important part of the shop. Collectively the 17 shops possessed 33 rooms, some of them 22ft. by 17ft. in size. The connection between the mezzanine, the shop, and the basement, might be maintained by a small staircase specially provided for each shop. A sitting-room, a lavatory, even bedrooms, could be arranged in the mezzanine; and 20 of the shops would possess window space before or behind, sufficient to construct a counting-house or a sitting-room on the ground floor. The basements to the whole could be lighted with facility from both the streets and the courtyards. In fine, besides the usual two stories—a ground floor and basement—to the 21 shops, there were eight shops with mezzanines, containing together 14 rooms; 7 with 9 rooms; and 6 with 10 rooms; a total of 33 rooms. Above the actual island there may be, say, 182 rooms, some of these being mere attics, and at least 150 but single rooms. He would give instead: (A) 3 complete and distinct houses of 14 rooms each; (E) 3 ditto, 10 rooms each; (B) 3 ditto, 9 rooms each, and (C and D) 10 of 5 rooms each, being in all 19 houses, containing 149 rooms, in addition to the 33 rooms over the shops. In the first block (A) of 3 houses, each of 14 rooms, each dwelling-house would be divided horizontally into (1) hall and reception or living rooms; (2) private or sleeping rooms; and (3) kitchen and servants' rooms. The house, Mr. White explained, contains four sitting-rooms, the largest of which, the dining-room, is about 22ft. by 17ft.; seven rooms suitable for use as bedrooms, toilet-rooms, or nurseries; also a bath-room with a fireplace; on the servants' side, a kitchen, about 20ft. by 13ft.; a coal-store and a larder; two rooms, each 10ft. by 8ft.; also a serving pantry and a wine cupboard. Only the hall, the bedroom corridor, the bath-room, three water-closets, two small rooms, and a larder are lighted and ventilated from the courtyard, which is not closed. He would construct at the level of each story a terrace open to the external street and

the internal courtyard; it would be supported at each end by columns, and protected by a balustrade. Block B consisted of three houses of nine rooms each, and, like the preceding houses, each was divided into three parts. In the servants' portion there was a kitchen 16ft. by 13ft., a scullery, a larder, a coal-store, a water-closet, and a serving pantry. There was also a servants' room 17ft. by 10ft. The servants' staircase had one side entirely open to the external air, and a broad landing at the level of each story permitted the working of the goods lift, which is in the centre of that staircase. The next block, C, of five houses of five rooms each, would be ordinary dwellings with one staircase and consisting of two sitting-rooms, two bedrooms, a w.c., a kitchen, and a coal-store; lift for coals and other heavy objects is placed outside the wall in the courtyard. Block D will be five houses of five rooms each, ordinary dwellings with one staircase, which also contains the goods lift. There is nothing to prevent the four living-rooms from being divided into one sitting-room and three bedrooms. The dwelling also contains a kitchen, a water-closet, and a coal-store. Block E will be three houses of ten rooms each, divided into two distinct parts, the family division and the servants' division. The living-rooms consist of drawing-room, library, and dining-room. The four bedrooms are arranged in two sets on either side of the corridor, between which and the rooms a small antechamber intervenes. On the servants' side is placed the family water-closet, approached from a lobby behind the dining-room. The corridor then leads straight to the kitchen. A scullery, a coal-store, and a larder are provided, as well as a water-closet for the servants. Two rooms, 13ft. by 10ft. and 13ft. by 8ft., with fireplaces, would make excellent sleeping-rooms for female servants. There is also a serving pantry. The author then pointed out several of the leading peculiarities of the plan, urging that the courtyard is a thoroughly English institution, and that, in a rainy country like ours, covered entrances to houses are a necessity. He next referred to one of the building restrictions existing on the Duke of Bedford's estate in central London, and to the appeal he recently made to the Duke to remove it. The lecturer showed plans of a block of houses on the Bedford estate, and a suggested rearrangement of the same block. The revenue from the two houses as they now existed, each with its two rooms over two rooms, and a central superfluous party wall, might, he thought, be safely calculated in the following manner:—Shop No. 1, with basement story of both houses, and work-rooms at the back, £350; shop No. 2, ground level only, £150; first floor of the two houses, £180; second ditto, £140; third ditto, £100; fourth ditto (for two house keepers), nil; total annual revenue, £920. The probable revenue from the houses as they might be was as follows:—Two shops, ground floor and basement, £700; eight offices, mezzanine £360; two residences, first floor, £140; two ditto, second floor, £120; two ditto, third floor, £100; total annual revenue, £1,420. Calculating the cost of the block as it might be about £2,000 more than the two houses as the now stood (all other expenses being equal), the new system showed, he held, a clear profit of £300 per annum over the old one, thus:—Total annual revenue obtained from two houses as they might be, £1,420; total annual revenue obtained from two houses as they are, £920; balance, £500; the increased cost of the two houses as they might be, interest on £200 at 10 per cent., £20; balance of profit in favour of the houses as they might be, £30. In conclusion, the lecturer said a paramount obligation on those building houses in flats was that the horizontal divisions should be fire-resisting, and this could be secured by the use of a framework of rolled iron joists enveloped in concrete—the latter being composed of materials that have passed through the fire. The joists should be coupled on the French system, and thereby made solid lintels, protecting top and bottom with plaster of Paris. The horizontal space between the lintels and the walls should be filled with fire-resisting concrete. Then, having roughly plastered the walls and ceilings; having finished the staircase, as well as the public entrance to both offices and re-

lences; having closed the building throughout with shop shutters and house windows; having established the position of the water-closets; having put the lift in its place; having fixed the private entrance doors to each residence from the staircase; and having duly installed a caretaker in a box on the ground story, he would leave the building to dry, while possible tenants paid probable visits, or offered their own ideas as to the best way of arranging the shops and their basements, the partitions of the mezzanine, and the distribution of rooms in the different residences.

The President remarked that the utility of the new rule, by which the discussion upon a paper is not entered upon till the following meeting, was clearly shown on this its first night of being applied. There were so many points to be considered in Mr. White's suggestions—as, for instance, how it would, in the face of the Metropolitan Building Act, be possible to gain all the advantages which had been so fancifully laid before them—that it was very desirable time should be given for thought. On one point they would all agree, and that was in tendering hearty thanks to Mr. White for the very attractive way in which he had treated his subject. He looked forward to the discussion to take place at their next meeting, on December 3rd, and at its conclusion a paper would be read by Mr. James Neale, F.S.A., on St. Alban's Abbey.

A DECORATIVE PROCESS.

THE latest and one of the most successful efforts in art decoration we have seen has been introduced by Mr. Aldam Heaton, of Bloomsbury-square, who has applied hand painting in a way that will find favour among architects and their patrons desirous of favouring the art decoration of interiors, in contrast to the "manufacturing" processes. Having seen some of Mr. Heaton's work, we can explain it simply by saying it is a kind of raised or gesso painting on panel, applicable to interiors of houses of a superior class. The work we saw was done on oak and pitch pine; and for the decoration of panelled work it is extremely suitable. One panel on pine was an admirable rendering in a naturalistic spirit of the oak and mistletoe, entwined or blended in a pleasing and thoroughly artistic manner, in which the leaves and berries were raised or painted in relief, the raised parts being discriminately juxtaposed with the portions flatly represented. The preparation of gilded gesso is, we believe, chiefly composed of lime mixed with oil and other ingredients, and productive of a remarkably fine surface. The colours chosen in the panel we saw were in a low scale—the leaves were of a bronze hue depicted in transparent colours or glazings upon the gilded ground, while the groundwork, or panel itself, was apparently stained with a dark colour transparent enough to show the natural grain of the wood. There is a remarkably pleasing solidity and cabinet-picture-like effect in the work, which the smoothness and high polish and transparency of the ground enhances. Another panel was treated with a lighter ground, the surface of the wood being apparently grounded with gold. The figure subjects treated by this process have all the beauty and finish of cameos or alto-relievs, owing to the polish of surface and reflection thereby caused. Mr. Heaton has recently executed a fine series of this panel painting for Mr. Ripley, M.P. for Bradford, for the billiard, smoking room, and other apartments of that gentleman's residence, "Acacia." The rooms are divided into panels by pilasters of conventional folial patterns, and contain subjects of rural pastimes and sports—boys climbing, hunting, fishing, shooting, &c., after the model of Luini. Above this is a frieze of foliage, children, birds, &c., is formed. The process has certainly more of the finished cabinet picture of oil, than the decorative and flat treatments that have recently been introduced for woodwork. Stamped leather supplies some analogy to it. We are informed that the best and highest class of subject can be done in this manner for about £5 per superficial foot, though of course the cost varies with the subject, and the labour bestowed. One immense gain in

this kind of art decoration is that it cannot fall into the hands of indifferent or manufacturing decorators, as its value consists in the high-class hand-work of the artist.

BOOKS RECEIVED.

Quantities, by Banister Fletcher (London: B. T. Batsford), is, our readers need hardly to be told, a good treatise by a competent master of his subject. The chapters which comprise it originally appeared in this journal, but some new matter has been added, and the series generally revised. It will, doubtless, be as successful as Mr. Banister Fletcher's other text-books, if we may judge from the number of inquiries that have reached us during the past two years as to whether it was likely to be published in a complete form. *The Geometry of Compasses*, by Oliver Byrne (London: Crosby Lockwood and Co.), is a collection of geometrical problems, resolvable by the description of circles only. The ability to describe a circle with a pair of compasses is the only previous knowledge required on the part of the student. The treatise is a good one and remarkable—like all Mr. Byrne's contributions to the science of geometry—for the lucid character of its teaching. *The Pleasures of House Building*, by J. Ford Mackenzie (London: G. Routledge and Sons), is a well-rendered version of the old story of the woes of the victims of jerry builders. An instructive comparison, of the fortunes of two friends who start house-owning and building is presented. One invests his carefully hoarded savings in a pair of semi-detached villas of the usual lath and plaster type, the creation of an unscrupulous rascal who disappears from the scene before even the houses are sold, and is glad, after a year or two's worry and bother, to part with them for half the original purchase money. The other, with no money of his own to start with, places himself in the hands of a respectable architect and building company, and, paying a fair and honest price for his work and materials, has the satisfaction of making money and becoming the possessor of a structure worth calling a house. The story is told with some humour.

New police buildings are about to be erected at Portobello, N.B., by Mr. H. Lake, at a cost of £4,120. Messrs. R. Paterson and Co. are the architects.

The ancient parish church of Selborne was reopened on Thursday week, after restoration under the care of Mr. White, of London, a relative of the genial naturalist who has made Selborne famous. The builders were Messrs. J. H. and E. Dyer.

A resolution was passed unanimously at the Court of Common Council of the City of London, on Thursday week, empowering the Gas and Water Committee to confer with the Government and the Metropolitan Board of Works upon the subject of the supply of water to the metropolis.

The directors of the Manchester Mechanics' Institution have resolved to establish a class for practical instruction in carpentry, and with that view they have obtained estimates for the supply of benches, lathes, and other appliances necessary for a model workshop. One of the rooms will be fitted up, and by the new year the first carpenters' and pattern-makers' workshop of the kind will be opened in Manchester.

The Corporation of London have given notice that in the next session of Parliament they intend to apply for leave to bring in a bill to enable them to widen London Bridge and to construct the necessary works in connection therewith, and for such purposes to borrow money on the credit of the Bridge House estates. The widening of the bridge will be to the extent of eleven feet on each side. They will also ask to amend any Acts relating to the bridge, and for other powers.

Queen Anne's statue in St. Paul's-churchyard was again attacked at the meeting last week of the Court of Common Council, one of the members remarking that its dirty and dilapidated condition was a disgrace to the dean and chapter of the cathedral.

The memorial stones of a new Wesleyan school at Shoreham, for 100 children, were laid last week. Mr. C. Bell, of London, is the architect, and Mr. J. Willis, of Sevenoaks, the builder, and the total cost of the erection will be about £1,000.

The West Kent Main Sewerage Board, on the 14th inst., raised the salaries of several inspectors of works in their employ, and appointed Mr. Wright to be an additional inspector, making the eighth. It was stated that an agreement with the Sevenoaks urban sanitary authority, for admission of that town into the board's system, was in course of preparation.

Building Intelligence.

AINTREE.—On Tuesday the new Church of St. Peter, Aintree, Liverpool, was consecrated. The church is designed in the style of the thirteenth century, and is simple in character throughout, both in plan and detail. It will consist, when complete, of a nave 26ft. wide, with north and south aisles, tower, forming north porch, north and south transepts and chancel, having the organ chamber on the north side, and double vestries on the south. The contractor has been Mr. Edward Hughes, of Bootle. Messrs. Asahel P. Bell and George Freeth Roper, of the Temple, London, and Royal Exchange, Manchester, are the architects.

CHELTFENHAM.—The new Roman Catholic church of St. Gregory, Cheltenham, has been consecrated, having been at length completed. The church is in the Early Decorated style, and consists of chancel, nave, with aisles and tower at the western end. The total length from the western door to the chancel wall is 153ft. 6in.; the chancel being 30ft. by 21ft.; the nave 103ft. by 30ft., with the aisles 69ft. by 12ft. 6in.; and the tower 25ft. square, independent of buttresses, which make the total base of the tower 35ft. The church is cruciform in shape, the transepts being 65ft. in length and 20ft. wide. The general width of the church is 55ft.; the height of the nave is 70ft., and the height of the tower and spire is 202ft. The total cost has been little less than £20,000. The church has been built from the design of Mr. C. F. Hansom, architect, of Clifton.

GATESHEAD.—Schools erected in Askew-road by the Gateshead School Board have just been formally opened. The schools are arranged in three departments, and will accommodate 800 children. Mr. Lee's contract amounted to £6,202, which equalled a cost of £7 15s. per child. The cost of land, furniture, &c., made the total expenditure about £10 per child. Mr. Edington has acted as clerk of the works, and the buildings have been designed and carried out under the superintendence of Mr. Thomas Oliver, architect, Newcastle. This makes the fourth block of schools completed by the board, in all affording accommodation for 3,351 children.—On Thursday, 15th inst., the new church for the parish of St. Cuthbert, Marley-hill, Gateshead-on-Tyne, was consecrated by the Bishop of Durham. The structure is built of local sandstone, the walling being of coursed rubble, with dressed stone to buttresses, quoins, doors, windows, water-tables, &c.—It is in the Early English style of architecture, and consists of a chancel 24ft. 6in. long, and 18ft. wide, a nave, 61ft. 6in., by 24ft. wide, a western porch, 14ft. by 7ft., and an organ-chamber at the north-east corner of the nave, opening into a vestry on the north side of chancel; under the vestry is a fire-proof heating-chamber. The building will seat 256 persons. The nave has an open-timbered roof, and both nave and chancel roofs are plastered under the rafters and divided into panels by moulded ribs. The nave is lighted by groups of lancets on the north and south sides, and by a rose window over the western porch, while the chancel has coupled lancets on the south side, and two enriched lancets at the east-end, with a vesica-shaped opening above. Over the chancel-arch is a stone bell gable, containing two bells. The chancel is seated with choir seats of pitch-pine, with priest's stalls at the west-end, and the nave has low, open seats of stained deal. The altar, rail, and pulpit are of oak, and the lectern of brass and iron. The font, of stone, with shafts of Frosterly marble, is placed on one side of the western door. The church is heated by Gundy's hot-air apparatus. The churchyard is surrounded by stone walls, with oak gates, and dressed stone piers. The cost has been about £3,000. The works have been carried out by Mr. S. B. Burton, builder, of Newcastle-on-Tyne, from the designs and under the superintendence of Mr. C. Hodgson Fowler, architect to the dean and chapter of Durham.

INCORPORATED CHURCH BUILDING SOCIETY.—The usual monthly meetings of the Incorporated Society for Promoting the Enlarge-

ment, Building, and Repairing of Churches and Chapels were resumed on Monday, at the Society's House, Whitehall, S.W. Grants of money were made in aid of building a new church at Eastbourne, All Saints, Sussex; enlarging or otherwise improving the accommodation in the churches at Bedstone, Salisbury; Bexhill, St. Peter, near Hastings; Cherry-Hinton, near Cambridge; Dordon, near Tamworth; Llangybi, Carnarvon; Marple, near Stockport; Sevenoaks, St. Nicholas; Whitsbury, near Salisbury; and Wormshill, near Sittingbourne. Under urgent circumstances the grant formerly made towards re-seating and restoring St. Luke's Church, Old-street, London, was increased. Grants were also made from the Special School-Church and Mission House Fund towards building schools or mission churches at Broom, in the parish of St. Oswald's, Durham; Camberwell, St. John the Evangelist, Surrey; Saxilby, Lincoln; St. Neot, Cornwall; Wadsley, near Sheffield; West End, in the parish of Silverstone, near Towcester; and Weston, in Portland. The society likewise accepted sums of money as repair funds for the churches at Walton-on-the-Hill, St. Cuthbert, Lancashire; and Branksome, All Saints, Dorset.

LONGWOOD.—On Thursday week the new Church of St. Mark, Longwood, in the diocese of Ripon, was consecrated. The new church is in the Early Pointed style, and as yet has no chancel or tower, and only temporary timber vestries. So far as it is completed, it has cost about £5,000, and will accommodate 468 persons. When the chancel is added there will be accommodation for 513 persons, but for this addition another £1,500 will be required. The church contains a nave 71ft. by 26ft., divided from the two aisles by five bays of pointed arches on octagonal columns, and each aisle is 9½ft. wide. The west elevation has a four-light geometrical tracery window, with a lancet window in the tympanum. The north and south elevations are divided into five bays by quoined buttresses, each bay containing a two-light tracery window, with label moulds and bosses. The clerestory is six feet high, and has five tracery windows on each side. The architects are Messrs. J. W. Cocking and Co., New-street, Huddersfield.

METROPOLITAN BOARD OF WORKS.—At Friday's meeting of this board, Sir J. McGarel Hogg, Bart., M.P., was for the eighth time unanimously re-elected chairman. The tender of Messrs. Mowlem and Co., of Westminster, was accepted for the execution of general works of the board in district A, north of the Thames. As the Fulham District Board have failed to comply with a resolution of the board of the 27th July last, requiring them to reconstruct the sewer in Blomfield-road, Hammersmith, it was decided that an order under seal be made upon the district board calling upon them to execute the necessary works within 21 days. £5,000, being half the estimated cost, was voted towards the expense of a proposed improvement by the Vestry of St. Luke's in Bath-street, the sum to be paid on the completion of the work. Advertisements were directed to be issued for an additional first-class officer in the superintending architect's office, at a salary of £200 a year. The Penge Vestry wrote, requesting the board to establish a fire-brigade station in the hamlet, and to take immediate steps for forming the telegraphic communication between Penge police-station and the existing engine-station; referred to the fire-brigade committee. This committee submitted a design for a medal proposed to be given to men of the Metropolitan Fire Brigade who distinguished themselves by extraordinary bravery at fires, and recommended that the medal be of silver instead of bronze. Some discussion arose on the latter point, and the design itself was objected to, a member declaring that he "could see no design in it." The whole matter was referred back to the committee. As to the "model" lodging-houses in Choumert's-road, Peckham, complained of by the Camberwell Vestry, the solicitor to the board was authorised to take proceedings against the builder. A letter was received from Mr. Russel Aitken, transmitting plans of a proposed railway from Chelsea to Charing-cross, and of a proposed terminus at Charing-cross, to be

constructed under Northumberland-avenue and other property owned by this board; and requesting that, as Parliamentary plans cannot be deposited in time this year, the board would arrange to keep the land open and free from new buildings until next year; and a further letter, stating that it is proposed to acquire the Millbank Penitentiary for a coal and goods depot. This was referred to the works committee, as was one from Mr. Brand, comptroller, stating that the Court of Common Council of the City have had under their consideration the desirability of constructing a bridge across the Thames from Little Tower-hill and Irongate-stairs, on the north side, and from Horsleydown-lane and Stairs on the south side of the river, and that the subject has been referred to a committee, who are desirous of a conference with the Metropolitan Board of Works thereon.

NEWCASTLE-ON-TYNE.—On Wednesday the foundation stone of the new Science and Art School, in Corporation-street, Newcastle, was laid. The building will be erected in stone. The design, though plain, is neat and appropriate. Upon the first floor will be placed the lecture-hall for science subjects, and also several large science class-rooms. On the second floor the rooms are to be devoted to art students. The chemical and physical laboratories will be placed on the third floor. The contract for the work has been placed in the hands of Mr. Humphrey Atkinson, Blydon, and Mr. Thomas Oliver, Newcastle, is architect.

PENN (BUCKS).—The chancel of St. Margaret's Church, Tyler's-green, has lately undergone considerable alterations and additions, the roof having been lined with pitch-pine boarding, fixed and panelled with moulded ribs and richly-gilt pateras. A reredos has also been erected, of Caen stone, with carved caps and columns of Mexican onyx and other marbles, and alabaster panels; the central panels over communion table are in gold and coloured mosaic, by Messrs. Salviati. A new ciborium on north side, and double sedilia on south side of chancel, have also been formed. The floor is laid with Messrs. Maw and Co.'s encaustic tiles. The new altar rail is wrought brass, and with the corona of four brilliant lamps, with duplex burners, was supplied by Messrs. Hardman; the whole of the interior of the church is about to undergo colour decorations in stencil patterns. The work has been designed by, and is being carried out under the superintendence of, Mr. H. G. Liley, 8, Bradmore-park, Hammersmith.

SHEFFIELD.—New Turkish baths, considered the finest and most complete in the kingdom, have just been opened in Victoria-street, on a triangular site at the rear of the old swimming bath and saloon, by a limited liability company. The exterior has no architectural pretensions, but the interior is luxuriously fitted with tessellated pavements, white and coloured glazed brick walls, arched and decorated ceilings, easy chairs, and marble and felt-covered seats, so as to conduce to the comfort of those using the baths. The heating apparatus has been manufactured by Messrs. Vickers, Sons, and Co., from the designs of Mr. T. E. Vickers. Only a portion of the building is finished as yet, and a new first-class swimming bath is in course of formation. This will be 77ft. by 30ft., and will have a depth of water at one end of 3ft. 6in. and at the other of 6ft. 6in.; the total capacity will be 70,000 gallons. The footway round the bath will be of marble; the bath itself is to be lined with white glazed tiles; the walls, too, are also of glazed bricks. The water will be filtered by an apparatus manufactured by a London firm. The old swimming bath has been improved, and the saloon has been re-decorated; there are two new retiring rooms, a large refreshment-room, and a supper-room and kitchen. The architect for the alterations and new building is Mr. E. M. Gibbs, Change-alley, Sheffield.

TORQUAY.—The memorial stone of a new Wesleyan chapel and schools were laid at Torquay the other day. The style is Classic. The plan of the chapel is a parallelogram, 79ft. in length and 50ft. 6in. in width. The main roof is to be formed in one span, with the tie-beams only exposed, and the plaster ceiling brought

to this level will have a circular cove formed the angles, where the tie-beams are supported with carved and moulded ribs. The ceiling will be thus formed into panels, picked out in color and stencilled, to relieve the plain surface. Accommodation is to be provided for 1,000 persons on the ground floor, and 350 in the gallery. The school buildings are to be situated at the side of the chapel. The front will be carried out in the same style as the chapel, but of rather less costly character. The plans have been prepared by Mr. J. W. Rowell, architect of Newton Abbot and Torquay; and the buildings will be carried out by Mr. E. P. Bovey, Torquay, the amount of the contract being £5,773 10s.

TUNBRIDGE WELLS.—The foundation stone of the pump-room, about to be built at the end of the Parade by a joint-stock company, was laid by the Marquis of Abergavenny on the 6th inst. The building will be Domestic Gothic in character, of white brick, with yellow malm-band courses and gables, filled in with ornamental brick panels. Mediæval lead-light glazing will be used for the windows; the roof will be slated with ribbed-tile edging. Facing the Parade will be a carved stone porch entrance. In the basement will be located the janitor's apartments and cellars; the ground floor will be devoted to library, reading-room and ladies' rooms, lavatories, and offices. The pump-room proper will be 73ft. 6in. x 38ft. with bay windows in front and a recess at the rear, in which will be a fountain supplied with chalybeate water. On the right hand side of the room will be provision for an orchestra. The ceiling will be moulded. The upper floor will contain a billiard-room, masonic lodge and ante-rooms, &c., and will be approached by a grand staircase. The architect is Mr. T. Ladds, and Messrs. E. J. Strange and Sons are the builders.

WHALLEY RANGE.—On Monday the foundation stone of a new Presbyterian church at school was laid at Whalley Range. The cost of the buildings is estimated at from £3,000 to £10,000. The building, which is being erected from the designs of Mr. H. R. Price, architect of Newcastle-on-Tyne, will be in the Early Gothic style, with a spire 127ft. high, rising from the principal entrance. The church will be 90ft. in length, with a breadth of 45ft., and will consist of nave, aisles, and transepts with galleries. In the church accommodation will be provided for 750 worshippers.

The Corporation of Sheffield decided, on Monday upon an extensive scheme of street improvement. They are promoting eight schemes in addition to thirteen for which power has already been obtained. The schemes will involve the outlay of an immense sum of money, and in the case of one of them a loan of nearly £100,000 has been rendered necessary, the running of tram-cars in narrow and crowded streets.

The new church of All Saints, Hawsker, near Whitby, was consecrated on Monday. The design was furnished by Mr. E. H. Smales, architect, Whitby. The style is Early French.

The Carmarthen Guardians anticipate getting their workhouse altered—so as to meet the wishes of the Local Government Board—at a very cheap rate, and to be able to dispense with the services of either an architect or builder. At their last meeting "very neat ground plans" were exhibited by Mr. Lewis, the master, showing the alterations which he and the medical officer (also Mr. Lewis) had agreed upon, including the erection of a tramp-shed and the formation of bath-rooms—that for males of the present dead-house, and that for females of a disused water-closet. The master said that he was a mason in the house, stones and broken bricks were on the premises, and all that he needed was to buy a little timber. The guardians direct their obliging official to set about the work at once, and to superintend it during progress; but no suggestion was thrown out as to payment for the extra labour involved thereby.

In our notice last week of the completion of the new military brigade depôts at Caterham and Reeding we should have stated that the locks and keys were supplied by Mr. James Hill, of 37, Upper Thames-street—not by Messrs. Higgs and Hill, the builders. The error was caused by the similarity of name.

The memorial stone of a new Sunday school lecture-room was laid at Pombury last week. Mr. J. W. Brooker, of London, is the architect.

A new Wesleyan mission chapel is being erected at Ipswich by Messrs. Smith and Welcham. The building, which is Gothic in style, will cost £400.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress, price 2d., post-free 2d. The number published November 23 contains articles on Our Roadways and Their Repairs, Nutrition and Health and Disease, The Medical Officers of Health Society's report of Prof. or Arsted's Paper on Water Supply, Improvements in Ventilation, Vegetable Nutrition, The Origin and Prevention of Infection, Public Health Reports, Legal Intelligence, Water Supply, Correspondence, Intercommunication, the Editor's Table, Gleanings, &c.—31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence. All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C. TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces. Cheques and Post-office Orders to be made payable to PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; or the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—Spero.—T. S.—E. P. Williams (drawing received).—L. P. Co.—E. L.—T. W. R. and Co.—T. W. C.—T. D.—W. P. M.—B. and B.—M. H. H. and Co.—J. H. R.—0 per cent. from Tradesmen.

Spero. (If the bay window projects beyond the line of building prescribed by the building committee, it is an infringement. You say the plans were sanctioned by the town surveyor, but did he sanction the projection of the bay window beyond the line? The old custom does not affect your case.)—T. C. NICHOLSON. (We do not know; but a very good one on the same principle is made by Colman and Glendinning, of Norwich.) "BUILDING NEWS" DESIGNING CLUB.—Drawings Received:—Cave Canem, Medicus, Josephus Orange Blossom, Navite, Fleur-de-lis, Magnet, X in circle, St. Lucy, L. in G.—Jag. (All drawings are returned, excepting those we intend using.)

Correspondence.

ILLICIT COMMISSIONS.

To the Editor of the BUILDING NEWS.

SIR,—Allow me to add to your able remarks, and the letter of your correspondent on "Illicit Commissions," a few observations. The facts related in the article are galling to every conscientious man, and they only confirm the opinion you expressed at the early part of this year. But, Sir, the evil is now so widespread among all professional men that there is considerable danger that the weaker men of the profession will become largely infected with the disease. I say weaker advisedly, for however much some men plume themselves on what they have made or pocketed by a little manoeuvring in the shape of fees—a little tactical sharpness that they think shows cleverness and worldly acumen, which they like to boast of to their friends—there is really nothing that displays such utter folly, so low an estimate of one's own ability and resources, and so contemptible a standard of morality as the pocketing of a dishonest fee, whether in the shape of commission to builders and advertising manufacturers, or the equally dishonest practice of making a stroke of business on behalf of an employer the means of private gain. There seems a danger that if the dishonest doer is not taken there is a great deal more tricky of another form, equally reprehensible, but perhaps even more selfish and antagonistic to employers, going on in a more concealed way. For example, I know some men in the receipt of salaries who double their income. How is this done? Either

by robbing their employers of time, or, what amounts to the same thing, physical capacity for their work, or by carrying on a little underhand business of their own. To take the architectural profession there is a great deal stealthily made, as "M." acquaints your readers, by assistants or managers pocketing fees from contractors, agents of manufacturing firms, and so forth; but a far greater evil is the trafficking in another's brains, name, or reputation, the secret and reprehensible practice of carrying on a business with the clientele of the master or firm—in short, robbing in another's name. It is not uncommon to find here and there individuals who like to make capital out of every little transaction they are engaged in, not on behalf of their employers, but on their own account. Shakespeare says:—

Who steals my purse steals trash. . . .
But he that filches from me my good name,
Robs me of that which poor not enriches him,
And makes me poor indeed.

A moral that points with great force to the habit of secretly plundering another's brain or reputation. As much of this kind of dishonesty is committed by otherwise useful and often religiously-convinced men, it deserves notice. Draughtsmen and assistants are sometimes addicted to this kind of delinquency. In firms a partner is sometimes found villain enough to do a little quiet business in this way, and whenever a firm is made up of an individual of this sort and a man of ability or strict integrity, there is always a danger of the latter being plundered. This source of dishonesty is, I am sorry to say, rather common in the architectural profession, where, as in other vocations, prigs and pilferers are met with rather largely; but both the prig and the pilferer are, in my opinion, equally dishonest men, and deserve the reprobation they sometimes get. Generally, however, my experience and observation have convinced me that the priggish individual is rather the better business man, the most oily, facetious, and bouncing individual of the two. With all professional men a high standard of morality is required, and till we find men act up to this law, we cannot value any pretensions of a more pronounced character.—I am, &c.,
G. H. G.

SIR,—It is high time that this matter was taken up by the powers that be so as to settle the matter once for all, and put the profession right with the public if possible.

There is one thing that has struck me forcibly for some time back respecting this attack upon architects, and that is why should the architectural profession be made the scapegoat on the point of illicit commissions when other professions are equally involved? As we are threatened with the law to put us right (?), would it not be as well to commence with the lawyers? The following extract is from a weekly local paper for this month, and I think will be apropos:—

"It appears that the solicitor, to begin with, is by no means *rectus in curia*. He takes large assurance commissions for the introduction of business, regardless of the stability of offices, he shares with stockbrokers and auctioneers allowances he would be ashamed openly to claim, and it is said that if he do not divide fees with counsel he is on the best of terms with official liquidators and accountants whenever estates with good assets are being wound up. Then the banker, who, if any one, should be above fear and reproach, is barely ingenuous in his system of charges on stock transactions, for, besides the commission he gets as his own proper demand, he shares with the broker the profit charged as 'brokerage.' Thus, if not obtaining money under false pretences, he is getting at least fictitious merit, for in those cases wherein he 'generously' foregoes his own commission he is realising a very fair profit. Tradesmen have been long known to be in the habit of giving douceurs for the purpose of obtaining custom."

In my opinion the public is not altogether free from blame in this matter, especially in his commission to a starvation point in many instances, and yet expected to be true to his client. It is scarcely possible, as a rule, to obtain honest labour at a dishonest price, and before illicit commissions are done away with, I appre-

hend the public have a duty to perform on their part by giving a fair price for labour received. To accomplish this desirable end, should not the Institute take up the matter seriously, as matters are at present looking somewhat ominous, and it is desirable that decision and promptitude in those assuming to be the mouthpiece of the profession should take place, and assume that leading position which is expected of them by the profession at large? Granting the architect's dignity up to late has been unsullied, and on that account he can afford to laugh to scorn his accusers, yet a continual dropping wears away stones, and his character may become so undermined by continual petty attacks, weak in themselves, yet when added together and disseminated before the world as truth, without any defence by the sufferer, the verdict of the public may go by default on account of the very fact of the accused's silence, leaving outsiders to conclude there must be some truth in the charge so pertinaciously brought forward.—I am, &c.,
PROVINCIAL.

ILLICIT ARCHITECTS.

SIR.—The few idiotic remarks of "50 per Cent." in your last issue show clearly enough his entire ignorance of the whole subject. Every one knows, and deplores the fact, that the illicit commission dodge exists, but every one does not know that its supporters are almost exclusively illicit architects. The ranks of quackery are daily being increased by builders and contractors; foremen joiners more particularly are very partial to setting up in what they call the architectural line, and are chiefly patronised by people like "50 per Cent.," who are deluded by their boasted practical knowledge and nominally ridiculously low charges.

Only lately I was promised a commission to the extent of 6 or 7 thousand pounds, and which might have given me a start in practice. I however hear from the proprietor that he has engaged a first-rate architect, recommended by solicitors, who is only charging 2 per cent. for his entire services. On inquiry I find that this first-rate man is an ex-artisan, and may be seen any day, now that the works are in progress, striking attitudes against the hoarding, smoking a very dirty clay pipe, and fraternising with the excavators. This ornament to the profession never writes a specification, but calls his quantities "quantities and specification," and writes a private note to tendering builders, telling them how much to add to their tender for payment for this mongrel document.

If "50 per Cent." and some others who have written plenty of twaddle on this subject would go to the root of the evil and expose illicit architects, instead of throwing their dirty bit of spiteful mud at the profession, they would do much more justice, and help architects' assistants to commence and carry on business in a straightforward and honourable manner—a thing at present almost impossible.—I am, &c.,
AN ARCHITECT'S ASSISTANT.

COMPETITIONS.

SIR,—It is encouraging to find the President of the Architectural Association (in his inaugural address) protesting so earnestly against open competitions, and denouncing the system as "a bane not only to the architectural profession, but to the art of architecture." It is not very easy to suggest a remedy, but if the members of the Institute and of the Architectural Association could be induced to pledge themselves (by their bye-laws or in some other equally powerful way) never to enter the lists of open competition, the profession would increase in affluence and rise in dignity; but united action is absolutely necessary to eradicate a system from the effects of which all are more or less suffering.

If united action is at present unattainable, and the younger members of the profession think their only road to influence and reputation is by means of competition, respect must doubtless be paid to their opinion, and the most that can then be done is to accept the system and endeavour to modify its baneful influence as much as possible.

One of the weak points of the competition system results from the inability of promoters to estimate the merits of a set of competition

drawings; and, however earnestly they may desire to act conscientiously and select the best design, they are often carried away by the subtle pen-and-ink or highly-coloured perspective placed before them (some of them, indeed, marvels of artistic ability regarded as drawings merely), to the exclusion of designs which are superior in pure architectural treatment and arrangement, but which lack the advantage of being so powerfully and subtly represented pictorially. Even to an educated and practised eye it is by no means an easy task to go through a large set of designs and intelligently select the one possessing the greatest merit in plan and elevation; and it is not, therefore, to be wondered at if amateurs so frequently fail in appreciating all the good points of an architectural composition.

This serious defect in the competition system might surely, to a great extent, be obviated if the Institute and the Association respectively were to appoint a "competition committee" of six or eight members whose duty it should be to examine competition drawings, and thereby encourage promoters of competitions to make these bodies the referees in all competitions. An impartial and professional examination would thereby be secured for all the designs, and an intelligent and authoritative award be made, such as would be received by the profession at large with confidence and respect.

A fee for such reference might easily be arranged at a percentage—say, $\frac{2}{3}$ per cent. on the advertised contemplated outlay on the buildings over £10,000 and 1 per cent. under £10,000. This would provide a fair remuneration to the gentlemen forming the committee for time expended in attending meetings to consider the designs, and the fee thus paid would at least be equal to the fee paid to directors of public companies for attendance at board meetings, added to which the benefit that would result to the profession in other ways would be incalculable.

The absolute financial loss to the profession, annually resulting from the competition system, must be very large indeed, and as all buildings of any importance would probably, under any circumstances, be entrusted to architects, if competitions were given up altogether, every architect of even average ability might hope to get his fair proportion of buildings to carry into execution.

I fear, however, the time has not yet arrived when the total abolition of the competition system would be received with universal favour, but that it will arrive sooner or later may be pretty safely predicted. THOMAS PORTER.

2, Westminster-chambers, 19th Nov., 1877.

BEDFORD-PARK ESTATE.

SIR,—My attention has been directed to your leader of Nov. 9, wherein my name is mentioned. Permit me to say that I have had nothing to do with the superintendence of any building on the Bedford-park Estate. I was asked for two designs, which I furnished, and for nothing else am I responsible.

Seeing a curious caricature of them at some of the metropolitan stations I was induced to visit Bedford-park Estate, where I found that my designs had been carried out with as much knowledge of the details of architecture as that exhibited in the railway caricature. If it were human to be amused at the sight of one's invention travestied, I should have had occasion for merriment as I looked at the mantel-pieces and staircases.—I am, &c.,

E. W. GODWIN.

8, Victoria-chambers, Westminster, S.W.

[Our chief objection was not so much to the detail as to the plan, which has been substantially carried out, and which we have already illustrated. We suppose Mr. Godwin leaves his plan undefended].

SIR,—As one who found reason for adversely criticising the houses first erected on the above estate, will you permit me to note in your pages the satisfaction with which I have inspected those recently erected from the designs of Mr. Norman Shaw, and which have been well described in your issue of the 9th inst.? They appear to me to be exceedingly well-planned houses, possessing every convenience which a

middle-class resident could expect. Of the two classes of houses which you have recently illustrated I certainly think that, as regards a thoroughly satisfactory interior, the palm must be given to those erected in "the Avenue," and although the staircase cuts the house in two, it is convenient, and we lose that overwhelming display of newel which we find in the houses erected in the Woodstock-road.

The elevations are, perhaps, matters of taste only, but I think the panels with the triangular pediment over them, between the windows of the first story to the houses in "the Avenue" might be omitted, as ugly and expensive luxuries; that the chimney-pieces and stoves to the drawing-rooms are far too small; that the centre flowers in the same rooms are ditto; that the fastenings to the scullery windows are inducements to burglary; and that the particular man or men who pointed the frames should point a few more, and then be sent to the place appointed for those who have done evil in their day.—I am, &c.,

WILLIAM WOODWARD.

OLD LEAD CISTERNS.

SIR,—Good specimens of ornamental lead cisterns belonging to the last century are always interesting when they are met with. There are two of these at the Star Castle, on the picturesque island of St. Mary's, Scilly, which seem to deserve a passing notice, for, being remotely situated, they are probably not familiar to the majority of your readers.

Both cisterns (there were originally four, but two have disappeared, although the downfall pipes of the missing ones still exist) are in capital preservation, and measure respectively 5' 4" long by 2' wide, by 2' 9" deep. They are richly panelled with raised moulds; whilst a bold bead runs right around the top. The fronts are divided into three compartments—the central one being the largest. Here occurs a shield, bearing three cannons and three balls, resting amidst a mantling composed of flags, barrels, ramrods, &c. Over and above these arms is a cupid with outstretched wings; whilst below another little cherub assumes a like position. Under all is the date, "1727," in raised 2" letters. On either side (the side panels) is a monogram G.R., with a little 2" nicely interwoven into the G. The royal crown occurs immediately over these; whilst above and below cupids stretch their wings continuously. The ends of the cisterns are panelled similarly to the front, but the central enrichments vary. One has, on either end, a wreath of laurel, surmounted by a crown; the other exhibits more elaborate work, consisting of very fairly modelled Italian ornament. A figure of a Roman centurion sits in the middle; whilst others of nude boys occur amongst the foliage by the side of him. Above two angels hold between them a basketful of fruit, over which an eagle hovers, carrying a spray of laurel in his mouth. At one end of each cistern, in quaint raised $\frac{3}{4}$ " letters, is the name:—

HEZ WALKER.

LONDON.

Inside the cisterns are divided into three equal parts—the leaden partitions ($\frac{3}{4}$ " lead) reaching up to within 5" of the top. The downfall pipe comes into the central compartment. The heads of these pipes are circular and moulded; but, although old, are not interesting. The cisterns, which are in a capital state of preservation, stand upon blocks of granite.

The Star Castle commands one of the most beautiful views of land and sea imaginable; but is quite uninteresting architecturally speaking. Built in 1593, it has no real strength; and as a place of defence is little better than a sham. Granite is the material used in its construction, and over the entrance portal is carved "E. R., 1593;" whilst on the base of either jamb occurs "R. A." on one side, and "F. C." on the other. Those, however, who know Pendennis Castle, at Falmouth (built in, or just before, Henry VIII.'s time), and the excellent granite work that building presents, will be sorely disappointed on first acquaintance with the masonry of the Star Castle on the Scilly Isles. And yet both—distant about 60 or 70 miles from each other—stand on singularly similar positions; both had the best of granite to fall back upon for their

construction; and both were built nearly about the same date. The two castles are remarkable illustrations of good work and bad.—I am, &c.

HARRY HEMS.

St. Mary's, Scilly Isles, Nov. 8, 1877.

P.S.—There is an old cistern on the top of St. Michael's Mount, near Penzance, close against the entrance door to Sir John St. Aubyn's picturesque residence, which occupies the summit. It is 5' 11" long by 5' 1" deep, and 3' $\frac{3}{4}$ " wide, and is simply panelled in three panels, with raised moulds around. In the centre is a small shield bearing a St. George's Cross. This is surmounted by a crest—a bird (apparently an eagle or dove)—and there is slight mantling around of palms. The shield stands upon what I take to be a cap, having the corners lifted up. Underneath, in raised 3 letters, runs the inscription:—

SEPT.

29

1784.

The head of the downfall pipe is circular, and not unlike those at Scilly.

CHIPS.

A new Wesleyan chapel has been opened at Aylesbury, erected by Mr. Charles Hayes, at a cost of about £3,000, from designs by William Watson, architect of Wakefield. It is of Classic design, of red brick with Hollington stone dressings, and is 60ft. long by 45ft. wide inside, with galleries on both sides, three pews deep and at end, vestry at the rear, and organ chamber over. The building will seat 750 worshippers; the fittings are of pitch pine; the galler front, rostrum, and fittings of the same material French polished. Ornamental iron railings and gates enclose the site.

The new reredos in Winchester College chapel has just been completed by the placing in position of the twelve statues. The five nearest on either side of the central cross are those of saints, whilst at the extreme ends of the structure are figures of Alfred the Great, said to have been educated in Winchester, and William de Wykeham, the founder of the institution, the two latter facing the Communion table. The carving has been executed by Messrs. Eardley and Co., of Westminster.

Two memorial stained glass windows have just been placed in the chancel of the parish church of Banham, Norfolk. The subjects are figures of the four Evangelists, under rich canopies, and the quatrefoil in the head of each window contains a censuring angel. The windows were supplied by Messrs. Powell and Son, Whitefriars Works, London, and fixed by Mr. Cracknell.

The restoration of the chancel of Belgrave parish church has been completed, under the care of Mr. Ewan Christian, and the building will be re-opened on Tuesday next.

Mr. Thomas Woolner has just completed the clay model of the gigantic statue of Captain Cook about to be cast in bronze for the Legislature in New South Wales. It represents the great sailor in the costume worn by naval men in the early years of George III.'s reign, with uplifted right arm. It is to be placed on a pedestal, 22ft. high, on a site overlooking the whole Bay of Sydney, and where it will be visible as far as Port Jackson Heads.

The works executed by students in the Lewes School of Science and Art during the past year were exhibited last week, and are said by the county press to have been more than equal to those of other years, and to have borne evidence to the efficient training of the head-master, Mr. Robinson. A marked feature of the exhibition was the numerous drawings from casts.

A new Free Gospel chapel at Liverpool was opened last week. The building, which has cost £1,800, is Gothic in style, and will seat 450 people. Mr. Middlebrook, of Walton, is the architect.

The mortuary chapel on the north side of the chancel of Hatfield Church, belonging to the Marquis of Salisbury, has recently been restored and decorated. The decorations consist of Italian fresco paintings.

On Wednesday evening the roadway in New Bridge-street, Blackfriars, gave way, just opposite Tudor-street, and above the old Fleet ditch. A policeman had to stand on duty at the spot to prevent danger to life.

The ancient church of Lanerton, near Tavistock was destroyed by fire on Monday night. It was restored last year at a cost of £1,600, Mr. J. P. St. Aubyn being the architect. The church was erected in 1588. Nothing but the four walls and towers remain, everything else being in ruins.

The School Board for London, on Wednesday, by a majority of 19 votes to 10, decided to instruct the school management committee to report as to the advisability of allowing any parish adopting the Free Libraries Act the use of board schools as free libraries and reading-rooms.

Intercommunication.

QUESTIONS.

[5200].—Antiquities of Malta.—Will some reader kindly inform me of any books speaking of the architectural history or antiquities of Malta?—R. MORRISON MARNOCK.

[5201].—Surveyor's Valuation.—Can a surveyor, without holding an appraiser's licence, legally value, for the owner's information, property proposed to be taken, under compulsory powers, by a railway company for new works; or is it necessary that he should hold a licence, and that his valuation report should be stamped? If so, can he charge for the stamp duty?—W.

[5202].—Appointment of Surveyor.—Is the appointment of a surveyor the architect's prerogative, according to custom, or is it not? Will some "intercommunicator" kindly give reasons for or against?—IPSE.

REPLIES.

[5164].—Surveyor's Charges.—The question hinges on another—were the quantities sanctioned by the employer? If so, then it is answered by answer No. 5176. The employer is liable for the fees. Quantities are prepared for the benefit of employers. The contractor receives the amount of the commission only as an agent.—IPSE.

[5178].—Surveyors and Inspectors of Nuisances.—If "T. S." will write to Dr. Lory Marsh, 20, Spring-gardens, London, S.W., he can obtain list of subjects and full particulars of the examinations.—G. B. M.

[5179].—Binding "Building News" Plates.—Thickness is avoided, and the larger plates are seen to best advantage, by taking one of them as the size of the volume. As regards the smaller plates, they are in almost all cases half the size of the larger ones. I have formed four handsome books, about $\frac{1}{2}$ in. thick, bound at 6s. each. The mode of procedure was, firstly, to pick out all full-page or double-page plates, then to cut asunder those which had no reference to each other, and stick together those which had. Paste and a narrow strip of foolscap, $\frac{1}{2}$ in. width, hold the plates together very well. The dates of publication show how long I waited for the interior or exterior; but the arrangement brings together public buildings and villas for secular volumes, and exteriors and interiors of churches, paintings, and ornamental designs for the ecclesiastical volumes, with details at the beginning of each respectively. This attempt at classification has added to the interest of the plates, and when a decided mistake occurs I cut out the plate, and put it aside for next year. It is a great thing to have them in good condition, and accessible for reference. Perfection of arrangement is, perhaps, of secondary importance.—H. I. W.

[5179].—Binding "Building News" Plates.—Will your correspondent, "T. E. O.," kindly give some particulars as to the way in which he bound up the plates of the BUILDING NEWS? Did he use guards? If not, what size was the book? If only of the size of one page of the newspaper, how did he manage with those plates which extend over two pages?—A. C.

[5187].—Board of Health and Building Line.—The Public Health Act, 1875, clause 156, enacts:—"It shall not be lawful in any urban district, without the written consent of the urban authority, to bring forward any house or building forming part of any street, or any part thereof, beyond the front wall of the house or building on either side thereof, nor to build any addition thereto beyond the front of the house or building on either side of the same."—G. B. M.

[5191].—Inaccessible Heights.—The theodolite, or box-sextant, may be applied to this very easily, and with great approximation to the truth.—WILLIAM BELL.

[5191].—Inaccessible Heights.—"Anxious" will find the rule he wants in the BUILDING NEWS for November 29th, 1872. Also another method in the BUILDING NEWS for October 25th, 1872.—SC. AND A.

[5193].—Hoop-iron Bond.—Though there may be no objection to hoop-iron bond in a rubble wall, it is not in the least essential, and is not often used in stone walls. It is requisite, however, that there should be occasional stones, termed "through-stones," laid across the whole thickness of the wall, placed, say, two to every superficial yard of wall surface.—R. H.

[5199].—Safe Load for Girders.—It is necessary, in order to arrive at the load which the girders will safely carry, to ascertain the net sectional area of the bottom flange, together with the angle irons, deducting the area of section of the rivet-holes. For this purpose "Anxious" has given scarcely sufficient data, in not having stated the size and number of the rivet-holes. The result may be got at by the following method:—Let W = load (distributed) in tons; S = strain on flanges in tons; L = length of girder in feet; D = depth of girder in feet.

$$\text{Formula: } W = \frac{8DS}{L}$$

Taking first the case of the large girder, the gross sectional area of one flange, together with the angle irons, is about 60 square inches, and, assuming that there are three rivet-holes, say, $\frac{1}{2}$ in. in diameter, to be taken into account (two in flange, and one in angle irons), this will give a net area of 53 square inches. If the load is to be stationary the iron will bear safely a tensional strain of 5 tons to the square inch, which gives 265 tons as the total amount of strain the flanges are capable of bearing. Applying the formula, we have:—

$$W = \frac{8 \times 4 \times 260}{72} = 115\frac{1}{3} \text{ tons, or } 1\frac{1}{6} \text{ ton per foot run.}$$

In the case of the small girder there is a gross area of about 23 $\frac{1}{2}$ square inches in the flanges, &c., and a net area of about 18 square inches. This will give a strain of 90 tons as the maximum for the flanges to bear. Applying the formula again:—

$$W = \frac{8 \times 3\frac{1}{2} \times 90}{42} = 64\frac{2}{3} \text{ tons, or } 1\frac{1}{3} \text{ ton per square inch.}$$

From the weights just found must be deducted the weight of the girders, which will give the safe (distributed) load. If the lengths given are the extreme lengths of the girders, the part lying on the walls must be deducted for the span—i.e., "L" in the formula.—R. H.

WATER SUPPLY AND SANITARY MATTERS.

CHAPELTOWN.—The inhabitants of this mining district have been greatly inconvenienced by the scarcity of water during the last few years; but at length there seems a probability that an abundant and constant supply will be procurable, as a draft agreement has been prepared as between the Sheffield Water Company and the Wortley rural sanitary authority, to which Chapeltown is one of the contributors. The Sheffield Water Company charges 7 $\frac{1}{2}$ d. per 1,000 gals., and undertakes to lay and maintain a water main of sufficient capacity to meet the requirements—about 20 gals. per head per day for the 6,000 inhabitants. The main will be laid from Sheffield to Potter Hill, where the authority will provide a tank to hold 14,000 gals. of water. From this it will be distributed through a low-pressure meter to Chapeltown, Barnecross, High-green, and Lane-end. The sanitary authority is to have power to use or sell the water for any purpose they think fit within their district, but not out of it. It is stated that the reduced price of iron has enabled the water company to offer terms which could not have been entertained by them when the negotiations commenced.

DORCHESTER.—The town council have applied for sanction to borrow £8,000 for works of sewerage and improved water supply. A Local Government Board inquiry was held before Lieut-Col. Cox, R.E., on Tuesday week. Both works are, it appears, required for the new and upper part of the borough, now beginning to be built upon. The estimated cost of the sewerage works is £3,850, while for a new elevated reservoir £1,350 is needed—£350 for an engine, £318 for buildings, and the balance for mains. Towards the reservoir expenditure a recoupment of £1,250 is anticipated from the Government in respect of the new barracks now being constructed. The sewerage works include provision for rainfall, and Colonel Cox criticised this portion of the scheme, remarking that if the surface water were excluded, the present 20 in. outfall-pipe would suffice for a population three times as great as that of Dorchester. He also condemned the proposed passing of the sewage into the river Frome.

MOUNTSORREL.—The drainage of the populous village of Mountsorrel is shortly to be commenced, from plans by Mr. Hodson, the engineer to the sanitary authority. Some opposition was manifested at the inquiry held by the Local Government Board inspector on Wednesday week, but evidently to little purpose. Mr. Martin, of the Mountsorrel Granite Company, has considerably facilitated matters by offering the use for flushing purposes of a considerable volume of water from the works of the company, and to allow the sewer ventilators to be connected with the shafts of the company's furnaces.

SEWAGE IRRIGATION NEAR BISHOP-AUCKLAND.—On Saturday last a Local Government Board inquiry was held at the Colliery Inn, Middlestone Moor, before Mr. Arnold Taylor, C.E., respecting an application from the Auckland rural sanitary authority to form portions of the townships of Middlestone and Westerton into a special drainage district, and to execute works of drainage irrigation therein, at an estimated cost of £2,000. This sum includes the expenses of draining and sewerage, the purchase of a plot of nine acres of land, and the preparation of the same for irrigation purposes. The scheme is strongly opposed by a portion of the ratepayers.

WESTON-SUPER-MARE.—At a special meeting of the town commissioners, held on Wednesday week, resolutions were adopted declaring it to be expedient that the commissioners promote, in the ensuing session of Parliament, a bill authorising them to purchase the undertaking of the water company, and that the sum of £65,000 be paid by the commissioners to the water company for their undertaking at the expiration of 60 years from the passing of the Act, and to be secured by bonds, which may be paid off at any time on giving six months' notice.

Our Office Table.

A NEW iron bridge which Sir William Armstrong is building across Jesmond Dene is rapidly approaching completion. It has a total length of 550ft., and its breadth is 24ft. 3in. The bridge is supported on 50 cross girders, each weighing about two tons, and is divided into eight spans. These rest upon seven pairs of iron pillars, erected on solid masonry bases. The columns vary in size according to the dip in the ground, the first two pairs nearest the Newcastle end of the bridge, being 36ft. high, the third pair 41ft., the next three pairs 44ft., and the last pair 41ft. Upon them, and rising to a height of about 5ft., stand the supporting pillars of the parapet, also relieved with circular-headed panels. Upon the cross girders already mentioned, and composing each span, are thirty intermediate girders and thirty cross-intermediate girders, making 450 intermediates altogether. The pillars supporting the structure are further strengthened by cross-stays, one cross-stay and four diagonal stays being riveted between each pair. The ends of the bridge rest upon two solid masonry abutments, and are made fast there, the play for expansion and contraction of the iron being allowed for in the centre of the structure. Here the two immense masses of iron forming the halves of the bridge are made to rest upon small rollers, and four inches of space are allowed for their movement. The floor of the bridge itself is laid down in raised $\frac{1}{2}$ -inch iron plates, each plate forming a kind of small flat arch, and upon which of course will be laid the asphalt and macadam. The weight of the six largest pillars is 6 $\frac{1}{2}$ tons. Of the whole eight, six have a weight of three tons each, and the two shortest two tons each. The bridge has a gradient from end to end of about two feet, gradually rising from the Newcastle end to that on the opposite side of the Dene.

A CORRESPONDENT of the *Birmingham Daily Post*, calls attention to the large number of failures which have recently occurred in the Birmingham building trade. During the last six months some thirty or forty have instituted proceedings under the Bankruptcy Act to relieve them from their liabilities. Eighteen months ago, and for some time previously, house property, both for occupation and investment, was in great demand, and there was a strong temptation to speculative builders to run up property with borrowed money, which numbers of persons and societies were ready to advance. The class of buildings erected has been for the most part bad, both in character and locality. Latterly capitalists, and particularly building societies, have been less ready to lend upon security of this kind, and in some instances their refusing to find any more money has brought builders dependent upon such aid to a complete stoppage. Under such circumstances the builder, having all his estate locked up in the property, he has already built, has had to file his petition, upon which, as the next step in the proceedings, the building society steps in, forecloses, and sells the property to the first bidder who will cover their advances, leaving the unfortunate creditors without the ghost of a dividend. Some of the points involved in these cases need bearing in mind by those who are considering what amendments are desirable in the existing bankruptcy law.

THE Debenture Trust—a financial association founded in 1875—seems to be making considerable headway. We know nothing about the character of its projectors, but the principle on which it was started is undoubtedly a correct and safe one, and the success hitherto attained justifies the supposition that in practice it has been adhered to. The object of the Trust is to secure to small investors the advantages which are open to the prudent large capitalist, of a safe and moderate return on his capital. A man with five or ten thousand pounds to invest can insure a fair and certain return on the same by spreading it over various investments. Most of these will probably be fairly good speculations, some may prove indifferent or totally bad; but the deficit so caused will be made good by exceptional successes, and so an average good return is practically secured. The small capitalist, for a very obvious reason—the insufficiency of his

funds—is unable to do this. The Debenture Trust Fund, however, gathers together the small fragments of capital and invests them in the lump on the principle explained, so far certainly with good results. There are also other features about the undertaking worthy of attention.

"RIVERS and their Relations to Public Health" formed the subject of a suggestive paper, read by Professor Ansted before the Medical Officers of Health Society on Friday evening. The lecturer pointed out that towns on rivers are more healthy than those otherwise situated, both because they remove and oxidise material that would otherwise decompose, and because they afford a channel for the passage of purifying breezes to and from the sea. The oxidising properties of a stream are most important to health, and in a thickly-peopled country like England are utilised to the utmost, and in some instances are over-taxed. But even where the smaller streams are polluted by the industrial work carried on on their banks they are subservient to the purposes of health. In most cases, he urged, the natural purification of a stream by oxidation may be sufficiently secured to permit the river-water being safely used for household purposes when taken at a moderate distance before towns well drained, and whose direct sewage is kept out of the stream. There may be some risk from sewage contamination, but not greater than those incurred in our daily associations, and it is no more imminent in fairly good water than in that regarded as the very best. The possible danger from the use of river-water has, he held, been greatly exaggerated, and the certain good insufficiently considered. It is doubtful if the endeavour to prevent all pollution from the rivers in Yorkshire and Lancashire will result in success, and if we succeed we shall only do so by inflicting a mortal injury on some of our most important industries, and occasion more deaths by starvation than are produced by permitting the rivers to be utilised. A smart discussion ensued, Dr. Bartlett questioning the chemical perfection of the oxidation effected in sewage during its passage through a river, Mr. Bischof urging that filtration was always needed for river-water, and that it cannot be depended upon as a source of supply during floods. Mr. Bailey Denton complained that sewage contamination had only been touched on in a very loose way; and Dr. Tripe and the President (Dr. Stevenson) urged that water in which particles of excrementitious matter could be detected must ever be regarded with suspicion, however fully filtered. The lecture appears in *extenso*, together with a full report of the criticisms it evoked, in to-day's number of *Public Health*.

The architectural collection at Westminster is complained of as being too exclusive—too Gothic for present needs. The Council of the Museum have, therefore, issued an appeal to the profession and all who are interested in the matter, for casts or examples, either as gifts or on loan, of details illustrating the later styles of English architecture, including the Renaissance and, of course, Queen Anne, with a view of thus making the collection in Tufton-street really more comprehensive.

The dragon vane on the spire of the church of St. Mary-le-Bow, in Cheapside, having been much damaged by the late gales, Messrs. Proctor and Co., engineers, of Turnagain-lane, City, on Tuesday proceeded to remove it, the feat exciting much interest. The height of the spire is 220ft., and the length of the vane to be removed 8ft. 6in. Ladders were placed close against the building, and secured by a spike at the top; a second ladder was then hoisted from the first with a block and rope, the foot being well secured to the top of the other, and the second made fast as before, and so on until reaching the top. Three ladders were used to get to the vane from the top of the balcony. On Wednesday a stage was erected around the top of the spire about 3ft. below the ball. From that the engineers hoisted a derrick, by which they lifted the dragon from its place, and lowered it to the ground. The inspection proved the existence of a fracture in the dragon's neck, of so serious a nature that the only wonder is that it did not

come down during the gales. The spindle also is bent considerably out of the perpendicular. The ball and vane will be re-gilt and replaced, the spire meantime being re-pointed. A correspondent writes to us that the removal of the dragon from Bow Church has always been regarded by the superstitious as an omen of some national misfortune. Like many others our correspondent has run away with half the story. There was an old prophesy—or one was manufactured for the occasion—to the effect that when

The Grasshopper met the Dragon of Bow
England should be steeped in woe.

And this vague prediction was declared by the wiseacres to have been fulfilled in 1861, when, shortly before the death of the Prince Consort, the vane of Bow Church, and the grasshopper on the campanile of the Royal Exchange, were sent at the same time to the same goldsmith's shop to be regilded. Probably there was not a word of truth either in the history of the prophesy or its fulfilment.

LEGAL INTELLIGENCE.

CLAIM FOR PLANS FOR AN ABANDONED UNDERTAKING.—A claim was made in the winding up of the Eastern Counties Aquarium Company, in the Chancery Division, by Mrs. Pugin, the widow of the late Mr. Edward W. Pugin, the architect, and Mr. Calder, formerly his assistant, for a sum of £825, alleged to be due in respect of plans and drawings prepared by them for the erection of an aquarium at Yarmouth. The company was originally promoted in 1872, when Mr. Pugin was employed to prepare the plans for the building. At the first meeting of directors the plans prepared by Mr. Pugin, which were of a very elaborate description, were approved of, and he was requested to make further plans for carrying out the buildings in sections. This was effected, but the company were unable to obtain sufficient money to carry out the undertaking, and the project failed. The directors had taken an indemnity from Mr. Jackson, the contractor, and several of the persons to be employed in carrying out the buildings, that, in case the capital could not be collected, there should be no liability in respect of the contracts entered into with them; but, in the case of Mr. Pugin, no such indemnity was required. The defence was that Mr. Pugin was employed by the promoters before any company was actually formed or directors appointed, and was himself one of the promoters; and that these plans and drawings were only prepared provisionally, and in case it should turn out that sufficient capital could be procured; and further, that no formal steps were ever taken by the directors to sanction the employment of Mr. Pugin to carry out the plans. Vice-Chancellor Sir R. Malins, without calling upon counsel for the defence, said that the work carried out by Mr. Pugin, as well as by the contractor, was done upon the understanding that if sufficient capital could not be obtained to start the company there would be no liability incurred by the directors. The claim could not be supported as against the company, whatever they might be against the persons by whom Mr. Pugin had been employed, and the summons must therefore be dismissed.

SUB-CONTRACTORS AND THE ORDERING OF GOODS.—The case of Marshall v. Meaking came on for hearing at the Bloomsbury County Court the other day. Plaintiff supplied sash fasteners to Messrs. Dargate and Co., of Darlington, to the amount of £19 2s. 6d., to be used in fitting up a bank at Stockton. Messrs. Dargate got into difficulties, and arranged with their creditors; and plaintiff, finding that they were only sub-contractors, now sued the principal contractors for the building. Plaintiff cited Lord Tenderden in a case where it was held that should a person take an order from a person who he was led to believe was the principal, and should afterwards find that he was not, that the aggrieved party should have power to sue the party who really was the principal. The judge held that in this case the work was sub-let to Messrs. Dargate, and they had been paid in full, and therefore the case cited would not apply. Judgment for the defendant.

EDINBURGH.—Another addition has been made to the decorations of the restored portion of St. Giles's Cathedral, in the filling with stained glass of the great east window as the gift of Lord Provost Falshaw. This, just completed by Messrs. Ballantine, was publicly inaugurated on Saturday, the 3rd inst. The window, 40ft. in height, is divided into under and upper tiers of five lights each, terminating at top in flowing tracery. In the lower lights has been placed the Crucifixion. The five upper lights are occupied with the Ascension. The tracery openings in the head of the window are filled with angelic forms. Designed by Messrs. Ballantine, the work has been carried out under the supervision of Mr. R. Herdman, R.S.A.

A new scheme for the disposal of the sewage of Salford, from plans by Mr. Alfred M. Fowler, the borough engineer of Newcastle-on-Tyne, is about to be carried out, at a cost of £40,000.

STATUES, MEMORIALS, &c.

THE LATE DR. GRAVES.—The *Irish Times* says:—"The statue about to be erected to the memory of the late Dr. Robert James Graves, arrived on last Saturday in the King's and Queen's College of Physicians, Kildare-street. It is the work of Mr. Bruce Joy, of London, and is made of white marble."

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Institution of Surveyors, 12 Great George-street, Westminster. Paper by Christopher Stephenson, on "The Pruning of Coniferous Trees;" 8 p.m.

NOTICE OF REMOVAL.

CHUBB AND SON,
LOCK, SAFE, AND IRON DOOR MAKERS
Have REMOVED their SAFE and LOCK BUSINESS to new and extensive Premises,
123, QUEEN VICTORIA STREET, ST. PAULS, E.C.
Illustrated Price Lists gratis and post-free.
Makers to the QUEEN, H.R.H. the PRINCE OF WALES, and the Bank of England.

Trade News.

WAGES MOVEMENT.

LONDON.—The weekly pay to the London mason on strike in London was on Saturday last increased from 18s. to 21s., in consequence of the material assistance which other trades are giving to the committee. The number on the roll is gradually diminishing. Last week upwards of 70 of the men on strike were taken on by some of the master builders at the new rate of 10d. per hour, and it is estimated that upwards of 1,400 are now employed on those terms in London and the suburbs. Nearly all the Americans who joined the strike have left, some for Dublin, and others for Scotland and elsewhere. It is now decided that the masters will refuse the merger conference that was suggested. A levy is about to be made throughout the country in support of the men on strike in London.

MANCHESTER.—The United Trade Committee who have the direction of the carpenters and joiners strike in Manchester and Salford have just issued a balance-sheet, showing the money received in aid of their funds during 28 weeks of the strike. They state that £4,388 6s. in the form of local levies have been subscribed by unionist joiners who are at work in the city and neighbourhood; £3,442 15s. 4d. has been received from their fellow-tradesmen in other towns; and £231 11s. 10d. from other trades. When the strike began about 4,400 left work, and of these something like 1,800 have since obtained employment from the non-associated masters, at an advance of wages, while a similar number have found work in other parts of the country. The men declare that the employers require considerably more than the number remaining on strike, and are therefore confident that they will give way in the end.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered) apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire.—ADVT.]

Holloway's Pills.—Cold, Catarrhs, and other febrile affections can be readily arrested in their early stages by these pills if taken according to their accompanying directions. In addition to their cooling and purifying properties these pills control the circulation, reduce febrile symptoms, relax the skin, promote perspiration, and restore health.

TENDERS.

BRISTOL.—For warehouse at Sharpness; quantities supplied:—

Chubb	£3,601 0 0
Thompson and Roberts	3,530 0 0
Church, Wm.	3,211 0 0
Stephens and Bastow	3,208 0 0
Brook and Bruce	3,150 0 0
King, A.	3,068 0 0
Jones, D. C., and Co.	3,061 0 0
Robertson, S.	2,993 15 0

CLEE.—For the erection of Board School for the Clee-with-Weelsby School Board. Mr. Charles Bell, architect London; quantities by Mr. H. Lovegrove, 30, Dudgeon-row, E. C.:

Darby	£4,180
Fidler	4,052
Fletcher and Thompson	4,035
Thompson	3,999
Brown	3,727
Haywood	3,696
Hobson	3,659
Hensman	3,580
Snowden	3,579
Hutcliffe	3,515
Farrow	3,466
Smith	3,315
Ruggall	3,256
Topham	3,220

EMMER GREEN, NEAR READING.—For pair of cottages for Mr. Winslet. Mr. John J. Smith, architect, New Swindon:—

Patience and White (accepted)	£270
-------------------------------	------

THE BUILDING NEWS.

LONDON, FRIDAY, NOV. 30, 1877.

THE MAHOMMEDANS AS BUILDERS.

THE Architectural Society of Berlin, which, however, styles itself by a more complicated title, has lately had under discussion the various benefits which may have been conferred upon the world by the conquests and establishments of Mahomedanism. Among these, it is asserted, a new class and style of architecture was established, and Europe was introduced to Asia by the most powerful of all influences: for architecture leaves its almost ineffaceable stamp wherever it is created. Now, since Islam and all its works are in full view, historically and actually, of all thinking mankind, it may be worth while for a moment to examine into these new theories of the German professors. It is a custom to speak of the Mogul monuments, of Saracenic art, and so forth, as of other wonders coming from the East; but, with respect to the second, the epithet "Saracenic" has been greatly abused. The Saracen was the Arab rudely transformed. The men who dwelt in Arabia—and this is a fact to be noticed more circumstantially than it has hitherto been—never possessed a building of a permanent or substantial kind while they inhabited their native deserts. There is not a single structure in all Arabia worth describing, except on account of its traditions. Nevertheless, as the German *savans* point out with perfect truth, from the moment in which they emerged from the wilderness their genius took fire, and they mastered a mighty Art-dominion for themselves. It would be hazardous to accept this theory as containing the whole or even a considerable part of the truth. It is unquestionable that the Arabs, overflowing their geographical frontiers, did carry their tents with them, and, inspired by new sentiments, convert them after a fashion into edifices of stone; but nearly all the famous structures known as Mosques in European Turkey are simply Christian churches, mechanically converted by an addition of minarets to the dome—an addition rendered necessary by the objection of the Mussulman to bells. For religious tradition sets its stamp upon architecture as upon everything else. So far, while not a single great temple of Islam, albeit characteristic enough, possesses any dignity, or is worth a study, the patchwork of its labour has alone come into view. But nothing of the kind can be urged, for example, against that unique edifice, the Alhambra in Spain, or the palaces and tombs of the Mogul Emperors on the banks of the Ganges. With reference to both of these, it is now admitted that European genius came largely, in the first instance, and almost wholly in the second, to the help of the Mahomedan conqueror. No doubt a pure Asiatic idea reigned through the exquisite fretwork, alphabetic decorations, and marble elaborations of the most celebrated, if not the most admirable, structure of Europe in Spain; but, whatever the design may have been, the work was in a great measure Italian and French. And so with those marvellous monuments of the Moguls in India, which won for them the praise—"they designed like Titans, and wrought like jewellers." Neither the design nor the work was strictly theirs, though the style may have been unique and the elaboration luxuriously Asiatic. We find in both, once more, the touch of the European hand in all those splendid domes, slender towers, sepulchral halls blazing with mosaic, vast terraces sloping down to ornamental waters, and "lawns of marble," as a traveller calls them,

"indispensable to a country without grass." Yet there never was a Mogul without a band of French and Italian architects in his pay. The Prince suggested the magnificence, the Western artist gave development to it, and hence those wondrous structures which, though mutilated and desecrated, still embellish, beyond all comparison elsewhere in the world, the great Ganges Valley. They are not the trophies of Mahomedan art: they illustrate rather the spirit of Mahomedan splendour, calling to its aid the more practical and adaptive genius of the Christian West. But it may, at the same time, be admitted that the inspiration of these monuments was not purely Western in any sense of the term. Not a trace of the Norman or the Goth is to be detected in those bulbous cupolas, those pillared arcades—except that those contain a hint now and then of the Byzantine manner—those marble-edged lakes, which have been compared with the Italian, though resembling them in no degree whatever, or those ornate façades, to which not the Alhambra itself can offer a parallel. Nevertheless, the East was the birthplace of ornament, though its genius for invention disappeared centuries ago. It of course gave a name to the Arabesque, and, as one of our Berlin architects says, "made even geometry beautiful." Certainly, to an equal extent, the genius that dreamed, as it were, these designs, never alone, of its own capacity, was capable of giving to them an enduring life and form. It may be doubted, however, whether the German Council is right when it insists that the Arabs, floating off their own sands, derived an education in art from Persia, Assyria, or what is called Magna Græcia. The types are altogether opposite. It must be remembered that Europeans, entering the service of the Arabs, were compelled to acquiesce in all their ideas, however these might be rebel against the ordinary aspirations of art. There must be no image, no resemblance of any living thing. Consequently, all that was done had to be done in the way of ornament—colours, tessellations, variegations of pattern, the very filagree of architecture, so to speak, which was an attempt to make up for the absence of fresco and sculpture—a fact, asserts the Berlin Society, of inestimable importance in the history of design; "because nothing is more easy than to fill up barren space with groups of conventional statues, or to occupy staring walls with equally staring pictures." The high arts may not feel flattered by this avowal; but it must be confessed that, from an historical point of view, there is an admixture of truth in it. The whole group of the arts together have never flourished prosperously, in one country, or in one age, and the interludes, perhaps, between one and another, have prevented the decay of all. The Berlin discussion, however, speaks of "Mahomedan architecture," which, as we have seen, is capable of superb developments under competent tutelage. Of course, in the nature of things, and under compulsion of date, none of it can be antique; yet, if the works of the Moguls, apart from the French and Italian impressions stamped upon them, be rigorously examined, they will be found to possess an older character, approaching even to a Pagan type, which clearly shows how acute the German critics have been in refusing to them a purely Mahomedan character.

As a special episode, illustrative of the subject, reference is made to a remarkable document, altogether unknown to the public in this country, so far as we are aware, on the Mohammedan remains and monuments in Sicily. That island was the limit of the Mahomedan conquests in Europe. Coming with a camel's skin as material for a tent, the Mahomedans were speedily taught

to live within walls, to erect citadels, with forced labour to assist them, and to destroy cities without an effort to restore them; but it was no part of their instinct to rebuild, although, strangely enough, no race, not even the Persian, exulted more in the enjoyment and pride of possessing magnificent palaces, or of giving to their dead more gorgeous tombs. There is not a relic worth a sketch extant of the Sicilian conqueror. But, it is pointed out, a line of discrimination has to be drawn between the Mahomedan in his almost heroic devotion to architecture and art of all kinds, within the limits of religious prohibition; his transformation of the Arabic character into an ornament—than which none more delicate or graceful can be conceived, in default of statuary and painting, and the even more absolute renunciation, by the Turk, of all such ideas. He delights in a sumptuous palace, whether built for himself or for a Christian predecessor. He has taste in landscape gardening, with every architectural accessory possible, in the form of fountains, terraces, kiosks, and artificial grottoes; but his ambition rises no higher, and the incomparable artificers from the West of Europe, who served the Great Mogul, would not find at Constantinople the patrons they found at Delhi. Nothing could be more natural. Half the wealth of the world was then accumulated in India, and there is not a modern palace upon the earth which would have satisfied Aurungzebe, Akbar, or even the least of their successors. Times have changed, and what is called Mohammedan architecture survives only, in our day and generation, in the shape of fragments. And yet, whence-soever it came, it was, for its time, incomparable, the difficulty being to understand its sudden disappearance. For, notwithstanding its modern and medley aspects, as the Berlin experts remind us, its germs must be hidden in a far past—probably in coincidence with some of the Scriptural ages. That which remains—even if so much be ascribed to Mahomedanism, pure and simple—is the invariable and monotonous pilgrim's sepulchre, with its square white basement, and semi-oval dome, or the equally unvarying khan, or traveller's rest, with its four plain walls, open courtyard, covered galleries, and flat roofs, without a suggestion of relief. This may be, climatically, well adapted; but it presents fewer features of real interest than the ordinary village inn of England. And yet, it is pointed out, while the Moorish monuments of Spain present obvious evidence of the Christian workmanship which has been employed to carry out that Oriental idealism nowhere so richly illustrated as in Lane's edition of the "Arabian Nights," there are anomalous indications of kinsmanship in the greatest of the Spanish cathedrals and churches, as at Burgos and Seville—a strong Mahomedan tinge being visible upon those surfaces where the architect has permitted full liberty to his imagination. This implies, we are bidden to believe, not that the conception of the Christian edifices was Oriental—which it assuredly was not—but that the Spanish, French, and Italian builders who sent their pupils far and wide over the world in search of patronage at Courts—no matter how barbaric—and this, even, before the epoch of the Moguls—infused some degree of the Eastern spirit into their after labours. The hypothesis is ingenious and interesting, though the traces of its truth may be vague. Colonel Sleeman, however, whose noble volumes are left unnoticed by the German authority—yet who brought the Mahomedan monuments of British India nearer, as it were, to the English eye than any other traveller—hints at a somewhat similar explanation, adding that there have been discovered, amid the foundations of some among the more

curious structures, scratched, as if surreptitiously, upon the stones, names, as of those of perfectly unknown and unacknowledged artists, who, it may be assumed, were working for ambitious taskmasters, who were also generous paymasters, and who gave them money, while they refused them fame. But, upon another, and a principal point, no ambiguity exists. Of course, these palaces and shrines of Islam excepted, there is no such thing as an even comparatively modern Eastern architecture. The Orientals of the last century or so have undisguisedly taken the West as their model, though attempting to make it harmonise with their traditional requirements. Thus, the finest edifices in Constantinople and the royal cities of Persia really resemble in spirit nothing so much as that which has been contemptuously termed, "Italianised Gothic"—that is, the overlaying of one style by another hopelessly incongruous with it. They are left out of the perspective, indeed, by the practical Council of Architects at Berlin. Considerable stress, however, though by no means too much, is laid upon the circumstance that, in fact, so far as India is concerned, we are apt to confuse the monuments in the building art of the Mahommedan world with the relics which the builders found existent upon their arrival, and with others which they caused to be reared in their own honour. The shores of the Ganges, near the water, are rich in edifices, upon no grand scale, which may have served them as models, but were, certainly not the work of their hands, nor those of the artists whom they employed. Upon the whole, then, whether the authors of the German monograph—not yet given to the world, we believe—set out with a predetermined view in favour of which they have bent the testimony on every side, or whether their opinion is the result of critical research, may be a question of doubt in some degree; but all the historical probabilities and even coincidences sustain them. It is true that the Saracen left a distinct impression of his peculiar genius in more than one part of Europe, though never exceeding the limits of the South, whether in the Spanish peninsula or Sicily—though, in the latter, they bequeathed no more enduring memorials of their power than did the Byzantine Emperors themselves; but the interesting problem—who commanded the tombs and palaces of Mahommedan India to be built, and who actually built them, can scarcely, with the demonstration before us, be said to remain unsolved.

A GENERAL BUILDING CODE.

A GENERAL code of building regulations for the United Kingdom hardly appears yet in a fair way to settlement. Last year we referred to the subject, and the propositions that had been made at the Architectural Conference in relation to it. We then expressed our agreement with many of the views that were brought forward by Mr. J. Honeyman, of Glasgow, in a paper read by him at the Conference; and we endorsed Mr. Cates' motion to appoint a committee of the Institute to consider the subject of "Building Regulations for the United Kingdom," and to communicate with the Local Government Board and provincial societies thereon. Mr. Honeyman's suggestions, which we gave at the time (see p. 641, 1st Vol. for 1876), were briefly to make the Metropolitan Building Act the framework of a general Act to be enforced in all boroughs with populations above 6,000; to appoint an administrative court, and that a block plan and block section should be submitted before building. Mr. J. Clarke and Mr. T. Porter, it will be remembered, proposed other schemes, the

first, the extension of the present district surveyorship to rural districts, and the raising of the status of the surveyors appointed. Since then the matter has been discussed by a committee of the Society of Arts, and recently the Local Government Board have issued, as our readers know, a series of bye-laws for the use of sanitary authorities. The general effect of these regulations we have pointed out, and the Liverpool Architectural Society have lately reported upon various sections. At all events, the position of the question is rather unsatisfactory as far as the architectural profession is concerned, despite its efforts and assistance. It may be interesting just to point out the main objections that the Liverpool Society have raised. They say, very truly, "It is obvious this form of bye-laws, being issued by a department of the Government, is likely to be adopted implicitly by various local sanitary authorities throughout the country; and, at the same time, that their design is of very grave importance to all persons interested in building operations, and especially to the profession of architects, by whom those building operations are designed and supervised." It will be readily admitted that the suggested bye-laws cannot be very cordially accepted by the profession, of which a great many members are connected with buildings in progress or engaged in their design; and especially objectionable is the bye-law that deprives the architect of his copyright or property in the designs he prepares. Moreover, the Building Regulations at Liverpool and Birmingham provide quite different rules upon which buildings have been erected. But to refer to the structural points that have been raised by the committee, we find exception has been taken to the rules respecting the formation of new streets. With respect to the width it is provided a new street intended as a carriage road shall not be less than 36ft. in width; that when it is not used as a carriage road, and does not exceed 100ft. in length, 24ft. be allowed as the width, except in roads used for removing refuse. A width of 36ft. is deemed excessive for a back road which is not the only access to a house, and the Council think that landowners in laying out new estates, bearing this rule in view, will reduce the number of streets; but we suspect they have overlooked the operation of Section 5. But the objections to the rules as to the structure of buildings are more to the point. It is here shown that in the classification of buildings the composite structure, such as a public room or shop and dwelling-house, so usual in the provinces, is overlooked, and requires recognition or a reference to either of the three classes named. Again, the division of walls into "party walls," "external walls," and "cross walls," is mentioned, and it is commented, "To define a wall which in any part of its height or length separates adjoining buildings to be a party wall appears very arbitrary, for in large towns much property is so interlocked that cases will arise in which the greater part of a wall will be required only as an internal wall dividing the apartments of one tenement, and a small remainder only as an actual separation between two properties or two tenements," &c. Again, it is urged, because two adjacent owners cannot agree to build a party wall, to require them to build two external walls is oppressive to that owner desirous of building a joint wall. These remarks will commend themselves to architects generally. Section 15, on the projection of footings, opens an important question as to whether a builder of a new building can project his footings upon another's land. The report of the Council observes that this clause "aims at conferring an easement which may be difficult to establish at law, for it certainly looks very like a trespass." When, the bye-law

says, an adjoining wall interferes the footing on that side may be omitted. This is a saving clause. Party and external walls are by Secs. 19 and 20 to be constructed of the same thickness, this being regulated by the height; but the report does not see the reason of this. It is also considered that Bye-laws 10, 17, and 56 may be amalgamated. The first provides that every domestic building shall have its ground surface or site asphalted or covered with a layer of cement concrete 6in. thick; No. 17 provides a damp proof course beneath the level of timbers and at not less than 6in. above the surface of ground, while No. 56 provides an air or clear space of 3in. between the asphalt surface and under side of joists for ventilation. An irreconcilable point is pointed out between these requirements. The report observes:—"If the joists are laid upon the damp course, which is 6in. above surface of ground (see Sec. 17), and if there are only 3in. between the under side of joists and the concrete under the footings, it follows that the top of concrete will be 3in. above surface of the ground." To us, it is doubtful whether No. 10 intends the concrete or asphalt to be spread over the site below the footing or after they have been laid. It is to be noted, however, Sec. 56 says a clear space of 3in. at the least shall be provided, and does not say more. At any rate the rules are not so clear as they should have been. Another inference, not intended to be drawn by the framers of the model bye-laws, is pointed out—namely, "if the lowest timbers are above the damp-course, and that above surface of ground, it is clear that they cannot be any wooden floors in the basement." It is also shown that Sec. 10 is irrespective of a rocky or impervious soil which ought to be taken into account. As regards the schedule of thicknesses of wall the Council do not say much, but comment the principle of allowing a reduction of thickness for piers and cross walls. It is thought that Bye-law 48, prohibiting the insertion of any wood too near flues or hearths, is sufficient protection without Bye-law 31, which prohibits the insertion of any plate or plug of wood into party walls. We pass over a few minor points and come to Bye-law 53, which requires that every domestic building shall have an open space in front of 24ft. at least. To this rule it is objected that it is arbitrary and may be injurious to the owner of property, and that in the case of a shop recessed from line of street it would be ruinous. The Council suggest that it would be better to substitute the centre line of street instead of the "boundary of any land or premises" and a space 12ft. wide instead of 24ft. We quite see the awkwardness of the operation of this rule in some streets. It appears the one useful suggestion, made by the Institute of Architects, has not been adopted—namely, that of inside areas or wells in confined localities. As regards windows, it is objected that by Bye-law 55 the windows are to be placed, irrespective of the comfort and convenience of occupants, fronting open spaces, and other restrictions are shown to be injurious to business premises. The bye-laws relating to drainage are criticised into which it will be needless for us here to enter. But the most important and interesting points touching architects' interests is in reference to the bye-laws relating to the giving of notice before forming streets or erecting buildings. The report speaks of the silence as to the length of notice required, and the period that must elapse after the plans are submitted, before building can be commenced. Bye-law 92 provides that every person who intends to erect a building shall give to the sanitary authority notice in writing, and "complete plans and sections of every floor of such intended building, which shall be drawn to a scale

of lin. to Sft., and shall show the position, form, and dimensions of the several parts of such building," and of all appurtenances; a description in writing of the materials of which it is intended to construct the building, and of the intended mode of drainage and water supply; and also a block plan, drawn to a scale of lin. to 24ft., showing the position of the buildings and appurtenances of properties adjoining. The report proceeds to comment on these rules. As regards the block plan it is evident a survey of the adjoining land, park, or adjoining properties would be required to be made and plotted in some cases, seeing there is no stated limitation of the properties adjoining. Even more exacting is the requirement for complete sets of plans and sections. All that is needed is that the position of the closets, drains, and other sanitary conveniences be shown. It is fairly said the requirements are inquisitorial; they would lead to disclosure of plans of those connected with the same business, as factories, and would deprive the architect of his copyright in his designs. Beyond this, perhaps, the greatest injustice would be that members of local boards and their surveyors, who may be practising architects, will have the advantage of studying the plans submitted, and thus profit by them often in a very unfair manner. Other points are raised upon which we need not dwell now.

As far as present administration is concerned, these regulations will create friction where generally applied. We believe that most of the unsatisfactory working of previous Acts might be traced to those who have to enforce the rules being themselves engaged as architects in a private capacity. As it has been suggested it is quite conceivable in such circumstances that, when a district surveyor is dealing with another architect, bye-laws may be comfortably arranged, because at that very moment the surveyor himself may be in the position of the said architect to some work of his own which he wishes also to be smoothly arranged with some other local surveyor. Hence the necessity, if public safety is to be insured in these matters, that the surveyor or inspector should be a man independent of private practice, and occupy a similar position to a School or a Board of Trade Inspector. A building code must be the result of experience, not of precipitate reform or radical change, and it must be based on piecemeal modification of existing rules.

THE SUBURBAN DWELLING.

THOSE who have taken the trouble to inspect some of the recently built houses of the middle class in the suburbs of London must have felt their labour, if unrequited, at least suggestive of many reflections on the subject. To the habitual house-hunter in search of a convenient residence, the paucity of ingenious and well-considered arrangements must have become tediously painful; but, to the architecturally-minded, the scarcity of clever planning to be found is even more disheartening. Between these two classes of persons, few trouble whether they get a house that is skilful in its appointments, economical in the distribution of its parts, well constructed or sanitariously perfect; while many, it is true, cannot select their ideal house. It is amazing, certainly, amid the diversity that exists, how few houses are to be found in the suburbs that really satisfy the householder. He has either to climb a flight of steps that would not do injustice to a foot-bridge over a level crossing; to enter a doorway that is barely wide enough to admit a sideboard; to push by the foot of his staircase every time he enters his back-parlour; to mount a staircase that is

dangerously steep or replete with foot-traps in the way of winders and odd steps; or it may be his rooms are either small, unnecessarily dark, or flooded with light; while there is no bath-room or convenience accessible from the principal floor. Of minor inconveniences, familiar only to materfamilias, it would be superfluous to speak, as every tenant in London has to put up with a great many. Lately, we have given examples in our own pages of a great many houses that aspire to something more than prosaic house-building, in which the skill of the architect has been called into requisition, combined with sound construction and modern sanitary appliances. In most of these cases it cannot be denied that the lease or freeholder has largely recouped himself for the additional thought and care he has purchased. In a few, however, we are reluctantly compelled to say he has lost. He has purchased artistic skill at the cost of convenience. It is painfully evident in some of these instances that the architect's plan is not invariably the best that can be obtained; that aptness for architectural effects has not kept pace with the convenient types of arrangement. While, in some cases, we are obliged to admit the reckless haste of plan "manufacture" has given the builder's plan, stereotyped as it is, a preference. The builder of a row of houses or a colony of detached villas selects what he considers a tenable model, and builds them wholesale; he makes his rooms spacious, even if he pinches his hall and stairs. His doorways are placed in set positions that experience has approved, and his offices are planned after all the conventional ideas of tenants have been consulted. He often gets his elevations drawn for him to suit his own whims, or they are allowed to follow his notions, and to conform to his idea of cheap construction and ornamentation. Though pretentious and vulgar they let well in spite of their architectural defects. At Finsbury-park, Holloway, Dalston, Chalk Farm, Hampstead, Kilburn, on the north; Norwood, Streatham, and Brixton, on the south; and Kensington, Hammersmith, and Battersea, on the west, we meet with houses and villas of this class by the hundred, of which the prevailing characteristics have much in common. We have inspected several of them, and we may here describe their general features. Let us enter one at Finsbury-park, which we may take as a sample. It forms one of a row, and is set back with the usual front garden from the road. Its exterior is of yellow stocks, with Bath stone used freely in the bay windows, in the entrance, jambs, and lintel, and in the window dressings. Neat at a little distance, it would disgust any man or woman of taste, much more an architect, when he approached it. Our readers can imagine better than we can describe the kind of flimsy ornament and nauseating carving it is covered with, common enough now in the suburbs. It is certainly not Queen Anne, nor Italian, nor Gothic, though if we were to describe its style we should call it a modern mixture, known to the speculative builder as an Italian Gothickesque, the main features of which are that the lintels of the bay and entrance are carried by diminutive circular shafts, with luxuriant carved capitals, and that the jambs of the first-floor windows have a repeat of the shaft at every angle, that a keystone crowns every arch, and that carved work has been lavished with no niggardly hand. The entrances, slightly recessed—a by no means bad plan—have the fancy-stock kind of door usual about these localities, with figured glass in the upper panels; passing through which we enter a passage scarcely 3ft. wide, bolt in front of us being the narrow ladder-like staircase, with the conventional break in the passage. Passing the stairs we descend three steps, for what reason the sequel will

perhaps explain. The kitchen is neatly fitted up with every requisite, a good kitchener, a spacious dresser, a capital side cupboard, passing through which is a small scullery with sink and copper, and beyond which is a garden and the usual out-offices. The appointments in every respect might captivate the most exacting and fastidious housewife. They are compact; she has a sink and tap for washing up and rinsing out, close to hand, and better than all there is no staircase to traverse every time the simplest culinary operation is to be performed. Entering the two reception-rooms we find them lofty, with folding doors between, a French casement back window leading to a small garden, the usual plaster cornices and centre flowers, vulgar in taste but withal attractive to the ordinary householder. There is a good pantry near the stairs, while under it is a stairway leading to a coal-cellar, which extends under the front passage with a shoot. Ascending the staircase and reaching the first landing, we enter a spacious room or nursery, over the kitchen and scullery, while on the landing is a w.c. We now become aware of the reason of the three steps in the passage just referred to, as we ascend five steps more before we land on the first floor. Here we see two good bedrooms, lofty and well-lighted in front, with two windows, while a side room is provided as a dressing or bath-room. Another short flight brings us to a second-floor room over the nursery, and a few steps more to two front attics. Thus there are seven bedrooms obtained, besides a dressing-room, by the mezzanine arrangement at the back. Unarchitectural and imperfect as it is to the educated taste, we leave the house with the idea that the requirements of modern comfort have been complied with. We have every requisite.

Let us turn now to a house built under an architect's supervision, and we may examine one of those at Haverstock-hill. It is built with some regard for antiquated domesticity. The walls are of red brick crowned by a deep eave, and surmounted by steep roofs, through which lofty brick chimney shafts pierce their way. Instead of large panes of sheet or plate-glass, we see small squares set in heavy-looking sashes, with thick old-fashioned bars. Gentlemen and ladies of the conventional taste might be shocked at this perversion of all that is light and elegant. Still, there is a strict avoidance of false ornament—no absurd carving, and everything appears to be what it is. We enter—a wide lobby intervenes between the outer and inner doors, and a square hall, with a plain antiquated staircase of dog-leg construction, with massive square newels and turned balusters, strikes us. From this hall three doorways open, one into a front room lighted by massive windows having an old-fashioned chimney-piece, and a door divided into four equal-lengthed panels, or with a couple of small ones between the lower and upper. We confess there is an awkward look about the door, but pass to another room of similar appearance, also without florid cornices or centre flowers, so common and looked-for a thing with those seeking "modern, and genteel or elegant villas." Re-entering the hall we are horrified to find the kitchen in the basement, where, too, is a "breakfast parlour"—that *sine quâ non* of the Londoner. The offices are crowded and dark, though snug and compact. Upstairs are three or four good bedrooms, a bath-room, and w.c., while above we have four more dormitories partly in the roof. Compared with the builder's model it is all that the seeker after the architectesque can desire, but its rental places it beyond the ordinary-built house, and its plan cannot be pronounced economical. We feel that we have lost something in the plan for the em-

pressement of the artist. Let us next take a semi-detached pair of houses. There are two obvious arrangements that suggest themselves as types—one in which the entrances and kitchen offices form lateral and projecting wings, and another, in which they are grouped, and thrown out as a central adjunct. Of the two the first is the most economical; hence its large adoption in London and elsewhere. It is, *par excellence*, the builder's favourite. But the second is less adjunctive, and therefore isolative; the entrances are desirably separated, and insure privacy, and the back gardens are more enclosed. At Turnham-green we see two marked examples of this last type. In one instance (see p. 36, Vol. XXXII.), the entrance breaks awkwardly into the two ground-floor reception-rooms by a lobby, the doorway being in the side wall, and not fronting the road. A slight projection laterally is obtained for the kitchen, which partly intrudes into the back room, while a scullery and pantry are thrown out at the back. Economy of area has here been carried to an inconvenient extreme, and a cramped inner lobby and offices are the result. Upstairs three bedrooms have been obtained over the principal rooms, and a small spare, or crib-room, and bath-room over the offices, while above are two dormitories in the roof. Another model on the same estate (illustrated on p. 192) is better planned, though the area covered is rather greater; while a more recent plan, lately illustrated by us (p. 456 of the present volume), exhibits to a still greater extent the principle of condensation, the lobby-entrance being in a line with the front, while the kitchen and offices are managed with better effect. In all these instances the kitchen is on the ground floor, and there is no basement—a most advantageous omission. The entrance-lobby and hall are spacious and compact, and another point to notice is that the area above the hall on the first floor has been well utilised by a bath-room and w.-c., while four excellent bedrooms are obtained, besides three in the roof. There is little necessary to make this plan perfect.

Comparing generally the builder's with the architect's plans, it may be observed that the former exercises a keen economy in the distribution of his apartments, while the architect aims more at exterior grouping. The builder takes a convenient model, and crudely works it out; the architect does not take one, but makes one fit his own notions and artistic idiosyncracies. If these methods were a little oftener combined better results would accrue, and it could not be said, as it now is, that the architect's plan is expensive, and not abreast of present ideas. The builder, too, is paid for labour and materials, and not for planning; but the architect is employed and paid to prepare plans only, and we submit that it would come with more dignity from the architect to make himself perfect, and master of the art of domestic planning and design. There are several little points by which a well-studied plan can be tested. One is the saving of passage and wall length, so that every room should have no more isolated walling than necessary. Economy of wall is in the separation of apartments, not in separation of passages—that is to say, no more wall length should be used than absolutely required between a room and a passage, and passages are invariably wasteful. Another point is the concentration of the offices. Few architects' plans are happy in the skilful contrivance of office space. How often do we see, by an unskilful and loose arrangement of doors, the kitchen is not shut off from the apartments as it might have been, and the dinner has to be brought across the hall in the front of visitors. In small middle-class houses we are prepared to admit greater skill is

needed than when the architect is not straitened for space and means; but a little forethought will often show how the neatest arrangement in this respect can be obtained. To be obliged to traverse a long passage with a hot joint or vegetables is one of the clumsiest things the service of a domestic requires, and no modern civilised art should tolerate it. Service doors and lifts might be more common than they are. Again, a good plan should show a careful utilisation of closet space. A recess for a sideboard can often be made serviceable on both sides of a wall; so, also, to contrive a china closet and pantry between the kitchen and dining-room helps not only to expedite the preparation of meals, but to deaden sound and to save the breakage of crockery. Again, the coal cellar should be near the kitchen, and facilities for the storage of fuel should never be left to chance. The sins of omission and commission in this one thing in the London suburban house are countless. Imagine the barbarous custom of having to traverse the main passages and hall, and often the kitchen, to fill the coal-cellar, with all its attendant inconveniences, or the still greater evil of bringing the refuse and ashes through the house from the ash-bin. Yet the suburban dwelling tolerates these shortcomings, and architects do not give them a thought. If the Englishman is driven to adopt the Parisian flat system of dwelling it will be more to avoid the domestic waste of the self-contained dwelling-house plan than from a rational conviction of its capabilities.

CEMENT TESTING.

THE various means of testing Portland cement have been examined by Mr. H. Reid, C.E., whose recent treatise on the "Science and Art of Portland Cement," we noticed last week. We may here profitably refer more in detail to this part of Mr. Reid's book. Mr. Mann's gravimeter—a test of specific gravity—is noticed. It consists of a pipette of glass, with a graduated stem and stop-cock, containing, when filled, a volume of liquid equal to that held by another vase-shaped vessel, minus the quantity displaced by 1,000 grains of the densest substance intended to be examined. The cement is introduced into the last-mentioned vessel, which is placed under the pipette and filled, the pipette being filled to a certain mark with paraffin, spirits of wine, or other liquid, which does not act on the cement. The height of the column of liquid remaining in the pipette determines the specific gravity. The denser the substance the less liquid is displaced in the smaller vessel. The average of results taken by this instrument upon the weights of cement of various manufacturers gives only 84lb. per cubic foot—very light cement, as Mr. Reid says, compared with the weight of the London and Stettin cements, the average of which is stated at 135½lb. per bushel. The author, while he points out the use of Mr. Mann's gravimeter in conjunction with other tests, quotes the results of experiments recorded in the "Thonindustrie Zeitung" upon various cements, which rather tend to shake one's confidence in the new test for specific gravity. Liebig's graduated glass tube test and Nicholson's portable balance are both described for the same purpose; but the author seems to place more reliance in the old bushel gauge than the specific gravity test. From the German experiments the general inference was that "the specific gravity neither indicates the quality of Portland cement, nor whether one and the same cement is lightly or heavily burnt." The writer next compares the experiments made by Mr. Grant, Mr. Colson, and Mr. Mann, all of which, we are told, fail to establish an accurate dependence on obtain-

ing tensile value from specific gravity. Mr. Mann's tests are considered most satisfactory. Taking an average weight of 108½lb. per bushel he reached an average breaking result of 889lb. per 2.25 square inches. Mr. Grant, with an average weight of 118lb., obtained 728½lb. tensile strength on the same surface of 2¼in. Taking Mr. Grant's first ten tests, and comparing them with Mr. Mann's, it is shown that the average of the first ten was 110½lb. per bushel, and the breakings 655½lb. per 2.25in., or—

Mr. Grant.		Mr. Colson.		Mr. Mann.	
Average weight per bushel.	Average bkg. wt. on 2.25in.	Average weight per bushel.	Average brk. wt. on 2.25in.	Average weight per bushel.	Average brk. wt. on 2.25in.
110½lb.	655½lb.	116½lb.	713.7lb.	108½lb.	889lb.

The tests of Mr. Mann's, made in 1877, are said to eclipse those of Mr. Colson and Mr. Grant in previous years. The author observes that less dependence is now placed on the maker's name than formerly, when over-confiding architects and engineers thought the name had a magic influence. Mr. Deacon's mode of testing at Liverpool is alluded to, and a paper read by that gentleman is quoted. Mr. Reid, animadverting on Mr. Deacon's statement that there is always a tendency to use too large a proportion of the cheaper material, clay, says:—"The too free use of clay is due to another cause, for it is really much the dearest of the raw material used; and by a careless or ignorant maker adopted to avoid the dangers incidental to an over-limed cement. This practice, before the institution of testing, was almost general, and cement thus made would withstand the water and a low tensile test, but failed if anything in excess of 100lb. per square inch was required from it. The colour or rather discolouration (for good Portland cement is of a uniform grey colour) is not easily detected, unless when broken after the sample has been immersed some time in water, but an air sample exemplifies all the intensity of spuriousness."

The Liverpool Corporation test is given *in extenso*, and the following requirements are of interest:—"1st. Samples of the cement being sifted through a number 50 gauge wire-sieve must not leave a residue of more than 10 per cent. 2nd. Samples of pure cement will be gauged with water, and placed in the brass moulds used by the Corporation within twenty-four hours; the casts thus made will be immersed in still water, in which they will remain until the expiration of the seven days from the date of moulding, when they will be taken out of the water and tested, to ascertain their tensile strength, which must not be less than 800lb. on the area of 2¼ square inches. 3rd. The slow-setting cement, when gauged neat in the mould, must not become firm in less than three hours; the quick-setting must assume a firm condition within ½ an hour. The test for firmness will be that of resistance to the finger-nail." These tests are applied after each delivery. Mr. Reid shows the erratic ideas on the subject of tests rife among the profession; that some agreement between makers and consumers is called for, so that the vexed questions of form of mould, machinery, age of briquette, and mixtures, should be placed on an established basis. In Germany some such agreement is being arranged. Summing up the points which primarily indicate the quality of Portland cement, the author shows:—1st. That the clinker of the true quality should be a dark greenish mass, homogenous, and slightly vitrified. 2nd. A clinker of metallic hardness, with a black lustre, is the result of an excess of carbonate of lime, caused by wasteful application of

fuel, and its cost of grinding is high. 3rd. The true normal clinker exhibits, when drawn from the kiln, a rough lava-like texture, having a tinge of green or bronze glitter when exposed to light. Generally, the conclusions are, that a clinker of a brown colour, dusting freely, indicates an abnormal or dangerous cement, and weak in indurating power; the blackish clinker producing a bluish-grey powder is unfit for use until matured by exposure; while the third or true clinker of greenish tinge, of light grey powder, can be used at once. Experiments have proved also that the constructive value of cement when mixed with sand depends on its being finely ground.

AMENDMENTS OF THE BUILDING ACTS.

WHILE the Local Government Board, with the assistance of the Royal Institute of British Architects, are engaged in preparing a General Building Act for the whole country, the Metropolitan Board of Works deem it expedient to promote certain amendments of the Acts relating to buildings in the metropolis. A bill for this purpose was prepared last session, but did not become law. At a recent meeting of the Board it was decided to bring forward this bill again next session, and so highly did the Board regard the extreme importance of early legislation on these matters, that they pronounced it undesirable to introduce into the bill further amendments of the law, as had been suggested at the last previous meeting of the Board, and the bill was referred to the Parliamentary Committee to be finally settled and deposited.

A copy of the bill of last session is now before us, and assuming the new bill to be in the same terms, we shall proceed to make some cursory remarks thereon.

The short title is to be "The Metropolis Management Amendment Act, 1877," and the full title runs thus:—"A Bill to amend the Metropolis Management Act, 1855, the Metropolitan Building Act, 1855, and the Acts amending the same respectively with respect to houses and buildings." The concluding phrase seems to require the word "other," though one hardly sees the necessity of commingling genus and species in the expression "houses and buildings." In the clauses of the Building Act of 1855 the word "building" alone is invariably used, except when houses are specially intended. The Metropolis Management Act, 1855, has the expression "house or other building." And it will certainly prove unfortunate if the proposed Amendment Act should narrow, even by implication, the word "building," so as not to include "house." At the outset we point to this apparently trivial matter since the phrase "house or building" continually recurs throughout the bill, and needlessly increases the length of the clauses.

In the first two paragraphs of the preamble this peculiarity is seen, and the word "street" is unaccountably omitted. It may tend to clearness if we quote the clauses in full, italicising words which seem to require striking out, and placing suggested additions in brackets. Here is the first clause of the preamble:—

"Whereas the provisions of the several Acts now in force within the metropolis are insufficient for duly regulating the erection and extension of *houses and buildings in close proximity* [near] to [streets], roads, passages, and ways, and it is expedient that for such purpose further and better provisions should be made." It is all the more difficult to see why "street" is left out of this and several other clauses, since it is very properly inserted in Section 7. Acts of Parliament are not of the most amusing kind of literature; but on reading the above paragraph we are irresistibly reminded of Dean Alford's story of the reporter who paraphrased "drew nigh to the place" by "arrived in close proximity to the scene of action." We quote from memory, but the moral is the same.

With the emendations which we suggest the second clause of the preamble is as follows:—"And whereas it is expedient to make provisions with respect to the making, filling up, and

preparation [preparing] of the foundations and sites of *houses and buildings* to be erected within the metropolis, and with respect to the [nature and] quality of the *substances* [materials] to be used in the construction of such *houses and buildings*, with a view to the stability of the same, the prevention of fires, and for purposes [the preservation] of health."

Part I. of the bill deals with the width of streets, and for this purpose Section 3, which is an interpretation clause, provides that, "The term, 'house or building,' shall mean a house or building, the inclosing walls of which *have not been* [shall not have been] carried higher than the footings previously to the 1st day of January, 1877."

The same section further provides that, "The term, 'the centre of the roadway' shall mean the centre of the space open for [public] traffic—that is to say, the *roadway* [public carriage-way], and the [public] footway or *foot-path*, footways or *footpaths* (if any) adjacent [and appurtenant] thereto." It will be seen that this clause is somewhat ambiguous, owing to the word "roadway" being used in two senses.

A better arrangement would be to let "roadway" be the major or generic term, and "carriage-way" and "footway" the minor or specific terms throughout the bill. If these small points be not made quite clear, the result will be much trouble and annoyance in the administration and observance of the Act. We shall return to the subject again. W. G.

THE MAIN DRAINAGE OF OXFORD.

WE have received an illustrated paper, prepared by Mr. W. H. White, Assoc. Inst. C.E., before the Ashmolean Society, upon the above subject, in which the author details the difficulties encountered in draining this very low and stream-intersected locality. The separate system has been adopted so far as the exclusion from the sewers of the rainfall on the streets and roads and front part of roofs is concerned. It is estimated that about 100 acres will contribute surface water to the sewers. But we desire to advert more particularly to the constructions that have been adopted in the main drainage. It may be mentioned that the existing sewers have been chiefly used to carry the surface drainage; that $7\frac{1}{4}$ miles of brick sewers and 25 miles of stoneware pipes have been laid, of which the former are egg-shaped, of the usual proportions, the upper, or crown arch, being double the radius of the invert. The dimensions of the former range from 4ft. 6in. by 3ft. to 2ft. by 1ft. 8in., while the pipe sewers vary from 18in. to 9in. diameter. The outfall sewer, and five other main sewers, intercept and collect the street discharges. There are several river crossings under the Isis and Cherwell, &c., and at these the construction is peculiar, and has been adapted to meet the exigencies of each case. In two cases inverted siphons, with vertical brick shafts at each side of river, have been provided. The shafts are connected by a straight line of cast-iron pipes surrounded by concrete. In the Hincksey sewer the pipes are circular, with a square mass of concrete about 1ft. at the sides, top, and bottom. At another crossing, to obtain headway, the main sewer has an egg-shaped invert covered by a flat segmental crown. Under the Cherwell the section is still more flattened to obtain the necessary capacity, the tubes being only 1ft. 10in. high by 3ft. 9in. wide, with segments top and bottom. Another form shown in the sections for the canal crossing is an egg-shaped invert of brick covered with cast-iron segment plates, with ribs at intervals and flange joints. All are embedded in concrete. Sluice gates are provided for flushing the siphons. The manholes devised are ingeniously constructed. They are placed at the summits, and at all junctions and change of gradient. The covers have open boxes with centre grating, and wrought-iron boxes to catch the road detritus, &c. The sewers and pipes are laid in straight lines between the manholes and lamp-holes, and bell-mouth junctions are formed to assist the meeting of currents. Where the branch-pipe sewers fall into mains below them in level an arrangement is made by which the sewage discharges through a downward branch at a descending angle of about 45° , while the straight line is continued at the real gradient,

joining the manhole at a higher level. By this means the line of sight is preserved at the same time. The stoneware pipes are jointed in some cases with Stanford's patent, which allows for settlement and prevents leakage. To keep out the subsoil water the sewers were rendered in cement between the rings of brickwork and on the outside. Thus the outfall had two skins $\frac{1}{2}$ in. thick, one between the concrete backing and the outside ring, and another between the rings. Great care was taken to insure a proper union of the lower and arch skins. The cement was gauged 2 parts cement to 1 of sand, and was laid on in three coats, finishing in neat cement. A tunnel under the old castle tower was driven below the river, and some difficulties were experienced in construction. We understand that some 370 acres have been obtained in the parish of Littlemore for irrigation, the pumping works of which are in progress. Three-fourths of Oxford are said to be already connected with the new sewers. We congratulate the city on the attainment at last of so desirable an object, which has been mainly accomplished by the persistent efforts of the Thames Conservancy Board.

LEAVES FROM MY SKETCH-BOOK.*

SOME very pleasing reminiscences of Continental travel, intended apparently as a kind of suggestive *souvenir* for the artist, has been published by Mr. John Murray, entitled "Leaves from My Sketch-Book," by Mr. E. W. Cooke, R.A. The second series is now before us, and contains a collection of about 30 lithographic sketches by the author, accompanied by short descriptions of some well-known places in Italy and along the Nile. Among them we note "Venice from Porto Franco," a pleasing study, in the background of which we catch the Doge's palace and the Campanile of St. Mark; a sketch of that busy thoroughfare, the Riva dei Schiavoni, taken from Petrarch's house, and embracing some well-known objects, and that imposing water-girt structure, the Church of Sta. Maria della Salute; also the Sanita, Naples; the Grotto di Pozzuoli, or tunnel of Posillipo—a grotto 750 yards in length by 22ft. wide, and of a varying height of from 25ft. to 69ft. The latter was thought, in Petrarch's time, to be the magical work of the poet Virgil. Some very pleasing subjects, illustrative of Venetian scenery and features, are given; thus we note "Evening in the Lagoons," a view taken at sunset, with the Veronese mountains in the background, and only wanting the rich variety of colour to make it perfect. The Triangular Forum, Pompeii, one of the earliest exhumed portions of Pompeii, is shown. Two of its sides have the remains of columns. This forum is situated on the highest point of the city. The temple of Pæstum is another classic spot delineated. Of sketches from the Nile we have several—one depicting the very picturesque boats on that river laden with sugar-cane, putting one very much in mind of a Thames barge. In another sketch we have the "Effects of a Hurricane" in the valley of the Nile, accompanied by a graphic description by an eye-witness. The ranges of hills and lofty cliffs on the right bank are given, and various sketches of Nile scenery and its accessories; also some striking effects on the left bank highly interesting to the painter of landscape. We may especially note the view of Roâineh, on the right bank, remarkable for beauty of outline, and as a truthful rendering of precipitous headlands. The cliffs of Gebel Abofoyda, the ruin of Karnak, the temple of Medeenet Háboo at the foot of the Theban hills, rock-tombs at Silsilis on the left side of Nile, temple of Kom Ombo on the right bank, and the little temple known as "Pharaoh's Bed," at Philæ. The sketches are all drawn on stone by the author, and thereby lose nothing by reproduction. Some of them are marvellously soft and transparent, and, as the autographs of so eminent a master of scenery and marine landscape as Mr. Cooke, will, we are sure, be valued by all students and artists. The letterpress adds much to its value. The book is well got up in sketch-book form, suitable for presentation

TYPICAL DETAILS OF THE ARCHITECTURE OF CORNWALL—
HOUSE AT ECCLESBOURNE—HOUSES AT HAMPSTEAD—ST.
NICHOLAS CHURCH, FOWEY—"BUILDING NEWS" CLUB
DESIGNS FOR ORIEL WINDOW.

OUR LITHOGRAPHIC ILLUSTRATIONS.

DOUBLE HOUSE, ARKWRIGHT-ROAD,
HAMPSTEAD.

This pair of houses are nearly finished. They are faced with dark-red brick, shippers, and stone dressings, and are covered with green slates. The houses were built from the designs and under the supervision of Mr. Theodore K. Green, M.I.B.A.

ECCLESBOURNE, STOKE BISHOP,
GLOUCESTERSHIRE.

This house, one of three, varying in design, is now in course of erection on the Stoke estate, near Clifton. The materials employed are local stone in rubble, laid in thin courses up to the first-floor level—the upper portion being principally half-timber work and weather tiling; the chimney stacks are of red brick, and the roof of Bridgwater tiles. The general accommodation is shown by the plans illustrated—a billiard-room, however, being provided in the basement in addition to the usual offices. There are also five bedrooms on the second floor. The works are being executed by Messrs. Stephens and Bastow, contractors, of Bristol, at a cost of £3,000, from the designs and under the superintendence of Mr. Henry Shaw, architect, of 25, New Broad-street, E.C.

FOWEY AND OTHER CORNISH CHURCHES.

WE reproduce some of Mr. J. P. St. Aubyn's illustrations of his paper on Cornish Churches, read before the Architectural Association on Friday evening. A west elevation of the fine tower of Fowey parish church forms the subject of one illustration, while a double page is devoted to representations of typical forms of roof construction, arcades, and mouldings employed throughout Cornwall, and indeed the whole peninsula forming the south-western extremity of England. The shallowness of the mouldings and bluntness of the arrises are very characteristic of granite-tooling in Cornwall. We refer our readers to the report of Mr. St. Aubyn's lecture on page 548.

"BUILDING NEWS" DESIGNING CLUB.

WE illustrate this week two of the best designs received in the oriel window competition of our club—those by "Début" and "Josephus Orange Blossom." These and the other designs sent in were critically reviewed on page 495 a fortnight since.

The bronze statues of the poet, Campbell, and the African missionary traveller, Dr. Livingstone, will be on view at Messrs. Cox and Son's bronze foundry, Thames Ditton, Surrey, on Thursday next. They are from models by Mr. J. Mossman, of Glasgow, in which city they are to be erected.

The committee of the School of Art at Manchester are to hold next spring an exhibition of pictures, sculpture, and all forms of art workmanship in aid of the building fund for a new School of Art. A large selection will be contributed from South Kensington, and the committee have already received promises of loans from private collections.

SCHOOLS OF ART.

BRISTOL.—The annual distribution of prizes to the students of the Bristol School of Art took place on Monday evening. The report stated that there had been a marked increase in the number of students attending the classes, the returns of the school showing 349 for the current year, against 290 in the year which went before it. The prize and certificate results of the second-grade examination are as follows:—Last year 125 students worked 168 exercises in the various subjects of the second-grade art examination in a satisfactory manner, 48 exercises gaining the mark excellent; 40 students received prizes, and 18 full certificates. This year 111 students worked 163 exercises satisfactorily, 77 exercises gaining the mark excellent, 60 students being rewarded with prizes, five of these being awarded prizes of the third or highest local grade for extraordinary success in the second grade, having passed in the four subjects of the grade at one examination. This is the first year that the Science and Art Department at Kensington has noticed, in a special manner, such work. 23 gained full certificates, or highest honour of the grade. In the third-grade school work last year there were 17 prizes, this year only nine. The Science and Art Department decided last year to hold examinations in various subjects of the third grade. These examinations were previously held only at South Kensington. Five candidates presented themselves for examination in perspective of the third grade, which includes oblique perspective and perspective of shadows and reflections. The five candidates passed, three out of the five receiving the mark "excellent," which entitled them to prizes of the third grade. This examination is the highest held by the Government. The total number of prizes of the third grade awarded to the students of the school is therefore nine for work done in the school during the year, five for extraordinary success in second grade, three for perspective of the third grade, 17 total; same as last year. One student received a Queen's prize at the national competition, and two received free studentships.

CITY AND SPITALFIELDS SCHOOL OF ART.—On Tuesday evening the annual distribution of prizes to the successful students of the City and Spitalfields School of Art was made in the large hall, Skinner-street. The school, which was one of the earliest established in the country, now numbers more than 200 pupils, of whom 111 have entered during the past year. Mr. J. C. Horsley, R.A., who distributed this year's prizes, drew a cheering contrast between the state of art education 30 years ago and what it is now. They might hope the next 30 years would be more fruitful still. He wished to remind them that no true artist ever lost his sense of being still a student, and illustrated this by Landseer's language, when for the second time he declined the presidency of the Royal Academy, saying, "No, I wish to die as I have lived, a student with my brush in my hand." Let them never forget that the real and vital part of their studies was their elementary training. Students in their schools were now often fathers of families, with family anxieties, while in his young days they got through in jackets. With this increase in the average age of pupils there should be growing thoughtfulness, care, and conscientiousness in their work. Nothing would make up for the want of elementary grinding. All great painters gave their works fair play, as we could see from the high finish of the masterpieces of Sir Joshua Reynolds and Landseer. Yet the latter, in pencil, painted a friend's dog, with a rabbit in his mouth, in a couple of hours and twenty minutes. Let them, however, combine with due attention to the technicalities of art an earnest study of nature, like Turner, who died in a poor Chelsea lodging hired for the study of Thames sunsets.

GUILDFORD.—The eighth annual distribution of Queen's prizes, certificates, and local prizes, in connection with the Science and Art Classes, were distributed on Monday evening by Mr. Denzil Onslow, M.P., at the Eastern Hall, Guildford. Three second and one third-grade Queen's prizes and twenty-three second certificates were awarded for free-hand perspective and model drawings, and nine local

prizes. An address on "Art" was afterwards delivered by Mr. Buckmaster, of South Kensington Museum.

NEWCASTLE-ON-TYNE.—The annual meeting of the Newcastle School of Art was held last week. The report of Mr. Way, the headmaster, stated that the number of pupils who received instruction during the year had been 324, being a decrease of 80 since last year. 15 third-grade prizes of books were awarded to students whose works were submitted for inspection; 8 second-grade prizes were awarded at the May examinations; 1 bronze medal was awarded in the national competition; 1 Queen's prize for science, building construction; 3 pupils passed successfully the third-grade examination in drawing from the antique and painting a group of still life; 4 free studentships were granted to the school; 285 students sent 3,076 works to the annual inspection at South Kensington, 260 of which were in the advanced stage; 105 pupils presented themselves at the annual examinations in freehand model drawing, practical geometry, and perspective, 51 of whom were successful in passing one or more exercises; 13 works from the advanced stages of drawing from the antique, drawing from life, design, and painting groups of still life were exhibited at the exhibition of national competition drawings; 16 pupils were successful in taking prizes in the local competition, amounting in all to £30.

COMPETITIONS.

CHIPPENHAM, WILTS.—In September last the drinking fountain committee of the borough of Chippenham advertised for designs for a granite drinking fountain, to be erected in the centre of the Market-place at a cost of £200, and a premium of £5 5s. was offered. The numerous designs which were sent in, in response to this invitation, were exhibited last week at the Town Hall, Chippenham, and the committee have selected the design submitted by Mr. W. Galsworthy Davie, architect, of King William-street, Strand. The design is described as a handsome structure, over 18ft. high, with a large circular basin, formed of two kinds of granite, and in addition to being a fountain strictly speaking, it will provide drinking places for man, horses, cattle, and dogs. The work is to be proceeded with without delay.

ECCLES.—The Local Board having invited plans for the laying out of the site of the proposed new cemetery, and for the erection of three mortuary chapels and gateway, &c., eight plans have been submitted for the grounds and seven for the mortuary chapels. The site is 40 acres in extent, and the stipulated prices for the three chapels were—Church of England £1,200, Dissenters £1,000, Roman Catholics, £800, and of the gatehouse £700—altogether, with ground, about £5,000. The plan of ground selected is by Mr. John Frith, of Reddish. A premium of £10 was given to Mr. J. J. Bradshaw, Bolton, and a second premium of £5 to Mr. H. J. Hove, of Eccles. The decision as to chapels is not final, the choice lying between "Catacomb" and "As You Like It" for adoption. The premium of £5 is given to Messrs. Rawson and Jackson, of Manchester.

MAIDENHEAD.—In response to the invitation issued a short time since to architects, by the town council of Maidenhead, for designs in competition for the new hospital for infectious diseases, a large number of plans (upwards of 80) were received, and from these the council have selected those bearing the motto "Ad Rem" for the first premium, and for the second those marked "Serio." The new building is to be erected at a cost of £800, and is to accommodate eight patients, four of either sex, with the necessary offices. The premiums were £10 for the best plans, and £5 for the second best. An assurance was given with the instructions issued by the sanitary authority that the author of the selected plans would be engaged to carry out the work. This promise probably accounts for so large a number of competitors.

The Local Board of Briton Ferry are considering as to how best to drain and sewer the district, and as a preliminary, drainage levels are being taken by Mr. R. Shopland, C.E., of Swinton.

BUILDING NEWS DESIGNING CLUB.

REVIEW OF DESIGNS.—NO. XIX.

A Small Railway Station.

WE have received several designs for this subject—a few commendable in particular points, but none possessing the architectural treatment we looked for. As an architectural thesis, indeed, the subject was a crucial one, and required more than ordinary effort in its accomplishment. Generally relegated to the engineer, or rather to his architectural assistant, the railway station may be classed among the *crucis* of design. In making our selection it must not be supposed that the designs we place first are ideal ones, nor that we give decided preference to any of them. The plan with motto “Pret” has the merit of compactness; it gives the general entrance, the waiting-room, and booking-office a central position, with wide doorways and space for weighing machine, trucks, &c., the widest part being on the exit, and the narrower on the ticket-office and platform side. The difference in width is caused by the ticket-office and refreshment-bar protruding into the space on the railway side. The ladies’ and gentlemen’s waiting-rooms open from the general waiting-room, and are placed on the outer or front side, the refreshment-bar being on the platform, with two doorways. A station-master’s and porters’ room occupy the space at one end, and above is the residence of the former, containing a living-room and two small bedrooms and scullery. The conveniences are placed at the extreme ends on the outside. In front elevation we have a suitable Gothic treatment in brick and stone, treated with wide mullioned lights, and bay windows to the waiting-rooms, while a news-agent’s stall projects between the main entrances, like another bay. On the platform side a verandah is formed, that side of the roof being extended over it with iron pillars. “Joseph Orange-blossom” fails mainly in not making evident the main function of a railway-station—namely, the entrance and booking-office. This is placed at one end, and has a very insignificant doorway compared to the recessed porch entrances to the waiting-rooms and luncheon-bar, the latter of which is made the central apartment, its outer angles being canted to obtain a doorway. The canting of the corners of waiting-rooms on each side, one for ladies and the other for gentlemen, with the semi-octagon-ended luncheon-bar, make triangular recesses or porches, which are arched over on line of front of station. These are more ingenious than roomy. It would have been better to have made one good general waiting-room, and another for ladies, instead of the three shown. The author manages to get his accommodation in a building 85ft. 3in. by 21ft., with a verandah along the platform and ends projecting over 16ft. of the platform, which is 20ft. wide. We object to the urinal recess in the back wall of third-class waiting-room, and it is questionable to show all the conveniences ranged along the back of station, with small windows. What of the elevation to this front? Towards the railway we have a free kind of Gothic, with a deep verandah, and a clock-turret at one end. No line of section is indicated on plan, and the action of roof overlooking office is incorrect.

“Student” is compact; it places the booking-office and general waiting-room in the centre, retired from the platform, and the refreshment-room and waiting-rooms on either side as advancing wings; between these, and topped by them, is a glass roof or verandah. The waiting-rooms, the ladies’ being the most retired, are judiciously planned as regards the conveniences, though it would have been better if a doorway had been shown between the ladies’ and the central waiting-room or booking-office. The latter forms a semicircular enclosure in the centre, with the main entrances from platform on each side of it. This portion is not pronounced enough externally. The general waiting-room is 30ft. by 20ft., and is provided with seats. On the left, with doorway from platform, is a porter’s room, with up-board and sink. In front is a projecting refreshment-room, with kitchen or retiring-room behind. The conveniences form a separate adjunct on the outside. In elevation we have a feeble attempt at Renaissance, with

rococo pediments over the windows and centre. The verandah is commonplace, and, by the way, the line of supports is placed in front of the doors to refreshment and waiting-rooms, instead of being placed outside of them. At present the roof covers only half of the thresholds.

“Noah” sends a more practicable plan, though of a somewhat hackneyed type. The booking-office and general waiting-room is made the central feature. On one side is a ticket-office and refreshment-room leading out of the latter, and a 2-storied residence of station-master; while on the other is a ladies’ room and first and second-class waiting-room, both leading from the booking-office. These side adjuncts are gabled on the platform and rear front, and the platform is partly covered with a glass roof on iron columns. This front, however, is not shown. Externally the style is of Queen Anne character. The master’s house is awkwardly managed, and the porter’s room and coal-stores, &c., form an unnecessarily long wing on the other side. Drawing wants care, and the detail is poor. “B” in a circle is too school-like, and its windows too small and ecclesiastical-looking. These are treated as square-headed mullion windows. A very straggling plan accompanies the design; the passage or entrance is in centre, the ticket-office being on one side. Ladies would have to walk to one end to their waiting-room, which is 18ft. by 15ft., and forms a gabled end, while next to it the gentlemen have a smaller room. On the other side is a luncheon-bar, a private room, and at end a general waiting-room, 25ft. by 15ft., beyond which a low range contains a porters’ room, urinal, and coal-store. Summing up the defects, the plan wants concentration, the general waiting-room should have been incorporated with the booking-office or entrance; there is too much space wasted in this department. The platform is covered by an iron roof in four bays.

Were it not for the very confused arrangement of “Cave Canem” we should have given it a better place, as it is carefully drawn. The booking-office is placed centrally, with two entrances from platform, and a small ladies’ waiting-room, &c., between. The refreshment-bar is small, on one side, with kitchen behind, and on the outside of that is a gentlemen’s waiting-room, while behind, accessible from end, is a urinal. On the other side of booking-office is the station-master’s house, partly of two stories, with a porters’ room and parcel-office at the extreme end. The ticket enclosure is placed within the booking-office. One great defect is the necessity of passing through the latter to get from one side to the other of station—a usual but bad arrangement, as it destroys the room as a general waiting-room, and two fireplaces opposite the entrances would create disagreeable draughts. In elevation there is too much of a jumble, the style is Early Gothic, with narrow pointed lights and transoms. We like the treatment of the booking-office, which has an arched dormer with clock, and is characteristic. On the whole the composition has an appearance fitting it rather for a school and master’s house than a station. “Jag”—plan certainly has the merit of a pronounced entrance and exit passage, with a side booking-office, the former carried up as a central clock tower. A spacious covered platform is also got in front, which is a good feature; the luncheon-bar forms a projecting wing on one side, and a gentlemen’s first-class waiting-room on the other. But the fault of the plan is the number of waiting-rooms; there are a gentlemen’s first-class, a ladies’ ditto, and a general waiting-room. There is a combined arrangement of conveniences, a porters’ room, a station-master’s, left-luggage, and booking-clerks’ rooms, with an attendants’ room, kitchen, &c., all well arranged. Externally the treatment is Jacobean, but scarcely suitable. “St. Lucy” sends a design resembling more a village school than a railway station. The plan is compact and economical. The booking-office is made a passage-room, but the doors are too narrow, and not made a feature of. A refreshment-room forms a gabled wing on one side, outside which is a low-walled enclosure in the usual form, all the conveniences badly planned. On the other side we have ladies’ and gentlemen’s

rooms and a porters’ room. The elevation, in a simple Gothic brick style, lacks character, though it betrays nothing *outré*.

“X,” in a circle, sends a clever idea, showing a station across the railway, with waiting-rooms, &c., on each side facing up and down platforms. The booking-office entrance faces main road, and crosses the railway on girder. The arrangements of offices, waiting-rooms, and conveniences are tolerably perfect, and a waiting-shed is provided on each platform, but the plan evidently does not fulfil our conditions of ordinary station wants. The design is half-timbered, but a little too rusticated in appearance. A cost of £1,449 is given. “Tempus Fugit” (late to hand) has some well-considered points, but the booking-office is too large, and the waiting-rooms are not well located. Style too fussy, and porch fragile-looking.

There are some other designs we may briefly enumerate in the order of their merit, but of a more commonplace order. “Marmion” sends a long, one-storied station, of very ordinary design, with a station-master’s residence at one end. The booking-office is large, with portico at back entrance. This and the luncheon-bar separate the first and second class waiting-rooms. The platform is covered with a flat-roofed verandah, with fringed border. There is nothing original in the elevation, and it has too much the semblance of a copy. Cost, at 6d., is put at £1,260. Design, “L in a G,” is more economical. It consists of a general waiting-room and booking-office, combined with three doorways 30ft. by 22ft., a luncheon-bar leading out of same and a refreshment-room on one side, with a ladies’ and parcels rooms on the other. A lamp and porters’ room are placed at the end, and at the other the conveniences. Elevation is too much like an engine-house; the isolated chimney-stack of booking-office in the centre is almost ludicrous. Cost, at 6d., £1,415 14s., the material being yellow stocks and red brick facing, with Bath stone dressings. “Naiveté,” Derby, has gone out of his way by showing a plan for a triangular site for a junction, the ladies’ waiting-room being placed at the acute angle. A booking-hall forms a centre passage through, with the office and master’s room on one side, and a gentlemen’s waiting-room on the other. The conveniences are compactly arranged back to back between the waiting-rooms, and the platform is covered with a glass roof in bays, details of which are shown. “Non quo sed quomodo” sends a plan that is wasteful. Three rooms are spoilt by the inner corridors to the first-class waiting-rooms at each end. There is no passage-way through the station, a gate being provided. The projecting gable of general waiting-room is a useless feature. Elevation puts us in mind of a school-house or Gothic lodge. “Medicus” has a too pretentious plan, though he takes care to provide a telegraph office and a parcels room. A central waiting or booking office is shown. The conveniences are not well arranged sanitarily. Elevation is poor. Why the useless parapets to hide roof? “Magnet”—try again. You have sent us a cottage—not a station. Surely, “Magnet” could not have seen the requirements of an English railway station! No entrance or passage is shown, and alas for corpulent people when they pass through such narrow doorways! There was no necessity to show the railway sleepers.

A Graveyard Monument.

This subject has been very inadequately responded to. “Fleur-de-lis” sends the best conception. It is an upright composition, on a square base of five steps, supporting a columnar substructure square on plan, with four angle columns crowned by pediments. From the centre, or intersection of pediments, rises another pedestal, which supports a plain cross, the faces of which are enriched with mosaic inlay. The design is in a severe Greek spirit, the ornamentation being obtained simply by incised work in the square angle *antæ*, pediments, and superstructure, with panels introduced to give variety. A looping of festoons is shown at the base of cross. The inscription is intended to be placed round the steps of base. The design is simple, dignified, and characteristic. “Début” is another clever and simply expressed idea, but flat instead of upright. It consists of a flat weathered “desk”

stone, with plain cross worked along the ridges, reposing upon a square pedestal for inscriptions at the head, and two square pillars at the foot, these resting on a flat stone base, with deep bevelled plinth. In the space under the foot of slab a wreath is shown. The monument is of grey granite, with red shafts. A French feeling pervades the design. "R. J." sends an obelisk, springing from a square base, with pediments at its summit. Below this there is an arcade of two panels to each face for the inscriptions. The pilasters are circular, are of three-quarter projection, and rest on a base of three steps. Such a plain feature as an obelisk demanded a simpler base, and the Roman detail looks out of character. "Medicus" is a square monument, composed of a stylobate, a pilastered superstructure crowned by four pediments. Panels for inscription occupy the spaces between the pilasters. The mouldings of the capitals are clumsy, and the members are certainly not Tuscan, though they are apparently intended to be of that order. Such a composition has rather a meaningless intention; it may mean a huge pedestal for a statue, a sentry-box, a drinking-fountain. As it is, it has an incomplete effect, and is exceedingly heavy.

Christmas Decorations.

Only two sketches have come to hand for this very reasonable subject, and we regret that the modes of decoration shown are not of that generally applicable character they might have been. It is not always possible for those who decorate parish churches to have time to prepare flexible laths for the hollows of the different arches and the angles of the pillars, nor can they afford the time or means to cover the spandrels and wall spaces with artificial emblems in frames of wire or canvas-painted decorations. But they can get a quantity of evergreen rope made by the indefatigable ladies of the parish—that is, sprigs of holly or other evergreen twisted round with wire till a sufficient quantity be made to form festoons and other pendent decorations from the arches, walls, and roofs. This sort of decoration is easily manufactured, can be applied readily in various ways without injuring the walls, and its very simplicity and facility render it, in our eyes, far more tasteful than the very artificial-looking and expensive appliances that have lately become fashionable. "Début" shows an arch, with laths of holly introduced into the hollows and over the labels; the pillars treated with slips between the shafts, banded by ornamental strings, and the spandrels decorated with figures of angels, with emblems of Peace and the Nativity painted on canvas stretched on light frames. A temporary chancel-screen of light lattice painted—the laths being placed square, with their intersections tied with knots of foliage, and a plain inscription along the top, "Holy, holy, holy," &c.—is shown. Along the top festoons are hung from the uprights, which run through and carry candlesticks. "Bee," in circle, shows an unusually lofty arch, with evergreen inserted in the arch members and twisted round the piers, the laths being held by galvanised bands covered with foliage. The chancel screen, shown to correspond with an existing stone screen, is a mistake architecturally, and the banners and coved top are too far-fetched for a wood erection of the kind.

LIST OF SUBJECTS.—NO. XX.

A. A cemetery chapel; cost not to exceed £1,500; plan and elevations, and sketch or section.

B. Treatment of wall decoration for a dining-room, showing door and buffet; 12ft. long, 9ft. high; scale, 1in. to the foot.

C. A pair of wrought foliated hinges for the principal door to a church; $\frac{1}{4}$ full size, and details.

DRAWINGS RECEIVED.—"Excelsior," Tom Pinch.

The memorial stone of a new bridge over the Kelvin at the junction of the Glasgow and Partick turnpike roads, was laid on Saturday afternoon. The bridge crosses the Kelvin by an iron span, and an arch of ashlar masonry carries the roadway over the mill-lane. The building is designed by Messrs. Bell and Miller. Mr. Hugh Kennedy is contractor, the ironwork being supplied by Messrs. Hannah, Donald, and Co. The cost of the bridge and alteration of the roadway will be about £19,000.

ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, the President, Mr. Bowes A. Paice, in the chair. The following were elected as members:—Messrs. W. G. Penty, Maurice B. Teulon, Wilson F. Grieves, A. F. Wills, J. M. Currey, A. S. Haynes, J. H. Wilson, E. Milner Allen, H. Dobie, J. Adkins, W. H. Hodges, C. Tait, F. T. H. Chambers, H. W. Twyman, R. Néjedly, jun., E. Mills, C. M. Burgoyne, T. C. Dalziel, F. W. Kite, J. Brown, A. W. Johnston, H. B. Flood, Harris Worthington, A. L. Lovegrove, C. W. Goodchap, T. B. Whinney, F. Stocker, C. A. Poland, and E. W. Charlton; fifteen other names were proposed for election next week.

NOTES ON CORNISH CHURCHES.

Mr. J. PIERS ST. AUBYN read a paper on the churches of Cornwall, illustrating his subject by a very numerous collection of working drawings, showing plans, elevations, and details of typical or peculiar modes of construction; some of these illustrations are reproduced in our lithographic pages.

The examples that the lecturer had examined range from the Norman period in the church of St. Germans to so recent a date as 1664, in the later works at Morwenstow church. The Norman works in Cornwall are not numerous, though there are some fine examples, the most notable being the west front and a small portion of the interior of St. Germans,* and the south doors of Kilkhampton and Morwenstow. At Tintagel there are considerable remains of Norman work, and there are also examples of small Norman doors at Cury and Myloe. At St. Germans, North Petherwin, and at St. Breward portions of Norman arcades remain, massive in proportion, but built up of small stones; and here it may be remarked that granite, although a very abundant material and at hand, was not used in church-building till the sixteenth century, probably because of the difficulty of working so hard a material with the tools and mechanical appliances then available. The building stones used to as late a period as the Second Pointed or Decorated are the slate stones and "elvans," both very good and workable, and abundant throughout the county. The elvans vary in every degree of texture and colour, from almost black to a light grey. Caen stone and Beer stone from Devonshire are also frequently used for windows and ornamental details, and in the Lizard district serpentine rock has been largely used. Early English or First Pointed work is very rare in Cornwall; one of the very few examples is the fragments of a lancet window in what is now the breakfast-room at St. Michael's Mount, brought to light a few years ago; a few single lancets are occasionally met with. The transepts of the churches which still either wholly or in part retain their original cross shape appear to have arches of this date. They are very simple and rude, being nothing more than depressed lancets, with slightly chamfered vousoirs, and a slight impost moulding. The north arcade of St. Minver, and the arches of the chancel aisles of St. Austell, are possibly of this period. The Decorated or Middle Pointed work is more abundant, and of great interest. Windows, as at St. Germans and at St. Colomb, have a character of their own, and a mode of treatment not met with in other districts. The arcades vary in treatment from the early and simple example at Fowey to the more elaborate specimens at St. Enodock and St. Columb Major. The only example of a Decorated tower that the author had noticed was that of St. Noot. It has massive buttresses and windows of simple tracery, and either had or was intended to have a spire, the springing of which is very apparent. Lostwithiel is a notable specimen of an open spire † of this date, and the plain steeple of St. Hilary is also of this period. We now come to the Perpendicular or Third Pointed period, to which the greater number of the Cornish churches belong, though mostly grafted on buildings

of much earlier date and of cross form, and so similar are they in plan, elevation, and details, that this may be fairly considered the typical Cornish church—the characteristics being the nearly equal length, height, and width of the nave and chancel, with the aisles; the almost universal absence of a chancel arch; the long, slender, and monolithic pier-shafts, sometimes merely octagonal, but mostly moulded; the depressed arches of the centres and small span; and the low-pitched roofs, seldom exceeding 45°, and often less, and cradle or waggon-shaped; and the depressed windows and arches, and plain three-light tracery often without cusping. In this period granite was largely employed, either native or imported from Lundy Island. The pillars supporting the arcades are generally monoliths. [We reproduce elevations of a bay of arcades at Sennen and St. Austell.] Clerestories are very unusual, but they occur at Fowey, Lostwithiel, and North Peterwin. The nave and aisles were formerly parted from the eastern part of the church by handsome and elaborately-carved oak screens, few of which remain, but those stumps that have been spared indicate their position and give an idea of the beauty of the destroyed superstructure so ruthlessly removed. The stone stairs to the rood-lofts in most cases remain. The chancel fittings have in almost all cases disappeared. In the Collegiate Church of St. Buryan only had the author seen a few fragments of the stalls and Miserere. But much of the benching remains and in some cases in good condition; in a large proportion of churches, however, it has been destroyed, to be replaced by the meanest of deal framing in the shape of "square," high pews. The roofs, screens, and benches appear to be of the end of the sixteenth century, or early seventeenth century. The latter are elaborately carved, generally with a running border of fern-leaf and foliage, and when not panelled the centre of the bench-end is covered with emblems, arms, crests, initial letters, and monograms. The benching at Morwenstow is dated 1595. The roofs of the Late Perpendicular period are of square pitch, and constructed in cradle or waggon form, divided into panels by moulded ribs and side-pieces, or purlins. The intersections are covered by large carved bosses of foliage. The wall plates, ribs, and purlins are very frequently enriched by a running pattern of fern-leaves but ordinarily they are merely moulded. They were never ceiled with plaster, but in some instances, over the altars, were under-boarded and illuminated with gold and colour. These roofs, although containing a large quantity of timber, and possessing much beauty, are not particularly strong in construction [as will be seen from the typical example illustrated.] The component parts are numerous and small; they are without longitudinal ties, and depend for stability on the soundness of the tenons and mortices. If from any case these failed the construction soon fell into ruin, as has been the case in too many instances. The details, plans and diagrams would show the mode of fifteenth century roof-construction in Cornwall. All the timbers are of oak; the slate laths are nailed immediately on the backs of the rafters. On these laths hang the small slates, locally called scantles; they are bedded in mortar, unless the timbers are under-boarded, the slating is exposed to view from the inside. The plastered ceilings taking the curve of the ribs, now so common in Cornwall, are quite modern additions, and intended to exclude the draught which followed dilapidation. It is plain that as soon as the failure or decay of the mortice and tenons, and the oak-pins which secure them, commenced, the timber subsided, and had a tendency to thrust the wall plates outward, and to drag the slender arcing with them. To this cause the leaning position of so many of the arcades may be traced. It is a singular fact that the carpenter of the fifteenth century, when he came to a knot in his wood, did not attempt to reduce it, but went round the knot piece and allowed it to break the continuity of the moulding. Nearly all the Cornish churches were originally cross-shaped. Some still remain so—notably the interesting one of Tintagel, where a Late Perpendicular tower is the only addition to the original planning. These churches were altered to aisled structures thus

* A perspective view of the west front of St. German's Minster appeared in the BUILDING NEWS on July 10th, 1874 (Vol. XXXV.)

† Illustrated in the BUILDING NEWS, October 27th, 1876 (Vol. XXXI.)

The limbs of the cross have been removed, or sometimes only the south one, a side arcade taking the place of the side walls, and new side walls, extending the whole length of the church, becoming the new boundary to aisle. This is very apparent in the case of Sennen church near Land's End [see litho page]. The churches of St. Mary (now the Cathedral), Truro, and St. Mary, Launceston, deserve particular attention from their unusual richness of detail. The latter is cut in granite, and very perfect; the former in Pentuan stone, and much decayed. The towers of Cornish churches, particularly the late ones, are characteristic. They are mostly of granite, except where this material was very distant, massive in design and construction. When buttressed these are slender, and obviously not intended for support, but more frequently the tower angles are plain. Sometimes the pinnacles are square, but often octagonal, rising considerably above the battlements. The tower of Fowey Church [as will be seen from our page illustration] is a fine example, 100ft. high to the top of battlements; it is highly embellished with well cut ornaments in Pentuan stone. That of St. Austell is elaborate; and that of Probus fine and lofty; and in the north-east of the county there are many fine towers. That of Maker is of granite, and has walls 5ft. 6in. thick. The spires do not number more than twenty. Lostwithiel, however, deserves attention from its peculiarity of design and construction. The singular example, ornamented with grotesque carving of archaic type in Fowey Church, was illustrated in the BUILDING NEWS on November 24, 1876. The fonts are of almost every variety of shape and description of stone; indeed, occasionally the workman seems to have taken an odd bit of stone and fashioned a bowl out of it, without troubling as to the outline of the blocks. Some are of very great antiquity (mostly earlier than the Third Pointed period), and possess much interest.* Granite is not a usual material. Pulpits of early date are uncommon; the only stone example is that at Eglosayle, and the wooden ones are not worthy of notice. A few fragments of wall painting of interest have occasionally been found beneath successive coats of whitewash, as at St. Thomas, Launceston, Calstock, and Lanivet. He had not found a single ancient encaustic tile within the county. Of metal work a few good monumental brasses remain at St. Columb Major, and at Stratton and elsewhere; but the damp climate, added to neglect, has left very few examples of iron work. Owing to the neglect of Cornish church furniture, painted glass is not common, but a notable instance exists at St. Neot's, where every window is filled with it, and there are a few fragments scattered here and there in the tracery of windows. Mr. St. Aubyn added that he had now, he feared, but imperfectly laid before the members some of the facts relating to the Cornish churches, in which he naturally took a very great interest. He hoped he need hardly add that it had been his aim, in his treatment of them, to preserve their ancient features, and to be as conservative as the exigencies of the several cases admitted of. He regretted he had never been able to replace one of the oak cradle roofs, on account of their great expense, and the difficulty of finding oak for the purpose within a limited time, and because, too, workmen in sufficient number and skill would not be forthcoming to carry the work into execution without importing men from a distance at a cost which cannot be met by the funds usually raised for the repairs of a Cornish church. From what had been stated the members would see the close resemblance one church has to another, and how this family likeness extended, not only over the whole of Cornwall, but far east into the adjoining county. It would seem as if one design was used throughout the district, giving the modern architect a lesson to be not too anxious to build his fame on the variety of his designs, but rather to follow the example of the men who built these Cornish churches.

Mr. PORTER proposed a vote of thanks to the lecturer, and said he had visited most of the churches described, and was struck by the

soundness of their construction. Granite was the principal building material, although Beer stone was not altogether ignored. The softer stone was only used for fonts and internal features, from which modern architects might take a lesson. It would be well if they could have granite dressings instead of Bath stone, for which many seem to have a passion. The arcade shafts, again, were usually monoliths. He asked if anything was about to be done to St. Mary's, Truro, to make it more like a cathedral? The present time would give a good opportunity for restoring the church, and especially for replacing the "piping" tower and spire by a more worthy one.

Mr. ST. AUBYN said before there was any idea of having a bishop of Truro a subscription was started for restoring St. Mary's, but the money was now held over towards a new cathedral. The Bishop of Truro was most anxious to have a worthy cathedral but as nothing less than £30,000 would suffice for such a purpose, and the sum raised is about £3,000, they must wait. He did not know who would build the new edifice; he did not think he should.

Mr. PRATT seconded the vote of thanks, remarking that there was a unique interest attaching to these Cornish churches. At St. Columb he had noticed that there was no west entrance through the tower; was this because of the exposed situation of the church? There was a singular four-light window at Fowey, of which Mr. St. Aubyn had shown a drawing. The window was much out of proportion to the others in the church, and would have been taken for a fourteenth-century one but that it had no cusping in the tracery. In the Decorated south doorway the wallflower ornament was introduced into the moulding, the only instance he had seen in the county. The external panelled carving at St. Mary's, Truro, and St. Mary's, Launceston, was very remarkable; there was a general resemblance in the work, which appeared of the same date, the chief difference being in the character of the stone used. He should like to know if the north and south towers, flanking the west front of St. Germans, were of the same date? If so, why was the formersquare, and the latter octagonal?

A MEMBER asked if any ancient screens yet existed in Cornish churches?

Mr. ST. AUBYN said that screens were formerly carried across all three aisles, but had invariably been destroyed, although strips yet remained. They were of the same date as the well-known Norfolk ones, but heavier both in tracery and mouldings. At St. Buryan part of the screen and some of the Miserere stalls exist. At Morwenstow the late Mr. Hawker fitted up one—of the Wardour-street class. Although the latter church was close to the slate quarries, it was roofed with ancient oak shingles. In many cases there was no direct west entrance to a church through the tower, but doorways existed in the north and south sides, making a kind of porch of the tower. The date of the carved work in the south aisle of St. Mary's, Truro, seemed to be Henry VII.'s reign, as his arms were displayed in the roof; that at Launceston was somewhat later, and ruder on account of the difficulty of cutting granite.

The PRESIDENT then put the vote of thanks to Mr. St. Aubyn for his paper, and the numerous series of drawings he had displayed, and this was carried by acclamation.

At the meeting of the Association to be held on Friday next, December 7th, Mr. J. J. Stevenson will read his paper on "Gothic Architecture."

ARCHÆOLOGICAL.

ARCHÆOLOGICAL DISCOVERIES IN COLORADO.—Some interesting discoveries in Colorado were recently made by the Geographical and Geological Survey of the Territories conducted, by Dr. Hayden. It would seem that the fertile valley of the Animas was densely inhabited and highly cultivated by an enlightened race of people centuries ago. The ruins of the houses, corals, towns, fortifications, ditches, pottery-ware, drawings, non-interpretible writings, &c., show that many arts were cultivated by these prehistoric people which are now entirely lost. Their houses were built of almost every kind of stone, from small boulders

to the finest sandstone. The finest of these ruins, and the nearest perfect, are situated about thirty-five miles below Animas City, in a large valley fifteen miles long by seven wide, on the west side of the river. This valley has been covered with buildings of every size, the two largest being 300 by 6,000ft., and about 300ft. apart. They are built of small blocks of sandstone, laid in adobe mud, the outside walls being four feet and the inside walls from a foot and a half to three feet thick. In the lower story are found port-holes a foot square. There are rooms now left, and walls for about four stories high are still standing. About the second story, on the west side, there was once a balcony along the entire length of the building. No signs of a door are visible in the outer walls, and the ingress must have been from the top, in the inside there being passages from room to room. Most of them are small, from eight by ten to twelve by fourteen feet, the doors being two by four feet. The arches over the doors and port-holes are made of small cedar poles two inches wide, placed across, on which the masonry is placed. The sleepers supporting the floors are of cedar, about eight inches thick, and from twenty to fifty feet long, and about three feet apart. A layer of small round poles was placed across the sleepers, then a layer of thinly split cedar sticks, then about three inches of earth, then a layer of cedar bark, then another layer of dirt, then a carpet of some kind of coarse grass. The rooms that have been protected from exposure are whitewashed, and the walls are ornamented with drawings and writings. In one of these rooms the impression of a hand dipped in whitewash, on a joist, is as plain as if it had been done only yesterday. In another room there are drawings of tarantulas, centipedes, horses, and men. In some of the rooms have been found human bones, bones of sheep, corn-cobs, goods, raw-hides, and all colours and varieties of pottery-ware. These two large buildings are exactly the same in every respect. Portions of the buildings plainly show that they were destroyed by fire, the timbers being burned off and the roofs caved in, leaving the lower rooms entirely protected. The rock that these buildings were built of must have been brought a long way, as nothing to compare with it can be found within a radius of twenty miles. All the timber used is cedar, and has been brought at least twenty-five miles. Old ditches and roads are to be seen in every direction. The Navajo Indians say, in regard to these ruins, that their forefathers came there five old men's age ago (500 years), and that these ruins were here, and the same then as now, and there is no record whatever of their origin.

A private chapel has just been completed at Newsham Hall, near Darlington, for Mr. W. T. Hustler, from the designs and under the superintendence of Mr. E. Lofthouse, architect, Middlesborough.

The Princess Mary of Teck, on Saturday, opened the new West Herts Infirmary, at Hemel Hempstead. The new building adjoins the old one, and is in the plainest form of Italian. It is divided into three blocks, the administrative department and out-relief offices being located in the centre, and the in-patients' wards from the wings. The building is ventilated on the Banner principle, and special care has also been given to the drainage. Messrs. Coe and Robinson are the architects of the new structure, the cost of which is about £13,000.

An inquiry was held before Mr. Robert Morgan, C.E., one of the inspectors of the Local Government Board, at Southampton Guildhall, on Friday, respecting an application from the town council of that borough for sanction to the borrowing of £87,000 for works of sewage and water supply and local improvements.

The first shelter for cabmen erected in Bradford was fixed last week. The structure is designed in plain Gothic by Messrs. T. H. and F. Healey, architects, Bradford, and will cost about £50.

The restoration of Tewkesbury Abbey has made such rapid progress that on Sunday week the restored choir was opened for divine service, it being the intention to use it for that purpose, with temporary seats and fittings for the congregation, while the nave is in the hands of the workmen. The work of restoration in the choir is now complete, with the exception of the mosaic floor and the stalls. It has been carried on, under the superintendence of Sir Gilbert Scott, by Mr. Thomas Collins, of Tewkesbury.

* The singular example in Fowey Church, which is ornamented with grotesque carving, was illustrated in the BUILDING NEWS on Nov. 24th, 1876.

Building Intelligence.

COLLINGBOURNE DUCIS.—St. Andrew's parish church—a well-proportioned edifice of the Late Norman period, with aisles and chancel of later date, and a good Perpendicular tower—was reopened on Tuesday week, after restoration of the nave from the designs of Mr. Blomfield. The stonework of the windows, pillars, and arches has been carefully restored. The chancel arch has been rebuilt, and the nave roof raised so as to correspond in pitch with the chancel, which was rebuilt in 1856, from the designs of Mr. Street, R.A. The works have been executed by Mr. John Woolbridge, of Hungerford, at a cost of about £7,300.

EVERTON.—The new church of St. Cuthbert, Everton, was consecrated last week. The building, which has cost £8,200, is in the Early Decorated, style and consists of nave 97ft. by 24ft. 7in.; chancel, 25ft. by 22ft. 7in.; north and south aisle, 83ft. by 13ft. 8in.; organ chamber and choristers' vestry at south-east, 23ft. by 14ft. 8in.; vestry at north-east, 18ft. 3in. by 14ft. 8in.; a tower at south-west angle and entrance porch at north-west. There is accommodation, without galleries, for 750 adults. A Sunday school is formed under the east-end, which will accommodate 300 children. The walls are of the local red sandstone, lined internally with brick, and plastered and faced externally with Burnley parpoints. Messrs. T. D. Barry and Son were the architects, and Mr. C. W. Mullin, of Kirkdale, the contractor.

GLASGOW.—The Marquis of Bute has offered to build at his own expense and present to the Glasgow University the grand hall, according to designs prepared by Sir Gilbert Scott, R.A. The hall is intended to run north and south across the quadrangle, and the architectural style will be Scottish Baronial, to harmonise with the rest of the University. The cost of this addition was estimated originally at £57,000, but the present scheme will, it is said, probably necessitate the expenditure of about £60,000.

GLASGOW.—The memorial stone of Galloway U.P. Church was laid on Saturday, on a site in Whitevale-street, adjacent to the North British Railway. The style chosen by Mr. Petrie, the architect, is Early Decorated Gothic. A conspicuous feature of the exterior will be a massive square tower at the south-east corner, nearly 100ft. in height, flanked by angle buttresses, and surmounted by a cornice with griffins as projecting gargoyles. In the centre of the Whitevale-street, or east front, will be a projecting gable, forming the chief entrance, and above will be a large traceried window. The nave roof will be supported by an arcade of columns with moulded caps and bases, and will be panelled with rib mouldings. The church will be seated for 950 persons, of which 600 will be provided for in the area. Behind the church will be a hall for 300 persons, and a session-house seated for 100, vestry, lavatories, &c. The outlay will be about £4,500.

KNIGHTON.—The parish church of St. Edward, Knighton, was reopened last week after restoration. The building committee two years since, in dealing with the old building, which consisted of a western tower and a plain parallelogram under one roof, determined to retain the tower and to build a new nave and aisle. This has been done from the designs of Mr. S. P. Smith, of Shrewsbury, at a cost of £3,023. The new nave and aisle, out to out, measure 67½ft. east to west, by 53½ft. north to south, the central height being 41ft., giving accommodation to from 400 to 420 worshippers. The tower has been repaired, a new porch added, and a baptistery formed. The style of the work is Early English. Mr. Williams, of Knighton, was the contractor. The restoration of the choir and chancel is to be at once proceeded with.

LEICESTERSHIRE CLUB HOUSE, LEICESTER.—This building was opened on the 14th inst., when a grand banquet was given. The style of architecture is Flemish, and the height of the building to the ridge is 58ft., to the parapet 46ft. The edifice is built of red brick, with Ancaster stone dressings, and forms an ornament to that portion of the town where it

is erected. On the basement are ten rooms, including the kitchen, which is 27ft. by 20ft. The architects are Messrs. Goddard and Paget, of Leicester; the clerk of the works, Mr. W. Clifton; whilst the builder is Mr. J. H. Herbert, of Leicester, whose contract was for £8,400, but that sum does not include extras. The probable cost of the club altogether, inclusive of its fittings, will amount to nearly £12,000.

LONDON SCHOOL BOARD.—At the meeting of this board, held on Wednesday, the tender of Messrs. Kirk and Randall, of Warren-lane Works, Woolwich, amounting to £6,937, was accepted for the erection of a school for 600 children, on a site in Calvert-road, Deptford. This school has been planned as a one-story building, with the main school-rooms 22ft. wide. The site contains an area of 32,620 square feet, and a provision of £643 has been made in the tender for the necessary boundary walls and gates. It was also decided to alter a mission-hall adjoining the Northey-street School, Limehouse, which has been recently acquired, so as to provide 200 school-places for infants, and for this work the offer of the executors of the late Mr. T. Ennor, of Commercial-road, E., to carry out the work on their contract schedule of prices for the adjacent school buildings, was accepted.

LOUGHBOROUGH.—On Tuesday week the foundation stone of the new church of Holy Trinity, Loughborough, was laid. Mr. Blomfield, of London, is the architect of the building, which will cost £4,530. The style of the church will be Early English. The height of the walls will be 24ft., while from the ground line to the top of the turret the distance will be 84ft. From east to west the ground line will be 186ft., and from north to south 60ft. The walls will consist of granite, with Bath stone dressings. Accommodation will be provided for 500 worshippers. The builder is Mr. C. Cliphsham, of Norwell, near Newark.

MANCHESTER.—The foundation stone of a Wesleyan school-chapel in Raby-street, Moss-side, was laid on the 24th inst. The building is designed as follows:—On the ground floor a porch with double entrance, spacious vestibule, and inner vestibule, connected by means of an arcade with the schoolroom, 60ft. by 35ft., open to the roof, and furnished with an arched recess at one end, containing a platform, and a small gallery at the other. In the rear are three class-rooms, passages, hoist, yard, conveniences, and heating apparatus, cellar, and adjacent to the entrance are four class-rooms, and a staircase to the secretary's room, gallery, &c. All internal woodwork is to be of pitch-pine, stained and varnished; walling externally to consist of white-headers, relieved by stock bricks and stonework. Haden's system of warming is that adopted. The contract has been undertaken at a cost of about £3,500, by Mr. W. W. Harrison, of Greenheys, from the designs of Mr. John Lowe, F.R.I.B.A., Manchester.

METROPOLITAN BOARD OF WORKS.—On Friday tenders were opened for the construction of 2,400ft. of sewer near New-road, Hammersmith. Eleven were received, ranging from £3,976 to £6,360, and after a discussion in committee, that of Messrs. Nowell and Robson, amounting to £4,685, was accepted by 13 votes to 9; 4 tenders were lower than that accepted. A month since the Floating Swimming Baths Company applied for permission to convert their swimming bath, moored off the Victoria Embankment, opposite the foot of Northumberland Avenue, into a public gymnasium during the winter months. The works committee then recommended the board to refuse this, and determine the agreement with the company. The recommendation was referred back, however, for further consideration, and on Friday the committee recommended that, having regard to the public benefits resulting from the company's operations, the application for permission be granted. The following applications for sanction to borrow were granted:—St. Luke's vestry, £500 towards improvement in Bath-street; Lewisham district, £900 sewage works at Pengo and Beckenham, and £3,700 for laying out and draining grounds, &c., and erecting lodges at the Sydenham recreation ground, and Bethnal-green vestry £20,000 for granite paving works. An advance

of £20,000 was, subject to the approval of the Local Government Board, and the Treasury being obtained, granted to Camberwell vestry towards the cost of erecting a new workhouse. An intimation was received from the City Commissioners of Sewers, stating that the improvement in front of the church of All Hallows, Upper Thames-street, has been completed. Mr. F. H. Fowler moved that so much of the resolutions of the board of the 14th inst. as approve the recommendation of the works committee for obtaining a new supply of water for potable, fire-extinguishing, and other purposes, and direct that a bill be introduced next session for carrying the same into effect, be rescinded. This was seconded by Mr. Munro, but after a long discussion the board upheld its original proposal in its entirety by the narrow majority of three, the numbers being 20 and 23. Mr. Dixon, C.E., was granted permission to erect a second wooden model of Cleopatra's Needle on the Victoria Embankment, either opposite Northumberland-avenue or elsewhere; the "dummy" to be erected subject to the supervision of the Board's architect (Mr. G. Vulliamy) and engineer (Sir Joseph Bazalgette).

THRASSINGTON.—The parish church of Thrassington, which has undergone thorough restoration, was reopened on Thursday week. A year or two ago Messrs. Goddard and Paget, architects, of Leicester, were requested to make a report upon the condition of the edifice, and the north aisle was found to be so ruinous as to be beyond restoration. This had to be removed, and a new aisle, the same width as the south aisle, erected. The modern west gallery, pews, and pulpit, have also been removed, and replaced by simple seats of stained pitch-pine, a pulpit of the same material with stone base, and choir stalls in the chancel. A window, priest's door, and leper window in the chancel, which were formerly built up, have been reopened. Three new windows have been inserted in the south aisle. The font has been carefully restored. The whole of the roofs were very decayed, and have been taken off. The nave and aisles are covered with open timbered roofs, and the chancel has a wagon roof. The stonework of the tower was very much decayed, and has been thoroughly restored. The whole of the works have been carried out by Mr. G. Hayes, builder, of Melton Mowbray, at a cost of £1,800, under the superintendence of Messrs. Goddard and Paget.

TRETOWER.—The new church of St. John the Evangelist, Tretower, was consecrated on Wednesday week. The building is a simple building of 13th century character. The plan is rectangular, comprising a nave 46ft. long and 21ft. wide; chancel 25ft. long, and 18ft. wide, with a vestry and organ chamber on the north side of chancel, and a south porch near the west end of nave. Externally the character of the building is very simple. A bell turret of somewhat unusual design stands over the chancel arch with pointed openings for two bells. The walls are built of the local stone on irregular coursed work; all dressings are of Bath stone, the walls inside are plastered, the roofs are covered with Broseley plain red tiles. The architect is Mr. J. L. Pearson, Harley-street.

Consequent on acquiring the gas commissioners' undertaking, the Haverfordwest Town Council met on Friday night to appoint officers. All were re-elected with the exception of Mr. James Thomas, the borough surveyor, whose duties are in future to be discharged by Mr. Gibbons, the gas manager. A reduction of £10 was made in the clerk to the gas commissioners' salary.

St. Luke's Church, Old-street, London, was reopened on Wednesday week, after restoration, at a cost of nearly £6,000, under the superintendence of Mr. Blomfield, architect, the general contractors being Messrs. Morland and Nixon, the decorative work being performed by Messrs. Heaton, Butler, and Bayne. The church, which is chiefly remarkable for its extraordinary fluted obelisk spire, dates from 1733, and was built by James, a pupil of Wren. The walls have been underpinned, and the interior decorated, while the high pews have been replaced by substantial benches of oak.

Heating apparatus on the continuous-flow hot-water system and ventilators have been placed in St. Mary's Church, Clontarf, by Messrs. Hodge and Sons, of Westmorland-street, Dublin, and were used for the first time on Sunday.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. Price 2d. weekly; annual subscription, post free, 15s. The number published November 30 contains articles on Infant Mortality in Birmingham, The Water Supply of London, Sympathy-of Sort, Sanitary Engineering, An Alleged New Cause of Small-Pox, Vaccination in San Francisco, A Washable Respirator, Intermittent Filtration, On the Cure of the Eyes, The Australian Health Society, Dr. Barton Sanderson on the Attributes of the Germinal Particles of Bacteria, Dr. Richardson on Total Abstinence, Public Health Reports, Legal Intelligence, Water Supply, Intercommunication, Public Health Patents, The Editor's Table, Gleanings, &c.—31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.
TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.
Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (and Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.
Cases for binding the half-yearly volumes, 2s. each.

Correspondence.

ENGLISH AND FOREIGN WORKMEN.

To the Editor of the BUILDING NEWS.

SIR,—While agreeing with "E. C. R." in the value he attaches to the establishment of technical colleges, and which you, sir, advocated only a few weeks ago in an article on "Technical Education," allow me to differ from him in thinking that free trade is the cause of the decline of British workmanship from an art point of view. The removal of restrictions ought rather to have helped on the artistic skill and progressiveness of our workmen. Has not ability and natural talent flourished more under the free-trade system in every department, and why should art be an exception? Again, I must differ from him in thinking the "tyranny of the trades' unions" has extinguished the individual efforts of the workman, by placing all on a level as regards uniformity of wage, number of hours, &c. It is true piecework is not approved; but I ask if piecework was the system under which our greatest architectural works were carried on? Has it not been rather the obstacle to artistic work? Has it not favoured scamping more than any other thing, and encouraged the under-cutting and all the worst features of the contract system? Those who are just now reviving the architecture of the past two hundred years must admit that the solidity, truthfulness, and honesty of the workmanship and art displayed—all, in fact, that we most admire in such work—were the results of a system totally different to the present mode of doing work. Piece and contract work was a thing unknown, and the artisan took pleasure and pains in carrying out the intention of the designer. What do we find now to be the case? Sir Edmund Beckett has very truly remarked, on

this point of the controversy, that workmen now are slovenly and indifferent, lazy or careless; but he forgot to state under which system this lack of art or individual interest took place. It seems to me, in the recent controversy in the *Times* and other papers, this point has been strangely overlooked, though every architect who has superintended his own work will have remarked on the present scamping system the contract or piece-work plan brings about. Our rubbishy houses and modern furniture of a certain class are the products of men who perform their labour, not as thinking men, but as machines set to perform a piece of work in a certain time and at a fixed price. There can be no interest felt in the work, for the workman knows it is the result of a cut-down on the part of his employer, who wants to make a certain profit. As both have to get a profit the work is neglected; one tries to make a bargain of the other—in short, mark, the work done is the minimum amount of material or labour that can be expended, not the maximum. Herein, then, I conceive, the secret lies of "C. B. A.'s" lamentations and Sir Edmund Beckett's complaints.

If we study the work done since measuring became an independent business—that is to say, since lump-sum contracts arose about the beginning of the present century—we shall have no difficulty in arriving at the conclusion that from that time a gradual decline is noticeable in British workmanship. Our great buildings, it is true, may be noted as exceptions, for they have been the work of men not restricted to "piece-work," or not so under-cut by it as in the smaller works, and their contractors were men who had a reputation that they could not afford to lose. But workmen themselves, if asked, will honestly admit that the "contract system" has done incalculable harm. Apprenticeship now is very different; the high-pressure master has no time to devote to his younger men, and every inducement is held out to scamp. The "jerry" builder is the natural offshoot of the system. Now, what trade-unionism has done is to protect the interests of labour by controlling the wages, the hours of work, &c., so as to determine a standard. I must confess I see in a trade union the object of any other professional society—namely, a centralising, controlling influence. If we regard trade-unionism as the aggregated experience of the trade, we must look upon it as performing a similar function for its members as a fly-wheel does to the machine—namely, a regulator of the motion, a check on exuberant irregularities, and so on. But it is evident "E. C. R." and a great many others look upon it as the disorganiser of the class, a promoter of strikes and discontent. If it fulfils its legitimate function it will simply content itself with the regulation of the profits of trade. The common accusation that the unions impede the skilful and best workmen, and reduce them to a level of the unskilful, is not founded on justice, for a skilful hand must necessarily do his work better if not faster. Those who have attempted to fasten this objection on the unionists confound skill with time.—I am, &c., G. H. G.

THE ARCHITECTURAL STUDENT.

SIR,—The remarks in your article on "The Architectural Student" (p. 506) are in the main just, but call for remark in a few instances. It appears to me that the librarian and his assistant have as much as they can do to supply the members of the Architectural Association, in the protracted half hour preceding the ordinary meetings, and the reference to the library in the annual report bears out this statement. With regard to the magnificent library at South Kensington, I believe there is scarcely an open evening throughout the year on which it is not crowded, and in nearly every instance a fair proportion of the readers are architectural students. There may be many like myself who do not need to go to these libraries on account of having sufficient ones of their own. From a few volumes of the BUILDING NEWS alone the student may gain nearly all the information which is necessary to him.

With regard to the Association classes, and those of the BUILDING NEWS, study is impos-

sible without inclination, and how few are likely to be inclined for study after seven or eight hours spent in the office, followed by an hour or a half occupied in getting home, and a good evening meal on the top of it all! The Saturday afternoon is a farce, as it frequently means only two or three hours less than on other days, taking into account the time given for dinner, and for a good part of the year is quite useless for purposes of country sketching, &c.

Let us turn to the classes at King's College, and others. At the one named all the classes but one meet in the afternoons—that for surveying on Saturdays from 10 to 3. What architect is there in London who would take a pupil that could give scarcely half his time to office work? Then, again, all the pupils and assistants of my own acquaintance have taken to the profession as a means of subsistence. The premium at starting is frequently a severe pull upon the purses of their parents; are they likely to pay in addition seven guineas per annum for the lectures at King's College, twelve guineas for drawing classes, and nine guineas for the surveying, at the same place? University College falls under the same objections as to time and fees. Why the Royal Academy of Arts should be included in the "Architectural Association Handbook" I can't imagine, for although the instruction is gratuitous, one must first "have acquired a reasonable degree of proficiency" (to my mind an unreasonable degree), and if the drawings and certificates are approved the student must bind himself for seven years! If such a course of study were necessary, complaints as to the profession being overstocked would soon come to an end, and instead of architects deploring the scarcity of clients, these latter would have to beg, and to wait before their wants could be attended to.—I am, &c.,

27th November, 1877.

C. P. E.

MIDDLE CLASS DWELLINGS.

SIR,—I am much obliged for your notice of my paper on "Middle-class Houses in Paris and Central London." Permit me, however, to explain what was doubtless left obscure during the lecture—namely, the reference to Pierre le Muet's designs for houses in 1663. You imply that the typical Paris house of to-day, and the typical London house erected after the Great Fire, both descend from the same stock, a hôtel, the plan of which I exhibited last Monday. But if you will look again in Pierre le Muet's book you will also find the London house of to-day—the houses of two rooms over two rooms—such as are being erected in the heart of town now. In the middle of the 17th century many of the shops and houses of central Paris were planned in exactly the same way as those to be seen at the present hour in Warwick-street and Beak-street. The march of progress has caused them to give place to the broad fronted *maison-à-loyer* of our time.—I am, &c.,

WILLIAM H. WHITE.

THE ROYAL TOMB, KING'S LANGLEY.

SIR,—I was surprised and grieved to find that the tomb of Prince Edmund had been taken down and removed from the chancel of the above church, the intention being to show better a modern miserable reredos, for which sort of thing (the reredos) there seems to be now a sort of craze. I say, Sir, it was a sacrilegious, wanton, and unjustifiable act. Not done, too, by ignorant country churchwardens, who are usually credited with such evil doings, but by the parson and diocesan architect, the latter a member of the R.I.B.A., &c. With so much fine talk at the present time about the value of, and need of, conserving national antiquities, such a thing as this should be impossible. A diocesan architect ought to be the last person to so commit himself. Here is defacement of a beautiful architectural ornament, interference with the royal remains, and destruction of the historical integrity of an ancient work, and by those who should have been its most jealous protectors. Whatever may be said by way of excuse—for even in such flagrant culpability as this I suppose some excuse will be offered—the fact is

certain that for five hundred years the royal tomb has stood in the chancel of King's Langley, respected by one generation after another, in spite of political and religious changes by which the country has been convulsed. Not until now—the blatant, pretentious nineteenth century—has the royal tomb been broken into, or the sacred remains of the dead disturbed. And for what? Vanity and five per cent.! These, Sir, are the cursed influences likely to rob us of every bit of antiquity in the land.—I am, &c., M.

BUILDINGS IN THE WEST OF BRIGHTON.

SIR,—In reference to your article on the above subject, will you pardon me if I remind you that all the buildings referred to are not in Brighton, but in the town of Hove, the annual rateable value of which is now upwards of £150,000, and which bids fair in 10 years' time to be equal to that of Brighton.—I am, &c., E. B. ELLICE-CLARK.

CHIPS.

A ratepayers' meeting was held at Weston-super-Mare on Wednesday week to consider the scheme for the proposed purchase of the waterworks by the town commissioners, when it was unanimously approved of, and resolutions were agreed to, giving formal consent to the promotion of the necessary bill in Parliament next session.

A new sluice and other works of drainage have been constructed for the Middle Level Commissioners, at Wiggenhall St. Mary, Isle of Ely, by Mr. W. Webster, contractor.

At a public meeting held at Kircudbright, on Friday se'night, it was decided to request the town council to provide a public hall for their meetings and the use of the community.

The memorial stone of a new public hall which has been erected in the village of Kippen, N.B., was laid on Saturday afternoon. The building is simple in form, and is designed in the Early English style, with plain lancet windows, open timber roof, and stained and varnished woodwork. The hall accommodates 300 persons, and the cost was £1,500. The architect was Mr. David Robertson, Edinburgh.

A new board school, situated between Boundary-lane and Albany-road, Camberwell, was opened on Monday evening. The building, which, with the playgrounds, occupies a superficial area of 22,000ft., is three-storied, and is in the Queen Anne style, containing, on the ground floor, a large school and "babies" room for the infants; on the first floor, double school-room and two class-rooms for the girls; and on the second floor a like accommodation for the boys, each department having separate entrances. The total cost of the site was £5,444 13s. 7d., and that of the building £8,230 15s. 9d., making a total of £13,675 9s. 4d., or equal to £16 17s. 7d. per head. The accommodation is for 271 boys, 271 girls, and 268 infants, or a total of 810 children, but the building is designed with a view to future enlargement.

It is stated that the efforts which have been made to secure to the people of London the ground round St. Paul's Cathedral have been successful, and that an agreement will shortly be entered into between the Dean and Chapter and the Corporation for this purpose. The contemplated improvements include lowering the palings, remodelling the ground, planting trees, and making the necessary pathways.

Professor Goldwin Smith, before distributing the prizes to the scholars of the Oxford School of Art on Friday last, delivered an address, remarking that it would appear to be bad policy on the part of the Government to stint the Science and Art Schools, as it was in the product of finished skill and cultivated taste that England should strive to retain a supremacy. The declining character of English goods has much to do with their exclusion from foreign markets, and if South Kensington could do anything to remedy that, it would be desirable.

It is announced that the Queen has presented to the town of Heywood 20 acres of land for the purposes of a public park. The money has been set apart by the Queen out of a sum exceeding £10,000 which fell to her as Duchess of Lancaster, through the death, without heirs, of Mr. C. M. Newhouse, of Heywood.

A bill is to be promoted next session by the Great Eastern Railway Company for an extension northwards through the county of Lincoln. It will be 130 miles in length, and be constructed, if sanctioned, between Somersham, Hunts, and Askern, in West Riding, Yorks, passing through the city of Lincoln. There will be a spur to Rotherham.

Board schools have just been completed for the Bridgend School Board by Mr. William David, contractor, at a total cost of about £2,500, from the designs of Mr. Harris, architect.

At a public meeting held at Winchester Guildhall, on Friday, it was resolved to rebuild Morden College, which has become unfit for habitation. Several plans were exhibited, and it was decided to erect on a site in the Cathedral-close a building worthy of the city and county.

Intercommunication.

QUESTIONS.

[5203.]—Darkening Pitch Pine.—I shall be grateful for any hints as to the best way to treat this wood, which is used for both the floors and the joinery of the better rooms in a house I am building for my own occupation. First, as to the floors. What I should have liked, but could not afford (even if it were obtainable), was an oak floor, with the rich brown colour which comes only with age and plentiful beeswax. Handsome as pitch pine is, and delightful as its hardness promises to be, its natural colour seems to me too light for a floor. Can it be made to approximate artificially to the colour of old oak, and in a satisfactory and durable way? If not, how is it best treated? I have often seen deal floors stained and varnished, and looking pretty well in quiet corners, but very bad when exposed to traffic, the varnish being scratched and even the stain partly rubbed off. Would pitch pine, by reason of its hardness, give any better result with stain and varnish? Or may I conclude that varnish is inadmissible, and that the floor should be either oiled or beeswaxed, whatever be the preliminary process of darkening? Further, will a stained and beeswaxed floor give a better result than a stained and varnished floor? As regards staining, I notice that it inverts, so to say, the grain of the wood, darkening the soft parts, which were light before, and affecting but little the colour of the hard parts, which though nominally darker than the rest, come out after staining as the lightest. With any wood of distinct and handsome grain, this seems to me a pity, and inclines me against the use of stain. My builder prepared me many samples, which were treated in different ways, and one amongst them was done with "oil stain," but I think with indifferent effect. One was treated with some preparation of asphaltic (?) or creosote, and the colour is admirable—a dark rich brown—but a disagreeable smell clings to it, even after varnishing. Some were treated with lime, and then oiled, and with one of these the result was excellent. The true graining of the wood was preserved, and even increased, and the whole greatly darkened, while the semi-orange shade which is sometimes disagreeably apparent in pitch pine was got rid of entirely. The general shade was by no means that of old oak, but still dark enough for the purpose. But, unfortunately, the result was not uniform. Other pieces darkened much less, in spite of many rubbings with boiled linseed oil. Is there any way of applying the lime which shall make the result certain? Is the process injurious to the wood? If not, is it better to lime and oil simply, or to lime and oil, and then polish with beeswax and turpentine? If the latter, is there any particular way in which the polishing should be done? Any hints how to make a really handsome floor with pitch pine would, doubtless, be acceptable to others besides myself, for every one complains of the ordinary deal floor. Few can afford oak, but the increased cost of pitch pine, as compared with deal, is so slight, that in the better sort of houses its use might well be the rule instead of the exception. With regard to joinery, any builder is willing to treat window frames and architraves with lime, but objects to treating the doors so, on the ground that the lime "raises the grain," and so neutralises the excellent finish of the surfaces. Any water-stain, he says, will do the same. He also states that any such application will lead to shrinkage and ill-fitting of the framework. Are these objections insuperable? Whether they be so or not, what is the best way to treat the pitch-pine doors?—PITCH PINE.

[5204.]—Competitions.—Suppose a competitor has his drawings returned without thanks, carriage to pay, and so forth; upon opening the same he finds them minus the specification and estimate, general plan of the buildings showing drains, &c., after waiting nearly twelve months without receiving any tidings or explanation whatever. In such a case can any compensation be claimed if lost? An answer from some of your correspondents will oblige.—AN INQUIRER.

[5205.]—Tar Paving.—Will any reader who is experienced in the laying of tar paving kindly give me a few plain practical directions as to description and proportion of materials best to be used, as well as method of preparing and laying the same?—ESTATE CLERK OF WORKS.

[5206.]—Cisterns.—I am wanting to collect water from a well to a cistern to be placed a short distance off. This cistern being kept underground, can any of your readers inform me of the best and most substantial material to use for it?—E. G. W.

[5207.]—Re-Gilding Picture Frames.—The writer has a number of picture-frames, the corners and some other protuberant parts of which are getting bare of gilding. Will some one kindly inform me, through your columns, how I can touch them up, and with what materials? Would "Bessemer's gold paint" do? I may say the said articles are in otherwise good condition, and would not require to be wholly re-gilt for some time to come.—IGNOTUS.

[5208.]—All Souls Church, Harlesdon, N.W.—I should much like to know how two bells can be swung in each of the turret spires to the above church in an octagon chamber only 4ft. 6in. internal diameter? The arrangement shown for ringing

chamber in a kind of cellar passage is very ingenious and a good idea.—ENQUIRER.

[5209.]—Ceilings.—In a house undergoing alterations the ceilings to most of the rooms are cracked and broken, the plaster "shellings" off, and presents a very untidy appearance. What is the cause of this, and the best and cheapest mode of making good the same? The ceilings were in this condition before alterations were commenced.—JOAN.

[5210.]—Main Sewers.—The Local Government Board have recently issued instructions to surveyors how to prepare plans for loads for sewerage, &c., works. They therein state that duplicate sewers are not required, and point out their defects; yet in the BUILDING NEWS of last week, at Dorchester, the inspector criticised the provision made to admit rainfall into the sewers. Under these circumstances what are the surveyors or local boards to do in such cases as when the whole district they have under their control is thickly built upon, and all paved? If the rainfall is not to be connected with the sewers, either the sewer proper or a duplicate sewer, is it to be allowed to remain on the surface until it evaporates, or what? Will some of your correspondents enlighten the profession on this matter?—C. E.

[5211.]—In Breaking-out Openings for Bay Windows.—How am I to calculate the strength of beam to carry the walling above such opening, and the best way of specifying the same?—JOAN.

[5212.]—New Hotel Dieu, Paris.—Where can a good description of the arrangements, said to be excellent, of the building generally be found? Has the BUILDING NEWS given one?—J. J.

[5213.]—Architects' Pupils.—What system is adopted in France and Germany for the training of the above? Will a travelled architect kindly give his opinion as to the superiority of the Continental or our own system of pupilage?—J. J.

[5214.]—Tilting Fillet.—Attachment of Girders.—Will any of my fellow-readers be kind enough to answer the following questions?—(1) Show by means of sketches what would be the result of laying slates without any tilting fillet at eaves, and how a fascia-board can be utilised in place of a tilting fillet. (2) How to show the rolled-iron cross-girders of a floor running into the main girders, over the head of a cast-iron column. Draw a section through main girder, showing in elevation the head of the column, the mode of attaching the cross girders, and the main girders bolted to the column. [A sketch sent us of the place shows main girders 12in. x 6in., and cross girders 10in. x 4in., and the head of column, 12in. x 7in.]—STUDENT.

REPLIES.

[5164 and 5202.]—Surveyors' Charges.—Appointment of Surveyor.—When a person appoints an agent—e.g., a broker or an architect—the law infers, if there is nothing to show to the contrary, that the broker or architect is empowered to do as brokers or architects usually do. Unless an architect is instructed to the contrary, he is empowered to appoint a quantity surveyor, and if no contract is accepted, the client is bound to pay the reasonable fees of the surveyor.—L.

[5179.]—Binding "Building News" Plates.—The size of the books when bound up were that of one page, to correspond with volumes of printed matter. The illustrations occupying more than one page were folded, narrow strips of paper were stitched in with the leaves, of sufficient quantity or thickness to correspond with the folds of larger leaves, thus keeping the back edge of book the same thickness. Whether these are the "guards" "A. C." means, I am not aware. The thickness of my books, including cloth-covered boards to backs, are Vol. "Domestic," 2½in.; "Ecclesiastical," &c., 3½in.; "Public Buildings and Miscellaneous Sketches," 3in. I may add, that having taken out all the plates and advertisement pages, I had the printed matter bound up in yearly volumes, instead of half-yearly, as published; these are about 2½in. thick, half-bound cloth, and cardboard backs. In arranging the plates, I took care to have all illustrations relating to one building put together—for instance, all the designs for the Edinburgh Cathedral, though not published consecutively as to date, nor by the same authors.—TEO.

[5181.]—Clearing Pieces.—Your correspondent, "S. A.," having received no answer to his question—What are clearing pieces? I venture to give him my unauthorised opinion of what is meant by the term, although I wish him to understand that I am subject to correction. In fixing framed soffit, shutters, &c., to windows, with raised or projecting moulds, you must of necessity hang the shutters low enough to clear moulds of soffit, and in so doing you have a space left between top rail of shutter and soffit, when the shutters are folded back in position during the day, so to finish and fill up same you have a beaked piece (hence the name) to fix to rail of soffits leaving the proper margin.—J. W.

[5181.]—Clearing Pieces.—I take these to be what are technically called freeing leads—small beaded or moulded pieces planted on plancers and soffits to caso shutters in opening.—MICHAEL MAWNEY.

[5182.]—Joists Laid Rounding.—If "S. A." would select his timbers with a natural chamber he would find it answer all his purposes. If, however,

the joists are already laid, let him upright a piece running at right-angles to his floor, and either with wedges or jacks give the required curve, which can be retained by bridging.—MICHAEL HAWNEY.

[5193.]—Concrete.—1. 1½ in. thick for first story and 9 in. for upper. There is some patent apparatus for building in concrete, but if the outline of the walling be constructed in stout planking, say 1½ in. thick, and connected with moveable keys, so as to admit shifting or rising every 18 in. in height, it will answer fully as well, the only care being to see that they are sufficiently stiffened to prevent the concrete from buckling them. 2. Slaty material is not as suitable for concrete as clean stone chippings to pass through a 2 in. ring, mixed with clean gravel and sharp sand. The concrete, when placed in moulds for walls, can be packed with clean spawls or refuse brick, but not to exceed two-thirds of wall's thickness. 3. To a cubic yard of concrete it would be well to have 4 cubic feet by measure of Portland cement. The cost would depend materially on the price of brickwork in the locality against the materials required for concreting. 4. I would prefer finishing the walls in a fine coat of cement, finished with a hand float, and it can have as finished a surface as required (lime plastering will not adhere to cement). The walls need not be battened.—MICHAEL HAWNEY.

[5195.]—Block and Start Quoins.—Block and start quoins are usually constructed in brickwork, but the same term applies to stone. They are the ordinary hammer-dressed quoin, the head of one breaking joint on the tail of the other, and a chisel draft worked on arras to plumb by.—MICHAEL HAWNEY.

[5201.]—Surveyors' Valuation.—"W." is informed that a surveyor can, without holding an appraiser's license, legally value, for the owner's information, property proposed to be taken, under compulsory powers, by a railway company. His valuation report need not be stamped. The license and stamp are only necessary when the appraisal or valuation is binding on any party or parties by force of law, or by contract.—L.

CHIPS.

The parish church of Spilby is about to be restored at a cost of £3,800, from designs by Mr. W. Smith, architect, of London.

All Saints Church, Alrewas, was opened on Wednesday week, after restoration of the chancel, under the superintendence of Mr. Basil Champneys.

St. Mary's, Bridgewater, is about to be restored at an outlay of £1,500.

Various alterations, including the tying-in of the front wall of the auxiliary buildings, are about to be carried out at the Rotunda Lying-in Hospital, Dublin, from the plans and specifications of Mr. F. A. Butler, architect.

The annual meeting of the Motherwell Building and Investment Society was held on Monday, when a report was presented showing that in spite of the commercial dulness of the past year, the society had prospered. Since the commencement of the society shares had been taken out to the extent of £20,675. The amount of loans on heritable security was now £4,600, and the balance of profit for the five years £578, yielding 5 per cent. compound interest per annum, and a bonus of 8½ per cent. on paid-up capital to all shareholders.

The improvement of the harbour at Boulogne is about to be taken up by the French Government, who propose to create a harbour that will admit vessels at all states of the tide. Massive walls will enclose the basin, which will be protected from the drifting sands by a jetty of wood, in addition to the present piers, 700 and 519 metres in length respectively. The scheme is to be carried out by the plans of M. Stœcklin, engineer-in-chief, and is estimated to involve an outlay of about seventeen million francs, or rather less than £650,000.

Mr. Joseph Edmund Greatorex, borough engineer of Portsmouth, died somewhat suddenly on Monday afternoon. He had held the appointment since November 5th, 1866, having been for 14 years previously borough engineer of Coventry, which city was drained under his supervision. During Mr. Greatorex's residence at Portsmouth, says a local journal, the sub-idiary drainage has been carried out, many roads and streets have been put in repair, and other works of importance devised and executed, and his unexpected demise has deprived the borough of a conscientious, painstaking, and experienced officer.

In the City of Providence, R.I., 220 street lamps, within a district over nine miles in length, are now lighted and extinguished in less than fifteen seconds by electricity, and the system is controlled by one man. After a trial of several months the practicability of the plan is assured, and if the whole of the 2,500 lamps in the city were lighted in this way, it is estimated that a net saving in expenditure for gas and labour would amount to about 25,000 dols. per annum.

Two board schools are about being erected at Llanelly, Carmarthenshire; also a school-church for the Baptist denomination, from plans prepared by Mr. J. B. Morgan, architect, Llanelly.

Our Office Table.

THE use of the various asphaltés as road pavements in London is—as we long ago predicted—being gradually abandoned. The tradespeople in Cranbourne-street, Leicester-square, who were among the first to lay it down, long ago begged that it might be taken up, carriage people finding it so slippery for their horses that they refused to go there. At last it is being taken up, and the old-fashioned granite is being substituted. Generally, however, it is the asphalté-wood paving which is preferred. For instance, only a few months ago a considerable portion of Holborn was blocked while the Val de Travers asphalté was being laid down. Since then the asphalté-wood system (which consists of a foundation of concrete, then a layer of asphalté, and then wood blocks) has been tried in Oxford-street with such success that last year's asphalté in Holborn is already being taken up and the other kind of roadway substituted. The process of laying either system is exceedingly unpleasant. The smoke and stench from the melted asphalté is suffocating, and a little while ago a householder successfully prosecuted some contractors engaged in this kind of work, the court holding that a nuisance had been proved.

THE Fine Arts Department in the city of Paris has under consideration a plan for adorning the promenades and open spaces, down to the smallest squares, in a way similar to what has been done in parts of the Park Monceau. The idea is to place, at certain distances, busts of all the historians who have left studies of the manners and customs of the capital in the great avenues, such as the Champs-Élysées, the Avenue du Bois de Boulogne, &c. In the squares will be erected statues of notable personages, provosts of the guilds, judges, soldiers, &c., of all periods who have in any way done credit to Paris. Finally, in the large spaces, such as the Bois de Boulogne, the Buttes-Chaumont, and Montsouris, groups will reproduce historical events which have occurred in the city from the most distant times to our days.

On Monday a deputation—appointed by a conference of municipal corporations, held at Westminster Palace in July last, for the purpose of obtaining grants of loans to municipal galleries and museums—waited upon the trustees of the National Gallery to ask for loans of pictures and drawings from the National Gallery, and generally to have the benefit of their co-operation. The deputation was introduced by the Mayor of Birmingham, who said that they represented 60 municipal bodies. Their first object was to obtain grants of money, and their second was to get loans, not in money, from the trustees of the British Museum and of the National Gallery. In answer, Mr. Russell, a trustee, said that the views of the deputation would be laid before the board, whose decision would be sent in writing.

THE conviction of Dr. Baxter Langley and others has, according to the *Leeds Mercury*, caused a great deal of excitement amongst the promoters of land societies in Sheffield. Considerable attention is being attracted to them, and the result is a more or less complete exposure of the system on which some of these societies are formed. The principle in starting such societies appears to be for two or three persons to select a plot of land, and to enter into a preliminary arrangement with the owners for its purchase for a certain sum. There are several instances of men who occupy respectable positions in life being subsidised to act as trustees, treasurer, and committee, and then on their names being announced steps are taken to form the society. The price at which the land is offered to the members is in some cases about double the amount agreed upon between the seller and the original negotiators. The first lots are sometimes taken up by men who have neither the means nor the inclination to follow up the purchase; and, as a rule, not more than half or three-quarters of the lots are taken up by bona fide members. What may be described as the bogus members decline to sign the trust deed. The real members, of course, sign it, and then they become severally

and individually responsible for the whole of the liabilities of the society. Until the recent conviction, and the discussion which has resulted therefrom, many of the members in Sheffield were unaware that they had incurred this responsibility; but in some cases it has been ascertained that societies which ought to have expired are still running, the members having to pay until all the liabilities are discharged. Even if members sell their plots they cannot divest themselves of their original responsibility.

THE Northfleet Brick Company is being formed with a capital of £10,000, in 1,000 shares of £10 each, for the purpose of acquiring and working a valuable leasehold property, situate at Northfleet, Kent, which contains brick earth of a superior quality and sufficient quantity for the manufacture of ten million bricks per annum, for the next ten or twelve years (with the option of taking some 80 acres additional land adjoining). The present demand for bricks is so great that purchasers have to wait for months before their orders can be executed; for the prices now ruling being at least 50 per cent. higher than those of, say, five years back, with very little prospect of a decline. It is estimated, after careful calculation, that the maximum cost of manufacturing and loading the bricks into barges will be 18s. per 1,000, and the minimum average selling price for the last five years has been, say, 25s. per 1,000, showing a profit to the company of at least £3,000 upon an annual manufacture of only ten millions of bricks. A special feature of the company is that the directors have determined to give a priority to orders for the supply of bricks emanating from members over those from non-members, and in executing orders emanating from members a priority will be given to those holding the greater number of shares. Members will also be entitled to a deduction of 1s. per thousand from current prices off all bricks purchased during the first five years after registration of the company.

THE forty-eighth election of pensioners on the funds of the Builders' Benevolent Institution was held on Thursday at Willis's Rooms, St. James's, the president, Mr. William Higgs, in the chair. There were three candidates, all of whom were elected—an event without precedent in the history of the institution, which has now been established 30 years. Including the three pensioners just elected there are now 46 recipients of the funds of the charity, 23 men and 23 women, the men receiving £30 per annum and the women £24. The names of the new pensioners are John Morris (who was a member of the committee of the institution twelve years, and also a subscriber), Mrs. Rebecca Brown (widow of Mr. John Thomas Brown, a subscriber to the institution), and Mrs. Mary Ann Ebbs (widow of Mr. John Ebbs, a subscriber to the institution from its foundation for twenty-four years).

If we are to judge by the length of time during which some of our tram-lines have been under repair, we should expect that considerable improvements have been made. In the South London tramways the metals in several places have been replaced by new and wider ones, but still fixed to longitudinal sleepers in the same objectionable manner we have before pointed out—namely, laying them on sleepers of the same width, without any footplates or flanges to break the straight jointing of the granite pitching. We shall be surprised if the same process of relaying has not to be performed again in a twelvemonth. Why are companies so slow to take advantage of improvements? Why has not the Liverpool plan been applied, of having a uniform bearing of Portland cement concrete for the whole road? There the sleepers rest on the concrete bed, the rail is of steel, weighs 60 lb. to the yard, is trough-shaped, and is firmly bolted to the concrete foundation. But, in some instances, experience teaches very slowly.

SLATES — SLATES — SLATES. — Bangor, Portmadoc, and Importers of American Blue and Green Slates, a large stock of which can be seen on the premises.
SCAFFOLD POLES, 22ft., 2s. 6d. each; 24ft., 2s. per foot; 35ft., 2s. 4d. per foot.
DEALS—BATTENS—FLOORING. — Send for price list. R. MAY & SON, Timber and Slate Merchants, Acorn Wharf, Old Kent-road, London, S.E.

STATUES, MEMORIALS, &c.

STATUE OF KING ROBERT THE BRUCE.—A monumental statue of the Bruce was unveiled at Stirling on Saturday afternoon. The work was intrusted to Mr. Andrew Currie, the Border sculptor. The statue, which is of stone, is 11ft. in height, and the king is represented as clad in complete chain and plate armour. Over the shoulders is flung a royal robe, and a plumed helmet, clasped by a crown of gold, decorates the head. The king looks towards Bannockburn, the line of the eye resting on the Borestone. Behind the statue is a Scottish shield, on which rests the crossier of St. Fillan, borne by the Abbot of Inchaffray as he signalled the troops to an act of devotion before the battle of Bannockburn began. Against the shield lies the king's battle-axe, with which he felled the adventurous Bohun. Shield and battle-axe are surrounded by plants of the Scottish thistle—the national emblem. The stone from which the statue was cut weighed seven tons, and the pedestal, which is 10ft. high and 6ft. square, is formed of 11 blocks. On the centre block, which is 4ft. in height, there is a Scottish lion in bas-relief, without support or motto.

STAINED GLASS.

HOLY TRINITY, SMETHWICK.—A window in the nave has been erected to the memory of the late W. Marshall, of Captbarn, by Messrs. Camm Bros., of 41, Frederick-street, Birmingham. The subject is taken from a favourite portion of Scripture—the conversation with the woman of Samaria: "If thou badst asked me I would have given thee that living water."—John, c. iv.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "Architectural Notes on St. Alban's Abbey," by James Neale, F.S.A., Associate; 8 p.m.
WEDNESDAY.—British Archaeological Association. Papers by J. D. Leader, on "The Exploration of the Roman Station at Templeborough, near Rotherham," and by Dr. Stevens, on "The Recently-Discovered Roman Villa at Preston, near Brighton;" 8 p.m.
FRIDAY.—Architectural Association. Paper by J. J. Stevenson, on "Gothic Architecture;" 7.30 p.m.

Trade News.

WAGES MOVEMENT.

BOLTON.—The Bolton Trades' Council had before them at their last meeting an appeal for support from the Brickmakers' Society, Bolton, who have been on strike for some weeks in opposition to a reduction of wages in one branch of the trade. It was unanimously resolved to grant the request, and to recommend the case as deserving the support of the trades' councils of the United Kingdom.

DUMBARTON.—The carpenters' strike, after lasting for fully three months, is in a fair way of settlement. The carpenters were asked to begin work on the "piece" principle, but this they refused to do, and struck work. Lately negotiations, at the request of the workmen, were entered into with a view to a settlement. The men expressed themselves as willing to resume work if a fair scale of prices was drawn up, and the masters stated their willingness to endeavour to have this done. A scale of prices was submitted to the men, and after consideration a number of them have gone to work with the view of testing the scale.

LONDON.—There is no change in the position of affairs with regard to the masons' strike, except that more men are arriving from Germany, and the position of the masters seems to improve. The men, however, seem as confident as ever, and have issued a manifesto appealing to their fellows throughout the country for help. The rate of strike pay is well maintained, and altogether—more is the pity—the strike seems likely to last indefinitely.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the **MANAGER, Clynderwen, R.S.O., Carmarthenshire.**—ADVT.]

Holloway's Pills purify the blood, and by this operation prevent the depressing effects of cold, damp, and foggy weather. They rouse the nervous system to a healthy standard, and give a wholesome tone to every organ of the body. Holloway's Pills present the surest means of checking all chest complaints.

TENDERS.

DEPTFORD.—For the erection of a school to provide seat accommodation for 600 children, on the site in Calvert-road, Deptford, the accommodation on the 9ft. and 8ft. basis being for 638 children. Mr. E. C. Rohins, architect to the board:—

Wall Bros.	£7,949
Hook and Oldrey	7,860
Johnson, F.	7,650
Downs, W.	7,630
Wood, F. and F. J.	7,552
Thompson, J.	7,490
Pritchard, G. S.	7,418
Jerrard, S. J.	7,289
Atherton and Latta	7,284
Nightingale, B. E.	7,081
Tongue, W.	6,973
Kirk and Randall (accepted)	6,937
[Cost of site (area, 32,620 square feet), £2,975 11s.; school buildings, including teachers' rooms, closets, and schoolkeeper's rooms, £5,984; tar pavement and playground, £310; boundary walls and gates, £643; cost per head of school buildings only (calculated on seat accommodation), £9 19s. 5d.; total cost per head of buildings, including boundary walls, and tar pavement, £11 11s. 2d.]	

FAVERSHAM.—For the erection of cottages at the School Farm, for the trustees of the Grammar School:—

Davis, A.	£298 0 0
Johnson, G.	315 0 0
Ratcliffe, J. J. (accepted)	295 15 0
Whiting, R. M. and H.	343 0 0

FOLKESTONE.—For converting and finishing 2 carcasses into show-rooms and warehouses for Mr. John Banks. Mr. Burgess J. Reeve, architect:—

Payne	£1,180 0 0
Prehhlle	1,140 0 0
Brooks	1,098 0 0
Slade	1,050 0 0
Butler	989 0 0
Holdom (accepted)	960 10 0

FOLKESTONE.—For pulling down and erecting new front to the Victoria Inn for Messrs A. Langton and Co. Mr. Burgess J. Reeve, architect:—

Major and Sons	£612 16 0
Amer, A.	629 0 0
Beckey, W.	612 0 0

HAMMERSMITH.—For the construction of 2,400ft. of brick and concrete sewers for the covering and diversion of a portion of Stamford Brook sewer, near New-road, Hammersmith, for the Metropolitan Board of Works. Sir Joseph M. Bazalgette, C.E., engineer:—

Downs and Co.	£6,360 0 0
Pearson	6,340 0 0
Young, H., and Co.	5,200 0 0
Wehster	4,867 0 0
Mowlem and Co.	4,850 0 0
Williams, Sons, and Wallington	4,750 0 0
Nowell and Rohson (accepted)	4,685 0 0
Youngs, Geo.	4,450 0 0
Batch	4,400 0 0
Dove Bros.	4,333 15 9
Dunmore	3,975 0 0

MAIDENHEAD.—For block of four cottages for J. J. Britton, Esq. Mr. E. J. Shrewsbury, A.R.I.B.A., architect:—

Woodbridge (accepted)	£735
------------------------------	------

MAIDENHEAD.—For granaries, &c., for Messrs. Gibson and Co. Mr. E. J. Shrewsbury, A.R.I.B.A., architect:—

Woodbridge (accepted)	£400
------------------------------	------

NOTTINGHAM.—For additional warehouse, &c., to brass works, Hyson Green, for Messrs. Smith Bros. and Co. Mr. A. H. Goodall, architect:—

Munks and Richer	£1,200 0 0
Ward	1,083 0 0
Underwood	1,079 18 6
Willmot and Wray	1,014 0 0

Langridge and Sons	2,694
Anley (accepted)	2,670

BATH STONE OF BEST QUALITY.
WESTWOOD GROUND BOX, GROUND, CORSHAM DOWN and COMBE DOWN.

RANDELL, SAUNDERS, & CO. LIMITED,

Quarrymen and Stone Merchant.
 Prices, delivered at any part of the United Kingdom, furnished on application to
BATH STONE OFFICE CORSHAM, WILTS. (ADVT.)

Geometrical and Encaustic Tile Pavements in every variety. Over sixty New Designs at 5s. 6d. per yard super. "The Tiles are excellent, both in quality and colour."—**BUILDING NEWS.** "They are of great excellence in design—the material is not surpassed by any found in this kingdom."—**Art Journal.** "For paving conservatories they are the best tiles we have seen; there can be no end to their wear."—**Gardener's Magazine, &c. &c.** Designs and sample Tiles free on application to **WEBB'S WORCESTER TILERIES COMPANY (Limited), Worcester.**

Epps's Cocoa.—Grateful and Comforting — "By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shew by keeping ourselves well fortified with pure blood and a properly nourished frame."—**Civil Service Gazette.**—Sold only in Packets labelled "JAMES EPPS & Co., Homeopathic Chemists, London."

VERITY BROTHERS' PATENT VENTILATOR OR AIR PROPELLER for the introduction of cold or warm air into dwellings, &c.

The machine may be seen in action at their Show-rooms, 127, Regent-street, London, W.
 The apparatus consists of a drum, with a double set of fans, which are worked by a fly-wheel placed in the centre, and on the same axle as fans. The motive for this fly-wheel is arrived at by a small jet of water being directed on to it, causing both the wheel and fans to revolve with great velocity; the air passing through machine at a rate equal to 2,500ft. per minute, if desired, according to size of apparatus.
 N.B.—The above machine may be used either as an exhaustor or injector as may be preferred, or both objects combined.

VERITY BROTHERS,
 Patentees and Manufacturers; also Patentees of the Fire-Clay Burners for gas fires and cooking purposes; and Patentees of the new Gas Boiler for Baths and Conservatories, &c.
 Designers and Manufacturers of Lamps and Candelabra.
OFFICE & WORKS: 155, QUEEN'S-ROAD, BAYSWATER, W.

STAFFORDSHIRE BLUE TERRA-METALLIC PAVING & KERBING

SUITABLE FOR FOOTPATHS, &c., &c.
 Now largely used.

ALSO
STABLE PAVING

Made in same Material to any Patterns or Designs.

The Cheapest and Most Durable Paving now in use.

JOSEPH HAMBLET WEST BROMWICH, STAFFORDSHIRE.

COPINGS FOR WALLS, STRING COURSES, BUILDING BRICKS,

FOR RESISTING DAMP, BEARING GREAT STRENGTH, &c., &c.

Made from this Material.

PRICES AND BOOK OF ILLUSTRATIONS ON APPLICATION.
 Through the widespread reputation which these goods have gained, many makers have been induced to send into the London and other markets spurious imitations, which are only COLOURED by a chemical process, and will not bear any comparison for strength, durability, &c., with the genuine article.
Gold and Silver Medals Awarded at Paris and Brussels Exhibitions.

THE BUILDING NEWS.

LONDON, FRIDAY, DEC. 7, 1877.

COMPETITION DESIGNS FOR INFECTIOUS HOSPITAL, MAIDENHEAD.

THE Town Council of Maidenhead must consider themselves fortunate in obtaining such a numerous response to their almost offensively small premiums for designs for their infectious diseases' hospital; though we cannot say they have made the best of their bargain. We find that as many as 86 designs have been submitted—some of considerable merit—but the bulk of them displaying a large amount of misdirected labour, and an utter disregard to the cost. The conditions issued to competitors were of a very general kind, and did not inform the competitors of the actual wants of the Sanitary Board. They only gave the shape and size of the land—a parallelogram, with a frontage of 328ft. to one road, and 238ft to the other; that the hospital had to accommodate 8 patients—four of each sex—with the “necessary offices;” the cost not to exceed £800. So inadequate, indeed, were the particulars furnished, that a second and amended set were furnished, giving the scale required, the materials to be used, the nature of subsoil and drainage, &c. To this cause we must assign, therefore, the different scales used by some, and especially the adoption of two-story buildings by many of the authors. It is to be regretted the Council did not make their views clear upon this and other points, as they would have saved an immense deal of thought and labour on the part of the competitors, who can now, with some justice, complain that certain conditions were not made known to them. Already we hear of much dissatisfaction on this score, and that the stipulated cost has been exceeded. We have published the mottoes of the two premiated designs, and it appears that the committee reduced the total number of plans to 29 in the first instance, and a further winnowing reduced the number to five for the final examination, and award of the Council. Last Friday week this duty was performed, with what result will be seen in the context; we fear, however, from what we have heard, the selection has not been so judicious or “above-board” as it might have been. We find that the committee selected five, in the following order:—“Fidelis,” “Serio,” “Ad Rem,” “Light and Air,” and “Economy.” After a long discussion this order, for doubtful reasons, was altered; “Ad Rem” was proposed by a member, and seconded by the Mayor, as the first in order of merit, and after a good deal of talk, “Serio” was placed next, though its merits, and those of “Light and Air,” “Through Ventilation,” “Fidelis,” and “Economy,” were warmly commended. The following are the list and names of the authors:—“Ad Rem” (1st premium), Mr. E. J. Shrewsbury, of Maidenhead; “Serio” (2nd premium), Mr. Ernest Turner, 44, Bedford-row, London; “Economy,” Mr. H. W. Beale, 21, Queen-street, W.; “Light and Air,” Mr. Joseph Brownlow, Liverpool; “Fidelis,” Messrs. Thicke and Pilleau, Great Queen-street, Westminster; “Thorough Ventilation,” Messrs. H. Cooper and Son, Maidenhead.

Let us here take the plans in this order, and examine them; and we may mention that the two-story buildings were eliminated in the final selection. “Ad Rem,” by Mr. Shrewsbury, has a parallelogram-shaped plan, with the wards at each end slightly advancing, a central entrance and longitudinal corridor giving access to the wards at ends; a kitchen on one side of entrance, and matron's bedroom on the other; while behind there are two end

convalescent wards, with adjacent w.c.'s, scullery, and bath room. The wards are 18ft. by 13ft., with three beds in each, besides the convalescent wards behind them, 13ft. by 9ft., for one bed each. We observe that there is only one end window to each ward, and consequently no cross ventilation; the beds are ranged along the side wall, and the author gives to each bed 78 square feet of floor, or 858 cubic feet; in the small, or special wards, 113 square feet are provided, or 1,243 cubic feet, though we are at a loss to know why the larger wards have less space given to the beds than the single-bed wards. For infectious wards, 1,000ft. or 1,200ft. cubic space is not too much per bed, though the author says in his description, that the dimensions are in accordance with Dr. Swete's opinion, and that the minimum standard is 800 cubic feet for country hospitals, and 72ft. floor space for each patient. The average given by the author, 954 cubic feet, includes both his large and small wards, and is, therefore, not a fair one. Another point we notice is that the w.c.'s are not close to the large wards, but near the smaller ones, and the corridor has to be crossed to reach them; there are no nurses' rooms near wards, no wash-house for foul linen, and the pantry, to our mind, so near a w.c. is not desirable. Earth closets are recommended very justly in these questionable positions, and mansard traps with air pipes. The vertical plan of ventilation is also shown, and the calorifer or Galton stove is suggested. In external design there is little to commend; there is an impoverished look about the Gothic and the small dormer over front kitchen is inadequate. The roof treatment and proposed means of extension are open to objection, both on the plea of ventilation and roofing. Stock bricks for the walling, with red dressings and tiled roof, are shown. The estimate is summed out at 7d. per foot, which, at 28,271ft., the total cubic capacity stated, equals £829 11s. A mortuary is shown as an adjunct at one end—this is certainly an excrescence. The design with motto, “Serio,” by Mr. Ernest Turner, of Bedford-row, while avoiding all the objections we entertain towards “Ad Rem,” exhibits a more satisfactory solution of the problem. The wards at end are more isolated, three parts of their enclosing walls are free; they are lighted, both at the ends and sides, between the beds. The earth closets and lavatories form adjuncts at the rear ends, with isolating lobbies, and sufficient space is given for four beds to each; nurses and assistants' rooms adjoin the wards, and have inspection windows, and the administrative department, containing a bath-room, kitchen, laundry, and cellar, is central, the latter apartments being thrown out behind. Matron's and nurses' stores are located also in a central position in front, with dormitories over for laundry woman. Two entrances, one on each side of centre, are shown, and the whole plan exhibits a careful study of the requirements necessary for pathological treatment. The author shows how 12 beds can be obtained either by front or back extension of wards, or 16 beds by both these means. A floor space of 100ft., or a cubic space of 1,290 feet per bed, is given, each ward being 22ft. by 18ft.—not too much, in our opinion, for infectious cases—while the windows have casements to fall inwards at the top, thereby deflecting the currents upwards, and preventing draughts—a plan which has been adopted in large hospitals with marked advantage. Vertical inlets or tubes for fresh-air admission and foul-air extraction, combined with ventilating stoves, are proposed. Earth closets in country hospitals with no drainage system are strongly to be preferred; these, we find, have been recommended, and the slops got rid of by a process of filtration through

agricultural pipes, laid just below the soil, in connection with a flush or precipitating tank. There is one omission, that of a convalescent ward, should such be found desirable. A disinfecting chest is recommended, and the foul linen can be taken from the wards by separate doors at the ends—a very desirable point. Externally we have a pleasing brick treatment, with gabled front. The author, in his description, calls attention to the gravel on the site, and suggests that cement concrete would be a very desirable material for the walls—a suggestion we think well worthy the attention of the Board, as no material would offer greater sanitary advantages than concrete. On the whole we consider “Serio” to be an economical plan. Its administration has been studied in reference to the requirements and saving of labour in a small hospital; the kitchen offices are concentrated, and not too far from wards, and the sanitary arrangements are more perfect than many others. “Through Ventilation,” by Messrs. H. Cooper & Son, is another clever plan, being a simple T-shaped arrangement; the administrative entrance block being the upright part of that letter, and the wards the horizontal cross part. But the leading point of the plan is the isolation of the two blocks by a wide passage or covered way, the matron or nurse being located at the end of the administrative block near the wards—rather too far, perhaps, from her work. The advantage of this passage of disconnection is that the foul linen can be taken direct out of wards, through passage, to the wash-house, which is at one end of the infectious block. Convalescent wards are provided between the main ones, the earth closets and bath-rooms are at the ends, and the arrangements are fairly complete. There is a verandah entrance at the north end of the administrative offices, a surgery on one side. The plan certainly indicates a knowledge of hospital requirements, and we must unhesitatingly give it a preference to the Council's choice. The elevation is of simple but common-sense character, the windows are plain, and there is some effect in the plain walling and channelled tiled roof of the blocks. We find hollow walls have been provided, which we think almost a necessity if brick is chosen as a material. We next come to “Economy,” by Mr. H. W. Beale, a very compact plan, with semi-detached wards at ends, having good cross ventilation, and central administrative offices which extend backwards. The wards are each 35ft. by 13ft. 6in., the beds being placed along one wall; they are entered from the centre lobby or entrance. We find the author has fitted the nurses' room with a cooking range, so as to answer the purpose of a kitchen. The w.c.'s are arranged at the angles between wards and central offices, and there is a large yard behind both the male and female wards. There is considerable compactness and economy in the arrangement, and the lengthwise disposition of the wards gives all the advantages of the pavilion system. “Light and Air” possesses some good points; a similar arrangement of wards to the latter has been adopted, but the offices want concentration. Mr. Brownlow, of Liverpool, is the author. “Fidelis,” by Messrs. Thicke and Pilleau, show wards for two beds each at ends, with single wards arranged between, the dimensions of each being 11ft. by 9ft., but the bed in corner is not desirable, and necessitates increased labour. There is a centre entrance, with kitchen behind; the communication between the offices and wards can hardly be pronounced economical, and the kitchen opposite entrance is scarcely desirable. The elevation is poor.

Let us now take some of the other designs. “Accomplish” shows the semi-

detached pavilion plan, with centre offices; the beds are ranged along one wall, with windows on each side, affording cross ventilation; the bath-rooms, lavatories, and w.c.'s are placed at extreme ends, and the kitchen and surgery in centre, behind the main cross corridor, are well located. The nurses' rooms, one on each side of centre entrance, with window overlooking ward, is a good feature, but we see no wash-house. "Choose well, your choice is brief yet endless," is the well-advised motto of a plan possessing some merit, but too costly. The wards are placed transversely with the front at ends, attached to the administrative part by corridors. Good cross ventilation is insured, and the type of arrangement is admirably suited for a large hospital of the class. The wash-house is detached; style is Gothic, and not worthy of the plan. "A. B. C." is a clever two-storied arrangement, the wards being placed side by side, the w.c.'s thrown out at the back as a projection in the centre, and with central stairs and communication. The drawback of this plan is that cross ventilation is not insured, though compactness is attained. The designs with motto "Health," by Mr. Galsworthy Davie, possess features that place them above the average architectural treatment, and if the plan had been less expensive, and its administration more simple, this design would have higher claims. The wards are planned on the separate principle—an excellent one for some cases, where separation is necessary. We see two wards made double-bedded rooms, and the others single. Of course the desirability of such a plan depends on the diseases likely to be treated as special cases. We like the octagon-ended wards of the one-story arrangement, and we prefer this to the alternative sent, showing two stories. The drawings are well got up and pleasingly tinted. An ingenious plan is that of "Pro Bono Publico." The wards end to end form a pavilion with a partially projecting nurses' room between, so that the nurse can have her eye upon the wards. Earth-closets, &c., are at the extreme ends; the beds are arranged two on each side. Perfectly isolated and at some distance is the office block, joined only by a covered way. For a small country hospital this isolation is hardly necessary, and is too costly in the administration. A space of 2,000 cubic feet is given to each patient. The elevations are commonplace, of the workhouse type. "Well Considered" is certainly a clever arrangement; the author puts his wards lengthwise, at the ends of each being a spacious verandah for convalescent patients, obtained between the angular buttress-like projections of the latrines. The offices are in the centre, and the nurses' rooms are well-placed to command the view of their respective wards at the angles, but the offices in rear are a long way from wards. The drawings are well studied, but embody a too costly scheme. "Vite" is another ingenious idea on the radiating principle, but poorly worked out. Under the motto "Westminster" is a two-story simple pavilion plan, showing semi-isolated wards placed lengthwise with bath-rooms, &c., at one end and attendants' room at the other, forming a slight projection J-shaped, and commanding the ward. The latter is fitted with range and boiler, and at the side is a staircase with matron's room behind. The arrangement has economy in its favour. A very thoughtful plan on the isolation principle is "Cross and Compasses" in circle. Its author has detached his wards, which form a simple parallelogram on plan from the kitchen and stores, but has well placed the matron and nurse between the wards, into which they have windows of inspection. The wards are 24ft. square, and the beds ranged two and two on opposite walls. A

covered way connects the kitchen offices. Design No. 2 shows the kitchen and matron's room in centre of the pavilion, with nurse and lavatories at ends. "Pour les Malades" has a well-conceived disposition on the pavilion plan, and entrance between the wards and offices, with special wards. The elevation is simple, and the plan economical. "Sanitas" shows detached blocks of cruciform arrangements, appropriated for men and women, the wards being placed endwise, with nurses and latrines arranged as projections. The nurses' and receiving rooms are well placed. "Efficiency and Economy" is an arrangement on the isolated plan, with three detached blocks, with the administrative building between the two wards. The expense of administration would be fatal to this plan. Mr. T. Ezard, of Camberwell, sends a compact scheme, but wanting in the convenient proximity of wards and offices. The author divides his accommodation into two bed-wards of two stories. Many other designs claim notice. "Romulus and Remus" is a costly long corridor arrangement, with indifferent elevation. "Light is Life" provides plenty of that element, but the plan necessitates costly administration; there are two stories over centre for matron; the elevation is too broken up. "Spes" is a clever side-by-side arrangement of wards, lacking cross-ventilation, with the administration at one end. There are two entrances, a convalescent room, and the elevation is neat and shown in a crude ink sketch. "Isolation" shows a complete but complex arrangement of administration; the wards are planned for two beds each, and there is no cross ventilation. "Red Cross," two large end wards and centre offices, the author detailing a mode of ventilation showing fresh-air inlets with foul-air pipes in ceiling, with dormer windows breaking into wards—an expensive treatment. Among other designs we may name "Santé," a two-storied, bright-coloured design, more like a villa; "Do as you would be done by;" "Hygeia," straggling plan, with picturesque exterior; "Square and Compasses," expensive single wards; "Chandos," an ill-studied plan, but with effective elevations, and possessing germs of success; "Veritas," more house than hospital like; "Try;" "Placetne," too like a semi-detached cottage; "Cornstalk," a plan of the conventional type; "Virgo," a right-angle arrangement, with end wards; "Nihil sine Labore," a radiate but costly plan; "Triangle in Circle," costly and scattered; "Fiat," "Nemo," "Endeavour," "Sick and ye visited Me," "Lycurgus," and "Hôtel Dieu."

From what we have said the plans fall into two general classes. We have the "isolation" and the semi-detached pavilion plan variously treated, and it is for the Council to determine which is most suitable to their wants. It may be considered as of primary importance that the staff should be small, and consist, at the utmost, of a matron (who would have a general control of the administration), a nurse or two (who would attend to the patients), and a general assistant or laundry-woman, who would also clean the wards. Sleeping accommodation would be required for the matron, nurses, and general servant. One of the obvious difficulties is to combine the sanitary wants of an isolated ward with the necessary administrative capabilities, to reduce the amount of labour to a minimum, and to bring the wards within easy reach of the nurses, the kitchen, and stores. Then the washing-room or laundry requires to be detached, or quite separated. It is evident that the isolation plan, while excellent in itself, does not admit of easy communication. On the other hand, the combined or semi-detached pavilion admits of all the advantages of the isolated system, with better and more economical administration.

From our comments it will be seen that we consider the committee have not selected the best design for execution; that "Serio" has higher claims, and that the committee might have included in their selection a few other designs possessing the requirement of an infectious hospital to a greater extent than the one accorded the highest honour. But, from what we have seen and heard, party interests run very high at Maider head, and despite some very excellent plans the Council have, it appears, made up their minds to sacrifice to personal motives their intelligence as a sanitary authority and the interest of the public. We understand that the letter accompanying the design awarded the second prize was not even opened at the last meeting. In this case we consider the Corporation should have been particularly anxious to avoid miscarriage of justice, as their premium were no bait, the requirements they published were inadequate, and competitor very justly thought that at least an honour decision would be their reward. We understand another meeting takes place this day (Friday).

REAL AND MANUFACTURED ORNAMENT.

THAT superfluity of ornament covers a multitude of defects may be accepted to be as trite a maxim as any dictum of the moralists. "Assume a virtue if you have it not," seems to be a modern precept of art among that large class of architects and artists who appeal to an impressionable public rather than to a cultured taste. There is a far too prevalent notion that art is merely skin-deep. It is a comfortable notion, exceedingly agreeable, and quite in unison with the commercial spirit. A house or a shop front, a piece of furniture or a book-cover commands, other things being equal, an appreciable increase of value in the market, if it have a little embellishment beyond its unadorned competitor. Speculative builders, furniture-makers, and manufacturers generally, find a little carving, colour, gilding, or embossing highly remunerative, and often that an inferior article pays better for the gilt. Utilitarian as the Englishman is, he is obliged to acknowledge the supremacy of that innate love of ornament that seems as keen a sense with the primitive savage as with civilised nations. Notwithstanding the fact, established by the philosopher, that in order of time decoration has preceded dress, and that the idea of adornment has predominated over that of use, we have yet in our advanced age to account for the continued power of the art that still administers as keen a pleasure to the civilised being of the present day as the tattooing with bright pigments does to the Orinoco Indian. It is only when we seek a little deeper that we discover the distinguishing test that separates the simple sense of children and savages from that of educated men. The ornamentist soon perceives the preference of the first for strong stimulants and bright colours, and of the latter for subdued tints, neutral colours, and avoidance of harsh contrasts. Watch the attention of the masses of our sightseers in street pageants and our picture galleries, and mark the admiration bestowed on brilliant costumes and tawdrily-coloured paintings. It is art instinct of a low type. Not so easy of discernment is the difference between the appreciation of bad and good architectural ornament. It is not a test of bright colour or strong contrast, but rather a discrimination between the kind and degree of ornament employed and a just or excessive use of it. It is a question of motive, quantity, as well as quality. The subordination of ornament to structure is a condition of its employment that is painfully disre-

rded. If we look at a piece of furniture say, a modern sideboard or pianoforte, we find in ordinary cases the carving either the wrong place or so diffused that we see entirely the meaning of the work. Its lines are so twisted and convoluted that we are forced to take cognisance of the ornament first, and afterwards of the use or purpose of the furniture. The evil has partly sprung from the use of manufactured and composition ornament, or the application of the "stuck-on" principle which has become so general in some classes of manufacture that the art workman uses it with as much complacency as the victualler adulterates food. Ornamentation may be broadly distinguished as structural, superficial, and poured ornament. The first belongs to the architect *par excellence* and its honesty and thoroughness are the first consideration. As Pugin remarked of architecture, there is a wide difference between decorative construction and constructed decoration. The latter is the system of the manufacturer of a meretricious art, the former that of the architect. It is necessary, also, to understand that there is a great difference between "ornamented" and "ornamental" construction. The former is the system which not long ago was seriously promulgated by a professor of art at the Architectural Association. It means simply this: To get an engineer to design a bridge or a structure of any sort, and then let the architect add ornament thereto in any way consistent with it. Now we believe this is a very common idea among some members of the profession. It is, at any rate, the idea most in favour with the manufacturing decorator. It is a facile, expeditious, and costless way of designing. It is the speculative builder's idea of architecture. Our American cousins carry this system to extremes. We lately had a thick folio sent us from a well-known Philadelphia firm under the ephemeristic title of a "Manual of Architectural Sheet Metal Work." Many of our readers will smile at the name, and will be curious to know its contents. Well, the work in short gave rules and tables to estimate and design every part of an architectural building from basement to roof—door and window dressings, cornices, pilasters, and every architectural ornament in sheet metal, manufactured to every conceivable style—by the K—Cornice and Ornament Co. Here the architect has at his hand a complete assortment of brackets, balconies, trusses, window architraves and cornices, mouldings, friezes, pediments, dormers, crown mouldings, crestings, &c., from which to pick and choose at his discretion. The book further gives him means and tables to estimate to a nicety every form and size of feature he may require, and supplies details, and a profusion of illustrated examples, to aid him. To give an example: An architect wants a main cornice; he selects a type, prepares an elevation and plan to scale, giving the heights and projections of the various members. Upon these the manufacturer identifies the different parts and ornaments, the brackets, modillions, and frieze pieces, and writes the names of the mouldings, numbering them for reference, the said numbers representing the profiles (stays as they are called in manufacturing parlance) kept in stock. Usually, however, the manufacturer supplies these drawings himself, and they are sent with a shipment of the goods. But there is another drawing prepared of a section of the cornice, and our readers will be interested to know that these cornices are supported by brackets or frames from the wall called "look-outs," and that the said section is, therefore, in American terminology, a "look-out section" or profile. In fact, a cornice of this sort bears considerable likeness to a wooden shop cornice

among ourselves. The look-outs or brackets are usually of wood, to which the galvanised iron mouldings are fixed, but large and fire-proof cornices are constructed upon bar-iron supports and braces, which give the general contour. The mouldings of sheet metal are attached by means of button-headed bolts, and modillions are attached by riveting. Anchors or ties passing through the wall, their ends bent down for a fastening, secure these metal supports and the centre cornice. Thus it is our Transatlantic brethren construct the ornamental features of many of their buildings, and thus it is the workman "puts up a cornice." Much is left to the discretion of the factory, and the forms and profiles are often varied to meet the mechanical requirements of the manufacturer. The architect often sends his elevations, or copies of them, to the factory, and the detail is entirely left to it. To select a few of the structures of recent erection of sheet metal work, we may name the New Court House, at Van Wert, Ohio (1875), entirely covered with metal ornament: in fact, we are informed the whole exterior finishing, from basement upwards, is of galvanised iron, with pressed zinc trimmings. Our readers will be amused to hear that these include string or belt courses, quoins at angles, window dressings, main cornices, balustrade, dormer windows, and mansard roofs. The walls are of pressed brick. We are told with amusing *naïveté* that the quoins are constructed "of cushion-pattern crimped iron, presenting a close appearance to cut stone," that the sheet-metal work is painted and sanded, and cannot be told from one of stone. We are further informed that the critic will find nothing lacking in stability, solidity, or durability, while the taxpayers of the country have an edifice of which they are justly proud. At Erie, Pennsylvania; Baltimore, New York, and many other towns the same species of ornament is used. We feel, however, that the sentiment above expressed will not be shared by our countrymen. We have here, at least, an instance of ornamented construction. At home we find numerous examples of this same kind of art—perhaps not so glaring and honestly-avowed, but still quite as pernicious. It is for architects to show the public the difference between good and false ornament, to show the dishonesty of cast cement and composition enrichments by contrast with well-conceived ornament. If we designed ornamentally—that is well, simply, and gracefully—we should soon give a tone to our work. The popular mind would immediately discern the difference between the real and counterfeit coin, much as it can now distinguish between gold and tinsel. Let it be once understood that all structural ornamentation is simply the correlative of building, or, in other words, the art of structural expression—that it really implies building in its right place in the same manner as we speak of good composition as writing with elegance, in which the rules of logic, syntax, and rhythm are observed, and we shall do much to dispel the false and popular notion that ornament is something added. It is this superfluous idea of ornament that has placed ornament in so low and false a position. Such a thing as manufactured ornament should be an impossibility. When we turn to the other kinds of ornament named—the superficial or surface, and the coloured—there is perhaps less evident connection between it and structure. We have no room here to lay down the limitations that should be imposed with regard to this species of ornamentation, though Ruskin's idea has always impressed us as embodying the correct principle—namely, that where the eye can rest there we may decorate. It would be almost supererogation to say that the violation of this principle is the general

cause of failure. Look at the speculative builder's gimerack embellishments; see where he places his carving, and incises his ornament, not on plain wall surfaces above the level of the eye, but on his window lintels, and round his arches—everywhere, in fact, but the right place. Paraphrasing a well-known motto, we may define true ornament to be form in its right place, while manufactured ornament is decoration out of place.

MECHANICS OF ROOFING.

IN the construction of roofs a great variety of mechanical problems have to be solved, the peculiarities of which depend on the particular arrangement of the several parts forming the truss. In all these problems it is essential to consider carefully how the pressures act at different points, and also the kind of force which each part will be required to resist. When these have been determined, their solution becomes an easy matter to any one who is familiar with the elementary mechanical principle known as the "triangle of forces." The following simple form of roof, which is a common one in practice, affords a good illustration of the application of this principle.

A sloping rafter, A B V, of a roof, whose vertex is at V, rests upon a wall at A, and on an intermediate support at B, being uniformly loaded throughout its length. It is required to find the relations between the several forces called into action.

In this case we shall consider that we have two distinct problems to solve, since we may treat the two portions, A B and B V, as separate structures, by supposing that the rafter is not continuous, but is divided into two parts at B, each of which rests on the top of the support at B.

In the first problem, which relates to the part B V only, we have the load, L, acting at M, the middle point; the re-action, T, at V, which acts horizontally, whether pressing against a wall or against a corresponding rafter on the opposite side of V; and for the third force the re-action at B, which must be in the direction of B N, meeting the directions of T and L, in the point, N; for when three forces are in equilibrium with each other, they must all meet in one point, by the principle of the "triangle of forces;" and they must also be proportional in effect to the sides of a triangle, which are parallel respectively to their several directions. If, then, we take N K to represent the load, L, we shall have B K representing the horizontal thrust, T at B, or the reaction at V, and B N the magnitude and direction of the reaction and pressure at B. The whole of the load, L, represented by K N, will act vertically on the support, B, but in consequence of the slope of the rafter, a horizontal thrust, T, is introduced at B, and the force, B N or S, will represent the resultant of T and L. If, then, a strut, B X (as in a curb-roof), is fixed at B, in the direction of the resultant, N B, produced, it will take all the load and thrust of the part of the roof from B to V, and there will be no pressure whatever on the upright support, B I. The force, S, will then be the compression down the strut, B X. The relative proportions of the forces, S and T, to the load, L, can thus be determined by drawing a simple geometrical figure; and also the exact direction in which the strut, B X, should be placed will be found at the same time. If θ is the angle of inclination, M B K of the rafter to the horizontal, and α that of S or B N to the vertical, we can calculate accurately by trigonometry the relations between θ , α , T, S, and L. For we have:—

$$\frac{L}{T} = \frac{K N}{K B} = \cot. \alpha = \frac{2 K M}{K B} = 2 \tan. \theta,$$

from which we obtain—

$$\tan. a = \frac{T}{L} = \frac{\cot. \theta}{2}, T = L \tan. a = \frac{L}{2 \tan. \theta}$$

$$\frac{S}{L} = \frac{1}{\cos. a} = \sec. a = \sqrt{1 + \tan. a^2}$$

$$= \frac{\sqrt{4 + \cot. \theta^2}}{2} = \frac{\sqrt{4 \tan. \theta^2 + 1}}{2 \tan. \theta};$$

$$\therefore \frac{S}{T} = \sqrt{4 \tan. \theta^2 + 1}.$$

From these relations we can form a table of the corresponding values of a, T and S for any given angle, θ , and given load, L. If we put L = 1, then the figures in the fourth and fifth columns of Table I. will represent the proportionate values of T and S.

TABLE I.

θ°	tan.	a°	T : L	S : L	S : T
14°	.25	63½	2.00	2.24	1.12
18½	.33	56°	1.50	1.80	1.20
26½	.50	45°	1.00	1.40	1.4
30½	.58	45	.87	1.30	1.5
37	.75	33½	.67	1.20	1.8
45	1.00	26½	.50	1.12	2.2
51	1.25	22°	.40	1.08	2.7
56	1.50	18½	.33	1.05	3.2
60	1.75	16	.29	1.04	3.6
63½	2.00	14	.25	1.03	4.1

From the above table we see that when K M is ¼ B K, or θ is 14°, the horizontal thrust, T, is equal to twice the load, L, upon the rafter. And when K M equals K B, or θ is 45°, the horizontal thrust is one-half of the load.

The second problem relates to the load on the beam, A B, which rests upon the two supports, A and B. In this case, the reaction, R, at B, must be perpendicular to the rafter, A B, since it rests on the top of the support at B. We have, then, as before, the load, W, acting vertically at C, the middle of the rafter; the reaction, R, acting at B, in the direction B D, at right angles to B A; and for the third force the reaction, R' at A, which must meet the other two forces in one point, D, in order that they may be in equilibrium. The line, A D, is, therefore, the direction of the reaction of the wall at A, and also of the thrust upon the wall at that point. Drawing C E parallel to B D, we have a triangle, C E D, whose sides are severally parallel to the three forces, R, R', and W, and, therefore (by the "triangle of forces"), these forces must be proportional to the sides of the triangle respectively. Taking C D to represent, on any scale, the given load, W, we can at once ascertain the relative values of R and R', by measuring the lengths of C E and D E on the same scale. The horizontal line, E F, will also represent the magnitude of the horizontal thrust at B and Attending to push out the two supports in opposite directions. If a strut, A Z, is placed at A in the direction of D A produced, it will take all the thrust, R', acting upon the support, A. The point, F, divides the line, C D, into two parts, C F and D F, which will represent the vertical pressures, Q and P, upon the supports at B and A. It is evident, from the geometry of the problem, that C F and D F can never be equal, except when A B is horizontal, and their difference increases with the increase of the angle of inclination of A B to the horizontal. The statement made by some writers that the pressure on the two supports is the same as in a horizontal beam, is, therefore, incorrect, and liable to lead into serious error when the angle of inclination is considerable.

As in the first problem, the relations between the angles and forces can be calculated by trigonometrical analysis. The angle, B D C, is equal to the angle, B A I,

or θ ; and the angle, E C D, is also equal to θ , since C E is parallel to B D. Let the angle, A D C, or Z A P, which the direction of R' makes with the vertical, be called ϕ ; then the angle, A D B, is $\phi + \theta$, and the angle, C E D, is $180^\circ - (\phi + \theta)$. Let P be the vertical pressure at A, Q the vertical pressure at B. We have then

$$\tan. (\phi + \theta) = \frac{A B}{B D} = \frac{2 B C}{B D} = 2 \tan. \theta,$$

from which we get—

$$\tan. \phi = \frac{\tan. \theta}{1 + 2 \tan. \theta^2}$$

And since the sides of a triangle are proportional to the sines of the opposite angles, we have—

$$\frac{R}{R'} = \frac{E C}{E D} = \frac{\sin. \phi}{\sin. \theta}, \frac{R'}{W} = \frac{E D}{D C} = \frac{\sin. \theta}{\sin. (\phi + \theta)}$$

$$\frac{R}{W} = \frac{E C}{D C} = \frac{\sin. \phi}{\sin. (\phi + \theta)};$$

$$\therefore R' = W \frac{\sin. \theta}{\sin. (\phi + \theta)}$$

$$\text{and } R = W \frac{\sin. \phi}{\sin. (\phi + \theta)}$$

Let H be the horizontal thrust at A and B, represented by the line E F; then

$$E F = H = R. \sin. \theta = R'. \sin. \phi$$

$$= W \frac{\sin. \theta \cdot \sin. \phi}{\sin. (\phi + \theta)} = \frac{W}{4} \sin. 2 \theta.$$

Also, since P and Q are represented by the lines D F and C F, we have—

$$P = D F = R'. \cos. \phi = W \frac{\sin. \theta \cdot \cos. \phi}{\sin. (\phi + \theta)},$$

$$Q = C F = R. \cos. \theta = W \frac{\cos. \theta \cdot \sin. \phi}{\sin. (\phi + \theta)};$$

$$\therefore \frac{P}{Q} = \frac{\sin. \theta \cdot \cos. \phi}{\cos. \theta \cdot \sin. \phi} = \frac{\tan. \theta}{\tan. \phi} = 1 + 2 \tan. \theta^2.$$

Also, $P + Q = W.$

By means of these formulæ we can ascertain the relations existing between all the forces and the angles for any given values of θ and W. Table II. shows the relative values of P, Q, and W, and the inclination (ϕ) of the thrust R' at A, which have been calculated for several values of θ . For the benefit of those of our readers who are not familiar with trigonometrical symbols, we may remark that by "tan. θ " is meant the ratio of B I to A I, or of B C to D B, or of E F to F C.

TABLE II.

θ°	tan. θ	ϕ°	P : Q	P : W	Q : W	H : W
14°	.25	12½	9 : 8	9 : 17	8 : 17	.12
18½	.33	15°	11 : 9	11 : 20	9 : 20	.15
26½	.50	18½	3 : 2	3 : 5	2 : 5	.20
30½	.58	19°	5 : 3	5 : 8	3 : 8	.22
37	.75	19	17 : 8	17 : 25	8 : 25	.24
45	1.00	18½	3 : 1	3 : 4	1 : 4	.25
51	1.25	17	4 : 1	4 : 5	1 : 5	.244
56	1.50	15½	11 : 2	11 : 13	2 : 13	.23
60	1.75	14	7 : 1	7 : 8	1 : 8	.22
63½	2.00	12½	9 : 1	9 : 10	1 : 10	.20

From this table it will be seen that when B I is half A I, or the angle θ is 26½°, the vertical pressure on A is half as much again as that on B; and when B I equals A I, or the angle θ is 45°, the vertical pressure on A is three times that on B; and for $\theta = 60^\circ$, P is seven times as great as Q. In fact, the pressure on A increases with the angle of inclination until the rafter becomes vertical, or $\theta = 90^\circ$, when it is evident that the whole weight is carried by the support at A. On the other hand, the difference between P and Q decreases as θ gets smaller and smaller, until they are equal, when θ vanishes, or the beam, A B, is level.

Combining the results of the two problems we find that the total vertical pressure on the support at B is Q + L; while the total horizontal thrust at B is the difference between T and H. If T is greater than H then there will be a horizontal thrust equal to T - H conveyed down the rafter, B A, and to be added to the horizontal thrust, H, already acting at A; consequently the total horizontal thrust at A will be H + T - H, or T; and the direction of the reaction at A will then be that of the resultant of the vertical force, P, and the horizontal force, T, the lines representing the two forces being of course measured upon the same scale of parts.

THE NATIONAL ART AND INDIVIDUALITY OF IRELAND — MR. GLADSTONE'S VISIT.

TWO not a little remarkable "expressions of opinion," by very eminent men, have but just been given to the world, and as they both of them involve the most important and vital of art principles, we cannot but think that the readers of this journal may feel interest in them, and, maybe, in a passing comment on them. We allude to Mr. Gladstone's pleasant talk about Ireland, and the "impressions" the things and doings there, artistic and otherwise, have made on him, even, as he says, beyond his expectations. The other is a more distant matter, certainly, but not the less important—that of the *résumé* of the impressions produced on Professor Monier Williams by a second tour he has made in Southern India. To our mind, these subjects, and such as these, have, and always have had, a peculiar interest, not alone for their strangeness and uniqueness, and from the fact of our knowing so very little indeed about them, but from the still more weighty fact of their being the artistic expression—for we confine ourselves here to art matters, though it be a little difficult to avoid wandering into bye-ways sometimes—of the national art-feeling of those by whom the special art and architecture have been produced. In the past, if not in the present, there can be no doubt that the individuality of thought and method of work of the Irishman and the Hindoo accomplished things distinct from all else, and worthy of attentive study, as quite separated and distinct expressions.

And first, then, of Mr. Gladstone's "impressions" of Ireland and Irish individuality. If India be somewhat too remote and out of the way to excite much, if any, of what may be termed homely interest and British sympathy, this cannot be said of Ireland. Ireland and England are as close to one another as two separate things can well be, and it is the fact of the individuality of Ireland—though so near—which seems to have made so strong an impression on Mr. Gladstone, and which makes his visit to it remarkable, and of note beyond the mere novelty of it and the excitement of the passing moment. Not quite so much note of this visit to Ireland, and the seeing it for himself, by the late Prime Minister, has been made as, perhaps, might have been

expected, for he has evidently seen what he never saw before, and never expected to see, or to have any experience of. What is this? That the things of Ireland and the art of Ireland are different from what they are here, and that they admit, as he says, of improvement—but improvement in an Irish way, and not in ours. In short, that Ireland is an individuality in the world. More no man can possibly say. It is, he says, impossible to speak on Ireland without some reference to its own history, both in the past, the present, and the future. "The beauties of Irish scenery are such, and the interest to be found in Irish antiquities are so profound and comprehensive, that I must say they entirely surpass my expectation." These are Mr. Gladstone's express words, and are, as it seems to us, full of emphasis.

It is really wonderful to note how little, considering the nearness of Ireland to ourselves, we know of it. Of Irish fine art or architecture how little, when going into details, we can be said to know, and how impossible, indeed, it would be, without the going to see it each one for himself, as Mr. Gladstone has done, the work *in situ* as it is! Of the Irish Gothic in out-of-the-way places, and unrestored, we know absolutely nothing. More is actually known here of the "stone age" era in Ireland than of the works of whatever date of her native Gothic architects. What we do know a something about is, of those buildings in the principal towns which have been restored and more or less adapted to the special wants of the day, and which are, indeed, English additions—or at least imitated from forms to be found here. Mr. Gladstone was struck with the beauties of Irish landscape scenery—not to compare it with landscape to be found here, and thus through it to see Irish nature—and with Ireland's antiquities and indigenous architecture, and could not but see in them a something different and quite distinct from what is to be found on English ground. It is to this distinctive art, architecture, and antiquities that we would call attention, for their own sake, and on account of their own special and national merits and individualities, and from the fact of their having made the impression they did on Mr. Gladstone's mind as Irish work *per se*.

It is very difficult, if not impossible, to put clearly and distinctly before the mind's eye of any one who does not actually see it, the precise character of an art-work, be it what it may—a picture, a statue, or a building; still less may be the details of one; and it is in the details that the Irish architects of past days at least accomplished so much that makes their work alike admirable and peculiar to themselves. It is to be seen conspicuously in the Round Towers, though the way in which they are built, as far as the walling is concerned, is at times of the roughest. Sharpness of outline, accurate balance of the different parts, fineness of drawing in the mouldings, where they exist, and a fine discrimination and keenness of eye, go to make up the perfection of the whole work, whatever it may be, insignificant as some may think it who have not studied such work with due and sufficient care. It is this which has given to the Greek work itself its all but incomparable place in art and architecture, and which has, though in many cases unconsciously, found to be the all-attractive element in it. It is the final triumph of art-skill—the artist-architect can go no further, and it is, though but nowadays all but unthought of, that supreme quantity in architecture which raises it and its production to the rank and level of sculpture and painting.

We might note here some of the antiquarian specialities of Ireland—objects not to be found elsewhere, and, even if found in other localities, in far distant ones.

There is the mysterious monument at New Grange which finds a counterpart in distant Mycenæ of antique days, and which would seem to connect the two countries together in some way or other—the old sea voyagers going farther and doing more than we, perhaps, now give them credit for. Was this the work of the native Irish of that distant day, or was it not? Equally mysterious either way. Then, again, there are the "raths" abounding, as it would seem, all over this Ireland—low circular mounds, with bushes and ditches, and thought to be of religious purport by some, and by others for living and building on and places of sepulchre. In all probability for all these purposes, for the Irish people are now, and have always been, a singularly religious people, full of pathos and intensity of feeling, and so constantly needing some outward form by which to express it. A remarkable race of men and women, and well able to improve themselves for themselves, and by themselves, if but left free to do so—right capable, as we think, of developing a style of architecture, and that of their own, and one peculiar to themselves. This, indeed, is the gist of Mr. Gladstone's speeches, and the expression of this opinion, fair and true as it is, has been drawn from him by the facts which he could not help seeing. More, much more, might here be said, for the subject is new.

And if it be true that we know so little of the art-specialities of a place so near as Ireland, how very much less can we be said to know of so distant a place as India, and one so entirely foreign to us in all possible ways? If any doubt this they have but to read with some attention the instructive letter, published at length in the *Times*, of Professor Monier Williams, on the state of Southern India. And here again it is that we are not a little tempted to wander beyond our proper work, that of art and architecture, for they both of them are not a little influenced by the "conditions" round and about them. They for the most part follow, but do not create, ideas. If Ireland be a distinct individuality, then certainly is India so. Professor Williams looks at the things about him in India with English eyes, fully as much so as Mr. Gladstone does at Ireland, but the wonderful and powerful individuality of the country he is in, and is writing about, is too much for him, and in spite of himself almost he has come to the conclusion that to really "improve" India such improvement must needs be in the native way, and through and by native agencies—*i.e.*, the Hindoos must do their work in their own way! But here, again, the thought strikes us how little do we know about the art and architecture of India out of the well-known and beaten paths? What are the special ideas which give birth to the Hindoo architecture, to the temple arrangements, and even to the minor forms and details? Are these now copies—mere copies—as our modern Gothic here is, of pre-existing forms, or are they quite new, and of to-day, and how far and in what way is the actual executive workman the author of the work he executes? Does he work unconsciously from drawings? We may well ask such questions, for nowhere in the world is the power of the executive work more conspicuously evident than in Hindoo work. Many things so hard and impossible of solution might here find explanation. In some elaborate photographs we have lately seen of Hindoo structures all looks more like magic and dreaming than reality—more like a realisation of a page out of the "Arabian Nights," more so even than any actual work of architectural "imaginings" by the Arabs themselves. We note these things to show how capable the "poor Hindoo" is of improving himself, and how there is in his mind faculties yet at work and active which

are capable maybe, and this is noteworthy, of anything in art and architecture, provided only that it is all his own, and from himself. We have thus thought that beyond the passing moment there might be some interest in these remarkable admissions by men so eminent. Ireland is but a small place, and but a part of a mighty empire, but it is quite distinct in its individualism, and serves to show, if it does no more, that there is in all nationalities a power of ever-present action and growth, but to be worth anything it must be their own. C. B. A.

ROADS AND STREETS.*

MR. D. K. CLARK has revised and condensed Mr. Henry Law's old work on the art of constructing common roads, and has added a second part by himself on recent practice in the construction of roads and streets, together with an historical sketch of the subject of road-making. The newly-added portions of the book will probably be the most valuable to the majority of its readers, but Mr. Clark's work in condensing and revising the older part is by no means wasted. Law's Treatise was undoubtedly the best of its kind when published, and Mr. D. K. Clark's additions have made it a book which every borough surveyor and engineer must possess, and which will be of considerable service to architects, builders, and property-owners generally.

Mr. Clark's description of the common roads, as they existed in England during the earlier years of the present century is instructive. At that time the common convex road was most prevalent, and the consequence of the false principles on which it was constructed, and of the want of proper repairs are well illustrated in several diagrams, which may probably appear exaggerated, except to those who are unfortunate enough to live in districts where such primitive roads are not yet altogether things of the past. Macadam and Telford were foremost in England in the work of road reconstruction. Their principles are too well known to require repetition. Mr. Clark reminds us that whilst Macadam deserves well as the pioneer of good roads, it may be observed that he had been to some extent anticipated in his system by Mr. Edgeworth, an Irish proprietor, who had previously advocated a similar plan. Mr. Edgeworth also recommended that the interstices should be filled up with small gravel or sharp sand, a practice which, though it was condemned by Macadam, is now adopted by the best surveyors. In his short review of the history of London pavements, Mr. Clark tells us that the first Act for paving and improving the metropolis was passed in 1532, when the streets were described as "very foul, and full of pits and sloughs, so as to be mighty perilous and noxious as well for all the King's subjects on horseback as on foot with carriages (litters)." Before the introduction of the turnpike-road system the streets of London and other large towns were paved with rounded boulders, or large irregular pebbles, imported from the sea-shore. These usually stood from 6in. to 9in. in depth in the carriage-way, and about three inches deep in the footpaths. The comforts and conveniences of such a pavement may be estimated by those unfortunate enough to have to travel over some of the cobble pavements in country towns, and for which a generation back Birmingham in particular was famous. The boulders were succeeded by pavements of irregularly-shaped blocks of stone, which did not fit well together, and which from this cause and their wide joints soon became uneven, and presented a sur-

* The Construction of Roads and Streets, By HENRY LAW, C.E. Revised and added to by D. K. CLARK, C.E. London: Crosby Lockwood and Co.

face alternating in muddy hollows and isolated stone blocks. Telford's system, introduced about fifty years ago, formed the basis of our present method, although smaller cubes of stone than he used have, for several reasons, become more generally used; Macadam's system was introduced in some of the streets where the traffic was light, but it was found unequal to the granite. Wood pavements seem to have been first used in Russia, where they appear to have been known for some hundreds of years. Hexagonal blocks of fir seem to have been adopted by preference, grouted with a boiling mixture of pitch and tar. Wood was also extensively used in Norway, Sweden, Denmark, and Ireland. In the United States and in this country wood has been tried in various ways. In England Mr. David Stead was the first constructor of wood pavements. His system, which was patented in 1838, consisted in the use of hexagonal blocks of Scotch fir or Norway pine, from 6in. to 8in. across and from 3½in. to 6in. deep, laid on a foundation of beaten gravel or concrete. He also tried experimentally pavements of round blocks of wood—sections of trees—placed vertically, the interspaces being filled with sifted gravel or sharp sand. His system was tried on the Old Bailey in 1829, but it did not answer. Various other systems were tried in succeeding years, one of the earliest and best being Mr. Carey's. Asphalte was first introduced from France in 1836, and has since been used with the best results for footpaths and open spaces, when some good variety (such as Claridge's) was selected, but with results more or less bad for carriage-ways.

Commencing with the construction of new roads, the reader is first instructed in the subject of exploration for roads. Of course, in laying out a road in an old country in which the position of the towns or industrial centres requiring means of intercommunication is already determined, there is little liberty for selecting the line to be taken; but in a new country, where the only object is to establish the easiest and best road between two distant stations, the physical character of the country constitutes the basis for the selection of the route. Hence the importance of a close acquaintance with the geography of the district, and of obtaining, if possible, a contour map thereof. Directions for making sectional plans of roads are given, and determining levels, and much useful information on earthwork, drainage, excavation, &c. The third chapter, which treats on the resistance to traction on common roads, is a good one, and so are those which follow it on road sections and repairing and improving roads. In the chapter on the foundation and superstructure of roads Mr. Clark adds a valuable note of some evidence given in 1819 by Mr. Walker, before the Select Committee on the Highways of the Kingdom. Speaking of the advantage of filling up or grouting the joints of granite pavement with lime water, which finds its way into the gravel under and beneath the stones, and forms the whole into a concrete mass, that gentleman suggested the use for the same purpose of a mixture of a little of the borings or clippings of iron, or small scraps of hoop iron, with the gravel used in filling up the joints of the paving. The water, he said, would very soon create an oxide of iron, and form the gravel into a species of rock. He instanced a piece of hoop which he had himself taken from under water, to which the gravel had so connected itself to four or five inches around the hoop, so as not to be separated without a blow from a hammer. Cast-iron pipes which are laid in moist gravel soon exhibit the same tendency.

Mr. Clark commences the second part of the book, which is more properly his own

work, with a description of the materials employed in the construction of roads and streets, and then gives a number of details connected with the construction of modern Macadam roads, omitted by Mr. Law. He then proceeds to consider the important question of wear and cost of such roads, and adds some particulars of their construction as practised in France. Passing on to stone pavements, Mr. Clark is naturally indebted, as we ourselves have been year after year, to the valuable reports of Mr. Haywood, the City Surveyor, for details and statistics; but Mr. Clark has, of course, been able to do more with these reports than we could, dealing with them as a whole, and not in part, and the information thus gained adds materially to the value of the book. The same is to be said with regard to asphalt and wood pavements. The extracts from the late Sir John Burgoyne's paper on rolling new-made roads, and from Mr. Paget's admirable report on the subject, made by order of the Metropolitan Board of Works in 1870, form, with other matter, an appendix which is likely to be very useful. Altogether the book is good, alike in its absence of all matter which does not really belong to the subject, and in the wise selection Mr. Clark has made of new sources of information.

THE MANUFACTURE OF MARBLEISED SLATE MANTELS IN AMERICA.

THE manufacture and use of marbleised slate for many purposes—the most important of which is for mantel-pieces—has reached a magnitude in America of as great an extent as in this country, and some particulars thereof will be acceptable. They are furnished by the *Polytechnic Review*. The material chosen for ornamentation, in imitation of fancy marbles, is slate, which has the advantage of low cost, ease of sawing and working, and fine grain. The slate used at these works comes from Vermont by vessel, and is landed on the wharf of the works. It is in slabs, about an inch thick, roughed to the sizes and shapes most used. The outlines are cut with a band saw. Marble is inferior for "marbleising," because of its cost and its coarser grain; the grain of slate running in planes parallel with the flat surfaces, while marble is open and porous, and requires more coats of pigment. Rubbing and smoothing are performed on a horizontal east-iron wheel, about 10ft. in diameter, running about 57 revolutions per minute. For marble, coarse grit-sand is used; for slate, a very fine grit. After smoothing, any channels that are to be made are cut with a rotary diamond cutter, the bit being hollow and rotating about 5,000 times per minute; a stream of water passing through it preventing injury to the diamonds. The channel in a "half front" is cut in about three minutes; by hand it would take one man an hour. The arm carrying the bit is heavily weighted, to ease the operator and cause greater steadiness of cut. Channels having acute angles or sunken bevells must be cut by hand, as must some irregular designs. The inner curve of the front is worked to a true line if a fireboard is to be set in, otherwise the frame of the heater will cover any trifling irregularity. The slab being worked to the required outline and surface, is now ready for marbleising. The "ground" is mineral colour, ground in copal varnish, because this is a quick dryer. The ground is generally black or brown. When dry it is ready for the veining or pattern. Upon the surface of a tank of water various colours mixed in oil are spread in peculiar characteristic patterns, these varying according as the colour is ground, dropped, or sprinkled on, and stirred, fanned, or otherwise mingled and interangled. The colours do not blend. A slab being dipped edgewise in the water is brought up so that the variegated film adheres to its surface, making the "marble pattern." The marbled slabs are put in a steam kiln and kept at from 185° to 210° F. for twelve hours, baking the colours thoroughly. They are next coated with copal varnish, and again kiln-dried; then rubbed down with pumice-stone powder, again varnished

and dried, and then rubbed with the finest polishing powder, and then with the hand; when they have a high rich lustric, and are ready to be shipped or to be put together by clamps, &c., in place. There are about nine "standard" marbles, which are imitated; about six or seven occasionally selected, and about six or eight odd patterns very rarely called for. "Tennessee" marble is the hardest to imitate, and Sienna the next. These are not done by dipping, as they are not "veined" patterns, but are produced by handwork somewhat as follows:—To imitate "Tennessee" the slab is ground in a reddish-brown colour mixed in copal varnish; this colour is dry in half an hour, and is then spotted with the same colour, made lighter with white or darker with burnt umber until it is covered with spots, which sink into the ground colour and present a somewhat blurred appearance. When this is perfectly dry (which will be next day), take white paint mixed in water, and coat the slab with it, take a sponge and soak up some of the paint, the balance will be in small white spots as in the natural marble. The blurred appearance underneath will look like various stones thrown and mixed together. To imitate "Red Pyrenese" the slab is ground in varnish and colour, as for dipping, but instead of oil colours water colours are used. For one peculiar pattern, the slab is (after black ground) coated with brown water colour, which is next partly removed, by touching with a handful of thin muslin strips. These absorb the colour, and leave bare places of peculiar outline. White colour is then dripped on with a sponge, and runs on the cleaned places only; giving a pattern which could not be obtained by dipping, or in any other way. The use of water-colours gives a peculiar pearly or transparent effect, needed in the imitation of conglomerate stones, and by it Mr. Williams hopes to imitate even the now inimitable Mexican onyx, which excited so much attention at the Centennial.

Where there are "panels" to represent various marbles on one slab, they are separated by cut lines, which are either filled with gold size, or otherwise used to act as boundaries. The veining of one stone should not appear continuous in an adjacent panel representing another kind of stone; this is a common fault, and is in part remedied by leaving a wide unveined band or channel between the panels. Where there is a small veined panel, or a series of such, on a plain black ground, the panels are first coloured by dipping or hand work, and the surrounding surface is coloured with a brush. If the general surface is veined, the panels are first made, and then covered with paper, the whole slab is then dipped, and the panels are protected by the paper. An expert "dipper" will prepare the films and dip 400 square feet of slate (about 150 slabs) in five hours.

THE LATE CAPTAIN DRAKE, J.P., OF BREAKSPEAR'S HALL.

THE death of this gentleman may fairly claim a record somewhat more ample than the short shrift of a mere obituary notice. He died possessed of one of the most extensive and valuable building estates in the suburbs of London—the Wickham Park estate, in Deptford, situated in the parish of St. Paul's, and principally in the districts of New Cross and Brockley. His ancestry and his residence are historically notable—the one including Prior Wykeham, of Wykeham, and the renowned Sir Francis Drake; the other Breakspear's Hall, Harefield, Uxbridge, Middlesex, the residence in a bygone age of Nicholas Breakspear, who was the only Englishman that ever reached the dignity—which he did as Adrian IV.—of the Papal throne and tiara, to which he rose from an humble condition, and despite of influential and virulent opposition to his advancement. Adrian acquired celebrity from the successes of his missionary labours when legate to Denmark and Norway. He was honoured by the young King Henry II. of England, whom by a bull, circa 1154, he made Master of Ireland. At Sutrium the stirrup of Adrian IV. was held by Frederick I., Emperor of Germany. If tradition is to be relied on, Pope Adrian, if infallible, was not invulnerable, the record

stating that his five years' pontificate was summarily ended by a blue-bottle fly getting into his throat while he yawned, and choking him. Breakspear's Hall, the residence in the 12th century of Nicholas Breakspear, afterwards Pope, and latterly of Captain William Wickham Drake, is a fine old mansion, built upon an eminence in a prettily wooded, pleasantly undulating district in the parish of Harefield, Middlesex. Within and without the mansion exhibits many interesting and antique objects and relics.

The late Captain Drake left the public service many years ago to take the oversight of the extensive properties—the Harefield and the Wickham Park estates—to which he fell heir on the death of his father. At that time, a little more than thirty years ago, the Wickham Park estate consisted almost entirely of market garden and meadow ground; there are now on the property in Breakspear, Manor, Wickham, Cranfield, Harefield, and Brockley Roads, Wickham-terrace, and other places, more than 1,000 dwellings and mansions, including detached and semi-detached villas, containing from 15 to 20 rooms each, and letting at rentals of from £50 to £180 per annum. Many of the houses most recently erected are, in their accommodation and in their internal and external proportions and decorations, of a very superior class, and great improvements upon the earlier buildings on the estate. It was laid out almost entirely by the late Mr. J. T. Jenkins, Captain Drake's efficient agent and surveyor, and, it may be added, judicious adviser. Mr. Jenkins is fitly succeeded in the important and responsible post he held by his son, Mr. J. J. Jenkins. The estate extends from Lewisham High-road for about a mile southwards. It also includes the whole of the houses in Florence-road, Mornington-road, Stanley-street, and other parts of Deptford.

An idea of the extent of the property may be formed from the fact that there have been built upon it St. Peter's parish church, St. David's Congregational church, a large Baptist church in Brockley-road, a Wesleyan church in the same road, Zion Chapel (Baptist), New Cross-road; in progress at the present time are a Presbyterian church and a London School Board school. The places of worship referred to, with their adjuncts, in spacious lecture, school, class, and waiting rooms, en suite, are in style and accommodation as remarkable evidences of progress during the last thirty years as those given in the character of the private residences built on the estate, as just referred to. The names of many of the roads and streets, &c., on the estate are memorials of the Drake family and properties, such as Breakspear, Wickham, Harefield, &c. Captain Drake died quite suddenly and unexpectedly on the 18th ult., at Breakspear's Hall, from a fit that followed his morning bath. His illness lasted for only a few hours. He was in his 68th year. His widow, there being no issue, will have a life interest in the estates.

ILLICIT COMMISSIONS.

ALMOST threadbare as this subject has become, it has too serious an influence to be let alone. Though not alarmists ourselves, we must be convinced, even from the correspondence in our own paper, how widespread the evil of taking secret commissions or bribes has become. No trade, agency, or profession appears exempt from its contaminating influence upon a certain class, whose only idea of moral rectitude is the conventional one of getting on well in the world and paying one's way. A reprint under the heading of "Illicit Commissions, Mercantile and Professional," from the *Westminster Review* of July last, is before us, in which the writer sums up the substance of the numerous articles and correspondence that have appeared on the subject. We cannot resist quoting the author's concluding remarks on the subject:—"Now, we are firmly convinced that the evil of these secret commissions, if not quite so far advanced as that of adulteration, has become so widespread and inveterate that nothing short of arming society with a similar remedy will avail to check it. Those who see its injurious tendency are too often powerless to make head against it. We have noted that the better

class of insurance offices find themselves unable to check or abandon a practice which competition compels them to adopt." The writer quotes Lord Chief Justice Cockburn's remarks, which admirably lay down the extent of the illegal bribe. These are his words: "The profits acquired by the servant or agent in the course of, or in connection with, his service or agency belong to the master or principal; that the profits directly or indirectly made in the course of, or in connection with, his employment by a servant or agent, without the sanction of the master or principal, belong absolutely to the principal." It is here seen that an indirect profit, a trafficking on an employer's name or business, is as much a species of dishonesty as a bribe offered or accepted. Many will be startled at this, but we cannot ourselves see the slightest difference in the two transactions—both are dishonest and surreptitious, and have been regarded so by the Court of Equity. It is clear that every kind of secret business or commission is recoverable by law, though it is also a fact that the remedy as it at present exists is not an easy or sure process by civil proceedings, and rather defeats the object to be desired—namely, the punishment of or the social stigma on the bribe-taker. What is required is a criminal procedure for such offences, with a penalty as a deterrent of the practice.

A copy of a letter by Mr. John S. Storr, which that gentleman sent to Mr. Cross the other day, gives a fair *résumé* of the extent of these irregularities, and which include among the offenders solicitors, architects, sworn brokers, bankers, theatrical managers, merchants, shipping agents, town clerks, directors, managers, secretaries, &c. It further informs us that the subject is now fairly before the Government. Thus we have some assurance that illicit commissions and bribes will soon be nipped in the bud, and that we may be saved the recurrence of such a fraud as that which lately ended in the conviction of a secretary, an agent, and a chairman of a well-known dwellings company.

IRISH NOTES.

A NEW parochial house in connection with the Church of the Sacred Heart of Jesus, Donnybrook, is being erected by Messrs. Meade and Son, builders, from designs by Mr. G. C. Ashlin, architect. Extensive buildings are being erected at Rathmines, at the intersection of Palmerston and Cooper-roads, under the title of "The McGrough Home." They are to be occupied by Protestant women, "who will be placed singly, or in pairs, in each house." The houses will be furnished and supplied with gas and water. It is expected that the works will be finished before January next. The funds left by the late Mr. McGrough for the erection, &c., of these buildings, amount to upwards of £50,000. Mr. Jaunes Rawson Carroll, architect, has furnished the designs, and is superintending the works, which are being carried out by Messrs. W. and J. Beckett, builders. A large chapel is attached to the Home.

Plans for alterations and additions to the Protestant Cathedral, Limerick, have been submitted by Mr. J. F. Fuller, architect, and are at present under consideration. It is thought that the changes will not be commenced till next spring.

A presbytery has been lately added to the Roman Catholic Church of St. Andoan, High-street, Dublin, from designs prepared for same by Mr. G. C. Ashlin, architect.

Mr. Spurgeon announces that Merrion Hall is to be sold for £7,000. It may be mentioned here that this building, erected about fifteen years since, from designs by Mr. A. C. Jones, architect, has collapsed financially since the death of Mr. Henry Bewley, an eminent Dublin citizen.

St. George's Church (diocese of Down and Connor), which had been closed for months past, has been reopened. The interior of this church has been entirely repainted and cleaned. The walls have been painted in oil a light neutral tint, the ceiling coloured white, the open beams and girders of the roof, with the remainder of the wood-work, stained and varnished in their natural

colours. The font, which is handsome, and of white marble, has been moved from the centre of the church to a more appropriate and ecclesiastical position near the entrance. The chancel has been cleaned, the painting and stencil work being retouched, and in some parts renewed. Altogether the interior now presents a bright and attractive appearance.

It is hoped that St. Coleman's Church, Gort, will be reopened, after extensive repairs, towards the end of next month.

A chancel has been added to the church of Loughmore, diocese of Ferns, from designs by Mr. J. F. Fuller, F.S.A., architect, who has also, we believe, prepared plans, &c., for a new tower and spire for Kilshane Church, for Mr. R. Wise, London, in whose demesne the church is situated.

The Church (Roman Catholic) of St. Mary of the Angels, Church-street, Dublin, is about being built from plans of Mr. J. J. McCarthy, R.H.A., architect. Part of the work was done about a year back, but owing to want of funds the works were stopped.

CHIPS.

The Wallingford Town Council decided, on Wednesday week, to invite Messrs. Ripley and Simmonds to make a preliminary survey of the town as a step towards meeting the sewerage and drainage difficulties.

The Town Council of Hull made in the year ended 30th August, 1877, a profit of £3,320 8s. on the supply of water to the town.

A large building in Conduit-street, Bedford, that has been in turn used as chapel, store-house, lumber-room, and hospital, has recently been acquired by Wesleyans, and has been altered to serve once more as a chapel. The exterior has been stuccoed, the interior furnished with pitch-pine open pews and other fittings, and a gallery added. The work has been carried out by Mr. L. B. Moore, contractor, at a cost of about £1,600.

Plans, prepared by Mr. Bohn, C.E., of Hull, have been accepted by the rural sanitary authority of Beverley for the drainage of the village of South Cave.

At the Fitzwilliam Museum, Cambridge, more than 500 engravings of the early German, Dutch, and Flemish schools have been mounted and incorporated in the collection, and the Syndicate have had all the etchings of Rembrandt and his scholars, numbering 1,328, to be stamped, arranged, and catalogued.

It was, on Thursday, decided to invite designs for a new building for Bolton Infirmary. Premiums of £50, £30, and £20 are offered.

The Freemasons of Aberdare are about to erect a mission-hall on a site secured for the purpose in Cannon-street. The plans and designs of the proposed building have been prepared by Mr. W. D. Blesley, architect, of Cardiff.

St. John's Parish Church, Sevenoaks, is in course of restoration, the contractors being Messrs. Punnett and Sons, of Tunbridge.

A steam saw-mill, in connection with a new scheme for smack-building on an extended scale, was opened on the 26th ult., at Gorleston, Great Yarmouth. The machinery was supplied by Mr. Barnes, and the building executed by Mr. J. H. Want, from plans prepared by Mr. H. Dudley Arnott, architect, of Gorleston.

The Blanford Town Council have accepted, with thanks, the offer by two ladies to defray the expenses of a new floor for the Corn Exchange, suitable for dancing, and other improvements. The floor will be of pitch pine, laid on 6in. of concrete, and the works will be carried out by Mr. Green, builder, under the supervision of the borough surveyor.

At the last meeting of the St. Austell School Board the tender of Messrs. Paul and Ede was accepted, at the sum of £1,922, for new schools at Carclaze. The plans are by Mr. Silvanus Trevail.

A new high altar and reredos has been erected in the Roman Catholic Church of St. Francis of Assisi, Stratford. The style of the work is Italian, and the work has been executed by Mr. Austey, from the designs of Mr. S. J. Nicholl, architect.

The Prince of Wales' Coffee Palace was opened at Fulbar-street, Renfrew, on Monday. It includes dining-hall, seating 140, and other accommodation on the ground floor, and reading-room, &c., upstairs. It is the gift of Mr. and the Hon. Mrs. Campbell, and is to be conducted on temperance principles. Mr. Macqueen was the architect of the building, and Mr. Gait, of Paisley, the builder.

A limited liability company is projected for the supply of the towns of Hayward's Heath, Cuckfield, and Lindfield, with water, to be procured from a reservoir at the foot of the Downs at Plumpton. The plans and estimates have been prepared by Mr. Blaber, surveyor. The three local boards concerned are considering the desirability or otherwise of taking shares in the proposed undertaking.

DOMESTIC CHAPEL, MOORESFOOT—"BUILDING NEWS"
CLUB DESIGNS FOR COTTAGE HOSPITALS—TRIANGULAR BRIDGE AT CROYLAND—EXTENSION OF THE WHOLESALE FISH MARKET, MANCHESTER—BOARD SCHOOLS AT HOVE—HOUSE AT NO. 21, HYDE PARK GATE.

OUR LITHOGRAPHIC ILLUSTRATIONS.

EXTENSION OF WHOLESALE FISH MARKET, SHUDEHILL—MANCHESTER CORPORATION.

THE markets committee invited four Manchester architects, in the early part of this year, to send in competition drawings under motto, and ultimately selected the designs of Messrs. Mangnall and Littlewoods out of the four for adoption. The plot of land for the site adjoins the present wholesale fish market, and covers an area of 1,996 square yards. The bays will be each 45ft. in width, the roofs being supported upon cast-iron columns of similar design to those of the present market. The centre portion of roof will be raised for ventilation, and ample light will be obtained from continuous skylights to the raised portion of roof, and one continuous bay on each of the lower roofs. The roof principals will be constructed with cast-iron principal backs and wrought-iron tie-rods, which will have a lighter effect than the wood principals to the present roofs. The elevation is treated in a similar manner to the existing market, which will form a series of four gables, faced with brick and stone, with an entrance in the centre of each, enclosed with ornamental wrought-iron gates, 14ft. wide, and carved recessed semi-circular panels over, about 12ft. diameter, with emblematical figures thereon. There will be openings on each side of entrance, with semi-circular heads, filled in with ornamental ironwork, finished externally with stone arches, and shafts with carved capitals. The portion devoted to shops, fronting Thomas-street, is laid out to contain 8 shops, each about 22ft. by 17ft., and 14ft. high on the ground floor, with cellars, and will have two stories over the same, which can be utilised either for offices, or sale-rooms in connection with the shops. A central entrance is provided in Thomas-street to approach the first and second floors. Columns, with beams over, are introduced every 17ft. at the division of each shop, so that a tenant can have one or more shops at pleasure; and the brick wall adjoining the market will have a continuous iron beam level with ceiling of shops, and supported on pillars, so that openings can be made, the width of each shop, communicating with the market, so that fish dealers could occupy some of the shops for a retail trade if thought desirable. The contract for the whole of the works has been recently let to Messrs. Robert Neill and Sons, contractors, Manchester, for the sum of £15,200, and the building is to be completed as speedily as possible.

DOMESTIC CHAPEL, MOORESFOOT.

THIS chapel is to be erected at the residence of Arthur Moore, Esq., M.P., and will be connected with it by a low cloister, 30ft. by 5ft. It will consist of a nave, 24ft. by 15ft., and chancel, 13ft. by 11ft., and will have a small sacristy and private tribune attached. In style the building bears a close resemblance to the stone-roofed churches erected in Ireland in the eleventh and twelfth centuries, and especially to Cormac's Chapel at Cashel (illustrated in these columns by a series of measured drawings a few years since), which is in the neighbourhood. The material adopted is the

sandstone of the locality, which is of a pale-red tint. The construction of the groined ceiling is precisely similar to that at Cashel. The engaged columns supporting the ribs are repeated at the exterior, and bear a stone cornice under the eaves. The public entrance for the tenants will be through a deeply-recessed doorway in the front gable. This gable has two stories of arched corresponding with those of the interior, and is pierced by a circular window, having a Celtic cross interwoven in the tracery. The cost will be about £2,000. The architect is Mr. George Ashlin, of Dublin.

ELLEN-STREET BOARD SCHOOLS, HOVE, BRIGHTON.

WE this week include in our pages of illustrations plans and an elevation of the schools about to be erected by the Hove School Board in Ellen-street, Hove. In our issue of October 26 we gave an account of the designs which were submitted in the competition for these schools, and we refer our readers to the description we then gave of this design, which was submitted under the motto, "Mens." Accommodation is provided for 800 children, in the proportion of 400 infants, 250 girls, and 150 boys. The materials will be picked stock brick for the walls, with red brick for the gables, groins, &c., and moulded red brick for the cornices, string-courses, and panels. The roofs will be covered with brown tiles, and the turret, constructed of oak, will be covered with lead. The most recent improvements will be adopted in the arrangements and fittings of the interior. As the front of the building will set back 10ft. from the line of street, a wrought iron railing, in character with the style adopted, will extend the whole length of frontage, a distance of 200ft. The architects are Mr. Fred. W. Roper, of 9, Adam-street, Adelphi, and Mr. Thomas Simpson, of 16, Ship-street, Brighton.

TRIANGULAR BRIDGE, CROYLAND.

VISITORS to Croyland regard with surprise this extraordinary and apparently useless bridge, which stands over dry ground at the intersection of the four main streets of the town. It is a very substantial building of Barnack rag, and was probably built early in the fourteenth century. The first mention of a triangular bridge occurs in a charter of King Eldred, A.D. 943, and it is supposed that the present bridge was erected on the site of the more ancient one. It did not always stand over dry ground, for the three great drains which meandered down the principal streets here met, and mingled their sluggish waters under the bridge, but the drains were filled in about 50 years ago. The bridge is crossed by three steep flights of stone steps and inclined planes, which meet over the crown of the arches; the roadways are from 7ft. to 9ft. in width. It was evidently intended for foot passengers only. Antiquarians have supposed that it was built with a three-centred arch, as an emblem of the Trinity, and that it was originally surmounted by a cross, from which outdoor sermons were addressed to the people. The large stone figure which is built into the wall at the foot of the bridge has proved a great puzzle to antiquarians, some of whom have supposed it to be a representation of our Saviour enthroned in glory, which formerly occupied some conspicuous position in the adjoining abbey, while others incline to the opinion that it is statue of King Ethelbald (who founded the monastery about the beginning of the eighth century), holding a globe in his hand; but the peasantry of Croyland assert that it is neither the one nor the other, but only Oliver Cromwell nursing a loaf of bread. There seems to be a strong feeling among the good people of Croyland that it is high time the bridge was demolished to make more room for the traffic at this rather awkward intersection of the main streets, and the grand old stones utilised for the very necessary work of repairing the roads, but it is devoutly to be hoped that a better feeling may soon spring up, and that when the long-talked-of railway across the great fens is constructed, road materials may be more plentiful, and this quaint monument of antiquity, with all its historical associations, may still remain an object of interest to many future generations.—G. R. WEBSTER.

NO. 21, HYDE-PARK GATE SOUTH.

THIS house has lately undergone extensive additions and alterations, the accommodation being much more than doubled, besides the addition of a four-stall stable, coach-house, and grooms' rooms over. The drawing-room, dining-room, and library are *en suite* on the entrance floor, all overlooking a large garden in the rear. On the upper floors are a billiard-room, twelve bedrooms, two bath-rooms, &c. The building is faced with picked stock bricks, with red Suffolk brick and Portland stone dressings. The carving was executed by Mr. Seale, and the works generally have been carried out by Messrs. Macey & Sons, under the superintendence of the architect, Mr. Alfred Williams, of 22, Southampton-buildings, W.C.

"BUILDING NEWS" DESIGNING CLUB.

THIS week we illustrate some of the designs for cottage hospitals received from contributors to our Designing Club. They were reviewed on Nov. 16, on p. 495.

LIVERPOOL ENGINEERING SOCIETY.

ON Wednesday evening last, Dec. 5th, 1877, this society held its usual fortnightly meeting at the Royal Institution, Colquitt-street; Mr. Graham Smith, A.I.C.E., president, in the chair. The usual business of the society having been transacted, Mr. F. C. Pembroke Jones read a paper on "Stone in Engineering Work." Granite, he said, is found in most mountain chains, and varies in colour in accordance with its chemical constituents, as also in strength and durability. Hornblende he considered as much superior to mica in the formation of granites, both for durability, strength, and hardness. As regards the decay of granite, he stated that it usually commences with the decomposition of the mica, which, by its exfoliating, deranges the cohesion of the grains. After briefly referring to talcous slates, some varieties of which are used for houses, mica slates, and flinty slates, he went into the details of common or clay slate, which is so largely used for roofing and other purposes, at some considerable length. The best sandstones, such as Craigleith, Darley Dales, Heddon, and Renton, contain on an average 95 per cent. of silica, and weigh about 142lb. After describing the magnesian limestones, the ordinary limestones and oolites, and the various purposes for which they are employed, he completed his remarks by describing quarrying operations, and the making of artificial stone. The meeting was well attended, and the discussion of this most important constructive material well sustained.

COMPETITIONS.

CAMBRIDGE.—A rather unusually important competition is just now in progress at Cambridge for new buildings in connection with King's College. The competition is a limited one, and the competitors are Sir George Gilbert Scott, R.A., Mr. George Edmund Street, R.A., and Mr. William Burges. The drawings are now at Cambridge for private inspection previous to the award. The new wing will complete the quadrangle, and face the street in the place of the screen wall which at present occupies the site. The buildings will provide chambers for professors and fellows of the college.

WEST HARTLEPOOL.—The West Hartlepool Improvement Commissioners have issued invitations to Mr. James Garry and Mr. John Hatton Lowe, architects, of that town, to send in competitive designs for their new market, public hall, town offices, &c., on the present market site. Maximum cost to be £20,000. Both gentlemen have decided to compete.

The tender of Mr. James Holden, the lowest of seven sent in, has been accepted by the Corporation of Bolton for sewerage and other works in the new road to the cemetery.

The Government, it is said, have no intention to carry out that portion of the report of the select committee of last session which recommended that the projected new public offices should be built on a site to be acquired between Charing-cross and the Horse Guards.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fortnightly meeting of the Institute was held on Monday evening; the President, Mr. Charles Barry, in the chair. Mr. F. Ouvry, F.S.A., who has for many years past discharged the duties of honorary solicitor to the Institute, was, on the motion of the President, elected by acclamation an honorary fellow. The compliment was acknowledged in appropriate terms by Mr. Ouvry. The forty noblemen and gentlemen proposed for membership in the new class of honorary associates (whose names we gave a month since, on page 469) were balloted for and elected, with the exception of Mr. Watts, R.A., in whose case there was some informality in the nomination forum. The following elections also took place:—As fellows: Messrs. Thomas Blashill, 10, Old Jewry-chambers, E.C.; John T. Christopher, 16, Bloomsbury-square, W.C.; Edmund B. Ferrey, 15, Spring-gardens, S.W.; Horace Gundry, 13, John-street, Adelphi, W.C.; George Legg, 61, King William-street, E.C.; Alfred Norman, Devonport and Plymouth. As associates: Messrs. William F. Hammond, 42, Insurance-road, Auckland; E. B. J. Knox, 93, Longmarket-street, Cape Town; Arthur G. Northover, Erith Villa, Lee, Kent; George Robson, 60, Waterford-road, Fulham, S.W.; Reginald St. Anbyn Ronuieu, 10, Lancaster-place, W.C.; William Scott, 3, Great Woodstock-street. Various donations to the library were acknowledged with thanks.

MIDDLE-CLASS HOUSES IN CENTRAL LONDON AND PARIS.

The PRESIDENT, having called attention to the series of drawings on the walls of the room, illustrative of architecture in Japan, forwarded by Mr. Josiah Conder (some of which were beautifully tinted), said under the new rules Mr. White's paper, read at the last meeting (see page 521, *ante*), was now open for discussion.

Mr. CATES said Mr. White had cleverly treated and almost exhausted his subject, on which he had qualified himself to speak by an experience gained by residence in two capitals. It was to be regretted that the prejudices and mistaken ideas of Englishmen should have been so opposed to the mode of building adopted on the other side of the water, and that in consequence this metropolis presented so sombre and woe-begone an appearance. This resulted from the common delusion amongst us that health could most certainly be secured by living in what the Londoner called the country, but which was simply an ill-built, ill-ventilated house (known as a suburban villa), erected on ill-drained land. To and from this residence and his business he was compelled to go daily by train or other conveyance, at a great expenditure of time and energy. Mr. White proposed a plan by which he would give residences adapted to all classes, within easy reach of the centre of the city. If this were adopted, and the extension of houses carried out vertically instead of horizontally, this metropolis would no longer be a huge polypus, rotten at the core, and stretching out with unhealthy suburbs on every side, with an enormous and needless outlay on formation of roads, drains, and sewers, gas and water mains, and police supervision. If they examined the maps of Paris and of London of 20 years ago and now, it would be seen that the former city had been almost reconstructed, and presented a most beautiful appearance, although it had undergone troubles from which London had been happily spared. The *maison-à-loyer* system of building had enabled this to be done, and it would be well for London if some bold man, and great landowner, would facilitate the erection of some of these dwellings. A great objection to the ordinary houses-in-flats was their closeness, but in the plans exhibited there were means afforded by the central court and carriage entrances for a full current of fresh air to be carried into the centre of the block. Such houses would have to be constructed substantially—they could not be run up by our speculative builders, but would afford work for a better class of builders, and a higher style of architecture might be expected to grow up. Referring to

the island in Regent-street, chiefly of Crown property, the planning of which Mr. White had used as a typical illustration of London house-over-shop arrangements, Mr. Cates defended the management of the Crown estates from the implied censure, and pointed to the greatly improved condition, and the great improvements in the thoroughfares through the Crown property in the west of London. He contrasted the action of its managers in the formation of Regent-street and Waterloo-place, through a labyrinth of narrow courts and streets, with that now being displayed in carrying into effect the Metropolitan Streets Improvement Act, under which there were being driven straight cab-roads from point to point by the simple process of taking down houses on one side of the suggested route, leaving that bare and unoccupied for years, while the miserable shanties and hovels still stood on the other side as foul witnesses of the course which the self-governing body of the metropolis thought it best to adopt. In dealing with their estates landowners were often hampered by leases of varying length, marriage settlements and entail, the existence of which they regretted as much as any one else.

Mr. WHICHARD said the subject of Mr. White's paper was practically a new one in the room, for while the housing of the lower classes in more compact dwellings had been recognised in London for the last 18 or 20 years, the principle had not been applied to providing for superior classes. It was worthy of notice that, whereas in the large towns of Scotland the system of building in flats was once common, it was now being abandoned, and new streets were laid out in rows of smaller, self-contained houses, with larger corner blocks, planned in flats. One great difficulty in adopting Mr. White's suggestions in London was, that ground was let on building leases, terminating at unequal intervals, in plots of extremely narrow frontage and irregular shape. Until this system could be rectified it would be almost impossible that such buildings could be largely erected. The chief difficulty was the existence of easements of various characters which prevailed to a great extent in London. The carrying out of many most important improvements was stopped by absence of a law as to rights to light and air. In any combined dwellings for the middle classes it would be necessary to carry the buildings to a great height, to recoup in some measure the outlay, and fireproof construction, lifts and external staircases would be absolute necessities to insure them being let to satisfactory occupiers.

Mr. HANSARD complained that Mr. White had not estimated the cost of the sites of his buildings in the rents to be paid, and this he feared would be very misleading both to members and the outside public. The cost of such a scheme would be so heavy that it could not be carried out. The island in Regent-street, for instance, was a plot of about 190ft. by 70ft. To rebuild it as suggested by Mr. White, after arranging with the leaseholders (who have about 40 years to run) for the purchase of their interests, the freeholder would have to expend about £500,000 in the erection of new buildings.

Mr. STREET, R.A., asked Mr. Hansard what he calculated the cost at per cubic foot?

Mr. HANSARD replied that Mr. Street might calculate it as he liked—the sum named would be about the cost.

Mr. HEBB had calculated that the superior system of planning and building suggested by Mr. White would cost about £30 per room, and, if that were so, such houses were out of the question in London. The more compact houses were, the more costly they proved to build, and probably the cheapest house that could be erected was the two-storied type of the speculating builder, for there could be no doubt that this individual knew how to build cheaply. He did not attach importance to the objection that had been raised as to acquiring sites for such buildings as had been suggested, that the leases of the land might run out at different times, for any surveyor or manager of a large estate would take care that all leases ended by one date.

Mr. DAWSON considered the suggested combined residences might prove useful and

would soon be occupied in central London; but if they attempted to build such in the suburbs they would certainly fail—the cost would be too great. Although Mr. White's plans were clever, they did not include many necessary improvements that should be looked for in a London middle-class house. The area covered was a great deal too small, and the cramped domestic offices, and total absence of scullery, would not be tolerated. The Parisian model had been too closely adhered to. Everything had been done to secure concentration, but such a block would cost 25 per cent. more than the London house.

Mr. FORSTER HAYWARD pointed out that the proposed carriage entrances to courtyards would cut up the pavements to a very large extent, and especially if thorough communications were made from front to back would much increase the dangers of London streets.

It being now half-past nine, the PRESIDENT took a show of hands as to whether the discussion should be adjourned or closed, as the new rules provided. The majority being in favour of terminating the discussion that evening, the President remarked that they must have sympathised with Mr. White when he gave them his experiences of the interminable arrangements that have to be made between the Parisian architect and his *compagnons de travaux*. He had come to the conclusion that although such residences as Mr. White had described might do very well for the bachelorhood of London, for those with small families, or "no incumbrances," yet nothing could be more uncomfortable than for those with large families to be in such dwellings. One could understand how this mode of housing the people vertically rather than horizontally grew up in Paris, but London was not so distinctly the centre and capital of the country as that city was, and there was therefore not the same demand for concentration. English servants would, too, have to be educated for several generations before they could be persuaded to use a room about 10ft. x 12ft. for every purpose required, nor would Englishmen like to store their wine in a small cupboard or rack instead of the mode to which they were accustomed. Mr. White would indeed have to revolutionise all the habits of Londoners to carry his suggestions into effect. At the same time there was a large class of people for whom these flats could be provided, and he should be very glad to see Mr. White display his skill; if such residences yielded a return of 8 or 10 per cent. he was sure the revolution Mr. White so much desired would be effected. He had himself, when at Vienna and Turin, and other Continental towns, heard the cry, "give us your English houses"—a demand which suggested that people were everywhere discontented with what they had, and fancied that which they did not possess was better.

Mr. WHITE, in replying on the discussion, acknowledged the vote of thanks passed to him at the last meeting, and expressed his pleasure that the subject had evoked so much discussion. It had been objected that his plan would seriously affect our national habits. This might be true, but the sooner some of those habits were altered the better. It was said to be a serious thing to interfere with an Englishman's castle. This title might apply to the houses in Belgrave and smaller squares, but not to the average dwellings of central London. Under his system every man would have his castle defended by a portcullis, placed as in Paris at the top of the landing. His houses were intended for central London, and while it might be granted that it would be much better to live in a £50 house in a suburb than in one of these, still people were willing, as in Paris, to pay more in proportion to nearness to the centre of the capital. It had been objected that so much space was taken up by passage room, but there was not proportionally more space occupied by walls than in an ordinary two-roomed house with its landings and staircases. Under the usual system they climbed this space; under the Parisian one they passed through it horizontally. These passages also shut off the several parts of a residence in a manner not provided for in the ordinary dwellings in flats. It had been said that his ideal façades were not high enough; this was true, and if he were to carry the buildings

half as high again his plans would show a still greater gain upon the common ones. He had been condemned, not only as a revolutionist but as a radical; the question was a political rather than an artistical one, certainly, and reform was greatly needed. Entail ought to be cut off, and a law of light and air determined upon, and passed. Before this reform could be carried out some amelioration of the condition of the thousands of those living in central London was possible, if the ground landlords would study their own interests by laying out their land on a scientific basis.

The PRESIDENT then called upon Mr. James Neale to read his paper on St. Alban's Abbey, amidst general cries of "Postpone." Mr. Street and others urged that it would be impossible to do justice to the subject if commenced at 3 minutes to ten o'clock, and Mr. Neale himself asked to be allowed to reserve it for another evening. The President gave way, and declared the meeting adjourned to the 17th inst., when Mr. Looock Webb, Q.C., would read a paper on "The Law of Easements." Replying to Messrs. Clarke and Street, he said it must be left to the council to decide as to when Mr. Neale's paper would be taken, and as to whether a special meeting should be convened for the purpose.

SCHOOLS OF ART.

BERWICK.—On Tuesday week the annual meeting of the art and science classes, held at Berwick in connection with the Kensington Museum, took place. From the annual report it appeared that the number of students under Mr. Wallace, the teacher, was 90, being the largest number which the class has yet reached. At the examination in May last 32 were examined in freehand, 20 of whom passed: in model 25, of whom 20 passed; in geometry 21, of whom 8 passed; and in perspective 19, of whom 6 passed. The prizes awarded were—in freehand and model, 3; geometry, 2; and perspective, 5. The total grant earned by the school was £109 17s., and the total income, £185 5s. 3d.

EDINBURGH.—The prizes gained by students in the Edinburgh School of Art were distributed on the 29th ult. The report, which showed an increase in the number of students, stated that the numbers in the school in 1876-77 were:—In the male school, 487, being an increase over the preceding year of 28 students; in the female school, 306, being an increase of 49. Total number of students, 793, or 77 more than in the preceding year. The awards to the school by the Science and Art Department were from the national competition:—To the male school—2 silver medals, 3 bronze medals, 4 Queen's prizes. To the female school—1 bronze medal, 1 Queen's prize. In the third-grade examination 29 students have been successful, viz.:—21 students of the male school and 8 of the female school. Of these 2 have obtained free studentships. At the local examination of the second grade, held in Edinburgh in May, 255 students in the school presented themselves for examination, viz.:—140 from the male school, 115 female school. Of these 129 passed, being 65 in the male school, and 64 in the female school. Of these 21 in the male school have gained prizes, and 18 in the female school. 77 strangers also came up to this examination, viz.:—39 males and 38 females. Of these 17 have passed, viz.:—12 males and 5 females; and of the males 7, and of the females 2, have gained prizes. Mr. Andrew Reid, one of the pupil teachers of the male school, went to South Kensington in February, where he passed examination, and has obtained an art master's certificate of the third grade. The results of the year are not so high as were attained in some previous years marked by brilliant success, but the school, like every other open to all comers, is subject to an extremely different range of ability in its students from year to year.

OXFORD.—The annual distribution of prizes and certificates was made in connection with this school last week by Mr. Goldwin Smith, who delivered an address on the relations of art to manufacture in which he endeavoured to establish that England is irremediably losing

the great American market for the heavier and coarser goods, but that she may yet retain, at all events for many years to come, all the productions in which art and cultivated taste play an important part. On this ground, he argued, schools of art and design should be supported with no niggard hand by the Government. The annual report of the school showed that classes had been held in the evening under the direction of Mr. Alexander Macdonald, Ruskin teacher of drawing, assisted by Mr. Price, who took entire charge of the afternoon classes. 971 drawings, the work of 114 students, were sent to South Kensington, only 15 of the drawings being in the advanced stage. None of the latter, and but 7 of the former, gained the full awards, showing a falling off from previous years. No third-grade prizes were awarded. At the second-grade examination in drawing 58 members and 11 "external" candidates from other parts of the district presented themselves. 23 of the members succeeded in taking 24 passes, and 4 external students were also successful in passing.

SALISBURY.—The annual distribution of prizes, in connection with this school of science and art, took place on Thursday, the 29th inst., in the council chamber, the walls of which were hung with an interesting and very numerous display of works, including some studies of architectural details from buildings as well as from copies, the work of carpenters and other artisans. The report was highly satisfactory, and stated that the evening classes are attended by 86 artisans or their children, and that they were bearing practical fruit, as four of the members were earning a livelihood by some branch of art acquired in the school. An ex-student is employed by a London firm in painting flowers, and a sixth has been recently engaged by a firm of carpet manufacturers in the North of England as a designer. 1,674 works—a larger number than in any previous year—were sent to South Kensington, and the money grant earned by them exceeded that of any previous period. 8 third-grade prizes, a bronze medal, and a Queen's prize of books were awarded in the national competition. The second-grade competition was not so satisfactory in results as in former years, 28 having obtained certificates, and only 4 prizes, besides 4 who completed their certificates. This was to be accounted for as the standard of excellence had been considerably raised since last year, and Salisbury had only five schools before it in the United Kingdom, including those of the metropolis. The committee pointed out, however, that the Department threatened to withdraw the grant unless the accommodation be increased, and this would be equivalent to closing the school. They, therefore, urged on the citizens the adoption of the Public Libraries Act. During the proceedings a vote of thanks was cordially passed to the master of the school, Mr. Joseph Harris, to whose exertions, it was stated, the school owed its position and successes.

SUNDERLAND.—The annual presentation of prizes in connection with the Sunderland School of Art classes was last week held in the hall school, and there was a very large attendance. The mayor said that there now in the school 214 pupils, being a decrease of 31 since last year. He also mentioned 194 out of 214 students had sent works up to the annual exhibition at South Kensington. These 194 persons, who represented nearly the whole of the 214 constituting the class, had sent up no less than 2,061 separate works, the average being 10 works for each person, indicating a considerable amount of labour and industry during the year.

TUNBRIDGE WELLS.—The prizes and certificates were distributed to the successful students in the science and art classes at the Old Town Hall, on Friday evening, by Sir David L. Salomons. The report of the art classes showed that the number of evening students was steadily increasing, and that the classes are self-supporting. 40 students presented themselves at the Government examinations, of whom 14 obtained certificates and 4 prizes; 343 works were sent up to South Kensington, for which the full grant had been

awarded, 1 student had gained a third-grade prize, and 4 second-grade prizes. For the local prizes the competitions had been very satisfactory, especially in that for design, which was added to the list in 1876.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

LEEDS ARCHITECTURAL ASSOCIATION.—The annual soirée of the Leeds Architectural Association was held on Friday last in the "Fidelity" Masonic Hall, Carlton-hill, Leeds. Amongst the exhibits were a number of sections of rolled iron joists. Some samples of concrete, made with a mixture of crushed slag as a substitute for granite, were exhibited by the Aireside Hematite Iron Company. We understand that this material has been adopted by Mr. Corson for the fire-proofing and steps at the new theatre. A variety of photographs of ruins in Yorkshire was exhibited by Mr. Wormals, whilst some interesting specimens of cement work and tiling were shown by Mr. Patterson, Manchester. Specimens of carved panels, &c., were exhibited by Messrs. Marsh and Jones, architectural drawings by Mr. G. Corson; stained glass windows by Messrs. Boer and Co., whilst the principal paintings and pictures were exhibited by Messrs. W. Howgate, F. Whitwell, and J. R. Watson. Prizes, consisting of books, were offered amongst the junior members of the association, and these were distributed by the president of the society, Mr. G. Corson. He remarked that by the establishment of that association, the architects of Leeds had followed the example of their brethren in Manchester, Birmingham, Liverpool, Edinburgh, Glasgow, and other places. The prizes which he had to distribute has been offered by various members of the Association. He himself had offered a prize for the best sketch of ancient or modern buildings in Leeds; Mr. T. Ambler had given another for the best series of architectural designs; Mr. Archibald Ramsden had given one for the best design for a pianoforte; Mr. Franks had offered one for a design for a plaster cornice; and Mr. Walker had given one for the best set of measured drawings of old buildings in the neighbourhood of Leeds. Mr. Hobson had carried away his (Mr. Corson's) prize, and those of Mr. Ramsden and Mr. Franks; Mr. E. P. Shires had secured Mr. Walker's prize with a drawing of the Chapel of St. Mary Magdalene, Ripon; and Mr. Riley had obtained Mr. Ambler's prize. Mr. Corson added that it was intended at a future period to give a medal for the best series of measured drawings of buildings erected previous to 1750. Their society, however, was only young, and they might have to amend their programme. The business portion of the proceedings having terminated, the company inspected the various objects of interest exhibited, and the soirée was brought to a close shortly after ten o'clock.

The local board of health for Chelmsford are about to borrow £15,000 for carrying on a scheme of sewerage for that town, the suburbs of Springfield and Moulsham, and a few closely adjoining parishes. The sewage will be treated by irrigation at Brookend, Springfield, to which point it will be conveyed by gravitation.

The complete lists of plans for private bills were deposited in the House of Commons Private Bill Office on Friday last. There has been an increase in the number of the plans of railways, tramways, provisional orders, and miscellaneous bills as compared with last year. In the session of 1877 there were 73 railway bills, 14 tramways, 69 provisional orders, and 67 miscellaneous—total, 223. In the ensuing session there are 78 railways, 20 tramways, 95 provisional orders, and 77 miscellaneous—total, 270, or 47 more than last year.

Plans and designs, prepared for the county magistrates of Bedfordshire, for the rebuilding of the Shire Hall in St. Paul's-square, Bedford, were submitted to the Town Council of Bedford on Friday. The ground plans were generally approved of, but Alderman Horsford and others complained of the mean character of the proposed elevation, which was a mere alteration, with little improvement, of the front put up 80 years ago. Several members considered that a more ornate elevation was desirable for such a site, but a rider suggesting this for the consideration of the county magistrates was lost by 6 votes against to 5 for, the majority of the council deprecating the expense and delay which might be occasioned by the recommendation.

Building Intelligence.

BOSTON SPA.—The rebuilding of St. Mary's Church, Boston Spa, which was commenced in 1872 by the erection of a chancel, south transept, and south aisle, has this year been further advanced by the addition of the nave. The north and south sides are formed, commenced eastward, with arches opening to the transepts, and carried westward by arcades of three arches and piers opening to the aisles. These carry a clerestory. The stone used for the clerestory walls is that which composed the western tower. All the ashlar stone for windows, piers, arches, &c., is from the limestone quarries at Bramham Moor. The work done up to the present time has cost over £5,000, and the future work for the completion of the church, for which about £3,000 is required, is the building of the tower at the west-end of the nave, and the alteration of the present north aisle.

GARSTON.—The new parish church of Garston, near Liverpool, was consecrated last week. The new church, the style of which is Decorated, consists of a nave 92ft. 6in. by 22ft.; chancel, 30ft. 6in. by 21ft. 3in., with apsis at east end; north and south transepts, 28ft. 6in. by 23ft. 9in.; and north and south aisles, 68ft. 9in. by 11ft. There is a tower at the north-west, 10ft. by 10ft. internally, used as a porch, opposite to which is a porch 11ft. 6in. by 9ft. At the south-east there is an organ-chamber 15ft. by 14ft., and a vestry at the north-east. There is accommodation for 800 adults. The designs include a spire, but the erection of this has been postponed for want of funds. The contract for the church was taken by Mr. C. W. Mullin, of Liverpool, for the sum of £5,830. The church has been erected from the designs of Messrs. T. D. Barry and Son, of Liverpool.

IPSWICH.—St. Peter's Church, Ipswich, has been partially restored, and enlarged under the care of Mr. Gilbert Scott. Three new arches have been placed across the church at the east end of the nave and aisles. The entire floor of the chancel and aisles has been raised a step, and paved with Minton's tiles, the spaces being filled with Clipsham stones. The aisles also, except where the tombstones which were formerly in the chancel have been relaid, are paved with Clipsham stones, and 9in. Staffordshire tiles. The north chancel aisle is an addition to the area of the church, and the walls of it are new, while almost the whole of the east end has been rebuilt and a new east window inserted. The additional space afforded by the added aisle about compensates for the seats lost by the demolition of the gallery. The present area will comfortably seat about 650 people. The south porch, a good specimen of 15th century work, has also been restored.

METROPOLITAN BOARD OF WORKS.—On Friday this board directed that, with reference to the Building Acts Amendment Bill, replies be forwarded to the Westminster District Board, stating that it is not proposed to take any steps next session for the prevention of the use of hoardings for advertising purposes; and to the Society of Medical Officers of Health, stating that the board is not in a position to add a clause to the bill giving power to vestries and district boards to make bye-laws for regulating drainage, water supply, &c., in a similar way to those given to extra metropolitan authorities under the provisions of the Public Health Act, 1875, and that the board be the confirming authority. Drawings prepared by the architect, showing proposed alterations and additions to be made to the buildings in Chapel-place and Bruton-mews, Brompton-road, to fit them for the purposes of a fire-brigade station, were approved, and it was directed that tenders be obtained for carrying them into effect. An application from Messrs. Holland and Hannen, on behalf of Messrs. Kershaw and Becton, for the construction of a bridge over Nelson-street, Leman-street, E., was granted. Permission was granted Mr. W. Seckham Witherington, to erect two pairs of cottages on the Plumstead-park Estate, with Gater's patent concrete bricks. It was reported that a large number of applications had been received for appointment of assistant in the drawing office of the

superintending architect, and the works committee were requested to examine these, and reduce the number of candidates to six, for selection by the board.

NORTON LEES, DERBYSHIRE.—A new church at this place has just been consecrated. It is in the Early English style, and consists simply of nave and chancel. The tower is octagonal on plan, and above the lancet light belfry windows the spire springs at each angle from carved gargoyles. Dunford Bridge stone has been used, and the roofs are steep-pitched, and are interspersed with bands of varied colour, the whole surmounted by a red cresting. The apex stones of the gable have richly-foliated crosses. The interior of the church, although small (just over 110ft. from east to west), is pleasing; the roofs are of considerable altitude, and, springing from stone corbels, are of red deal, stained and varnished. The chancel arch is carried by foliated capital, and there is a carved pulpit and lectern in oak, the other fittings being of pitch pine. Mr. T. R. Rodby, of Sheffield, carried out the stonework, and Mr. T. Bodger, of the same town, the woodwork. The stone carving is by Mr. Harry Hems, of Exeter. The church has been designed and erected under the immediate superintendence of Mr. J. D. Webster, architect, of Church-street, Sheffield, at a cost of £3,400.

TADCASTER.—A new cemetery at Tadcaster was consecrated last week. In all it has cost about £2,800. It is about 6½ acres in extent, and contains a keeper's lodge and two chapels. These buildings are built of Bramham Moor stone, with slate roofs. Messrs. Atkinson and Co., of Micklegate, York, are the architects, and Mr. Watson, of Barkstow, was the contractor.

UNION CHAPEL, ISLINGTON.—The new chapel at Islington for Dr. Allon's congregation was opened on Wednesday, Dec. 5th. In plan and arrangement it is somewhat of a novelty, belonging to the class which includes Santa Fosca, Torcello, St. Stephen's, Walbrook, and other churches based, not on the ordinary principle of a nave and aisles, but rather on that of a large central area. The purpose of this arrangement is to bring all the congregation, numbering 1,600 or more, well within range of the preacher's voice, and to place them where the stone piers will not intercept their view of the pulpit. The galleries, unlike those which it was the fashion a hundred years ago to thrust into many old and all new churches, are not mere wooden stages. As at Andernach and Flavigny, in Western Europe, and in many Byzantine structures, they form an essential part of the general design; they are carried on stone arcades, and have stone parapets inlaid with marble and onyx. A large tower, of which the first 60ft. only are built as yet, forms the centre of the west front. Internally it opens into the church by a lofty arch, and contains nearly 300 sittings. Behind the chapel are schools for 700 children, a lecture-hall, and a multitude of class-rooms and vestries. The architect is Mr. James Cubitt, author of "Church Design for Congregations."

A new clock and bells have been added to Sligo Cathedral by Messrs. Gillett and Bland, of Croydon.

There are rumours, we are sorry to hear, on the authority of the *Athenaeum*, that a very extensive and comprehensive scheme of restoration has been resolved on by the chapter of Southwell Minster. It is proposed first to re-roof the whole building, to build two spires on the magnificent Norman towers at present existing, to remove the present choir screen, modelled by Bernasconi, and substitute an "elegant" iron grill for it; and, in short, to make this ancient building a great deal better than new. Surely the funds for such an outrage will not be forthcoming.

Several improvements and developments are in contemplation at the Lincolnshire watering-place of Skegness. At a meeting held on the 22nd ult., of the Pier and Hotel Company, plans for a pier, prepared by Mr. Sandeman, C.E., of Newcastle-on-Tyne, were approved. The pier is to extend 600 yards into the sea, to be floored 15ft. above spring-tide level, and, with ornamental head, landing-stage, and refreshment-rooms, is estimated to cost £14,000. It was also decided to erect an hotel adjacent to the foot of the pier, at a cost of about £6,000. A meeting has since been held to promote the erection of a new parish church to seat 700 persons, and to cost £3,000. The Earl of Scarborough is supporting each of the undertakings, and in this instance gives the site and some of the materials.

PUBLIC HEALTH.

The Leading Journal of Sanitary Science and Progress. The number published December 7 contains articles on Over-crowding in Liverpool, Proposed Hospital for Infectious Diseases at Maidenhead, Biblical Sanitation, Dr. Acland on Hydrophobia, Tube Wells, Purification of Sewage, Epidemics in India, Unhealthy Premises in Liverpool, Dr. Richardson on Temperance, Accrington and its Medical Officer of Health, Rewards for Information as to Cases of Infection, Public Health Reports, Legal Intelligence, Correspondence, Intercommunication, The Editor's Table, Clearings, &c. Price 2d. Annual subscription, postfree, 11s. 3d. Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—G. A., Dublin.—E. T.—H. C. and Son. DESIGNING CLUB.—Drawings received:—A. L. B., Medicus, Mentouniere, L. in G., Excelsior, Cave Canem, J. W. C. (in circle), Naiveté, Nomme, Ambition, Discreet Volo, Tom Pinch, D. and H., J. A. Seward, S. Dutton, Walker, W. Watson, H. F. B., W. W. N., J. E. S., R. H. Hill.

Correspondence.

THE ARCHITECTURAL STUDENT.

To the Editor of the BUILDING NEWS.

SIR,—In a letter published in your last week's issue your correspondent, "C. P. E." cannot imagine why the Royal Academy of Arts (course) should be included in the "Architectural Association Handbook." The reasonable degree of proficiency is, to his mind, an unreasonable degree, and a student must bind himself for seven years.

The regulations for admission as student of the Royal Academy are inserted in the handbook for the same reason that the lectures at King's and University Colleges, and other courses of instruction, are given—viz., to point out to the members where they can obtain further training than that which is to be acquired by office routine.

The standard of excellence required by the Academy is far lower than that which is insisted on in all the French, German, and Italian schools. Many of the students of the Academy, after one year's study there, join the classes of the Association, but I have not yet heard that the excellence of their drawings is superlatively good or unreasonable. It would be interesting to learn from "C. P. E." in what manner the students of the Academy are bound for seven years, and the nature of the penalties inflicted if they fail to attend; also whether, as a member of the Association, "C. P. E." considers himself bound to attend all the meetings, work for all the classes, and contribute regularly to the "Sketch Book." The privileges of an Academy student are:—(1st) Gratuitous instruction in drawing and design; (2nd) the right of attending all the lectures; and (3rd) free admission to the exhibitions held at Burlington House for a period of seven years. But "C. P. E." is not obliged to avail himself

of these privileges any more than he is expected to raise the standard of excellence of his drawings to an unreasonable degree to pass through the course there prescribed.—I am, &c.,
R. PHENE SPIERS.

ENGLISH AND FOREIGN WORKMEN.

SIR,—I am glad to find your correspondent, "G. H. G.," agrees with me as to the importance of establishing the proposed technical colleges for workmen not properly taught, and for artisans' boys on leaving school, for whom no proper provision is made by apprenticeship or otherwise at the present time.

I did not say, however, that free trade was the necessary cause of the decline of British workmanship, but I pointed out how free trade had been misused and turned to the convenience of capitalists, with the evil consequences inseparable from selfish aggrandisements.

The common accusation that the unions impede the skilful and best workmen and reduce them to the level of the unskilful, is founded on fact, and therefore it is a just accusation, the grave consequences of which are best known to those who have suffered by them. Let me give an example:—A gang of masons were set to prepare a quantity of stone steps. The builder, a master mason, observed that at the rate the work proceeded he would lose money by the staircase, although he had been allowed a fair price. He watched the gang and soon spotted the inferior workman, down to whose capacity all the rest were working. Upon the withdrawal of this man the work proceeded at the usual pace, and the builder reaped the reward of his tact and observation. Comment is superfluous.

As regards "piecework," "sub-contracting" is not exactly the same thing. A contract may include piecework, often with advantage to every one concerned, when a skilful workman by this means is enabled to exercise his talents to his own advantage, reaping the reward of excellence and that which commonly accompanies it—rapidity of execution. Whatever tends to individualise work is as helpful to the best workman as it is injurious to the worst. The piecework system so understood, was exactly "that under which our greatest architectural works were carried on."

Separate contracts for separate trades always existed, and masters of each trade took pride in their work, and their apprentices were proud of their masters, and sometimes eclipsed them, which in the case of the 'prentice pillar at Roslyn had a tragic ending, but the pier remains to tell of loving handicraft. It is the association of all trades in one great contractor that is the invention of our times, and without it, perhaps, many of our greatest achievements would never have been realised. But this is essentially an engineering system, and where time is limited, and concentration and co-operation is demanded in vast inartistic works, no better plan could be devised; but in works of art and taste it is different.

Both architect and proprietor may be glad of the concentration of responsibility peculiar to the one-contractor system, and of the ease with which it enables them to get through the business of building at the lowest cost and least trouble and risk to themselves; but they must not expect the same interest to be taken in the work, or the best workmanship to be the result, unless the work be done and measured at a schedule of prices, which then ceases to be contract work at all, as is usually understood and practised.

"G. H. G." rightly remarks "apprenticeship now is very different: the high-pressure master has no time to devote to his younger men." In fact, many of the great contractors haven't a single apprentice, and how the young men pick up their knowledge of their trades is a marvel, and without doubt the levelling principles of trade-unions alone enable many men to get a living. Good workmen, well taught in youth, are, and always will be, independent of associations; bad workmen, ill-taught in youth, are, and always must be, dependent on extraneous aids.

High prices are not grudged to men whose separate work will command it, but they are withheld from men whose aggregate work is

inferior, or certainly not meritorious. As "G. H. G." admits, "If trade-unionism fulfils its legitimate function, it will simply content itself with the regulation of the profits of trade." Nothing can be more unprofitable than the disorganisation produced by strikes, which have never yet been proved an advantage to those for whom they are supposed to be a defence. The carpenters' strike in France in 1840 led to the invention, and subsequent, almost exclusive construction, of roofs and floors of iron and plaster. Substitutes for stone are now in demand, and the loss of work to be done hereafter will lessen the profit of higher prices even if they are gained; in short, in such a case, the next harmful thing to defeat is victory.—I am, &c.,
E. C. R.

TOWER BRIDGE.

SIR,—Among the Parliamentary plans deposited for the ensuing session are two proposals for relieving the traffic north and south of the Thames, the widening of London-bridge, and the erection of a bridge at the Tower. The former is deposited by the City architect, and the latter by Messrs. Le Fevre and Co.

The bridge at the Tower is to consist of five spans or openings—one span 200ft., 30ft. clear headway; two spans 150ft., 28ft. clear headway; two spans 110ft., 25ft. clear headway. The bridge has been designed by Messrs. Le Fevre and Co. with a view to meeting the objections raised by the Thames Conservancy and the wharfingers during the progress of the bill last session. A model of proposed bridge may be seen at Messrs. J. and G. Rennie's, Holland-street, Blackfriars.—We are, &c.,
LE FEVRE AND CO.

PRESERVING AND RESTORING ANCIENT BUILDINGS.

[COPY.]

The Society for the Protection of Ancient Buildings, 26, Queen-sq., Bloomsbury, Oct. 30, 1877.

SIR,—It having come to the knowledge of the committee of this society that the interesting church of North Frodingham was about to be restored, a letter was written to the vicar (a copy of which I enclose) deprecating such restoration. A reply was received, in which he says, "Allow me to refer you to my architect, Hugh R. Gough, Esq., 6, Queen Anne's-gate, Westminster, who will no doubt be able to correct your mistaken judgment." I enclose a prospectus, and shall be glad if you would kindly reply at your earliest convenience.—I am, Sir, yours very truly,

For WM. MORRIS, Hon. Secy.
Hugh R. Gough, Esq. (Sgd.) V. Newman Marks.

The following is a copy of the enclosure referred to in the above:—

The Society for the Protection of Ancient Buildings, 26, Queen-sq., Bloomsbury, Oct. 1, 1877.

SIR,—The Committee of the Society for the Protection of Ancient Buildings have heard with regret that you propose to "restore" your church of North Frodingham, and they desire me to call your attention, and to note the dangers that beset all restorations. As you will see by the enclosed prospectus, the society protests against any restoration that means anything but necessary repairs. Having seen your sketches of the church "as it is" and "as it will be," the committee infinitely prefer the old structure "as it is," and they trust that such an act of vandalism, as is contemplated, will not be carried out.—I am, Sir, yours very truly,

(Signed) WM. MORRIS, Hon. Secy.
Rev. H. West, Vicar of North Frodingham.

Re North Frodingham Church,
6, Queen Anne's-gate, St. James's-park, S.W.,
November 1st, 1877.

SIR,—I should be glad to know the grounds on which your society see fit to accuse me of an act of vandalism. It is a serious charge to bring against an architect, and if, as I presume, it be founded simply upon a very badly-executed sketch of the church as it was and as it is to be, issued by the vicar in an appeal for funds, and without their having any actual knowledge of the church itself or the works now being carried out, I must say I think the liberty they have taken is a most unwarrantable one; indeed, it appears to me to amount to libel, and such statements made to clients are calculated to injure my reputation and put me to pecuniary loss.

Although I have a very great reverence for antiquity, and have constantly to insist upon retaining old work, often against the wish of my clients, I am unprepared to go to what seems to my mind the absurd extremes of your society—that is, if I read your prospectus aright.

The neglect and irreverence of the past three centuries have left much to be amended, and much to be undone: fine roofs concealed by plaster ceilings, good masonry plastered over, mural decoration hidden by successive coats of whitewash, mean ricketty tables in lieu of altars, "three-deckers" in place of decent pulpits, "the squire's pew" instead of stalls and desks for priests and

choir, family pews and faculty pews of all sizes and shapes; the singers' and other galleries, with their inevitable ricketty staircases, destroying the beautiful proportions of many a parish church; the Lion and Unicorn instead of Holy Rood; stoves with hideous pipes carried through roof or window; these and a host of other such abominations are certainly "historical," but their history is a sad one, and I, for my part, feel no reluctance in sweeping such things away, and "restoring" a church to the use for which its founders and benefactors in times past intended it. Doubtless, as Mr. Ruskin says, "the dead have still their right in them." The faithful departed who built them, not only for themselves, but for posterity, will not grieve but rather rejoice at such restoration as this. Again, your society would, I presume, simply "protect" a ruin. Many an old abbey, crumbling away, and half overgrown with ivy, ferns, and mosses, is, I admit, a "picturesque" object, yet, I think, a painful one, and I would infinitely rather see all such "restored" to their religious use, crowded with devout worshippers, than "protected" as choice subjects for the artist's pencil, or sights for gaping and irreverent excursionists, perhaps picnicing at a ruined altar. Although we have no 19th century style of architecture, I do not see that we want one any more than we require a new religion. Your society pray me "to remember how much is gone of the religion, thought, and manners of times past, never, by almost universal consent, to be restored." In this opinion we differ vastly. The very work you attempt so feebly to resist, indiscreet and unwise as much of it has been I admit, goes far to disprove your statement. What has the work of the last 40 or 50 years been but to restore the beauty of the religion, and with it much of the thought and manners of times past?

If such a work as this be vandalism I rejoice to say I plead guilty to the charge, and trust I may add many more such acts to those I have already and am now committing. I can only respect the history of a sacred building so long as it has not interfered with the use for which it was intended. Changes, historical though they be, which have interfered with its use, I am ever ready and anxious to obliterate, but whatever else remains to show the ancient structure and its alterations in successive ages I am unwilling to touch. Thus it is not my practice to remove a particle of old work so long as it is or can be made capable of doing the duty it was intended for, nor do I in any case permit old stone or other material to be scraped and made to look like new—such, I admit, is vandalism; but when roof or walls are, from age or neglect, unsafe or incapable of doing their duty, I do not hesitate to pull down and rebuild, unless they admit of repair. Contrary to Mr. Ruskin, whose brilliant talents I am bound to esteem, I consider we have the same right to touch an old building, when occasion requires, that our forefathers had, and if the original builders intended their works to be permanent they must at the same time have been aware that materials were liable to decay, and have trusted to future generations, renewing from time to time, and with careful and reverent hands, that which should decay. I am also of opinion that a lost limb even is often better than a crutch, as a decayed member may affect the whole body.—I have the honour to be, Sir, your obedient servant,

(Signed) HUGH ROUMIEU GOUGH.
The Society for the Protection of Ancient Buildings, Wm. Morris, Esq., Hon. Sec.

P.S.—I reserve to myself the right to publish this and any further correspondence on the subject.

The Society for the Protection of Ancient Buildings, 26, Queen-sq., Bloomsbury, Nov. 28, 1877.

SIR,—I am afraid we must plead guilty to having founded our criticism on the sketch you have mentioned, to which a member of our society called our attention. It was clear from this sketch that considerable alterations are proposed to be made in the fabric of the church, and we presumed that these alterations would be of such a nature as our society would condemn. That we were not mistaken in this presumption has been rendered obvious by your letter to me, which undoubtedly advocates principles diametrically opposed to ours. It would be useless for me to enter into a lengthened argument upon these principles, especially as you have seen a general statement put forward by the authority of our committee, and all the more useless as it seems to me that you argue beside the question, and make it rather a matter of Ecclesiastical* propriety than of art or antiquarian interest. It is from these latter points of view alone that our society professes to deal with the matter, believing, at the same time, that it is not impossible to reconcile the interests of art with Ecclesiastical* propriety.

You may be quite sure that there could be nothing personal intended in what we have said about work which it seems you have contemplated. We should have said the same to any other architect under similar circumstances.—I am, Sir, your obedient servant,
(Signed) WILLIAM MORRIS, Hon. Sec.

Re North Frodingham Church,
6, Queen Anne's Gate, St. James's-park, S.W.,
1st December, 1877.

SIR,—I have to acknowledge the receipt of your letter on the 28th in reply to mine of the 1st ult. If the principles therein advocated by me are diametrically opposed to yours, I quite agree that it would

* Thus in original.—H. R. G.

be useless to enter into argument. I am glad to hear that you think "it is not impossible to reconcile the interests of art with ecclesiastical propriety." Such has been my aim, and the question whether this result will be best attained by following the principles advocated by me or by those which are diametrically opposed to them and put forward by your society, I am content to leave others to judge. It may be that you intended nothing personal in your remarks to my client, but as you say you would do the same in the case of any other architect under similar circumstances, I would remind you that in so doing you incur a responsibility and lay yourselves open to an action for damages. It would, therefore, be desirable for you in future to know a little more of a proposed work before condemning it.—I am, Sir, your obedient servant.
(Signed) HUGH ROUMIEU GOUGH.
Wm. Morris, Esq.

ARCHITECTS AND BELLS.

SIR,—Will you allow me to make a few remarks about the very awkward way in which architects often design steeples and turrets for bells in new churches? I shall not now speak of the high narrow steeples often designed for peals of eight and upwards, where it is often impossible to hang all the bells for ringing without "hoisting" some; but I shall touch on the awkward inaccessible turrets designed to carry one or more "ting-tongs." Several times I have been compelled to bring ropes down from these through diagonal or even horizontal pipes in the wall, over pulleys, though I knew all the while they would not act properly so. Then, again, these turrets are generally accessible only by a high ladder, so that it is quite an undertaking even to mend a rope or oil the bell. To remedy this, and render breaking the rope less liable, I have seen heavy chains attached at top, which almost weigh the bells up by themselves, and render anything but slight jangling impossible. The drawings of All Souls, Harlesden, amused me, where five small bells seem to be hung in three different turrets, and four of them have the ropes down a long pipe, and drawn out by the chimer almost horizontally—the worst thing possible. These I perceive are not inaccessible, but, may I ask, are these all meant to be chimed together? Surely, architects might always manage to make a weatherproof turret where the rope could be carried straight from the wheel or lever through the roof; and, if not accessible by stairs, could not fixed ladders or irons in the wall be provided for a man to be able to reach the bell at five minutes' notice at most? As for steeples, let them never be less than 15ft. square inside.—I am, &c.,
Sutton Bridge, Lincolnshire. J. R. JERRAM.

Intercommunication.

QUESTIONS.

[5215].—Heaton Norris and Reddish Cemetery Competition.—Can any correspondent inform me whether any decision has been come to in the above competition, and, if so, whether the premiums have been awarded, and to whom?—M. E. T.

[5216].—Wanted a Remedy for Checking Progress of Damp in a House.—Would you kindly, through your columns, obtain for me a word of advice on the following? A gentleman living in the south of Ireland called me in professionally to suggest a remedy or even a stay to the progress of damp, which exists in his dwelling. The house has four stories, its front and gables neatly and substantially cemented, has a projecting cornice, with good weathering, a blocking, with sound lead gutter behind, having high turn-up and broad-top flashings, set with slate slips in cement. On examination I found most of the rooms uninhabitable—not damp alone, but actually water streaming down the walls, the plaster cornices saturated, and, in many instances, crumbling away, while the ceilings were wet and discoloured for many feet into the rooms. My first impression was that the gutter was faulty. This I examined, inch by inch, yet not a flaw, the slating perfect, and not the slightest evidence anywhere of a weak point. On inquiry, I found that this house was built about ten years since, of our local sloh bricks. These bricks are made out of the slob at the mouth of the Douglas river, a place not far distant from Cork Harbour, and, of course, before burning must contain a large percentage of salt; but I thought the open-air process of drying, with the subsequent calcination would suffice to drive out such an amount of this treacherous substance, that the residue would be, for all practical purposes, harmless. Yet, in this case I must ascribe all the evil to the use of those bricks. I should very much wish to obtain other opinions, and to learn what remedy there may be. Battening and sheeting may hide the walls, but how save the ceilings?—A CONSTANT SUBSCRIBER.

[5217].—Mansard Roof.—Will some practical reader kindly give me the dimensions of scantlings in a mansard roof—distance between centre of walls 32ft?—Two Foot.

[5218].—Raising House.—What is the proper mode to ascertain the additional weight thrown upon the walls, caused by raising a two-storied house another story, and what precautions should be taken to ensure the old building settling; and in building

a new wing to the old house, what depth should the foundations be taken to be safe for both portions?—Two Foot.

REPLIES.

[5153].—Damp Ceiling.—I should recommend "I. A. C." to dig up the earth over the cellar or that part of it which is damp, and to cover the rag landings which form the ceiling of cellar with a layer of asphalt about an inch thick. This layer would be judiciously extended below the flagged path as well. The asphalt may be laid to a slight fall on either side. After this has been laid, fill in the garden earth again.—G. H. G.

[5155].—Projecting Perspectives.—It is quite practicable to project the rays backwards from a small scale plan. Of course, the draughtsman must decide on the size he requires for the perspective, and draw the seat of his picture plane at right angles to the line of sight, upon which the several diverging rays are projected. As to the elevational heights, they may be obtained by making a proportional scale.—G. H.

[5179].—Binding the "Building News."—Your correspondent will find it much more convenient to bind his large illustrations the full size of the page, and avoid folding them. The binding should be on the end and not on the side. I have the illustrations for the last three years bound in two large and 5 small volumes, each about 1 1/2 in. thick, and find this arrangement exceedingly convenient.—G. Z. A.

[5193].—Concrete.—"J. M. S." will find all the information he can well get on the subject in "Concrete: its Use in Building," by Thomas Potter; or he may inspect houses I am erecting in concrete and brick.—WM. CHYNOWETH, Handsworth.

[5203].—Competitions.—By all means "Engineer" can claim compensation for the missing specification and plans, if he has applied for them without satisfaction. Architects are put to enough trouble and cost in sending in drawings without being losers of their labours.—H.

[5205].—Tar Paving.—A good tar paving is made by boiling creosote oil and pitch together, in the proportions of 1 gal. of oil to 1 lb. of pitch. Mix well together. The best foundation is clean gravel, well dried, the coarser sort being laid at the bottom, and the finer at the top. The dark surface of the tar can be lightened by siftings of fine gravel or crushed spar.—G.

[5209].—Ceilings.—The best remedy would be to knock off the loose plaster and repair the ceiling. Sometimes lining with paper may be resorted to; the latter is the cheapest mode of making good a ceiling in the condition named.—BUILDER.

[5214].—Tilting Fillet.—Attachment of Girders.—The effect of laying slate without any tilting fillet may be conceived without a sketch. Of course, the effect would be meagre, and there would be less prominence or contrast. A fascia board may be utilised by making it deeper, so that its top edge would form the tilt under the first row of slates.—H.

LEGAL INTELLIGENCE.

LOCAL BOARD BYE-LAWS.—INFRINGEMENT.—A somewhat extraordinary case was recently heard at Eastbourne before Mr. Swift (in the chair), Mr. Goldfinch, and Mr. H. Curtis. John Harding, a local builder, was summoned for building four houses without the distance at the rear required by the Local Board Bye-laws.—Mr. Coles, the clerk of the Eastbourne Local Board, appeared for the prosecution; and Mr. Lamb, of Brighton, for the defence.—The facts are as follows:—In the month of June last, the defendant, wishing to build some houses in the York-road, instructed Messrs. Blessby and Spurrell, architects, to prepare the plans. They were accordingly prepared, and in due course submitted to the building committee of the Local Board, were passed by them, and sent before the board, who, by resolution on the 2nd of July last, approved the plans. The property in question adjoins that of the chairman of the board. About the end of July the defendant began to build the houses, and continued to do so until the 28th September, when he received a complaint from Mr. Jones, the surveyor, as to two of the houses, that they did not comply with the bye-laws. On the 4th of October he received a notice to discontinue the building altogether, and did so. Mr. Graham then met the defendant, and told him that the cottages would overlook his premises, and wished to know whether they could come to terms for purchasing the carcasses of the cottages as they stood. Ultimately, however, a summons was issued to compel him to pull down the buildings.—Mr. Lamb, in his defence, contended, firstly, that having given their approval of the plans the board could not, after such a lapse of time, withdraw it. In the course of his observations he commented strongly upon the course adopted by the board in actually prosecuting Mr. Harding for erecting a building according to plans which the board itself had sanctioned. He further contended that the proceedings of the board were premature, inasmuch as the buildings, being incomplete, were not, according to the bye-law, a dwelling-house.—The Chairman of the Bench said the magistrates were of opinion that however discreditable it might be to the board to institute these proceedings against a person for building according

to plans which they had sanctioned, the Local Board had no power whatever to alter their bye-laws as they pleased to suit different cases, and were in all instances bound to enforce them, as much, indeed, as if they were Acts of Parliament. Under these circumstances, the board was not bound by its mistake. The penalty was £5, but defendant would be fined 5s.—Mr. Lamb then asked for a case, which was granted.

FIRE REINSTATEMENT.—GREENWICH POLICE-COURT.—Messrs. Cubitt and Co. appeared to two summonses at the instance of the Vestry of Rotherhithe, charging them with infringements of the Metropolitan Local Management Act, in failing to give notice of the rebuilding of two houses in Rotherhithe-street, in that parish. Mr. Stokes attended in support of the summonses, and Mr. H. D. Greene, barrister, instructed by Messrs. Dawes, of the Temple, City, for the defendants. The case occupied some time in hearing, but the facts may be briefly stated. On Sunday morning, the 24th June last, between four and five o'clock, an extensive fire broke out at granaries in the above street, and the flames spread and set fire to two houses, situate north and south, and numbered respectively 357 and 35. The former was occupied by Mr. Carpenter, a pawbroker, and the windows were broken by the heat of the flames, which entered the building, and great damage was sustained, the whole of the original walls standing, except a wall at the back of the premises, where there was 5ft. of the old wall left, and of the premises. 35, the old walls stood at the height of 15ft. Mr. Greene contended that there had been no rebuilding, only repairing, of the premises, and that under the 75th and 76th sections of the Act the penalty imposed was only applicable where notices were not given of the digging of foundations for new buildings. The premises in question had received extensive repairs with the assent of the Phoenix and the Guardian Insurance Companies, by the defendants, who had for years carried out works damaged by fire, and had never given such notice. The case was one of great importance, and he objected to an adjournment of the case, which had been asked for, to call the surveyor to the vestry to give evidence, who had failed to attend that day. Mr. Slade said, from the evidence before him, he did not consider that any offence had been committed, and both summonses would be dismissed. Mr. Greene asked that defendants' costs of attendance should be allowed, but was informed that costs were not usually allowed in such cases.

LIGHT AND AIR.—Motion to Commit for Contempt.—Chancery Division.—Dickey v. Pfeil and others.—Mr. Chitty, Q.C. (with whom was Mr. Ribton), moved on the part of the plaintiff to commit Messrs. Pfeil, Stedall, and Co., wholesale iron-mongers, of Holborn, for an alleged breach of an injunction granted in the long vacation by Mr. Justice Fry, restraining them from carrying up a wall beyond certain specified limits, so as to obstruct the access of light and air to contiguous houses belonging to the plaintiff. The wall, as erected since the order, caused a current of air, which drove the smoke down the chimneys of the plaintiff's houses, and his tenants had in consequence left, and the plaintiff, asserting that the defendants had contravened the order of the court, moved for the committal of the defendants. Mr. Martin, Q.C., appeared for the defendants, and referred his lordship to the precise terms of the order, by which it appeared that the wall complained of was not built in breach of the injunction. His Lordship (the Master of the Rolls) refused the motion with costs, and the defendants afterwards undertook to raise the chimneys of the plaintiff at present affected by the wall of the defendants.

IN RE J. F. AND E. VAN CAMP.—The bankrupts, Messrs. John Francis and Edward Van Camp, were builders and contractors, carrying on an extensive business at Station-terrace, Kilburn. This was a first sitting, held on Wednesday, for the proof of debts and the appointment of trustees. The bankrupts had presented a petition for liquidation, but at the first meeting no resolution was passed by the creditors, and an adjudication followed. The debts were returned at about £230,000, of which the greater portion were unsecured, with assets of the nominal value of £23,000; but it was understood that a composition of 5s. in the pound would shortly be offered to the creditors. Proofs to a large amount having been admitted, Mr. J. J. Michael, merchant, Portobello-road, and Mr. S. Lovelock, Coleman-street, were appointed trustees, with a committee of inspection consisting of Mr. E. M. W. Goslett, Soho-square, and Mr. Henry Lucas, Lombard-street.

STONEMASONS' NAMES ON WORK.—A singular case came before the West Hamlet bench on Monday week, a stonemason, named Francis Jones, being summoned by a Dr. Atkinson, of the same town, for damage inflicted by him on a stone enclosure at the cemetery. At Dr. Atkinson's request defendant made a palisading, and took the opportunity of inscribing his name upon the stonework, and had since refused to erase it, alleging it was the usual custom; hence the action. Mr. Simpson, who appeared for the prosecutor, contended for the purpose of bringing the case within the Act, that the conduct of defendant was wilful and malicious, and cited a case in point. Mr. Francis Oldfield assessed the damage at a sovereign. He admitted that it was usual to put the mason's name on a stone bearing an inscription, but not if objected to, and never

on a blank stone. The defendant said he had no idea the doctor would have objected, but he had since obliterated the name from the palisading. Mr. Oldfield, recalled, said this was so, but the stone was worn off the plumb. Defendant thereupon promised to supply another stone, and on this arrangement the magistrates adjourned the case for a week.

WATER SUPPLY AND SANITARY MATTERS.

FRASERBURGH, ABERDEENSHIRE.—On Thursday in last week the police commissioners met for the purpose of formally inspecting the sewerage works, which have just been completed throughout the town. The work has been carried out from the plans, and under the supervision of Mr. John Jenkins, of Aberdeen, by Messrs. Murray and Urquhart, contractors of the same city, at a cost to the commissioners somewhat exceeding £4,000.

TUBE WELLS FOR WATER SUPPLY.—At a meeting of the Society of Engineers, held on Monday evening, a paper was read by Mr. Robert Sutcliff on "Tube Wells for large supplies and in various strata." Mr. Sutcliff observed that in laying down plant for obtaining large supplies of water a number of tube wells were coupled together by horizontal mains, so that one pumping engine drew from many tubes. In this way, for the last eight or nine years, the leading breweries in Burton-on-Trent have obtained the bulk of their water supplies. Messrs. Allsopp and Sons pump 600,000 gallons daily from 30 three-inch wells, and Messrs. Bass and Co. 500,000 gallons from 25 tubes. Thus in one town two breweries are obtaining sufficient water for a town of 40,000 inhabitants. Although some of these Burton wells are within a stone's throw from the Trent, the quality, level, and temperature of the tube water differ from those of the river water. The town of Carmarthen, in Wales, is supplied by 10 two-inch tube wells. In sandy soil strainers or filters are used, which prevent sand coming into the tubes. A tube well was sunk in a very fine sand at Chislehurst by pumping up six barrow loads of sand and replacing it with gravel. One advantage of the gravel filter is its imperishability, and if made sufficiently large the velocity of the water is not sufficient to bring the grains of sand within the area acted upon by the pump. The author observed that in rocks and other hard strata the method of sinking tube wells was similar to that employed in making artesian borings, but the mode of pumping and development of supply was entirely peculiar to the tube well system. Bored tube wells can be made through any stratum and to any depth that an ordinary artesian boring can reach. Mr. Sutcliff thought it possible that coupled tube wells in the chalk might solve the problem of providing London with pure water.

The guardians of Eastbourne Union propose to expend £2,500 on the erection of an infectious diseases hospital in connection with the workhouse. At Friday's meeting of the board, besides deciding on this step, the members accepted the contract of Messrs. Morris and Son, amounting to £114, for laying on gas to the house.

Messrs. Wilson and Masters, of Sheffield, have this week been appointed architects to the School Board for Hunshelf.

The Rawmarsh School Board last week adopted a plan and specifications by Mr. Platts, architect, for a new school for 700 children, to be erected in Netherfield-lane. The building will be of brick, with stone facings, and is estimated to cost £4,000, exclusive of site, for which another £1,000 is to be paid.

The thirtieth annual ball in aid of the funds of the Builders' Benevolent Institution will be held at Willis's Rooms, on Thursday, the 31st of January.

Our Office Table.

LECTURING on Saturday upon technical education, Professor Huxley regarded its basis as elementary education plus such a training as would awaken intelligence, some knowledge of the elements of physical science, and an ability to draw. The present system of universal education formed the nucleus out of which a satisfactory system of technical education might be developed. He advocated an intellectual ladder, by which youths of special aptitude might be assisted to rise through the universities to any position they could reach; and commended the modern movement of the London livery companies towards reviving the traditions of the guilds of the middle ages.

We thought the doom of Temple Bar was sealed when a fortnight since we read an advertisement in our own columns, inviting application from persons willing to undertake its removal. A few days later, however, our advertisement manager received instructions to stop the second insertion of the said advertisement, and a foreboding at once seized us that the friends of antiquity and obstruction were resolved on one more effort on behalf of the ugly relic. At last week's meeting of the Court of Common Council the City Lands Committee received permission to remove the Bar, but were instructed to take care of the materials until they had considered the advisability of re-erecting them in some more convenient locality in or near the City. Somebody asserted it would cost £20,000 to re-construct Temple Bar in Epping Forest, and one Alderman had the common sense to declare that the City might make a much better use of its money than to incur the cost of such a re-erection. If any citizen has such a veneration for the last of the Bars as to undertake its removal and re-erection at his own cost, no one need grumble; meanwhile the City can take care of the old stones, along with the thousands of tons of similar material in their possession, removed to make way for the asphalted roadways.

THE Council of the Society of Arts offer the sum of £100 (placed at their disposal by Messrs. Watherston and Son), together with the society's medal, for the best Essay on the Art of the Silversmith, past and present, of all nations, with practical suggestions for its future development. The essay must be historical as well as practical, and should point out the chefs d'œuvre produced in various countries.

NOTICE OF REMOVAL.

**CHUBB AND SON,
LOCK, SAFE, AND IRON DOOR MAKERS,**

Have REMOVED their SAFE and LOCK BUSINESS to new and extensive Premises,

123, QUEEN VICTORIA STREET, ST. PAUL'S, E.C.

Illustrated Price Lists gratis and post-free.

Makers to the QUEEN, H.R.H. the PRINCE OF WALES, and the Bank of England.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Arts. Cartor Lectures. "Manufacture of Paper." Lecture III. by W. Arnott, F.C.S.; 8 p.m.

WEDNESDAY.—Society of Arts. "Freedom in the Growth and Side of the Crops of the Farm considered in its bearings upon the interest of Landowners and Tenant-Farmers," by J. B. Lawes, F.R.S.; 8 p.m.

Trade News.

WAGES MOVEMENT.

MANCHESTER.—In a circular the Manchester and Salford joiners' strike committee state that the number of men now on strike is 773, and that they intend to prosecute Messrs. Neill and the chief constable of Salford for the false and malicious imprisonment of one of their pickets.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Clynderwen, R.S.O., Carmarthenshire. — [ADVT.]

Holloway's Ointment is not only useful and certain of effecting a cure in outward diseases, it may be employed with like benefit in diphtheria, sore throat, hoarseness, bronchitis, pleurisy, influenza, asthmatical complications, and chronic coughs. The ointment must be well rubbed into the skin adjacent to the disordered or diseased parts.

TENDERS.

BANSTEAD.—For fencing land at Banstead, the site of proposed Kensington and Chelsea school. Messrs. A. and C. Harston, architects, 15, Leadenhall-street:—
Taylor and Brooker (accepted) £597

CROSSINGTON.—For the sewerage of the parish of Crossington for the Rural Sanitary Authority of Bridgwater:—
Tucker and Davis, of Middlezey (acc) £260

EDMONTON.—For making and kerbing roads, laying sewers, &c., on the Millbrook Estate for S. Bird, Esq. Messrs. Whitmore and Kennard, surveyors; quantities supplied:—

Killingback	£2,257
Williamson	1,871
Crockett	1,500
Bloomfield	1,411
Wood, F. and F. J.	1,382
Jackson	1,250
Pound	1,152
Taylor	1,138
Rutty	1,130

EXETER.—For rebuilding No. 99, Fore-street, for Sir F. Bathurst, Bart. Messrs. Tarring and Wilkinson, architects, 69, Basinghall-street, London:—

Gillard, J. R., Exeter	£4,469
Stile, J., and Sons, Exeter	4,411
Sharland, T., Exeter	4,180
Seadding, H. J., Exeter	3,829
Stratford, J., Okehampton	3,785

[* Accepted subject to reductions.]

GREAT BERKHAMPTSTEAD.—For erecting a new Sanitary Hospital for the Rural Sanitary Authority:—

Genner and Co.	£2,345 0 0
Wilkins	2,310 15 0
Holdstock	2,162 0 6
Fincher and Smith	1,709 0 0
Nash and Matthews	1,673 3 0
Monk	1,643 0 0
Cook	1,623 0 0
Honour	1,609 1 0
Harris (accepted)	1,595 11 6
Allaway	1,575 0 0
Sears	1,549 4 0
Pangbourne	1,470 4 0

SOUTHBOROUGH.—For the construction of sewerage from the present tanks to land proposed to be taken for a sewage farm for the Local Board of Health:—

Punnett, G., and Sons, Tunbridge	£988 5 10
Perigo, J., Tunbridge Wells	883 0 0
Potter, H., London (accepted)	857 7 6

[A fourth tender was received, but was disqualified by the omission to enclose either schedule of prices or bill of quantities.]

**STAFFORDSHIRE
BLUE TERRA-METALLIC
PAVING & KERBING**

SUITABLE FOR FOOTPATHS, &c., &c.

Now largely used.

ALSO

STABLE PAVING

Made in same Material to any Patterns or Designs.

The Cheapest and Most Durable Paving
now in use.

PRICES AND BOOK OF ILLUSTRATIONS ON APPLICATION.

Through the widespread reputation which these goods have gained, many makers have been induced to scud into the London and other markets spurious imitations, which are only COLOURED by a chemical process, and will not bear any comparison for strength, durability, &c., with the genuine article.

Gold and Silver Medals Awarded at Paris and Brussels Exhibitions.

THE BUILDING NEWS.

LONDON, FRIDAY, DEC. 14, 1877.

ARCHITECTURAL PRIZE DESIGNS
AND DRAWINGS AT THE ROYAL
ACADEMY.

THOSE who prepared the list of architectural subjects for the Academy prizes this year could certainly not have been aware of the nature and requirements of a complex structure, such as that proposed to competitors for the "Gold Medal and Scholarship." Imagine a "House of Legislature for a great colonial capital" advertised for without any particulars being given respecting site or dimensions. Would any architect go to the trouble of preparing plans with such meagre instructions? It is true the Academy subjects are ideal and not restricted, but the least that could have been done would have been to have given the area and dimensions of the site, and the requirements of the building. In the absence of such data students—especially novices—are completely without helm or compass, and it is absurd to expect anything but purely visionary and impracticable designs. It may be said the Academy's idea of art is a very different thing to every-day prosaic architecture—a mere abstraction—an artist's aerial fancy; if so the architectural school is a misnomer. The most genial imagination and mind best stored with data would be perplexed in the contemplation of such a subject as a Legislative Assembly for a great capital. We may here just ask, too, whether the purpose of the prize would not be better attained if the council proposed subjects more within the compass of the student's conceptions? Would not the faculty of design be called into play in a more thoroughly practicable manner? The result of the Utopian ground taken by the Academy and the absence of conditions, is that only two candidates have entered the arena for the gold medal this year, and having no precise data to determine the merits, the committee of selection have had to make an award that appears at least open to animadversion. One of the designs shows a plan distributed in the most palatial manner, with an extravagant quadrangle in front, while the other covers little more than half the area. Looking at the two designs, and remembering the seven months of study and labour their authors have expended upon them, it is certainly rather difficult, under the circumstances, to award the palm to either. The Gold Medal and Scholarship of £25 has been awarded to "Detur Digniori," Mr. Edward Clarke. The plan is a parallelogram, the main entrance being at one end, with four open courts for light and air. There is a grand loggia entrance, and vestibule in front leading to an octagon hall, from which cross corridors branch right and left, leading to longitudinal ones, which surround the building. Along the main or longitudinal axis, or block, are ranged the entrance, central hall, described as the Commons lobby, House of Commons, with its side division lobbies, Speaker's lobby, and entrance in rear. Entrances are also provided at each side, with grand flights of stairs to the first floor. On each side of the grand entrance we have the public and private bill offices, reading-rooms, with libraries at the angles. In the rear are the committee-rooms, with the refreshment-rooms and clerks' offices at the sides. It will thus be observed that the scheme consists of a parallelogram of surrounding blocks, crossed by a main centre, and another block, the corridors being lighted from the courts, the apartments through the four façades, and the main chamber or House of Commons by clerestory windows.

The upper floor comprises the residential apartments, governor's or conference-room over the vestibule in front, and the official chambers and conveniences. The Speaker's private room, we note, is rather far from the main assembly. In other respects there is lack of judgment in location and size, though we find considerable merit in the general distribution of the departments, considering the author had no programme to follow. In the architectural relation of the parts there are one or two points to find fault with. Thus the octagon hall is preposterously high, and is carried up for the only purpose of making an external feature. First we have the octagon itself surrounded by coupled columns. Above this is another order and entablature, then an attic or two, and then the dome. Internally, such a hall would be as ridiculous and unmeaning as it could possibly be, as we pass from a moderately high vestibule into it. This sad want of proportion is quite as offensive externally. The dome and substructure appear to rise very inelegantly over the portico of the façade. It has a very stilted look, and the tambour is unpleasingly abrupt. No feature is so apt to pass into the phase of the pompous or ridiculous, when the height is disproportionate to the requirements and other dimensions, as the dome, and its employment here is questionable. Above the division lobbies, which are shut off from the body of the assembly hall by a screen between the coupled columns on both sides, are the ladies', Speaker's, and public galleries, and at the end the reporters' gallery. The columns support an entablature, above which rise the clerestory walls, pierced by coupled windows, the piers being adorned by an order of caryatides, which, in their turn, carry a flat ceiling. There is much taste and good drawing in the ornamental accessories, though the order of caryatides has a weak effect. In the elevation of the main front, designed in a Classical spirit, there is much that is both ostentatious and commonplace, though the centre portico of two orders and the slightly projecting columnar blocks at end are well managed. If the author had omitted the small and puny domes over the angles, we should have liked the elevation better, and they do not harmonise with the very ungraceful-looking central dome. The delineation of the latter in the perspective, by the way, is sadly out of drawing, the horizontal curves of the peristyle and drum not partaking of the flexure necessary at such a height above the point of sight. In other respects the perspective is carefully drawn, shaded in Indian ink. "Alea Jaeta Est" is the second design, and were it not for the very extravagant area of ground covered, we should be inclined to say there was little to choose between them. The author of this design has certainly exhibited much skill in the distribution of his building; the legislative halls are placed right and left of a long and spacious central vestibule, in the middle of which is a grand portico entrance. Thus the halls and the vestibule form a longitudinal axis the length of the building. There are five courts or areas, one large garden in the rear of the vestibule, and a court on each side of the two halls, round which are ranged the quadrangles or wings connected by corridors lighted from areas. The executive council hall is on the left and the legislative assembly on the right side, with end entrances and side division lobbies. Round each hall is an aisle or ambulatory, with stairs to galleries at the inner ends. At the back, facing the garden, is the conference hall, with the executive and assembly libraries right and left. A glazed portico surrounds the garden, and ample communication is given by means of the connecting corridors with the halls and other official departments. The grand

octagon vestibule is domed in the centre, in the front of which is a hexastyle portico. The advancing wings contain the president's and committee-rooms, while a members' entrance is provided on the left and the Speaker's and committee entrance on the right wings respectively. The offices and smaller apartments occupy the blocks behind. Private entrances are also shown in the rear, giving access respectively to the two assemblies. Smoking, refreshment, and coffee rooms are placed in convenient proximity to the wants of the two halls. On the first floor, in front, are the official residences for the President and Speaker, the rear portions of the wings being occupied by drawing and dining rooms, official chambers and bedrooms. On the whole, the plan is on a too palatial and extravagant scale for a colonial legislative structure; the vestibule, with its flanking corridors, is extremely pretentious and grandiose, and the halls are perhaps open to the objection of being too far separated for the economical discharge of their functions. There is, nevertheless, a certain grandeur in the architectural grouping of the parts, and considerable ingenuity and artistic subordination exhibited. The great length of the front elevation, and the rather dwarfed effect of the vestibule porticoes between the halls, is destructive of unity, and this defect is increased by the impoverished close range of Ionic pilasters, which screen the said vestibule in front. The external treatment here is certainly wanting in harmony with the end wings, and these also do not agree with the upper parts of the halls which flank the front, and are too pronounced. The clerestory windows of vestibule are poor, and do not accord with those of the chambers; the windows to the two-storied offices of wings are commonplace and badly proportioned; the central dome, with its crown-shaped lantern, is lumpy, and the portico below it does not combine agreeably with the composition, and looks stuck on. We note these defects in a composition that may fairly be said almost to divide the honours of the awarded design. The drawings are too faintly shown to do them justice, the ink used is too light, and the sepia tinted perspective is not finished, and scarcely represents fairly the effect.

Turning to the "Travelling Studentship" prize, won by Mr. Eley E. White, for a design for assembly-rooms, we find a boldly-conceived design in Gothic, with strong French tendencies, displaying considerable merit. There is a pleasing breadth of treatment in the work, which consists of a gabled hall with fleche, some well-designed windows in flank, and a clever arrangement of entrance, buttresses, and chimneys. The drawing, however, is rather faint, and lacks the precision and detail of an experienced hand, but there is evidence of artistic skill. In plan we find the entrance at one end, with a vestibule, a restaurant or refreshment-room in centre, and kitchen offices behind. The latter are very confused. The hall is approached by a staircase and vestibule, and is 120ft. by 60ft., with end gallery. "Ars Longa" is another design, and is by Mr. W. Scott, also in French Gothic. It is shown in a very vigorously-drawn and clever ink perspective and elevation, the hall above being well pronounced, with gabled ante-rooms at each end, a lofty tower crowned by a steep roof over one, and a series of gabled windows with sexfoil heads along the top, below which is another range of two-light windows, with circle-pierced heads. A range of circular-headed arches from the entrance. The plan is in many points preferable; the entrance is placed in the centre of the side, where there is a large hall and centre stairs to assembly-room, on each side of which are the cloak and lavatory-rooms. Behind these a large supper-room extends the whole length, well lighted, with ante-

rooms at ends. On the upper floor is the hall of the same length, but wider (120ft. by 60ft.), with minstrels' gallery over corridor, grand and second stairs, lifts, &c. For the figured architectural drawings Mr. J. H. Rayner carries off the medal. The subject chosen is the Church of St. Saviour, Southwark, the choir and crossing being delineated to a scale of $\frac{1}{4}$ in. to the foot, showing the groining in detail, and comprising plan, cross and longitudinal section and details. The drawings are effectively executed, and the cross section showing the iron roof over vaulting is interesting. A second medal for the same subject is given to Mr. George E. Langford. The measurements are more ample, and we note some divergences in the thickness, &c., of vaulting, &c. A third set of drawings are exhibited, showing lines of vaulting, but in an unfinished state. We see only one perspective outline, and for this Harriette Edith Grace takes the prize, as also for an example in sciography. The perspective is the Vestibule of the Farnese Palace, and the pencilling is exceedingly neat.

RESTORATION OF ITALIAN MONUMENTS.

IT would appear that all over the Continent, except where wars and rumours of wars distract the public mind, a general ambition exists to restore to their primitive grandeur the monuments of national history. Among the Germans this movement has been accompanied by a simultaneous multiplying of new memorials, whether dedicated to soldiers, statesmen, artists, or musicians, while Frankfort itself is not as yet satisfied with the honours awarded by it to Goethe and the Three Great Printers. The Italians, as a rule, have a less martial taste, and their revival of trophies long left to decay includes a far wider scope than is ever contemplated in Germany. For, although the people of the Fatherland never leave off adding stone to stone and sculpture to sculpture to the still uncompleted shrine of Cologne, the work is inexplicably slow, and the funds for its advancement exhibit no great degree of enthusiasm on the part of the nation. In Italy, however, a favourite moment has arrived for stimulating the popular feeling with reference to this patriotic task of art. At Mentana has been erected a monument, designed by one of the artist-bred Castellani, composed of granite, and characterised by the ornate style supreme in modern Italy, to the glory of the Garibaldian volunteers who fought for Rome—a pyramidal base, five steep Cyclopean steps, a noble square shaft, with something like a pagan altar on the summit, intended for the lighting of an anniversary fire, to be visible from every window of the Vatican, an inscription, and a florid architectural coronation of the whole. This, of course, was an undertaking representative of a special public spirit in the nineteenth century, but it had little or nothing to do with those grand relics of the past which it is seriously declared are more or less falling into decay, and which a national society of Italian archaeologists are eager to rescue. They are anxious not to be misunderstood. It is not ancient but modern Italy that they would preserve. It is not with the Coliseum, or the Forum, or Trajan's Arch or Column, that they concern themselves, but with the newer glories, the Duomo of Milan—which is betraying signs of a sad decay—the Cathedral of St. Mark, the Pisan Tower, and the Palaces of Florence and Genoa. More than this, some of the noblest creations of Michael Angelo are giving evidence of neglect, and, as we are reminded, it is almost impossible to travel from north to south of the Peninsula

without coming upon the warnings of incipient ruin. The quarries of Carrara, in numerous instances, are being put under requisition to supply the essential repairs; but in others, even more numerous, the process of dilapidation goes on more or less unregarded. Examples of this, in fact, are pointed out in the shape of protests at Ferrara, Parma, Modena itself—the very city—the Carrara marbles—Sienna, Naples, and Padua. But it is perhaps to be wondered at that, among the primal objects in view, the restoration of the Castle of St. Angelo should be included. Strictly speaking this is not an Italian monument at all—at any rate, of the period professedly selected by the restorers. Originally the tomb of Hadrian, it was converted into a fortress by the Goths, and has ever since, until recent years, been a symbol of Italian servitude. Apart from that, however, which forms no element in the subject, it is a mere citadel in combination with a prison, and if it does recal the names of Belisarius, Arnold of Brescia, and Rienzi, what have they to do with the annals of Italian art? It has come out of late that St. Peter's itself—styled by Madame de Staël “the greatest edifice ever constructed by man, for the Pyramids of Egypt themselves are inferior to it in height” (though therein Madame de Staël was wrong)—is not kept in adequate repair, notwithstanding the ample revenue set apart for that purpose. There are not a few Etruscan remains, indeed, which, comparatively speaking, have commanded more care than the most sacred monuments of modern Italy. Even the scarce memorials of genius bequeathed from the reigns of the Dukes of Urbino and Milan must moulder out of recognition before long, unless a saving hand be brought to their rescue. The Duomo of Milan itself, we are told—which, though shorter than Winchester Cathedral by a hundred feet, covers a third more ground—is exhibiting proofs of “mould” and “rust”—as Italian architects employ those terms—is losing its mellowness of tint, and becoming white again, and seems as though it had almost approached its destined age. This, however, is simply incredible. The massiveness of the masonry, peculiar though the material be, and the elaboration, so to speak, of the architectural framework inspire no such fears in the minds of those who have undertaken to renovate and preserve the Italian monuments for future Italian generations. In one respect possibly their complaints are justified. There are numbers of Italians, they say, who would cherish a fragment of the Bearded Bacchus, or the statue of an Athlete, or a marble monkey from the Vatican, while they would resign to dust the most exquisite memorial of the Renaissance. Tourist after tourist tells the same story, and Italian after Italian deplures it. It is true, no doubt, that the purely classical examples are the more typical of art in its highest development, but there is justice in demanding that the works of the Christian Italian genius shall not be relegated to decay. It is true, moreover, that the works of art belonging to the non-classic periods of the Italian chronicles are generally more or less ecclesiastical in their character. There is little of the romantic, the heroic, or the purely ideal to distinguish them, if we except the gigantic conceptions of Buonarroti; but even these, it is said, are gradually losing their perfection, while of the celebrated Roman frescoes it is still more positively asserted that the influences of a malign atmosphere are visibly beginning to tell upon their surfaces, and, so to speak, solidity. What remedies are proposed, and how such a kind of decay may in either case be guarded against, is not, as yet, even tentatively suggested. Hitherto, indeed, less attention has been bestowed upon these indications of, as it were, decom-

position than upon the restoration of monuments which have sustained rude and apparent injuries through the operations of time, or war, or civic neglect. There are, no doubt, preventive measures of the highest utility, but the solicitude of the associated restorers must before long be claimed by necessities more delicate, and unquestionably more difficult, to cope with. If once the great cartoons, or the marbles of Michael Angelo are assailed by that mysterious “rot,” which is even now whispered about in Italy, the salvage of these treasures will in itself constitute a national care. But it may be assumed that, in a considerable proportion, this is little more than the rumour of the studios.

In one instance, nevertheless, a structure among the most perfect, exquisite, and noble of all the Italian trophies, has been officially pronounced to have fallen into a state of dangerous decay, and it is believed the restorers—or, perhaps, they should be styled the conservators—propose, with permission from the Government, to commence their work. This is the Church of St. Mark, at Venice, and its façade especially. The great shrine which represents Venetian genius and history has been, perhaps, a thousand times described; yet the public-spirited Italian artists of our day are right in suggesting what it was in its full splendour, in order to show what it would be as a ruin—not, like most other ruins, a spectacle of ancient grandeur fallen; but gaudy, superb, and ostentatious—a picture of dilapidated magnificence. The façade of that basilica, no doubt, was, in its original design and condition, an incomparable though a medley monument—rather a triumph of riches, luxury, and an exulting genius, than a work accomplished in the pure pride of art; but a wonder of artistic magic, nevertheless. Its façade was a blaze of beauty, enriched with paintings in gold, “heaven blue,” purple, and scarlet; with architecture of every order and origin; sculptures including every form and subjects, the ideas of every people, as it were, and the parables of every religion—groups of saints and deities, friezes of animals and flowers, jasper from the East, marbles from Pentelicus and Africa, and gates of Corinthian bronze—the last, however, being prizes from the Mosque of St. Sophia at Constantinople, which, in its turn, was a copy from a previous edifice, and which, in fact, supplied in a general way the model of St. Mark's. But the builders were Italian still, notwithstanding their mixed Greek and Saracenic inspirations. Ornament is everywhere—on the green cupolas, the gilded globes, the peristyle, and its vaults lined with gilded mosaics; all this, indeed, exteriorly. Within, wealth was spread in every direction, like the rays of a sun, and gold was literally plastered on every capital, cornice, and intersection of arches—gleaming from five hundred pillars, from fifty altars, from every half-dim window. Add the pavement of tinted Oriental stones, the Grecian carvings in marble—the last illustrations, perhaps, of that dying genius—and we arrive at a faint notion of what this unique fane—not intended for the services of religion alone, but also for mundane pomps, as the audiences of great Venice, the reception of ambassadors, and solemn public assemblages—was in one period of its annals. The transformations recorded, for the information of the Government at Rome are, however, singularly enough, not so distinctly or so deplorably visible on the exterior as in the interior of the structure. There, we are told, in the somewhat florid language of the South, death has attacked the Cathedral of St. Mark from foundation to ceiling. Large cakes—so to term them—of blue and golden embellishment continually drop from the vaulted roof, leaving panels of melancholy emptiness. “The

skies and the stars descend in dust, leaving, in many places, nothing more than the bare masonry of the walls." Tourists carry away the fragments, and nothing as yet has been done—though something is now proposed—to arrest the process of artistic dissolution. Similar reports come from the Ducal Palace, where, it is asserted, the two celebrated colossal statues of Mars and Neptune—the tutelary genii of Venice in its Pagan mood, planted at the bottom of the Giants' Staircase—are drooping towards their fall, and where even the Tintoretto Gallery is said to be scandalously uncared for. In the midst of all this slow and silent decay the conservators, in a spirit of antiquarian patriotism, remind us, spaces are left vacant for the portraits of sixteen future Doges—spaces which will never be filled up. There are not many regrets, possibly, to be spared upon that point, and scarcely more upon another which, nevertheless, is emphatically dwelt upon. That the gradual decadence of the old monuments is to be deplored, and that a national effort to stay the insidious havoc would be a work worthy of Italy and of art may be at once and cordially admitted; but that the non-multiplication of structures so ambitious is a sign of Italian decadence may equally well be doubted. The great ecclesiastical and palatial ages have passed away for Italy, as for other countries, and we might as well sigh for another Appian Way or Street of Tombs as for a new Grand Canal or Genoa the Superb, or for the time when half a province was famished for funds to build a "Palace of the Syrens." In the meanwhile, it may be allowed that no less solicitude is due to the works of mediæval genius than to the excavated labyrinths of Herculaneum and Pompeii. The bronze doors of Andrea Pisani and of Lorenzo Ghiberti, at Florence, are worth at least as much as any number of funereal urns disinterred from beneath the cinders of Vesuvius; while the palace of the great Dukes of Urbino, with the interior of St. Apollinaris Nuovo and St. Vitale at Ravenna, are surely not less interesting as monuments than the Bridge of Augustus at Rimini, or the house of Diocletian at Spalato, even though the latter was long ago converted into a Christian church. They are not all purely Italian, or indeed of precisely Italian origin, but they are sufficiently associated with that nationality which gave its chief glory to the Renaissance to claim an inheritance from beyond the darker generations of the middle ages. But, as a universal rule, all men are to be praised who, in this, which is essentially and necessarily an utilitarian epoch, would recover and cherish what has been bequeathed to us by more imaginative and less scientific ages. We shall not, probably, gather the same fruit again from the same tree, and the world, so to speak, will be for the future, in these respects, rather more of a museum than a workshop. We may go on, indeed, up to a certain point, creating as well as preserving; but, in any case, the Italian archæologists are right in affirming that we cannot afford to lose, and ought to be ashamed of losing, a single memorial of beauty or greatness which we at present possess; and, therefore, while deprecating the interference of all irresponsible or experimental restorers, the world would gladly witness the establishment of an intellectual, sympathetic, and critical curatorship over the modern monuments of Italy.

THE LATE MR. SYDNEY SMIRKE, R.A.

IN the late Mr. Sydney Smirke, who died on the 8th inst., at the ripe age of 79, at Tunbridge Wells, we seem to have lost one of the remaining links between the present and the past generation. The family of the Smirkes appear to have been

long associated with art. Mr. Sydney Smirke's father was an old Royal Academician, and attained a prominent place as a depicter of many of Shakespeare's characters, while his talent in the representation of the humorous was largely sought after, and his pencil enriched many important works. Sir Robert Smirke, his brother, was, as our readers well know, celebrated as an architect, his name being associated with some of the earlier monuments of architectural art of the present century in the metropolis—the British Museum, the old Covent Garden Theatre, the General Post-office, &c., being a few of his well-known works. Another brother, the late Sir Edward Smirke, was also well known as an archæologist, and was warden of the Stannaries. Mr. Sydney Smirke was a pupil of his brother, Sir Robert Smirke, and soon acquired the taste for Classic architecture which had made the name of the latter so celebrated, though it must be remarked that Sydney Smirke's predilections were not exclusively towards that school, as he evinced a cultured and wider range of taste. On the death of Sir Robert much of his connection fell into the hands of Sydney, who continued to hold many of his brother's appointments. Probably one of the first buildings which brought the name of Sydney Smirke prominently before the public and the profession, was the Carlton Club House in Pall-mall, at that time considered one of the leading structures in the Venetian style of modern Italian. The design, as is well known, is founded on the model of Sansovino's library of St. Mark at Venice, the proportions and columnar façade of the Libreria being adapted with considerable judgment and taste, though it has not escaped the censure of the critics of its day. As a modern adaptation for the purpose of a club-house, it may be said to savour too much of a copy; nevertheless, we may affirm that it is far more appropriate in fenestration to the atmosphere of London than the heavier structures which accompany it, conceived in the spirit of the Florentine or the Pandolfini and Farnese palaces. Our objections are mainly to the colonniation and arcades and the heavy entablatures, though these have been considerably modified from the original. In conjunction with the late Mr. Basevi, a very eminent architect in his day, Mr. Sydney Smirke also designed the Conservative Club-house, another conspicuous example. Another great work that will long be connected with his name as an architect is the reading-room of the British Museum, a building deservedly esteemed for many points of constructive adaptability, ingenious economy of space, and fire-proof properties, though hidden from public view behind the severer and more monumental structure of his brother. That work Mr. Sydney Smirke obtained by the efforts of Sir A. Panizzi, the late principal librarian, to whom much of the merit of the design is, perhaps, due. He was also the architect of the new galleries of the Royal Academy at Burlington House, and of the Roman and Assyrian galleries at the British Museum, and designed the Italian arcades of the Horticultural Gardens, Kensington, in the latter of which considerable skill and taste are shown in the terraces and arrangement of levels, and the general effects and details of the arcades and terraces of the Villa Albano, and the cloisters of San Giovanni in Laterano have been kept in view. Of other works we may mention, the Juvenile Reformatory, Isle of Wight, Custom-houses at Gloucester and Newcastle, the restorations of portions of Lichfield Cathedral and York Minster after the second fire, the Savoy Chapel, and the Temple Church with Mr. Decimus Burton. Among domestic buildings we may note Oakley-park, Clumber-park, Luton Hoo,

and portions of Drayton Manor. Mr. Sydney Smirke held many important offices. He was architect to Bridewell and Bethlehem Hospitals, and to the Inner Temple; surveyor-general to the Duchy of Lancaster, and trustee to the Soane Museum. Many years ago he obtained the Royal Academy gold medal, was elected a Royal Academician, and was also elected a professor of architecture of the Academy in 1861, besides being its treasurer. He also obtained the gold medal of the Institute of British Architects.

The opinions and views of Mr. Sydney Smirke on architectural questions may be gathered from his very excellent lectures on architecture at the Royal Academy. Indeed, it may be affirmed that few men who have occupied the distinguished chair of professor at the Academy during the present century, have so thoroughly and logically handled the elementary principles of the art. In a lecture delivered in 1859, on "The Use and Application of Architectural Ornament," we find a masterly exposition of the subjects delivered in the clear yet elegant style of the lecturer. Sententious and epigrammatic, it contains a fund of valuable suggestions that even now would be read with keen interest. Speaking of the application of statues to the decoration of buildings, he says—"When a sculptor's object is exclusively to represent life, he can hardly, I apprehend, give to his subject too much of the freedom and elasticity of life; but when he applies himself to the very distinct object of architectural decoration some restraint must be submitted to. When the Greek artist designed the Athenian caryatides, we see in every portion of his work that, whilst never falsifying nature, he felt the necessity of giving both to the flesh and to the drapery a rigidity and formality which stamped a peculiarly artificial character on the statues. So, in the best times of mediæval art, a figure is usually designed in so severe and so simple a manner, with such angularity and rigidity in its drawing, that one sees at once that the natural model has been very widely departed from, and that an architectural character has been impressed upon it, which admirably fits it for its special purpose as an accessory to architecture." With similar reasoning, Mr. Sydney Smirke shows that all architectural ornament must be conventionalised, and he classifies it under—1, ornamental objects that have a direct practical utility; 2, purely æsthetic ornament; 3, ornaments designed with a view to impress a specific character on the work. Another paper by Mr. Sidney Smirke, read at the now defunct Architectural Exhibition, "On the Use of Colour in Architecture," is before us, treated in the same exhaustive and complete manner, and displaying a deep and exact acquaintance with the theories of colour, and an extensive knowledge of the art history of the subject. His study of classic Italian art was accurate and profound, and his Academy lectures on Architecture and Form may be regarded as the ablest discourses on the Italian style that have been delivered within the present century. It was Mr. S. Smirke, A.R.A., in conjunction with Professor Donaldson, who introduced to Lord Palmerston the deputation, in 1859, of many influential members of the profession to resist the adoption of the Gothic style for the new Foreign Office. Not a competitor himself, he was elected to express the views of the Classicists, and he fortified his opinion by referring to the practice of architects at Berlin, Munich, Paris, and Vienna. Speaking of style, he said, in a paper read at the Royal Academy:—"In architecture, I fear, it is a vain struggle to attempt to renew exactly any phase or state of existence that the art may have passed through. We may exactly reproduce a building, we may exactly repeat a form, we

may mimic every feature, but I greatly doubt whether we can ever really and truly recall to life a style that has once passed away." His mind was rich in ideas, called in his travels, and his sketch-books teem with notes and memoranda of foreign buildings. He was an accurate sketcher. It is said, too, he was extremely accurate in his estimates—a virtue which he inherited from his brother, Sir Robert, who, it has been asserted, never exceeded his estimate. Reserved in manner, he was highly valued by all who knew him for his genuine friendship, amiability, and strict integrity.

BUILDING NEWS DESIGNING CLUB.

REVIEW OF DESIGNS.—NO. XX.

A Hall Fireplace.

THE designs we have received for this subject are very numerous, and many of them have been skilfully handled. "Début," whose design we place first, has sent a very characteristic and highly-pleasing sketch of a projecting chimney-piece, the breast being supported on bold truss-like jambs, with moulded faces. The mantel forms a deep frieze, having a panel in bas-relief, with figures of chubby boys. The shelf forms a dentil cornice of small projection, and the breast or hood above is carried up vertically, its front having panelled pilasters with bas-relief enrichments standing above the jambs; between these the breast is relieved by a square panel, within which is a diagonal panel enriched with a centre shield. A dado is carried round at the level of mantel-shelf. There is a structural meaning evinced, and the design bears the impress of a cultivated taste in a semi-Classic spirit. No plan is shown. "B," in circle, is also simply treated and effective; the jambs of fireplace are vertical, and rise from attached semi-octagonal shafts. The arch is segmental, and springs from a recessed plane of the jambs, and the opening is partly recessed in wall. It is enclosed under a square moulded mantel, carrying a shelf, above which rises a plain gathered hood, having a projecting shelf near the top for bric-à-brac. Red-glazed tiles line the fire-opening, which has a dog-bar grate. Under the motto, "Tom Pinch," we have a cleverly drawn chimney-piece of domestic Gothic type, with a large arched opening or recess 9ft. wide, embracing side seats and lights on each side of the fireplace proper. A massive stone hood of pyramidal form springs from a richly-carved cornice or mantel 11ft. 6in. from floor. The arch is of semi-elliptical form, moulded, with flowers carved in the hollow. An impost moulding runs round, having a dado. The fireplace has simple jambs and mantel, and dogs are shown, between which, on a low hearth, are kindled the logs. Artistically, the treatment is clever, but the projecting jambs of the hooded recess, which take up 2ft. of hall, are questionable. The details show some good moulding. "Fleur-de-Lis" is also a cleverly-conceived hooded fireplace, with slightly projecting jambs and straight mantel. The band of oak foliage below the shelf is too florid, and the hood, which is canted at angles, is amenable to the charge of being redundant of carving. The oak branching in front of the sloped hood holding a shield is clever, but the foliage is too heavy. The motto below the circumambient label moulding on each side, "East or West, Home is Best," is characteristic. A shelf is shown, and the fire-grate is open, with dog-bars. "Another for Hector" is a clever and simple design, a low plain hood being carried by jambs projecting as consoles on each side. The fire-back is splayed and tiled, and a dog-grate is shown. "War" sends two designs of sloped hooded fireplaces. We prefer the one with the straight-sided hood. The jambs have bold console bases, the faces of which are deeply grooved—not very desirable for black or soot. We do not like the treatment of arch and tiles over the opening, and there is no shelf. The finish of hood, too, is meaningless, and the mouldings not happy. The smaller hooded design shows a better sort of corbel to jambs, less obstructive in hall, but we dislike the curved

lines of hood, and the heavy, barbaric-looking arch in three orders introduced. One would imagine it had to a portcullis. "Noah" shows the fireplace flush with wall, in a recess, the side jambs of which project slightly into hall, and carry a sloping hood. A seat is shown on each side, and narrow lights are pierced above them. There is also a corbelled shelf for ornaments within the recess. We take exception to the corbels supporting the arch of hood, which is a flat segment, and the treatment is a trifle too heavy. "Unit" is a similar composition, in a German Gothic style, but more florid. There is a flat arched recess, with hood over, the jambs projecting about 3ft. into hall. The fireplace is flush with wall, and above it is a band of carving with side leaded lights, filled with painted figure subjects, while over the opening is a mirror. The design is wanting in consistency of detail; the quatrefoils along the arch and the small spandrels are in bad taste. "Mentonnière" has a large splayed fire-opening recessed; the jambs are corbelled out above, and carry a hood. There is a gabled niche for clock in centre of mantel-piece, but no shelf. The carving is rather overdone, and the floriated cresting out of place. The author shows a flat mantel, a straight bar-grate, with polished steel uprights. "Bee" in circle goes in for a corbelled hooded chimney-piece, out of the hood of which springs a base, supporting a clock with chimes in wood case. The idea is fanciful, but certainly not architectural. Whatever reason induced "Discere Volo" to design such an excessively lumpy mantel passes us; and such jamb shafts! as if they were intended to carry a bridge. If the author had been contented to have given us a mantel, or half the depth, without a tenth of the exuberance of moulding and carving, he would have come nearer the mark. Why black in the sectional details so thickly? A line would have done. "Unit" takes an unnecessary deal of pains to show a design of little merit. It is too clever, and chopped up in the hood, just for the sake of getting a shelf or two. How much better it would have been to have omitted the corner vases, or to have abandoned the upper hood, which seems to rest on the shoulders of the lower one in a very acrobatic fashion. This part is beyond us—the jambs and mantel are better. We may mention also "Discipulus," too lofty in the proportion; "Watt," spoilt by the groaning bats carrying the hood, the corbels and the crowning; "Ambition," too meagre and commonplace; "Medicus," rather heavy, and with bad mouldings; "Cave Canem," not up to mark.

A Fender and Fire-Irons.

Coming to this subject, "Début" carries off the palm. His sketch shows a very spirited treatment of the fender and coal-scuttle. The fender is a flat semi-ellipse on plan, divided into panels by turned metal uprights, between which, upon a low plinth or band of plain metal, is open metal scroll-work. The coal-scuttle to match is of wrought metal, of a square basket shape, with hollowed scroll sides, and movable lining, the handle folding down under the cover. The sketches display much taste and refinement, and the fire-irons are equally appropriate, without losing their utilitarian character. The designs harmonise with the style of the chimney-piece of this author. "Another for Hector" is a clever treatment. The fender is of pierced brass and copper, with oxidised rail and base mouldings. Its profile is ovate, sloping inwards, the ornament being pierced foliage in panels of a Classic type. The moulded members are chaste. The scuttle is proposed to be of beaten copper sides, with a border of brass and copper studs, oxidised at the outer edge. Its form partakes of the ordinary type, there being a base and handle, with a lid. Brass folial ornament enriches the top, base, and sides. The fire-irons are scarcely so pleasing—the tongs have an awkward bend near the hinge. "Mentonnière" sends a Classical conception. The coal-scuttle is circular, of sheet iron, proposed to be painted chocolate, with gold and blue ornaments round base and top. We may doubt the appropriateness of its shape. It has a raised and moulded lid, and a handle. The fender is of cast iron or steel in the upright

open part, with cast brass rail. The top rail runs to a point in the centre—the middle panels being rather the deepest. The ends of fender form scrolls, in the middle of which are the rests for the fire-irons. These are of a commonplace character.

An Oak Lectern.

"B" in circle sends a pleasing Gothic design for lectern, not marked by any originality, but but by a quiet treatment. The base is cruciform, composed of four buttress-like projections, panelled on the fronts and return sides, and resting on a moulded square base. A centre square post, carved on each face, rises between the buttresses, carved in gabled form at top and carrying a revolving double slope with pierced ends, having a niched figure of an apostle on each side. The four buttressed projections are dovetailed to the post. "Fleur-de-Lis" is a more florid attempt in Late Gothic. We like the plainer shaft shown. The double-sloped desk, with carved ends and candle brackets, is in keeping, and the details display taste. "Noah" is a study displaying some ability, and the drawing is commendable, but we do not think the base and turned three-pillared stand harmonises with the lectern top with its quatre-foiled tracery. "Excelsior" has scarcely given us a lectern; it is more of a table or desk supported on four carved legs; style, Renaissance. "A. L. B." exhibits a fair slope for the books, and the tracery ends are neatly drawn. The carved cap and the four evangelists round the base are not so good, and would have been better omitted. We cannot understand the artistic interest in the lizard-like reptiles crawling up the four spurs of the base. Such representations are best avoided. "Normie's" book-rest is too flat, and the pedestal of four combined pillars not pleasing. We cannot see why a lectern support should be a pillar with capital and base; it is hardly appropriate. "L. in G." is more of a reading-desk. It is framed, with three sides filled with open tracery in panels; cut displays a want of knowledge in the adaptation of traceried forms. The sacred monogram occupies the centre panel, and a row of smaller panels at the base is proposed to be filled with coloured embossed figures of Christ, the evangelists, and the prophets. We may mention also "Prenez Garde," "Cleo" (overdone with stop-notches and meaningless ornament), "Naivète," and "J. W. C.," in circle. Our correspondents will pardon our saying that in the majority of these designs there is an immoderate attempt at ornament of a false kind, and a desire to mimic richly-carved pillars and unmeaning tracery, instead of designing something appropriate. For example, many have chosen a pillar as a pedestal, with caps and base. One has given us the model of a cast-iron clustered column, plain and very heavy, standing upon an open traceried base of icicle-like fragility.

AMENDMENTS OF THE BUILDING ACTS.—II.

(Continued from p. 533.)

RESUMING consideration of the Metropolis Management Amendment Bill, which is being promoted by the Metropolitan Board of Works, we now come to deal with Section 4, one of the most important in the bill. This section is intended to secure that in future all streets used for carriage traffic shall be 40ft. wide, and streets for foot traffic only shall be 20ft. wide. The method of effecting this object is the prohibition of any wall nearer to the centre of the roadway than 20ft. or 10ft. as the case may be. Whatever may be the fate of the details of the bill before passing into law, the principle of measuring the widths of streets from a centre line should be welcomed as a valuable innovation. And it has been pointed out by the Liverpool Architectural Society, in their recent report on the Model Bye-Laws, that the embodying of the same principle in Bye-law No. 53 would be an improvement of the model.

Cases will arise, however, of irregular streets in which it will be difficult to define the centre line throughout every part of its length; and it seems desirable that in these cases the Metropolitan Board should have power to prescribe the line. For this purpose an enabling clause

could be added to that clause in this section which empowers the Board to consent to the reduction of the specified distance.

It is not difficult to foresee that upon rebuilding in existing streets, owners will often suffer loss by being compelled under this section to set back from the general line of building; and it may be expected that some effort will be made to insert provisions enabling such owners to receive compensation. In cases of this kind it will frequently happen that old vaults or areas remain under the footway, or that it is desired to retain the front wall of the basement so far as it is below the level of the footway. On the one hand, it appears not quite reasonable that the consent of the Board should be necessary for the retention of such underground structures; and, on the other hand, it is desirable that the Board should have power to prevent the formation of new areas or vaults in any street before it is given up to the public. It is to be hoped that in order to meet these cases Section 4 will be amended in some such way as suggested below.

The expressions "the external wall or front" and "space left in front," are at once too vague and too narrow—too vague as not conveying a clear idea, and too narrow as limiting "front" to one only of the sides of a building. For in the absence of any definition of "front" it is quite arguable that a building may have two, three, or even four fronts to as many different streets. It would be better to discard these expressions, and to specify "building" simply.

Perhaps it is doubtful whether the term "extension" as used in this section would apply to such a case as that of a porch, say, removed from one side or front of a building to another; but "alteration" would cover all such contingencies, and would therefore be the better word for the purpose.

We here give the first paragraph of Section 4 in full, italicising whatever appears to be better excluded, and bracketing suggested additions:—

"4. From and after the passing of this Act no house or building [nor any part thereof] shall be *constructed* [erected] or *extended* [altered or enlarged] in such manner that the [outer face of any] external wall or front of such house or building or if there be a forecourt or other space left in front of such house or building the external [the outer face of any] fence or boundary of such [any] forecourt or other space [appurtenant to such building (whether such external wall or such fence shall be above the surface of the roadway or not)] shall be at a distance of less than 20ft. from the centre of the roadway of any [street] road passage or way [() whether a thoroughfare or not ()] being a highway (whether repairable or not by the inhabitants at large) which may [shall] be used [or intended to be used] for the purposes of carriage traffic or within [at] a distance of less than 10ft. from the centre of the roadway of any such [street] road passage or way which may [shall] be used [or intended to be used] for the purposes of foot traffic only without the consent in writing of the Board [.] Provided always that [And] it shall be lawful for the Board in all cases where they shall think it expedient to consent to the *construction* formation or *extension* [erection alteration or enlargement] of any houses buildings forecourts or spaces [fences] within the said distances respectively at such distances and subject to such conditions and terms (if any) as they shall think fit to prescribe. [Provided always that in cases where buildings shall be rebuilt nothing in this section contained shall prevent such portions of the external walls as shall have been below the surface of the roadway from remaining or being rebuilt in the positions which they shall have occupied immediately before the rebuilding of the superstructure.]"

It will be seen by the clause just quoted that the present requirements as to widths of streets will not be extended but will be made more precise. The same widths are prescribed by the Metropolis Management Amendment Act, 1862. Much difficulty, however, has arisen in enforcing the observance of those provisions, owing to the cropping up of peculiar cases which have not come within the statutory

definitions, and especially owing to a decision of the superior Court restricting the meaning of "street" to places where houses are built on both sides. It may be for this reason that the framers of the bill have omitted "street" from several clauses. The mention of "road, passage, or way," seems to be a sufficient safeguard, however; or if not, an interpretation clause could be added which would give to the term a meaning wide enough to include all possible cases.

The remainder of Section 4, with the desired alterations, runs thus:—

"In every case where any such house building forecourt or space [such fence] shall be *constructed* formed [erected] or *extended* [altered or enlarged] or begun to be *constructed* formed [erected] or *extended* [altered or enlarged] in any such road passage or way as aforesaid at a lesser distance from the centre of the roadway of [any] such [street] road passage or way [as aforesaid] than is [the distance] prescribed by this enactment or by the Board it shall be lawful for the Board to serve a notice upon the owner or occupier of the said house building forecourt or [of such] space [as aforesaid bounded by the said fence] or upon the builder or person engaged in *constructing* forming [erecting] or *extending* [altering or enlarging] the same requiring him to cause such house building forecourt or space [such fence] or any part thereof to be set back so that the external wall[s] of such house or building or the external [face of such] fence or boundary of such forecourt or space shall be at the distance prescribed by this enactment or by the Board from the centre of such roadway."

Section 5 provides that in case streets which are not highways shall afterwards become highways, any building or fence within 20ft. of the centre, if carriage ways, or within 10ft. of the centre if footways only, shall be set back to the prescribed distance when the Board so require.

Section 6 gives directions as to proceedings in case of default, and limits the penalty to five pounds and a continuing penalty of forty shillings a day.

Section 7 prescribes that streets formed for foot traffic only shall not afterwards be used for carriage traffic, without the consent of the Board, unless the width be 40ft. where there are houses on each side, or 20ft. where there are houses on one side only.

The latter part of this clause appears likely to produce rather awkward results. The effect of it would probably be that a 20ft. street used for foot traffic only, the cost of which had been borne by the landowners on each side, might at any time be made a carriage road, without the consent of the Board, by building on one side; and the owner on the opposite side must then add 20ft. to the width of the carriage road thus formed before he could build houses on his own land. There should be added a proviso that on the conversion of a foot road into a carriage road the houses on either side shall be kept back 20ft. from the centre of the original foot road, and the extra width added to the road, whether there are buildings on the other side or not. Or, otherwise, the landowners on both sides should be required to enter into a mutual undertaking with the Board for the addition of 20ft. to the road on the second side, so to speak, whenever houses shall be built on that side.

But here it occurs to us that Section 4 prohibits building within 20ft. of the centre of a carriage road; so that there seems to be some contradiction between that section and this, unless one of the sides of what has been a foot road is to be deemed the centre of a carriage road the formation of the other half of which may be deferred until houses are to be built abutting upon it. There ought to be no room left for doubt on this point, especially in such a case as that already mentioned, where the road divides the land of different persons.

In pointing to these apparent anomalies and omissions, it is assumed that there is no existing enactment which quite meets the cases that have been supposed. The remaining clauses of the bill, which relate chiefly to "foundations," shall be referred to in another notice.

W. G.

CHIPS.

The parish church of Wetherby was reopened on Friday last, after restoration by Mr. H. Walker, of Wetherby, at a cost of £750.

A meeting, convened by the Mayor, has been held in Birmingham, to consider the expediency of authorising the Town Council to make an application to Parliament for an Act to empower them to acquire, by purchase, agreement, gift, or otherwise, the disused burial-grounds within the borough, and to fence, lay out, and appropriate the same as open spaces accessible to the public, and for other purposes.

A resolution has been unanimously passed by the vestry of the parish of St. Anne, Westminster, regretting that the Metropolitan Board of Works has postponed the formation of the new street from Charing-cross to Tottenham-court-road; declaring that such postponement of a great metropolitan improvement is attended with great loss and inconvenience to a large body of ratepayers.

A new passenger station has been erected at Middlesborough, from designs by Mr. W. Peachey, of Darlington. Messrs. Shaffo and Barry, of York, were the contractors, and Mr. Alonzo Taylor, of Middlesborough, the clerk of works.

An extension of the bridge, and considerable addition to the railway station, have been executed at Sale, under the direction of Mr. Henry Woodhouse, C.E.

The members of the Association of Municipal and Sanitary Engineers and Surveyors will visit Dartford to-morrow, for the purpose of inspecting the West Kent Main Sewerage Works. The visitors will assemble at the offices of Messrs. Hayward and Co., the clerks to the Dartford Local Board, at 11 a.m.

Approval has been formally given by the Irish Local Government Board to a plan prepared by Mr. P. F. Leonard, C.E., for the drainage of the districts of Drumcondra and Glasnevin, in the rural sanitary district of North Dublin Union.

Walcot Parish Church, East Norfolk, was reopened last week, after restoration at a cost of £1,000.

The Cheltenham Town Council have received the assent of the ratepayers to the bill to be promoted next session for the purchase of the waterworks from the limited liability company.

The transfer negotiations between the Town Council and gas company of Retford have been brought to an amicable termination—the corporate seal having been affixed on Monday last to an agreement by which the local authority acquires the undertaking and works at a cost to the ratepayers of £24,000.

The annual exhibition of the works executed by students in the Great Yarmouth School of Art took place last week. The Norfolk journals speak of the exhibits as reflecting the highest credit on the students and their head-master, Mr. J. F. Ryan.

The local board of health for Cirencester determined last week to adopt a system of sewage irrigation for Cirencester, with an outlet on a sewage farm at Siddington, to which point the sewage will flow by gravitation.

Plans have been prepared for the Wrexham rural sanitary district by Mr. Glennie, their engineer, of a proposed separate drainage scheme for the districts of Bersham, Minera, and Brymbo, with an outfall on Barnhill Farm. The expense is estimated at £3,500.

In our notice last week of the Leeds Architectural Association we did not mention that Messrs. Powell Bros. of that town exhibited some specimens of the tile cartoons, similar to those exhibited by Messrs. Chubb and Son at the recent Croydon Congress Exhibition. As this series of designs has attracted favourable attention, Messrs. Chubb and Son request us to say that they will be happy to show the cartoons to any of our readers who will call at 57, St. Paul's Churchyard, E.C.

The new Conservative club at Broughton is approaching completion. Messrs. Armstrong and Dow, of that city, are the architects. A new Liberal club is now about to be erected from the designs of Mr. Whittington, architect, of Manchester.

The Council of the Society of Arts offer the sum of £100, together with the society's medal, for the best essay on the art of the silversmith, past and present, of all nations, together with practical suggestions for its future development.

Designs by Messrs. Adkins and Son have been accepted by the School Board for Wisbech, for schools in Elm-road. They provide for 200 girls and 137 infants, and are estimated to cost, together with school-house and internal fittings, £3,450.

Aleconbury Church, Hunts, was re-opened on Tuesday, after restoration and re-seating, from the designs of Mr. Christian, the erection of an organ by Messrs. Hill and Son, and the re-founding of some of the bells, now raised from a peal of five to one of six.

New school buildings were opened at Pontminster by the Risca School Board on Tuesday week. They are Gothic in style, accommodate 400 children, have spacious playgrounds attached to each department, and were built by Mr. J. Piggford, of Newport, at a cost to the board of £2,300.

OUR LITHOGRAPHIC ILLUSTRATIONS.

KIMBOLTON GRAMMAR SCHOOL, NEAR ST. NEOT'S, HUNTS.

THESE buildings have been erected on a new site just outside the town, and were opened in September last under a new scheme, drawn up by the Charity Commissioners, for the management of the grammar school, founded by Henry Bayle and William Dawson, at Kimbolton, in the county of Huntingdonshire, in the year 1600, and the new scheme provides that the governing body shall consist of nine persons, of whom one shall be the owner for the time being of Kimbolton Castle, or some person named by him, to serve for a term of five years. Four to be representative governors, and four to be co-optative governors. The school is provided as a day school and boarding school for boys, to accommodate 80 boys, of whom 16 are boarders. The head-master is to be a graduate of some university. The new buildings have been erected by Mr. Thos. Spencer, builder, of Bedford, from plans prepared by and under the personal superintendence of Mr. John Ladds, architect, London. They have been built with local red bricks, and Bath stone has been used for all sills of windows, and sparingly introduced into the dressings of principal entrance to school and master's house, so as to make them at once apparent. The arrangement is simple, and the that for boys, tradesmen, and visitors, and entrance to master's house, are as far as practicable separate and distinct. There is plenty of room on the site, and provision is made for future extension, if at any time found necessary and the funds will admit. The buildings are covered with plain tiles—those from the old buildings, as far as sound, being re-used. The dormitory is partitioned off into cubicles that each boarder may be provided with a small room to himself—the wood partitions being about 7ft. high. The old buildings hemmed in the church on one side, and were so cramped for room that it was considered quite impossible to alter and rearrange them in accordance with the present notions of school requirements; so subscriptions were raised in the town and county, and they were purchased, taken down, and considerable improvements effected in widening the high road round churchyard, and part given to the churchyard, which is to be planted with shrubs. A low brick wall has been built round the yard, with ornamental oak gates, on the site of the old school, leading to the west door of church. This removal of the old buildings has the effect of exposing the south and west sides of church to view, also the exceedingly handsome tower and spire, with the elaborately moulded Early west doorway in tower.

"BUILDING NEWS" DESIGNING CLUB.

THE designs for a graveyard monument, and for a small railway station, illustrated this week, were reviewed a fortnight since (p. 547).

APSE OF CHRIST CHURCH, WESTMINSTER-BRIDGE-ROAD.

OUR illustration is taken from Mr. A. Bickerdike's drawing in the Royal Academy Exhibition of the present year. The original design for the pulpit contained richly sculptured subjects, but much objection was made to representations of this character, and a simpler design, with all sculpture omitted, as shown in the view, had to be substituted. Funds are now being raised for its execution. The organ was built by Messrs. Lewis, of Brixton, from the architect's designs. The two apse windows are filled with painted glass by Messrs. Clayton and Bell. The east window could not be pierced as the building abuts against adjoining property at this point—the centre bay has therefore been prepared for subjects in mosaic work. The spaces beneath the windows were intended for frescoes. The reredos is shown according to the architect's original intention. The objections to sculpture, however, apply here also, and it will probably not be erected at present. The space behind the reredos is used as a communication between the organist and choir, &c.

CHURCH OF ENGLAND SCHOOLS, HEWORTH, YORK.

THESE schools were built in 1872 for the new district of Heworth, for which Lady Wheeler had previously erected the church and parsonage. The schools are for boys and girls, with an addition, made in 1875, for infants, accommodating in all about 250. The Rev. Horace Newton, the first vicar, gave the ground, and contributed largely towards the expense of the buildings, which are of red and white brick, and some stone dressings. Messrs. G. Fowler Jones and Son were the architects.

ENTRANCE GATEWAY AND LODGE, MOUNT ST. JOHN, NEAR THIRSK.

THE illustration represents the external view of this lodge, now nearly completed for John Walker, Esq., who has also rebuilt the larger portion of the house, which is plain and built, like the lodge, of the local stone, and stands on the site of the old monastery of St. John, near Whitestonecliff, on a spur of the Hamilton hills. Messrs. G. Fowler Jones & Son were the architects, and the works are being carried out under their directions.

THE MARKET HALL, LEDBURY.

THIS structure was designed by the architect John Abel, who died in 1674. The building originally contained first and second floors, but within the last few years it has been restored, and the second floor at the level of tie beams of roof removed; the tie beams show mortices for floor joists, arranged like those of first floor. The present mullions and transoms of windows are modern, and from a piece of old mullion of larger section it is probable that each window had fewer lights originally. During the restoration it was found that, on the first floor, the building had sagged some 3 or 4in. all round the outside; this has been made up under the modern floor. The size of the building on the ground floor is 50ft. 2in. by 22ft. 3½in.; the 16 large posts are 15in. square at the base, diminishing to 13in. square at the top; the main timbers under first floor are from 13½ to 11in. square—all curved struts, 3½in. thick. The main wall timbers on first floor are from 11 to 10in. square, chamfered, and projecting on the inside; intermediate and diagonal ones, not showing on the inside, about 9 by 4in. All filling in between timbers is lath and plaster work.

SCHOOLS OF ART.

THE ROYAL ACADEMY.—Sir Francis Grant distributed the prizes to the students of the Royal Academy on Monday night. He spoke at some length on the necessity of truth in art. The following is the prize list:—Historical painting, gold medal, £25 scholarship and books, James Elder Christie; landscape painting, gold medal (Turner), Allen C. Scaley; painting of a figure from the life, silver medal, H. H. La Thangue; painting of a head from the life, silver medal, Blanche Macarthur; extra silver medal, Henry Gibbs; copy of an oil painting, silver medal, William Walker; drawing of a figure from the life, 1st, silver medal, not awarded; 2nd, silver

medal, Charles Knighton Warren; drawing of a head from the life, silver medal, Edgar Hanley; extra, silver medal, Lewis Will Jackson; composition in sculpture, gold medal, £25 scholarship and books, Thomas Stirling Lee; design for a medal, silver medal, not awarded; model of a figure from the life, 1st, silver medal, not awarded; 2nd, silver medal, not awarded; model of a statue or group, 1st, silver medal, Emmeline Halse; 2nd, silver medal, not awarded; drawing of a statue or group, 1st, silver medal, Bernard Evans Ward; 2nd, silver medal, Arthur William Hayes; drawing of a statue or group, £10 premium, Richard Alfred Williams; design in architecture, gold medal, £25 scholarship and books, Edward Clarke; design in architecture, travelling studentship, Eley Emlyn White; architectural drawing, 1st, silver medal, George H. Rayner; 2nd, silver medal, George E. Langford; perspective drawing and sciography, silver medal, Harriette Edith Grace; composition and design of a figure picture, 1st, £40, James Elder Christie; 2nd, £10, Henry Marriott Paget; proxime accessit, Walter Charles Horsley.

LEICESTER.—The annual distribution of prizes to the students of the Leicester School of Art took place on Wednesday week. The report of Mr. Pilsbury, the head master, stated that the number of students who attended the school last year was 258; this year there has been an increase of 46, the total number being 304. Last year 1,016 works executed by the students during that year, were forwarded to South Kensington. This year the number was 902, but the awards were higher in merit, and the grant to the school greater than that of last year. Last year 16 works were chosen for prizes, all of which received third-grade awards, but none were successful in the national competition. This year 15 were chosen, to 10 of which were awarded third grade prizes, while 5 obtained national awards. The highest result in former national competitions was in 1874, when the school obtained two awards—viz., a silver medal and a book prize. This year it has gained one silver medal, one bronze medal, and three book prizes. At the local time-examinations 69 students presented themselves last year, of whose exercises 9 were marked "Excellent" and 50 "Pass." This year 78 students were examined, and of their exercises 15 received the mark "Excellent," for which prizes were awarded, and 29 the mark "Pass," for which the students receive certificates. Whilst the number of successful exercises, therefore, is less than last year, the number of prizes is greater. Had not the classes been interrupted by the closing of the school the total number of successful papers would probably have been still greater. Five of these successful students have obtained "full certificates" for having passed in the four subjects of the second grade examination, whilst last year four such certificates were awarded. Free scholarships entitling the holders to attend the evening classes for a year without the payment of fees, have been awarded to five students. The school obtained the same number last year.

The Church of St. Mary, Old Linslade, near Leighton Buzzard, was reopened on Thursday week, after restoration from the designs of Mr. Lawrence, architect. The works are said by a local newspaper to "partake more of durability than artistic effect." They include the whitewashing of the walls, laying a new flooring, erecting a substantial stonework north porch, the blocking up of the south entrance, and rearrangement of the churchyard.

At a vestry meeting, held at Wallingford, on Thursday, the 6th inst., it was decided to enlarge the parish church of St. Peter by the erection of a chancel and vestry. The plans are being prepared by Mr. Stevenson, who was the architect for the grammar school.

Allhallows' Mission School, St. Paul's, Bedford, was opened on Wednesday week. It consists of a principal room, 62ft. by 28ft., with hammer-beam roof, ceiled between the principals, and two classrooms, each 20ft. by 18ft. It is built of red Bedford bricks, and roofed with plain tiles. Mr. Day, diocesan architect, furnished the design, and Mr. Samuel Foster, of Kempston and Bedford, carried out the contract, which amounted to about £1,000.

The Town Commissioners of Kingstown have applied to the Local Government Board of Ireland for sanction to borrow £1,000, for asphaltting the footpaths in the township.

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association took place on Friday evening; the President, Mr. B. A. Paice, in the chair. The following were elected as members: — A. Burnell Smith, F. J. J. Whitwell, E. C. Newmarch, Ellis Mawland, H. W. Booth, E. A. Mason, J. P. Cutts, F. Baldwin, W. F. Keen, E. H. Abbot, H. Rose, H. Ainsworth, C. C. Wilson, F. Barrows, and W. F. Essex. Five others were nominated for election. On the motion of the President the presentation by Miss Jones of a framed portrait of her late brother, Mr. Owen Jones, was directed to be acknowledged with thanks.

GOTHIC ARCHITECTURE.

Mr. J. J. STEVENSON read a paper on the "Development of Gothic Architecture," the subject being illustrated by a number of drawings in water colour and pencil, executed by Mr. H. W. Brewer. The lecture was of an elementary character, and, as the author intimated in his prefatory remarks, was substantially identical with a paper published some time since. The development of Gothic architecture could, he said, be best traced in France,

vaulting almost immediately adopted. But the arches opening between nave and aisles and those of the windows were still round. Attempts, again from a desire for fireproof construction, were soon made to build domes. Gothic had once a chance of becoming a domical

(Fig. 6). Then the roofs all stone were not watertight, and it was found necessary to make the vault merely an inner ceiling, protected outside by a simple wooden-framed roof. Gothic, as we know it, developed in the north of France, in the Royal Domain. At first, their churches being large, the builders confined their fireproof constructions to the side aisles, for they were unable to vault over the wider central portion, nor could they afford to lose the clerestory which lighted this central part by raising the side aisles so as to make them abutments to a waggon vault. But by dividing the continuous waggon vault of the nave into square compartments, and running another vault across each compartment, so that the two vaults intersected, as the Romans had done, they concentrated the thrust on the four angles of the compartment, where it was abutted, at first ineffectually, by tall buttresses, but with larger experience completely, being carried down to the ground by half an arch—a flying

FIG. 7.

style of architecture. If a square were supported on four arches, and carried a dome (Fig. 3, plan), the bottom of the dome being quite inside the angle pillars, must be supported from them by four spherical triangles (a a, Figs. 3, 4, and 5) whose points rested each on one of the pillars, and whose bases, turned uppermost, formed together the lowest ring of the dome. These triangles resting on their points, their tops a quarter of a circle, their sides each half of one of the supporting arches, were called pendentives. Now, if the arches whose curves their sides followed were pointed (Fig. 5), the pendentive would be longer than

FIG. 11.

FIG. 8.

FIG. 9.

if the arches were round, and, the projection being the same, would not slope so steeply forward; while, if the arches were round, the top part of these pendentives must project actually level, and thin away to nothing. Consequently a dome was more easily placed on pointed arches than on round. Neither of these styles of Gothic was ever developed. In them the windows and openings always remained round. The domical style with the means at the command of the builders was suited only for small churches. The style with waggon vaults was suited only for the south, for churches so constructed were difficult to

FIG. 12.

FIG. 13.

buttress above the aisle roofs. An arched space was thus left clear in each compartment of the nave above the aisle roof in which windows could be opened. These improvements are shown in Fig. 7. This form of vaulting was called groining, in contradistinction to the continuous waggon vault. To vault both nave and aisles at the same time, using only the Roman round arch, was a problem of some difficulty. For, if the width of the nave was taken as the size of the square of vaulting, the vaults of the narrower aisles became oblong in plan, the arches across the aisles only half the size of those into the nave (Fig. 7), and the vaults rising from these lower arches to the higher ones had an awkward domical appearance. If, again, the aisle vaults, as well as those of the nave, were made square in plan, each square of the nave corresponding with two squares of the aisles on each sides (Fig. 8), the thrust of the nave vault was brought on every second pier only. Again, if only semi-circular arches were used, the windows under the diagonal vaulting could be as high as the

FIG. 1.

FIG. 2.

FIG. 4.

FIG. 3.

FIG. 5.

FIG. 6.

in which country it was adopted earlier than in England. It sprang from an imitation of the palaces, baths, aqueducts, bridges, basilicas, and villas left by the Romans in every part of Gaul. After the departure of the Romans the land was invaded by German barbarians, who gradually occupied the greater portion of the country, and anarchy reigned for centuries. When, with rising civilisation, about the 10th century, churches or monasteries and towns began to be built, architecture had to be commenced afresh. Roman buildings remained everywhere, but none knew how they had been constructed. These buildings they copied as well as they could, making up for miserable construction by lining them with marble and gaudy painting. As models for their churches they reproduced the old halls of justice, or basilicas, but made the roofs of wood. As the churches were frequently burnt attempts were made to render the roof as well as the walls incombustible. In the South of France this was attempted—without the use of wood—by a plain waggon vault, covered with solid masonry in the ordinary form of a roof (Fig. 1). But for this a round arch was very unsuitable; a pointed one saved weight on the apex, and had less thrust (Fig. 2). And the pointed arch was for

FIG. 10.

light. To form an abutment for the massive central vault the lower side aisles had to be carried up to its springing, thus abolishing the clerestory and preventing any light getting into the central nave except from the side aisles, leaving the central vaults dark caverns

centre of the vault, and thus light was lost. By the use of the pointed arch all those difficulties were got over, for by breaking the round arch into two parts, attached by a point at the top, the arch could be widened or narrowed like a pair of compasses, and arches of different span could be made of the same height. Thus the determination to render churches fire-proof by means of vaulting produced the Pointed style of architecture. For some time after the discovery of the pointed arch the width of the nave continued to be taken as the size of the square of vaulting, the aisles also being vaulted in square compartments, two to each square of the nave on each side. The defect of the thrust of the nave vault coming on each second pier only was partially obviated by springing a subsidiary rib from the intermediate pier, thus dividing the vault into six parts, instead of four, whence this method was called sexpartite vaulting (Fig. 8). Taking the aisles' width as the size of the square of vaulting, which the use of the pointed arch rendered possible, obviated all difficulties (Fig. 9). The central nave vault became thereby oblong, its length the width of the nave, its breadth the width of the aisles, and the arches across the nave twice the span of those against the clerestory walls, which, springing from the same piers as the nave arcade, were of the same span (Fig. 10). The clerestory windows were raised to the full height of the apex of the central vault, sometimes even higher, and the thrust of the vault was equal on each pier. Even after the vaults became pointed the windows under them continued round-headed (Fig. 11). But a round arch under a pointed one leaves a space something like an arrow-head in shape between them, which it was soon seen could be made available for lighting. The windows were therefore made the same shape as the vaults, and the same form was, from the principles of harmony, carried out throughout the building. A new impulse was given to the art of vaulting by the invention of vaulting ribs. The Gothic builders, even while still using the round-arched style, made the angles of the groin strong arch ribs, which form the skeleton of the vaulting, filling-in the spaces between these ribs with light flat arching, or even, where the distance between the ribs was short, with long stones resting from one rib to another. These ribs were made to spring each from a separate slender column, one of a cluster. As the style developed the columns and the vaulting ribs coalesced, the capitals dividing them became absorbed, the ribs in Late Gothic rising without break from the base of the building to the crown of the arch. The development of the style was doubtless influenced not only by the mechanical requirements, but by the sense of beauty in the mind of its inventors, and by the environment in which they found themselves placed. If, in the problem which they had to solve, they had been guided purely by mathematical principles, they would have found a more perfect solution, not in the pointed but in the elliptical arch. But in the light of art the result would have been far less beautiful, and even if they had possessed mathematical knowledge sufficient for working out their problem by the use of the elliptical arch, their instinct as artists would have prevented them from adopting it. At first the windows were small, leaving large surfaces of wall to be decorated with colour and painting, and the decoration was carried out over the windows also by the use of stained glass. This latter mode of decoration was felt to be so brilliant and charming that it ruled the development of the style. The object of every change was to reduce the surface of masonry, and give more space for stained glass. The small windows were put closer together, and the masonry between them reduced to mullions, narrow on the face, but deep across the plane of the window, so as to give as much opening as possible for glass, at the same time retaining strength. Openings shaped like flowers, of three or four or more leaves, were placed above them; the corners left between were pierced; the stone between these openings was reduced to bars bending round the foliated forms; and thus at last one great window was formed, which filled the whole space under the vault. These mullioned and traceried windows were

one of the most charming features of Gothic architecture, so beautiful in themselves that they have been used even when the causes which led to their adoption do not exist. For large windows such a division of the surface would always remain one of the simplest and most admirable means of producing architectural effect; as windows of all sizes could thus be brought into harmony with each other, an immense advantage in domestic architecture. The form of the stone bars naturally partook of the constructive lines of the architecture. Under vaultings mullions were curved, but in ordinary domestic architecture the straight form was simpler and more suitable. Gothic architecture had a magnificent opportunity of development in the construction of the great cathedrals, which, in France, were all built or rebuilt at the end of the twelfth and beginning of the thirteenth centuries. Their architects were laymen, for the most part, as in several instances we know from their names, and the representations which occur of some in the lay dress. In fact, the regular clergy disliked the movement, and continued to practise still their own old round-arched style. In France the cathedrals were rebuilt in the new (the Pointed) style. In England, in accordance with our spirit of compromise, our cathedrals were generally monasteries or minsters as well. The main characteristics of Gothic were its system of pointed vaulting and traceried windows, filled with stained glass. The style possessed also a beautiful and vigorous style of carving, founded on natural foliage, and truthful and admirable modes of metal work. The style thus developed was, of course, used for other purposes than churches. Castles and houses were built in Gothic, and the mouldings and minor ornaments were the same as in churches. Pointed windows and tracery it was found necessary to modify; while between vaulted floors when height was valuable, flat arches, segments of a circle, were adopted. Very few specimens of Gothic houses remain anywhere. During the middle ages the style of living was poor, and even miserable, as is proved by the general prevalence of leprosy, testified to by the necessity everywhere felt of establishing lazaret-houses. The disease has ceased in every European country except Norway, in parts of which the people are miserably fed. The houses, except in the rich cities of Italy, were generally poor and small, but many of them were built of wood, and in the course of centuries got out of repair; and almost everywhere the more comfortable style of living in every class of society which the Revival brought with it, caused them to be rebuilt. In Nuremberg, though it possesses two noble Gothic churches, there is scarcely a house older than the 16th century. Here and there, in places where prosperity had departed, and where the people were too poor to rebuild, Gothic houses still exist. Everywhere in great halls built for civil and domestic purposes, pointed vaults, and consequently pointed arches, were used, although the windows were flat-headed. During the highest development of the Pointed style, while the pointed arch was used for all decorative features, it was frankly abandoned in the windows, where the form would have been impracticable. It may be urged against the statement that vaulting is an essential of Gothic architecture, that Gothic churches as well as domestic buildings, in England especially, frequently had wooden ceilings, and then not always from economy, but even, as in St. Stephen's Chapel at Westminster, where the wealth of English art was lavished. This, however, does not disprove the fact that the Pointed style arose from vaulting necessities, and, indeed, to the use of wooden roofs in England may be traced the abandonment of the pointed arch, and the adoption of the flattened perpendicular form, while in France, where the use of vaulting was continued, the pointed arch also was retained to the last. Till the end of the 13th century the development of Gothic architecture was similar in France, England, and Germany. There are some slight national differences, but every advance of the art was common to the civilisation of those countries. It was even carried as far as Norway, where the Cathedral of Drontheim, built in the 13th century, is in the ordinary style of the period. It is built of

stone, not in the national wooden mode of construction, which the Norwegians did not abandon for their other churches. The style of their carving in wood, which had always been a national art, prosecuted during their six months of continual night in winter, became, and continues still, thirteenth-century Gothic in character. This similarity of style in the different countries of Europe was due greatly to the organisation of the great monastic orders, who sent missionaries to found new houses and establish religion in outlying districts. The new inventions of architecture were thus carried everywhere, as those of engineering are at the present day. During the fourteenth century, each country where the style was established took it into its own hands and developed it into a national style of its own. It is absurd to call these latter styles degraded, as has been the fashion of late. Each of them, if studied without prejudice, will be seen to have developed characteristic and interesting, and often noble qualities of architecture. One common quality characterised them, as compared with the earlier style, greater lightness and elegance in construction, more window in proportion to wall, giving an effect of space and height and light in the interior, which is the glory of Gothic. This was attained by more scientific construction and greater mechanical skill, which enabled the builders to dispense with the masses of material necessary in the earlier style. So far as practical convenience is concerned, one of these great Perpendicular churches, unencumbered by massive columns, with its feeling of space, is more suitable for our congregational purposes than those built in what is considered a more perfect period of Gothic. The name "Perpendicular," as expressing the true character of style, is—like "Gothic" itself, "Queen Anne," and some others—a misnomer. The main lines of the style, as compared with those of any other style of Gothic in England or elsewhere, and the disposition of its masses, which gave it its character, are horizontal, in sympathy with the cornice, which, Mr. Stevenson thought, determined its origin. Perpendicular architecture loses the tendency which every other form of Gothic had to increase the height of the building by high-peaked roofs, which specially characterise contemporary styles in France, where the roofs became steeper than ever. The roofs are flattened to a lower pitch than that of a Greek temple. In domestic architecture, the low level lines of the Tudor house, in which the roofs, often so low as to be concealed by the parapet, are in direct contrast to the tall peaked roofs of the French chateau of the period. It has been the fashion to abuse our English Perpendicular churches, and much beautiful work in the style has in the last few years been destroyed, though it had three centuries of antiquity to boast of, because the clergyman or his architect disliked it, and preferred a modern imitation of an earlier style. The dislike of Perpendicular architecture, in which we have all been trained has arisen from our judging it from the modern imitations of the last generation. For a like reason it is possible the earlier styles may find little favour with the coming generation. But one only needs to look at the Perpendicular style in its genuine productions to appreciate its high artistic qualities. By its common sense and severity it saved English architecture from the looseness and degradation into which Gothic fell in other countries. In few styles of architecture has there been a truer sense of proportion, or greater skill in the disposition of the masses than in Perpendicular. In the grandeur of its towers it is unsurpassed, and the appearance of height in these is increased by the low roofs and the prevalence of the horizontal lines, for which there is the authority of Greek architecture. This explanation of the development of Gothic led to the consideration of its suitability for our domestic architecture. It has been asserted that the style was gloomy and dark, and did not give sufficient light. But one of its chief characteristics was that it was all window—that the main aim in its development was to reduce the surface of the wall, and increase the space for stained glass. No doubt old Gothic castles had little window-light, but that was no essen-

tial of the style. Again, it was called a barbarous product of the dark ages, when the people were serfs. On the contrary, it was the product of the revived intelligence of the people, the outcome and sign of their civil freedom, and it gave evidence of a development of art, of skill and refinement and grandeur in building, such as we are incapable of furnishing. It was said to be a style purely ecclesiastical, and it was just as much civil. It was, in fact, in its origin, the lay style of architecture, as distinguished from the religious or monastic. Is there, however, the lecturer asked, anything in the Gothic style which makes it more suitable than any other for our modern houses? For this, it is not sufficient that it may appear to us more beautiful than any other. No architecture can be satisfactory, even from an artistic point of view, whose forms are not founded on use. Of the various characteristics which make up Gothic architecture, its system of vaulting does not suit our ordinary domestic requirements. In a building divided into stories, as our houses are, a pointed vault is a disadvantage, and if, in special buildings, we want fireproof construction, we can get it conveniently and cheaply by means of iron and brick, or concrete, in the usual thickness of a floor, without the loss of space which would be involved between the springing of the vault and a level floor over its crown. In the modern revival of the style, however, the attempt has rarely been made to revive the vaulting. In fact, in the application of Gothic to house-building, from the earliest period the pointed arch was dispensed with. Numerous instances occur where the pointed arch is retained over the windows, but the window openings are square. The glass was set in wooden frames so as to open like shutters, and the architects were too sensible to attempt to make these in such an awkward form for wood construction as a pointed arch. In another form of window common in old domestic Gothic, the pointed arch is purely ornamental, carved on a simple straight lintel. Even when in great halls, built for civil and domestic purposes, the lower lights of pointed windows being arranged to open for air and view, were always square-headed. Yet our architects and builders think they are working in the Gothic style when they stick a pointed arch where it is not wanted, and means nothing, while the whole construction and details of the house follow the ordinary Classic traditions. Old Gothic has always the merit of truthful and apparent construction. But this also, to some extent, unfits the style for modern use. It involves, unless when money could be lavished in decoration, an appearance of severity which does not accord with our modern feelings. Moreover, truthfulness of construction cannot be eluded among the excellences of modern Gothic. The copiers of the style, after the manner of copyists, are very apt in their zeal for its forms to neglect its spirit. As illustrations of this the pseudo-hinges on oak caskets, the fire-dogs of Gothic grates, and the corona form of gasaliers, were mentioned and denounced by Mr. Stevenson as contrary to the spirit of the style. The new Midland Hotel at St. Pancras Station is a splendid example of the modern Gothic style, but it cannot be said that the specially Gothic features in it, such as the pointed windows filled with tracery, are the outcome of any modern hotel requirements. Pointed windows are inconvenient for blinds and curtains, and reduce the light at the top, where it is of most value for lighting the room. The tracery further obstructs it, and it is scarcely sufficient justification for it that the circles in it are utilised as ventilators. The beauty of the architecture may be sufficient compensation for the inconvenience and expense which the use of the style involves, but when applied to modern domestic use it has not the justification which is claimed for it, that its features are the outcome of use and convenience. To the old Gothic architecture belonged the almost singular merit of perfect truthfulness. When a form ceased to have meaning, it was frankly given up; people did not weakly cling to the dead carcase. This evidenced a freshness and independence of thought rare in the history of humanity, and a wealth of artistic conception employed in making every new necessity beautiful, which few races have possessed.

If we could but do likewise, we should have no pointed windows, and quatrefoils, and buttresses which receive no thrust. We should not have in stonework chamfer stops at the angles of windows simulating wooden framed work, and all sorts of ugly and unmeaning notchings, and roofs so steep, that they endanger men's lives. Could it be said that the Gothic revival had exhibited these signs of the true Gothic spirit? On the whole, certainly not; and he feared that such vices as appeared in it were almost inseparable from the attempt to apply a thirteenth-century style to nineteenth-century use; that the Gothic style was, in fact, the artistic expression of an obsolete mode of construction.

In the discussion which ensued Mr. R. PHENE SPIERS said, Mr. Stevenson was looked upon as the apostle of the later style known as Queen Anne. He had been puzzled by the first part of the lecture, but a glimpse of Mr. Stevenson's purpose at length dawned on him—that he was reading a funeral oration over the Gothic style. Beginning by observing the rule *de mortuis nil nisi bonum*, Mr. Stevenson had shown them how truthful the style was, but he gradually warmed to his subject, and explained how the forms became debased. He had brought them down to the modern revival, and predicted that within the next 20 or 30 years we should give up copying the very earliest examples as we had done the later ones, leading his hearers to the inference that more attention would be given to the style in which he was a chief leader. He was a little disappointed in the paper. He believed Mr. Stevenson was about to publish a work on the history of architecture, and this might explain some of its features. True, one must necessarily in a history re-write some things that had been treated of by others—one must use a portion of the facts; but it was to be regretted that he had confined himself almost solely to M. Viollet-le-Duc, and that he had entirely neglected fan vaulting, a most important question to Englishmen. Mr. Stevenson had said that the development of Gothic architecture was very much the same in England, France, and Germany, but there were, in fact, very important differences in principle. In French vaulting the web stones followed the line of the vault, producing a slightly domical effect. In English work they were set falling, leaving an awkward filling-up to be made. To hide this the ridge rib was introduced, diagonal ribs were added and multiplied, and a different mode of construction was thus brought about, and the four-centred arch introduced. He would recommend Mr. Stevenson to study Professor Willis's theory of fan vaulting, which he believed to be correct, as it was of great importance to the English student. He wished to propose a vote of thanks to the lecturer.

Mr. BREWER disagreed from Mr. Spiers, and even from Professor Willis, as to the fan vault being the origin of the four-centred arch, because he had found that those churches in which the fan vaulting was most perfect had no—or but slightly marked—four-centred windows. Instances of this were the Lady Chapel, Peterborough Cathedral; King's College Chapel, Cambridge; and Henry VII.'s Chapel, Westminster Abbey. He believed the use of the four-centred window arose from the desire to fill up with as much light as possible the space below the wall-plate. In the fourteenth century, and even now and then in the thirteenth, the clerestory windows were often square-headed, and in some cases a flat segmental arch was used. The name Horizontal would certainly be a better name than the Perpendicular for the style of the fifteenth century. He had recently examined the churches of Norfolk and Suffolk, and was struck by the fact that the transoms, squarely-cut off towers, and chief features evidence horizontality rather than perpendicularity. Even in King's College Chapel the vertical lines were broken at the plate line by a series of enormous shields borne by angels.

Mr. MAURICE B. ADAMS could not agree with Mr. Stevenson's wholesale condemnations. The discussion, as so often was the case, appeared to have become a battle of the styles. A true artist would make a good building in any style, so long as it was tolerably pure. They had reason to be proud of the Gothic

works of the present century, many of which were of great beauty, and thoroughness of spirit. It remained for the workers in the present style to produce buildings of equal merit and picturesqueness. If we were to have good works we must have good artists. As the skillful tailor could make a good coat out of almost any material, so the clever artist could produce a good building in almost any style. As artists must necessarily be few, so good buildings would be correspondingly rare.

Mr. FLORENCE seconded the vote of thanks to Mr. Stevenson, which was carried by acclamation, a similar compliment being paid to Mr. Brewer for preparing the illustrative drawings.

In replying, Mr. STEVENSON mentioned that in deference to the time of the members, he omitted some portions of his paper, including the part dealing with fan vaulting. Immense difficulties were encountered by the architect of the Perpendicular period in the endeavour to keep these vault-surfaces flat, and the only reason for it that he could see was that the architects of the Perpendicular period were impressed with the effect of horizontality, symmetry, and length. Replying to Mr. Florence, he would admit that, as living in a feeble age, he should be quite willing to put up things, because they were beautiful, and try to find a use for them, such as turrets, affording an opportunity for looking up and down a street; but such a defence of modern Gothic as they had had was a sad come-down from its old pretensions—that it alone was true in construction, whereas Classic was false. Although one might to a certain extent use old, undeveloped organisms, no longer necessary, it was a greater evidence of mental power to do as did the old Gothic builders, and boldly throw a feature away when no longer needed; but this required the exercise of enormous skill and art. In engineering works they saw that the best results were obtained when a work was put up in its native roughness, with no attempt to apply ornament. At one time he had great enthusiasm for Gothic, but more study showed that it was unsuited for modern requirements; that a Gothic building to be grand must be vaulted, otherwise it would be a more or less unsatisfactory attempt. Modern Gothic buildings were as insipid as the play of "Hamlet," with the part of the Prince of Denmark omitted.

COMPETITIONS.

KILMARNOCK.—The exhibition of competing models for the proposed Burns statue attracted a large number of visitors on Saturday. There are in all twenty-one models. In a few cases the features of the Nasmyth portrait have been followed with considerable success, and one or two are considered admirable likenesses. The greater number, however, fail to convey any accurate idea of the poet, and there are some truly ludicrous specimens. For the second best model a prize of £50 will be given, and the third will secure a prize of £25. Voting papers have been provided for the use of subscribers to the statue, with the view of eliciting their opinion as to the best models—the final decision, however, resting with the committee.

READING.—We understand that the competition drawings for the erection of a new town hall at Reading will be on view in a few days. We are informed 30 sets have been received, and out of these 8 have been selected by the committee, and sent to some architect at Brighton (?) to adjudicate upon. The existing building is a very good one by Mr. Waterhouse, and the proposed buildings will be attached thereto, forming one whole. The cost is to be £25,000. We trust shortly to notice the designs sent in.

SHEFFIELD.—The competition for the new district church, Ecclesall-road, Sheffield, was decided on Friday last in favour of Mr. J. D. Webster, F.R.I.B.A., of Sheffield, and the work will be proceeded with at once. There were 9 or 10 competitors, some of whom submitted designs which at least would take double the amount named in the instructions issued by the committee, and the unfairness of such a procedure is obvious. When a sum is named competitors, at least, should endeavour to provide a design which could fairly be executed for

the amount given, else those whose designs are prepared with this view stand at an undue disadvantage. The church above mentioned is to cost £5,000, and to seat 700 worshippers.

SOUTHPORT.—At a meeting of the Southport Town Council, on Tuesday, the following report was read from Mr. Waterhouse on the designs submitted in competition for the erection of the new covered markets:—"Having been honoured with your instructions to examine and report upon the 25 designs submitted in competition for the proposed new covered markets, I beg to say that I have visited Southport for the purpose, and have made a careful inspection of the designs, and of the site which the new buildings are intended to occupy. It appeared to me that the essential points for consideration were the following:—

1. The cost of each design.
2. Its value as a source of revenue considered from two points—(a) the extent of accommodation provided, and (b) the quality of that accommodation (such as the means taken to direct the stream of public traffic to all the stalls equally).
3. The isolation of the fish market, and its contiguity to the yard.
4. The treatment of the basement (especially as to its lighting and modes of access), so as to make it worth the cost of its construction.
5. The appliances for lighting and ventilating the markets themselves.
6. The suitability of the designs to the general architectural character of the town.

As might have been expected, I looked in vain amongst the competitive designs for one which embraced the whole of the good points which appeared to me to be desirable; but, though such was the case, I do not find it difficult to mention three designs, the authors of which are, in my opinion, entitled to the three premiums. Those designs are: "Iron," to which I would assign the first place; "Southport," the second; and "Regardez Moi," the third. The desirability, or otherwise, of shops fronting the street appears to be a moot point, and though I think there cannot be a doubt as to their cheerfulness (especially desirable towards Eastbank-street), nor as to their proving an additional source of revenue, I have not allowed that consideration to influence my recommendation. It has appeared to me that it would be of considerable importance to secure an entrance to the markets at the corner of Eastbank-street and Upper King-street, and another of more imposing character in Eastbank-street immediately opposite the end of Chapel-street; also, that the principal lighting of the markets should come from the northern and eastern slopes of the roofs, and that the unloading from cart bottoms should take place at the level of the floor of the markets. These points are to be found carefully carried out in some of the designs which I have not considered to be equal in merit, on the whole, with the three to which I have made particular reference. The competing architects, I fear, have all laboured under some disadvantage in having their limit of expenditure fixed at too low a figure. An assessor would ordinarily exclude from a competition all designs which manifestly could not be carried out for the sum mentioned in the instructions; but in this instance I think the competitors may be pardoned if, providing only the amount of accommodation asked for with no useless features nor excessive ornamentation, they have assumed that the work could be carried out for the figure mentioned. The committee will not be disappointed, however, if the tenders exceed the amount of this estimate.—**ALFRED WATERHOUSE.**" A lengthy discussion ensued, and an amendment was proposed to the effect that the instructions not having been complied with, the recommendation of the committee as to the adoption of Mr. Waterhouse's report be not approved. It was, however, ultimately resolved to adopt Mr. Waterhouse's report. The authors of the premiated designs are as follows:—"Iron," Coe and Robinson, Furnival's-inn, London; "Southport," Bell and Roper, London and Manchester; "Regardez Moi," Mellor and Sutton, Southport, and John Dence, London.

STAFFORD.—Last week, at the meeting of the Town Council, a letter was read from Messrs. Beaumont and Bare, architects, Manchester, with reference to the recent award of premiums

for the competitive plans for the market extension. The letter stated that the setting aside by the council of the recommendation of the markets-committee caused the firms some surprise. After examination of the premiated designs they submitted that the verdict of the committee was fair and impartial, and they would have been quite willing to have bowed to the decision arrived at so carefully, whether they had been placed first or second; but considering that there was an evident doubt as to whether "Staffordshire Knot" or "A. B. C." was most entitled to the first premium, they respectfully suggested that they were entitled to some consideration for the time and money expended for the benefit of the borough of Stafford. They felt sure that if the decision of the council was fairly considered it would be felt that a special premium might be awarded to the designs under the motto "A. B. C." Mr. Day moved that the letter be referred to the works committee. Mr. Kelsall thought the question might be settled now. Mr. Nixon moved that the council proceed to the next business. This was seconded by Mr. Kelsall, and agreed to.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The second meeting of the session was held last Wednesday; Mr. Thos. Morgan, F.S.A., V.P., in the chair. The completion of the most pressing repairs to uphold the ruins of Denbigh Castle was announced. Notices were made of the discovery of various traces of the old Priory of St. James, Derby, by Mr. A. Wallis. The discovery of three Roman villas was reported, in addition to the important excavations at Templeborough. The first of these is at Abinger, near Dorking, in a district not hitherto remarkable for Roman remains, notwithstanding the proximity of the Stane-street-road. Traces of several chambers with tessellated pavements have already been met with. The second is at Itchen Abbas, Hants, and Dr. Stevens reported that some trial excavations have shown the existence of two tessellated pavements, and a system of heating almost perfect. The uncovering of these buried remains promises results of interest. Dr. Stevens, in a paper read by Mr. Previté, gave a fully detailed description of a third villa at Preston, near Brighton. Here several apartments were opened, and various antiquarian relics found, many of which are now in the Brighton Museum. Mr. J. S. Leader, F.S.A., described the exploration of the Roman Castrum at Templeborough, near Rotherham, which is being excavated by local subscription. Traces of two, if not three, occupations have been found, and the area of a large building has been opened, remarkable for a peritico of four columns to the south front, and a long colonnaded range to the east of smaller columns. The bases only remain, but one shaft 9ft. long was found entire, in one stone. This building had evidently been ruined and afterwards rebuilt, for the bases were found walled up in later Roman work. Several of the bricks were inscribed "C IIII G" (Cohors IIII Gallorum). This body of auxiliaries has left several records of its presence along the great Roman wall, but this is probably the first indication of its presence elsewhere in Britain. A discussion followed, and Mr. Loftus Brock, F.S.A., who read the paper in Mr. Leader's absence, pointed out that the columns could only have supported a timber superstructure, rather than stone, since the columns were 22ft. apart. A large number of plans and photographs of the remains were exhibited.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At the usual fortnightly meeting of this association, held on Wednesday week, a paper was read by Mr. J. W. Small, architect, on "The Scottish Woodwork of the 16th and 17th Centuries," illustrated by measured drawings and full-sized details of old woodwork from a forthcoming volume on that subject by Mr. Small. He discussed the question of the authorship of the woodwork remaining in Scotland of this period; went into the question of date, the peculiarity and distinctive characteristics of its construction, mouldings, carvings, inlaid work, and metal work; and concluded by

advocating the measuring and sketching of old examples as the best way of obtaining the true knowledge of any style of woodwork.

HOUGHTON-LE-SPRING.—At a meeting of the Newcastle Society of Antiquarians last week, the Rev. Canon Greenwell gave an account of the opening of a barrow at Houghton-le-Spring. He said that the occurrence of barrows in the county of Durham, such as that he was going to describe, was extremely rare. He knew scarcely any remains of ancient British times in the county. There were very few bronze or stone implements found, a fact which was inexplicable; for Yorkshire was full of remains of all kinds, and so was Northumberland. Though Durham possessed the same opportunities for early occupation, yet there was a great want of any indication of it. The places that had been occupied seemed to have been more or less in the valley of the Wear. A sepulchral mound of no great extent—something like 60ft. long by 5 or 6ft. high—within a mile of Houghton-le-Spring, attracted his attention some years ago. He, however, did not attempt the opening of it until this year, when, with the aid of Mr. Robertson, another member of the society, he examined the whole of it, and it turned out to be one of the most interesting mounds he had ever had an opportunity of examining. It was of a round form and he at first expected that it would turn out to be a barrow of the period after bronze was introduced; but on commencing operations, he found that it had a much earlier history, and belonged to the time when only stone was in use. Wherever mounds of that period had been found they had been oblong and of the proportion of 4 in length to 1 in breadth. They were generally placed east and west, the higher and wider end being towards the east; and in that end, generally, the interments had been found. The space thus occupied was but a small part, generally speaking, of the whole mound. A very few feet would be found to constitute the entire burial space in a mound nearly 200ft. long by 50 to 60ft. wide. Whether this mound near Houghton-le-Spring had originally been oblong he could not say. It might have been so, and might have been altered by later burials, several of which he found in it. The early Britons buried their dead sometimes after burning them, and sometimes without that. In the North of England by far the greater number had been after burning; and this at Houghton-le-Spring contained the burials after this fashion. The bodies found in these mounds appeared to have been seldom buried entire; and the idea had suggested itself to him that they had been buried first in some other place, and afterwards removed to these barrows. In addition to these early interments there were found at Houghton burials of a much later date. They found, quite outside the line of burning, what seemed to have been an addition to the original mound, a small chamber containing the body of a child. They found also three or four other bodies, one of which had been buried along with a good flint implement. Other implements were also found. On the summit of the mound was found a small grave, made with stones set on edge, which contained a body buried at full length—a position which led him to conclude that the body was that of an Anglo-Saxon, buried probably in Christian times, the general position in earlier graves being a contracted one, with the knees drawn up towards the chin.

Temple Bar is absolutely coming down at last, orders having been definitively given to Messrs. Mowlem, Burt, and Freeman, to remove the structure before the end of the year. On Wednesday afternoon the work was commenced; the frames were taken out of the windows looking up and down street, from the gaping voids scaffold poles soon projected, and a substantial stage is thus being formed on either side. It is believed that the demolition will be carried out during Christmas week. Ten days, at the very outside, will be sufficient for the operations, and such a force of men will be put upon the work that the street traffic will not be stopped for more than two or three days. The stones are all being numbered, and will be placed for a time on a vacant space of land in Farringdon-road, until some definite place is fixed by the Court of Common Council as a new site for the Bar.

The subscriptions for a new church to replace that recently destroyed by fire at Lamerton, near Tavistock, has been taken up spiritedly, and already exceeds £2,300.

Building Intelligence.

BUILTH.—The block of buildings, forming public hall, market-house, and assembly-room, erected at Pound Well, on the banks of the Wye, in Builth, by a limited liability company, were opened on Friday. The market-house is 63ft. by 33ft., with triplet-span roof, constructed of iron and glass, and having a side entrance for supply by trucks. Around this are nine lock-up stalls. The basement story has two shops next the front street, and store cellars and the usual conveniences. The ground floor story has four shops on the principal front; whilst on the Station-road front are a wine merchant's office and two shops. At the angle is a broad staircase leading to the large public hall over the whole. This hall is 70ft. by 30ft., and 23ft. high, with a platform or orchestra, to which are attached two retiring-rooms. Over the entrance end is a spacious gallery. Accommodation is afforded for 400 persons on the floor level, and 100 in the gallery. The roof is waggon-shaped, with curved ribbed principals. The façade is executed in local stone masonry, with free stone dressings. The roofs are covered with Broseley tiles. In the centre is an effective clock campanile. The works have been carried out by the contractors, Messrs. D. J. and D. Davies, of Cardiff, at a cost of less than £3,500, from the designs and under the direction of Messrs. Haddon Brothers, of Hereford, Great Malvern, and London, whose designs were selected in public competition.

CHELTEMHAM.—The first section of the winter-garden and aquarium project for Cheltenham—the skating rink—has been completed, and was opened on Tuesday week. It covers an area of 15,000 square feet, more than half of which is under cover, laid by the Limmer Asphalte Company. In the centre and side-wings is a ball-room, and at the lower end a small winter-garden. The surface can be flooded within five minutes from a tank containing 3,000 gallons of water, and is to be thus washed down nightly. A band platform and seats are provided, and the covered part is lighted by a double row of lights; retiring-rooms and lavatories are provided for both sexes. The main building, which is a cruciform structure of yellow bricks, with an oval glass roof, will be finished in about three months time. The architect (selected by competition) is Mr. J. T. Darby, and the brick and woodwork are entrusted to Messrs. Scammel and Walkerdine, and the ironwork to Messrs. Vernon and Hewens. The contractors are Cheltenham men, and the plan followed throughout is to employ local labour. The total cost of the scheme will be about £23,000.

EDINBURGH.—The new Heriot School for the Stockbridge district, erected from plans by Mr. Chessar, architect to the Hospital, will be opened on Monday next. The building, which is two stories in height, consists of a central block, with two large projecting wings. Its style resembles that of the parent hospital. The schools are calculated to accommodate 200 infants and 400 juveniles of both sexes. The cost, it is estimated, will be £5,800—or £9 13s. 8d. per head, exclusive of feu-duty.

GRANTCHESTER.—The parish church of Grantchester, near Cambridge, was reopened by the Bishop of Ely, on Wednesday week, after enlargement and restoration. A south aisle, of rubble work, with stone buttresses, has been added, opening into the nave by new columns and an arcade of Bath stone. A new roof of Baltic timber, covered with Staffordshire tiles, has been placed on the nave, the floor of which and that of the aisle have been laid with wood bricks in pitch, pine, and oak. The seating is now of open pine benches. A brass lectern has been presented, and the font has been moved from near the organ gallery to the new aisle. The building is warmed by Porritt's air-warming underground stove, but lighting will still be effected by candles, new standards for which have been set up. Mr. A. Blomfield, M.A., was the architect; Mr. G. M. Bates, of Stevenage, the builder; Mr. H. Edgcomb, foreman and manager of works. The expense has been £1,740, exclusive of special gifts of about £500 in value.

HOLCOMBE REGIS.—The parish church of Holcombe Regis has been restored under the care of Mr. J. Mountford Allen, of Crewkerne, and the works generally have been carried out by Mr. James Yellen, builder, of Holcombe Regis. The floors are laid with Maw's encaustic tiles, and the new parclose screen, on the south side, and the stalls, as well as the altar-rail and holy-table, are of oak. The walls have been plastered, and are of a warm cream colour. The principal feature in the restoration is the new reredos, which is made principally of Caen stone and Devonshire and other marbles. Its construction and erection were entrusted to Mr. Harry Hems, of Exeter.

LONDON SCHOOL BOARD.—On Wednesday this board accepted the tender of Mr. B. E. Nightingale, of Albert Works, S.E., for the erection of a shopkeeper's house next the school buildings in Ann-street, Clerkenwell, for which he is the contractor. The works committee were authorised to expend £805 10s. upon erecting an infirmary on enclosing additional land recently acquired next the Brentwood Industrial School; and to expend on supplying necessary furniture and fittings £384 3s. 1d. for the school in New North-street, Shoreditch, recently enlarged by 467 school places; and £787 10s. 2d. for the new school in Portman-place, Globe-road, E., which contains 1,172 places. The same committee recommended for adoption the amended tender of Mr. E. Lawrence, of Wharf-road, City-road, for erection of a school (756 places) in Gillespie-road, Highbury Vale, but this (which was at the rate of £10 5s. 9d. per head for buildings alone) was referred back for further consideration. Some months since the tender of Mr. Nightingale was accepted for new schools in King-street, Soho, but after operations had been commenced the site was scheduled by the Metropolitan Board of Works for the construction of the new street from Charing-cross to Hart-street. The board now decided to pay Mr. Nightingale the sum of £2,568 10s. in full settlement of his claim for the abandonment of the contract. An estimate from Messrs. Atkinson and Co., of Westminster-bridge-road, amounting to £317 15s. 8d., for furniture for the new truant school, was received, and the expenditure sanctioned.

METROPOLITAN BOARD OF WORKS.—This Board, at its weekly meeting on Friday, received a deputation from the Lewisham District Board, who presented a memorial asking permission to effect a loan for paving new streets. In speaking to the memorial, Mr. Thompson stated that the paving was absolutely required in consequence of the rapid increase of streets and buildings, and remarked that during the last three weeks the district had been granted between 400 and 500 applications for permission to erect houses. The memorial, as well as others from the Lewisham and Plumstead District Boards, relating to the construction of a sewer from the Broadway, at Deptford, to Lee-bridge, were referred to the works committee. That committee submitted drafts of bills prepared by them for the purchase of the interests of the Metropolitan Water Companies, and for providing a new supply of water for potable, fire-extinguishing, and other purposes. After a long discussion the drafts were approved, and referred to the parliamentary committee. In reference to the proposed railway from Chelsea to Charing-cross, the clerk was directed to reply to Mr. Russel Aitken, that the Board could not undertake to keep Northumberland-avenue free from buildings till next year, as requested. The sanction of the Board was given to the borrowing for sewerage works, by the vestry of Hampstead, of the sum of £1,966 18s., to be repaid by 30 annual instalments, together with interest, at 5 per cent.

NEW VAGRANT WARDS, KENSINGTON.—The guardians of St. Mary Abbott's, Kensington, are about to erect vagrant wards on the cellular plan at Mary-place, Notting-hill. The plans have been prepared by Messrs. A. and C. Harston, architects, and they provide for 40 sleeping cells for males, each with a work cell attached, and 20 sleeping cells for women, eight of which are double cells, for women with children. Each cell is warmed by means of hot-water

pipes, and has electric communication with the attendants' room. A feature in the building will be the great use which is to be made of concrete for floors, roofs, sills, window-heads steps, &c. The contract, which includes a solid foundation of concrete over the whole of the site, and also all fittings, has been taken by Messrs. Lathey Brothers at £4,620, and will be carried out under the superintendence of the architects.

RICHMOND (SURREY).—The new mortuary chapel in the cemetery was consecrated by the Bishop of Rochester on Tuesday week. It has been built from the designs of Mr. Arthur Blomfield, M.A., and is in plan a Latin cross, with small central spire. It is of Kentish rag with Bath stone dressings. Over the west door is an inscription from John xix., and above it a niche containing a figure of Joseph of Arimathea, carved by Messrs. Farman and Brindley, of London. The reredos is in gold and mosaic work, executed by Mr. Daniel Bell, and represents angels in the act of adoration of the cross, which forms the centre of the panel. To the right of the communion table are a sedilia and credence table. The three stained glass windows over the reredos are the work of Messrs. Heaton, Butler, and Bayne, and depict events in the life of our Lord. Mr. G. Sims was the contractor for the chapel.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published December 14 contains articles on Manchester and the Thirmere Water Supply Scheme, The Water Supply of our Towns, Roads and Streets, Hospital Hygiene, The late Mr. J. E. Geatorex, Overcrowding in Whitechapel, The late Dr. Trench, Intemperance and Insanity, Germ Life and Surgical Operations, The Manchester and Salford Ladies' Association, Arrow Poison, Profitable Philanthropy, The Thames and the Sewage, Public Health Reports, Legal Intelligence, Water Supply and Drainage, Correspondence, Intercommunication, Public Health Patents, The Editor's Table, Cleanings, &c. Price 2s.—31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—D. and H.—L. B.—H. and G.—J. G. and Son.—E. B.—Montreal.—B. M.—L. C. F.—S. and P.—H. and Co.—Rev. B. G. Soffers.—W. and Co.—J. D. and Co.—G. H.—J. S.—M. A. E. G.—F. H. H. and F. H.—H. B.—W. H. H.—G. H. G.—J. C.—H. and B.—H. W. B.—G. A.—G. E. G.—W. Barlow Morgan.

A VICTIM. (There is no protection for architectural drawings of the kind you mention.)—S. J. COLES. (Certainly you have a claim—not for the premium, but for your drawings. Perhaps a letter from your solicitor would be the best thing to teach the School Board courtesy.)—M. F. (We should be glad to see the drawing.)—A CONSTANT SUBSCRIBER. (The clerk of the works is the architect's servant, but the architect is bound to supply all details.)

NOTE.—The Designing Club having now concluded its assigned course, we shall consider our award, which we hope to publish shortly.

"BUILDING NEWS" DESIGNING CLUB.—Drawings received: "Jag." (The design under this motto had just turned up, it having by some mishap not been given us. We express our regret to the author. There are points of merit in the plan which we shall take into consideration, though nothing that will make a reconsideration of the plans published necessary.)

Correspondence.

THE NEW LAW COURTS.

To the Editor of the BUILDING NEWS.

SIR,—The eastern or Bell-yard front of the New Law Courts is now sufficiently near completion for its architecture to be clearly judged. The whole building was exhaustively described in the numbers of the BUILDING NEWS between October 13th and November 3rd, 1871, and I need not, therefore, describe, or in any way take up space with a description of, the interior arrangement of this Bell-yard block.

The subject of the style selected has been so often discussed that we may leave it now to take care of itself. It is the style approved by the judges, and is one of which Mr. Street is master; and we are the more concerned, therefore, in seeing how far he has shown all the beauties and adaptations of which the style is capable. Although there are certain evidences in the front we are dealing with, not altogether innocent of ecclesiastical architecture, still the detail generally is as secular as perhaps is possible. The front to Bell-yard is contained, we may say, between the great tower at the south-east angle of the entire block and the tower at the north-east angle, next Carey-street, and is broken up on plan by an entrance tower nearly in the centre of the façade, with on the south of it an attached turret, a large square bay projection, a range of windows interrupted by two smaller square bays, then a recessed portion containing a bay with canted sides, and we are at once on the northern face of the great tower, and by an extension further westward with two oriel windows forming the return of the Bell-yard front this part of the elevation south of what may be termed the central tower is completed. Northwards of the tower the front is composed of two double-gabled projections, with between a long range of windows, interrupted by two square bays; then a recessed portion, with a bay and chimney-stack breaching it up, and then the northern angle, with a gabled front to Carey-street, the tower behind it forming, as before stated, the northern extremity of the front.

If we start at the great south-east tower we note at once its picturesque effect behind the oriel windows before-mentioned; these oriels are in themselves of good design, but the parapet of one is very playful and very heavy. At this point the treatment of the internal angle is unsatisfactory—there is confusion in the parts and want of breadth. Passing on to the central tower, there is little to find fault with (except the bays and top story, of which I shall hereafter speak), and very much to admire. The roof, however, of the attached turret need not have been so crushed into the tower, and the termination of the tower is too abrupt. The first and second-story windows of the tower, with the segmental arches, are extremely weak-looking, compared with the other portions of the front, and are, I should say, out of style, but the detail of the entrance to this tower is simply exquisite.

We now come to the southern double-gabled feature, which is similar to the northern one, except in the satisfactory omission of the recesses at side of third-story windows, and in a little more projection to the one than to the other—in order, I suppose, that it should not be said that the two are alike. These two features, as a whole, are dignified, remarkably beautiful, and will break up the long line of ridge to main roof. The stretch of façade between these features is only broken by two slightly-projecting square bays, and at once proves that, if there had been more of this treatment, the front would have been more imposing. Another recessed portion, with a bay awkwardly crushed up in the angle, and we are at the extremity of the front, with the return gabled projection next Carey-street; this gabled block is finely treated, and, excepting as to centre line (of which I shall hereafter speak), and that the farther the work recedes from the eye the richer it becomes, the whole is, I think, a very fine composition.

There can, I think, be but one opinion as to the variety and beauty of the detail of this Bell-yard front, exhibiting, as it does, such refinement and such a thorough knowledge of

the style, and that without a slavish following of it in any particular. The chimney-stacks, in particular, are exceedingly picturesque, and most cleverly treated.

The square bays throughout the front are huge blunders—they are quite insignificant, but they do not by that give predominance to the other parts; the ornament is by no means good, except as a receptacle for London soot, the parapets or terminations are utterly weak, and the whole are excrescences.

I cannot at all understand how the top windows to this front came to be placed where they are; they are, with the intermediate columns, far too heavy, even had they been used in the basement story, but at top they crush entirely those below. The detail is at variance with every other part of the front; they are expensive errors.

But the crowning defect in this front is one to which too much blame cannot be attached. It is a maxim in architecture that solids should not be over voids any more than is necessary—that is, speaking constructively—hut, apart from this, no good effect can be expected if centre lines of fenestration are ignored. Throughout the front Mr. Street has disregarded this maxim in the top range of windows and in the gabled block at the angle next Carey-street, and where the windows occur over the bays the collapse of the design is secured. Nothing can excuse or palliate this treatment; it will remain the damning incident of the design.

The parapet along the whole main front is well moulded, but I doubt the wisdom of bringing the lead up the gutter, and returning it over on to the front of the parapet with an scalloped edge; apart from the rain washing down over the front in black counterparts of the scalloppings, I fancy the sun will turn up the points of the lead. The heads of the rain-water pipes are too heavy—in fact, I should have thought that Mr. Street had by this time concluded that all ornamental heads to rain-water pipes are fallacies, and that swan necks and gratings over the outlets in gutters are proper, and avoid all the objections of the rain-water heads.

I have now to refer to the item as regards the interior. In my opinion, the corridors and staircases, and some other parts of the building, will be insufficiently lighted. I need not say that if I am right the finest exterior in the world would not condone the fault—it means utter failure; and I do not think Mr. Street would be putting himself to unnecessary trouble if he caused all openings—such as doors, &c.—where no light can pass through from the windows of the rooms, to be hoarded up, and he could then pretty well guess the result when the building is finished; and, should there be insufficient light for the future occupants of the building, he could adopt means to bring in more, and thus prevent another public building from becoming a direct injury to the architectural profession.—I am, &c.,

WM. WOODWARD.

UNION CHAPEL, ISLINGTON.

SIR,—A good deal of criticism appears to have been called forth, and very naturally called forth, by the amazing combinations of colour in the marble work on the gallery parapets of this building. May I therefore be allowed to say that this marble work, as it now stands, is simply the result of an extraordinary mistake in the manufacture? The panels were directed to be of green and other marbles, on white onyx spandrels; they arrived with spandrels of all the colours and materials that one could find in a museum of marbles; and there was no time to correct them. As soon as the opening services are over the mistake will be set right, and the present patchwork-quilt appearance, I hope, get rid of.—I am &c.,

JAMES CUBITT, Architect.

MAIDENHEAD COMPETITION.

SIR,—I cannot see how the minutes of the Privy Council regarding infectious hospitals, published in your columns some time ago, can be reconciled with the provisions embodied in the premiated plans. The Privy Council state that 144ft. floor space and 2,000 cube feet are necessary for each patient, whereas the plans

selected by the Town Council of Maidenhead affords only 78ft. of floor space and 858 cube feet to each patient; but probably a knowledge of these matters goes for naught against party interest and influence. My plans were based entirely on the instructions issued by the Privy Council, combined with a rigid regard to cost—viz., £800.

Will you please correct my name from "Brownlow," as the author of "Light and Air?"—I am, &c.,

JOSEPH BROMILOW.

Liverpool, 8th December, 1877.

PRESERVING AND RESTORING ANCIENT BUILDINGS.

SIR,—Allow me to express my astonishment, and to offer an indignant protest against the action which the "Society for the Protection of Ancient Buildings" has taken. The profession will thank Mr. Hugh Roumieu Gough for the publication and exposure of the correspondence, and I think every architect will have ground for rebuking this unwarrantable interference with professional duty. It seems a pity to me the society, composed of men excellent in their motives and sentiments, should not have put their organisation into force against the spoliation and destruction of greater objects. Why not have championed Temple Bar, for instance, now on its last crutches? But this, I suppose, would have been too formidable a task to undertake.—I am, &c.,

G. H. G.

Intercommunication.

QUESTIONS.

[5219].—Coloured Spectacles.—Having occasion to draw for a considerable time in the evenings by gaslight, I find that my eyes become inflamed and painful. I should be glad if any one, having used coloured spectacles under like circumstances, would say if they are efficacious in preventing what I complain of, and if so, which is the best colour for the glasses—green or blue, or a pair of each colour used alternately?—BLIND BAT.

[5220].—Roofs.—Would some of your reader recommend a good book on modern roofs, giving directions for construction, scantling, &c.?—A SUB.

[5221].—Ceilings.—Would some of your reader give simple directions for making ceilings in Parian or Keen's cement, stating the lathing, &c.?—A SUB. SCRIBER.

REPLIES.

[5191].—Inaccessible Heights.—Take two stakes, differing considerably in length, and place one some distance from the foot of object to be measured. In a straight line through the object, and first stake—which should be the longer—move the other until its top is in line with top of other, and top of object. Both stakes should be held vertically, and not driven into ground; also the line of the soil should be selected of uniform slope, though not necessarily horizontal. Let the height of first stake be A; of second, B; measure between stakes, and call this distance C; and finally measure from stake nearest object to object itself, adding as nearly as possible the distance which its highest point falls within its edge. Let this whole latter distance equal D. The formula for height is then $H = \frac{D}{C} (A - B) + A$. If the shapes are 10ft. by 5ft. long—which is convenient for use—then $H = 5 \frac{D}{C} + 10$, or

multiply the distance from tallest stake to object by 5, divide this by distance between stakes, and add 10. The stakes should not be placed too near the object to be measured. For an object about 30ft. high place the taller stake about 40ft. from it, the two stakes would then be about 10ft. apart.—N. L. DERBY, New York.

[5214].—Tilting Fillets.—The reply of "H." is misleading. The *raison d'être* of the tilting fillet is constructional. Its use is to lift the lower edge, or "tail" of the eaves courses to such a height as to

make them be parallel with the planes of the other courses of stakes above them, all of which lie at a lower angle than the plane of the roof boarding or slating fillets, as shown in sketch below.—L.

Our Office Table.

THE city of Pesth has almost accomplished the task of obtaining an unlimited supply of nearly boiling water, which will be available for public and private use. The ready-heated fluid is obtained from a deep artesian well, from which, when completed, the water will issue in a mighty fountain to the height of nearly fifty feet. The deepest artesian well in the world has hitherto been that at Paris, which measures 1,794ft. in depth. The Pesth well has already attained a depth of 3,120ft., and will, when bored the required depth, more than double the depth of its Paris rival. The water now issuing from the bowels of the earth, three-fifths of a mile below the surface, has a temperature of 161 degrees Fahrenheit, and the work will be prosecuted until a warmth of 178 degrees Fahrenheit is obtained. The meaning of these figures will be better understood when it is remembered that the temperature of a hot bath is 98 degrees; while that of boiling water is 212 degrees. The daily supply is already 175,000 gallons—a quantity which will be greatly increased at the enhanced depth. The work progresses at the rate of 50ft. a month, and recent improvements in the mechanical appliances render possible a still more rapid rate of working. This remarkable undertaking is being carried on partly at the expense of the city, and partly at the expense of the engineers, Messrs. Zsigmondy.

THE decision given on Tuesday in the High Court of Appeal in the case of Lewis v. Brass, which is reported at length in another column, will probably surprise some people. Nobody, however, can question its justice, and, henceforth, builders and contractors will do well to be more cautious in sending in tenders, remembering that they are liable to be bound by them, in spite of any mistakes on their own part. Very few respectable builders will feel themselves aggrieved by the decision—they will rather congratulate themselves on the practical exclusion of a class of tenderers who could afford to be as bold as they were unscrupulous, and who embarrassed architects, builders, and the public alike. The new question raised in the Court of Appeal by the defendant—viz., that the tender of the defendant had not been accepted "pure and simple," but with an additional term intimating that a contract would be prepared by the plaintiff's solicitor—was at once dismissed by the judges, who pointed out that the added condition was a usual and proper one, which did not in any way affect the validity of the contract created by the tender and its acceptance, and that the defendant, if he chose, might have rejected the proposed condition, and taken his stand upon the terms of his tender. One thing is evident, that in future great care should be exercised by all concerned in drawing up the "form of tender" furnished to the builder, and the latter should be certain of its meaning before filling up and sending in what, it is now decided, is a binding contract, leaving no loophole for withdrawal.

AT the twenty-third Annual General Meeting of the Society of Engineers, held on Monday last, the 10th December, Mr. Thomas Cargill, President, in the chair, the following gentlemen were balloted for, and duly elected as the council and officers of the society, for the year 1878, viz.:—As President—Mr. R. P. Spice; as Vice-Presidents—Mr. C. Barnard, Mr. J. Bernays, and Mr. T. Porter; as other members of council—Mr. J. Church, Mr. F. E. Duckham, Mr. F. W. Hartley, Mr. C. Horsley, Mr. A. Rigg, Mr. J. Walker, Mr. S. Outler, and Mr. L. Perkins; as honorary secretary and treasurer—Mr. Alfred Williams; and as auditor—Mr. W. H. Bennett. It was announced by the president that the following premiums had been awarded by the council for papers read during the year—viz., to Mr. J. W. Pearse for his paper on the Mechanical Firing of Steam Boilers; to Mr. Alfred Le Grand, for his Paper on Tube Wells; and to Mr. Ralph H. Tweddell, for his paper on Direct-Acting Hydraulic Machinery. Votes of thanks were unanimously accorded to the president and council for 1877; to the honorary secretary and treasurer, Mr. Alfred Williams; to the acting secretary Mr. Perry F. Nursey; and to Mr. T. H. Martin and Mr. W. S. Wilkins for acting as scrutineers of the balloting lists.

A MUCH-NEEDED improvement of Western London is said to be in contemplation. For years people have wondered how it happens that the row of houses in the Knightsbridge-road, the backs and gardens of which reach up to the most fashionable part of Hyde-park, should remain in the same insignificant condition as when they were originally built. Lord Beaumont, the owner of the freehold, is only now coming into possession of the property by the gradual dropping in of the leases, and he proposes to take advantage of his opportunity by widening the road and building houses worthy of the outlook. Up to the present time the two blocks of buildings which flank Albert-gate have been known as Malta and Gibraltar, names which were given them when those strongholds were first taken. Over one of these houses an unlucky spell seems to reign. George Hudson, "the Railway King," was its first tenant; then followed the Counts Walewski and Persigny and other representatives of the French Empire; and the character of its occupiers has hardly been raised by a recent tenant—the Duc de Broglie.

LEGAL INTELLIGENCE.

ACCEPTED TENDERS.—Lewis v. Brass.—This case was tried before the Supreme Court of Appeal on Tuesday. The case raised a question of great importance to builders and contractors—viz., whether the acceptance of a builder's tender in writing amounted to a contract between the parties. The plaintiff, desiring to make certain alterations to his premises, had sent to a number of builders bills of quantities, as they are called—that is, statements of the quantities of materials required to carry out the work, with envelopes entitled "tenders," for them to return with the price for which they would undertake the work, and in answer thereto the defendant sent a tender in these terms:—"I hereby agree to execute complete, within the space of 26 weeks from the day of receiving instructions to commence, the whole of the work required to be done in alterations and additions to above premises, with the best materials, in strict accordance with the drawings and specification, and to your entire satisfaction, for the sum of £4,193." The plaintiff's architect accepted this tender in these terms:—"I am instructed by my client, Mr. John Lewis, to accept your tender of £4,193 for works as above referred to. The contract will be prepared by Messrs. Underwood and Colman, Mr. Lewis's solicitors, and I have no doubt it will be ready for signature in the course of a few days." The defendant, however, found that he had made a mistake in his estimate, and withdrew his tender. The plaintiff had the work done by another builder for a large sum, and sued the defendant for the difference. At the trial before Mr. Justice Hawkins, he left it to the jury whether the parties intended that they should be bound by the document as a contract. The jury found that they did, and gave a verdict for the plaintiff. Three Judges of the Queen's Bench Division (Mr. Justice Mellor, Mr. Justice Lush, and Mr. Justice Field) upheld the verdict, and the defendant, the builder, appealed from that judgment. The case was argued on the 7th inst., Mr. Herschell, Q.C., and Mr. Horace Smith appearing for the plaintiff; Mr. Charles, Q.C., and Mr. Edwyn Jones for the defendant. In the course of the argument, Lord Justice Bramwell observed that he did not doubt that the parties thought that they were bound by the acceptance of the tender. At the close of the arguments, the Court took time to consider their judgment, which they now delivered as follows, dismissing the appeal:—Lord Justice Bramwell: We are of opinion that this judgment must be affirmed. There certainly was evidence to go to the jury that the parties were doing more than negotiating, and I think the verdict of the jury was right, that a contract was made, and not that certain steps in a negotiation had been made. I agree with the opinion of the Court below for the reasons there given when the appeal to them was made. But a point was made before us that was not mentioned in the Court below, and it was this—that the tender of the defendant had not been accepted "pure and simple," but with an additional term. And that contention was founded upon this—that the letter of the plaintiff's agent, after saying, "I am instructed by my client, Mr. John Lewis, to accept your tender of £4,193 for works as above referred to," went on and said, "The contract will be prepared by Messrs. Underwood and Colman." It was said that meant, "I don't really accept your tender as you have made it; but I accept it with this additional term, that a contract shall be made between you and my client by certain professional gentlemen." I don't think that is so. We must take into account that it is a matter of common knowledge that in works of this magnitude there generally is a formal contract drawn up between the parties, knowledge which we are justified in bringing to bear upon this case, as the defendant does not take any exception to this matter in the letter; and I think that the right construction to be put upon that is to read the words as though they were, "Of course, a contract will be desirable, and that will be prepared by Messrs. Underwood and Colman," not

making the contract an addition to the terms agreed upon, but simply intimating what in the opinion of the writer was a convenient way to carry out the intentions of the parties. If that be so, the acceptance was pure and simple, and not in any way qualified or one containing any additional terms. Lord Justice Brett: I am of the same opinion. It seems to me the first question raised by Mr. Herschell was whether the parties intended to contract. The jury found that they did, and the moment the answer is given in the affirmative the question becomes a matter of construction for the Court. Upon the construction, therefore, of the tender and the letter of acceptance it seems to me that those documents made a contract embodying the specifications and plans. The moment that letter was written there was a contract made and complete. The latter part of that letter, speaking of a contract, speaks of a contract already made; that would be drawn up in the usual form, and presented for signature. Therefore, I am of opinion the decision below was right in every respect. Lord Justice Bramwell: I intended to say that it is very likely that the formal contract, when drawn up, would have contained terms not in the specification and letter. I mean such terms as this—that the money was to be paid by certain instalments, or that one part of the work should be begun before another; but, in my opinion, either party would be at liberty to say, "I will not agree to those terms;" and they would have had to go on with the best contract they could make without them. Lord Justice Cotton agreed that on the construction of the documents, there was a binding contract between the plaintiff and defendant, the acceptance in the letter not being rendered subject to the condition that a contract was to be agreed to and signed by the parties, and quoted certain decided cases in support of his opinion.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Papers by James Neale, F.S.A., "Architectural Notes on St. Alban's Abbey," and Locock Webb, Q.C., "On the Law of Easements;" 7.30 p.m.
 "—Society of Arts. Cantor Lectures No. IV., by William Arnott, F.C.S., "The Manufacture of Paper;" 8 p.m.
 WEDNESDAY.—Society of Arts. Ordinary meeting at Freemasons' Tavern, Great Queen-street. Professor Graham Bell on "The Telephone;" 8 p.m.
 FRIDAY.—Architectural Association. Paper by J. D. Sedding, on "The Revival of the Latest Styles of English Gothic;" 7.30 p.m.

SLATES — SLATES — SLATES.—Bangor, Portmadoc, and Importers of American Blue and Green Slates, a large stock of which can be seen on the premises.
SCAFFOLD POLES, 22ft., 2s. 6d. each;
 28ft., 2s. per foot; 35ft., 2s. 4d. per foot.
DEALS—BATTENS—FLOORING.—Send for price list.—R. MAY & SON, Timber and Slate Merchants, Acorn Wharf, Old Kent-road, London, S.E.

Trade News.

WAGES MOVEMENT.

LONDON.—Last Saturday saw the termination of the 20th week of the masons' strike, and no prospect of the ending of the dispute. At the Law Courts nearly the same number of men are now at work as turned out on strike. The strike committee assert that they have now 1,600 masons at work at 10d. per hour, and only 600 men out on strike. The returns from their local levies last week were the highest on record, having realised £320, the average in former weeks being about £250, and the highest on any previous week being £270. The married men were paid on Saturday at the rate of 20s. per man, and the single men 18s. Out of about 80 American and Canadian masons whom the strike committee induced to leave work only about four now remain on the strike roll, the remainder having been either sent away or found employment. The total amount received by the strike committee from outside sources in aid of the struggle was up to Saturday £762.

WHITLAND ABBEY GREEN SLATES.

These SLATES are of a grey-green tint, are stout, and made in all sizes. A large stock available for immediate delivery. For further particulars (with a list of important buildings covered), apply to the MANAGER, Glynedwen, R.S.O., Carmarthenshire. [ADVT.]

Holloway's Pills purify the blood, and by this operation prevent the depressing effects of cold, damp, and foggy weather. They raise the nervous system to a healthy standard, and give a wholesome tone to every organ of the body. Holloway's Pills present the surest means of checking all chest complaints.

TENDERS.

BETHNAL GREEN.—For construction of road and sewer at Mansford-street, Bethnal Green, for J. Remington Mills, Esq. Messrs. Farcrother, Ellis, Clarke, and Co., surveyors, 5, Lancaster-place:—

Hiscock	£1,890 0 0
Anderson	1,840 15 0
Nowell and Robson	1,652 10 0
Culverhouse	1,599 0 0
Killingback (accepted)	1,500 0 0

ASCOT.—For new house at Ascot, near Windsor. Mr. W. Jeffrey Hopkins, architect, quantities by Mr. Lewis Sheppard, Worcester:—

Table listing construction costs for Ascot, including items like Warns, Patrick and Son, Carter, Williams and Son, Silver and Son, Terry, Wood and Sons, Kimberley, Braid and Co., Clavidge, Shapley, Watson, Boyce (accepted), Harris, Norris, Inwood.

CLAPHAM.—On the 6th inst. 12 tenders were opened by the Wandsworth and Clapham guardians for alterations to the infirmary. These ranged from £1,860 to £1,385. The contract was divided—that of Messrs. Newton and Triggs, of Clapham Common (£895), being accepted for one portion, and that of Mr. H. Wagner, of Buckingham Gate (£453), for the other, these being the lowest received.

CLERKENWELL.—For a schoolkeeper's house on the school site in Ann-street, Clerkenwell, for the School Board for London. Mr. E. C. Robins, architect to the Board:—

Nightingale, B. E. (accepted)... £347

CORBY.—For alterations and additions to vicarage house and stabling for the Rev. Charles Farebrother, Mr. Ernest W. Farebrother, A.R.I.B.A., architect:—

Storey and Son ... £400

DERBYSHIRE.—For carrying out the Tupton additional main drainage scheme for the rural sanitary authority of Chesterfield. Mr. Firth, engineer:—

Oxley, C., of Grassmoor (accepted) ... £106

HIGHBURY VALE.—For the erection of a school for 756 children in Gillespie-road, Highbury Vale, N., for the London School Board. Mr. E. C. Robins, architect:—

Amended tender: Lawrance, E. ... £9,573

HADDINGTON.—Accepted tenders for new Board Schools at Haddington, N.B.:—

Ormiston, T., Haddington (mason work) ... £5,000 0 0

Wightman and Tod, Edinburgh (joiner work) ... 1,990 0 0

Brown, J., Haddington (plumber work) ... 579 0 0

Anderson and Son, Edinburgh (slater work) ... 457 18 7

Aitken, J., Haddington (plasterer work) ... 251 0 0

LONDON.—The Chambers, corner of Savoy-street, Strand, for George Rees, Esq. Messrs. A. and C. Harston, architects, 15, Leadenhall-street:—

Howard and Co. ... £12,399

Bangs and Co. ... 11,900

Sheffield and Prebble ... 799 15 0

Kirk and Randall ... 11,340

Oliver ... 11,140

Nightingale (accepted) ... 10,980

LOUTH.—For new house and conservatory for Mr. W. Walkington. Mr. Ernest W. Farebrother, A.R.I.B.A., architect:—

Clark and Son ... £1,075 0 0

Harrison, Samuel ... 963 0 0

Harrison, James ... 799 15 0

Smith, Robert (accepted) ... 795 19 0

LOUTH.—For alterations and additions to the King's Head Hotel for Mr. Nimrod Long. Mr. Ernest W. Farebrother, A.R.I.B.A., architect:—

Clark and Son (accepted) ... £187 10 0

NORWICH.—For the restoration and enlargement of St. Bartholomew's Church, Norwich. Mr. R. Makilwaine Phipson, F.S.A., architect:—

Newel ... £2,920 1 1

Cornish and Gaywer ... 2,589 3 6

Wilkin ... 2,519 10 0

Downing ... 2,516 5 2

Grimwood ... 2,315 0 0

Rust ... 2,285 0 0

Hawes (accepted) ... 2,160 0 0

Curtis ... 2,156 0 0

PLUMSTEAD.—For 8 houses at Plumstead for Mr. Hunter, of 487 and 489, Oxford-street, Mr. Dovey, Manchester, architect:—

Table listing construction costs for Plumstead, including items like Tongue, Vickery, Wagner (accepted), Hall.

STANLEY-CUM-WRENTHORPE.—Accepted tenders for Board Schools at Lingwell Gate, for the Stanley-cum-Wrenthorpe School Board. Mr. Wm. Watson, architect, Wakefield:—

Table listing construction costs for Stanley-cum-Wrenthorpe, including items like Wilson (excavating, brick, and stone-work), Stewart (slating), Eastwood (plastering), Cheesborough (carpenter and joiner), Johnson (plumbing, glazing, and iron-work), Turner (painting).

[94 tenders were received for the above, the highest for the whole work, £1,507 3s. 9d.; the lowest, £652 7s.]

BATH STONE OF BEST QUALITY. WESTWOOD GROUND BOX, GROUND, CORSHAM DOWN and CO. LTD.

RANDELL, SAUNDERS, & CO. LIMITED, Quarrymen and Stone Merchant.

Prices, delivered at any part of the United Kingdom, furnished on application to BATH STONE OFFICE CORSHAM, WILTS. [ADVT.]

Epps's Cocoa.—Grateful and Comforting — "By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—Civil Service Gazette.—Sold only in Packets labelled "JAMES EPPS & Co., Homoeopathic Chemists, London."

VERITY BROTHERS' PATENT VENTILATOR OR AIR PROPELLER for the introduction of cold or warm air into dwellings, &c.

The machine may be seen in action at their Show-rooms, 127, Regent-street, London, W. The apparatus consists of a drum, with a double set of fans, which are worked by a fly-wheel placed in the centre, and on the same axle as fans. The motive for this fly wheel is arrived at by a small jet of water being directed on to it, causing both the wheel and fans to revolve with great velocity; the air passing through machine at a rate equal to 2,500ft. per minute, if desired, according to size of apparatus.

N.B.—The above machine may be used either as an exhaustor or injector as may be preferred, or both objects combined.

VERITY BROTHERS, Patentees and Manufacturers; also Patentees of the Fire-Clay Burners for gas fires and cooking purposes; and Patentees of the new Gas Boiler for Baths and Conservatories, &c. Designers and Manufacturers of Lamps and Candelabra. OFFICE & WORKS: 155, QUEEN'S ROAD, BAYSWATER, W.

CAREY'S SYSTEM OF WOOD PAVEMENT. ADVANTAGES: CHEAPNESS, DURABILITY, & NO SMELL. NOR WILL WATER PERCOLATE.

There are over 9,000yds. of this system laid in 1874 in Cannon-st., City, where small experimental layouts have been made by several Companies on so-called improved systems of Wood Pavement.

CAREY, SONS, & Co., PRACTICAL WOOD & STONE PAVIORS (ESTABLISHED 1879), Camperdown House; and New Weston Street, Bermondsey, S.E. CITY OFFICE: 24, COLEMAN STREET, E.C.

ROLLED MALLEABLE IRON JOISTS AND GIRDERS. ANGLE, TEE, CHANNEL.

And all other forms of Rolled Iron of extraordinary sizes and length. Apply to

CATTO, PEARSON, & CO., Liverpool.

Just Published, with 42 Woodcut Illustrations, crown 8vo., cloth, price 6s., post-free.

QUANTITIES:

A TEXT-BOOK for SURVEYORS, in TABULATED FORM. Explanatory of the best methods adopted in the measurement of Builders Work, &c., &c., with Tables of the various Trades, Tables of constants for the valuation of labour, &c., and a complete Index for ready reference.

By BANISTER FLETCHER, F.R.I.B.A., Author of 'Model Houses,' 'Dilapidations,' &c. London: B. T. BATSFORD, 52, High Holborn.

Just published. Second Edition, with 13 Plates, 8vo., price 6s., post-free.

MODEL HOUSES INDUSTRIAL CLASSES.

By BANISTER FLETCHER, F.R.I.B.A., Author of "Quantities," "Dilapidations," "Arbitrations," and "Compensations"

The Reviews of the First Edition, which appeared in the Builder, Building News, Saturday Review, and other leading journals, may be seen at 29, New Bridge-street, E.C., during office hours. London: B. T. BATSFORD, 52, High Holborn.

ARCHITECTURAL STUDIES IN FRANCE.

By W. GALSORTHY DAVIE, Architect, Gold Medalist Royal Academy, and Soane Medalist Royal Institute of British Architects.

90 LITHOGRAPHIC PLATES, OF WHICH 16 ARE PRINTED IN COLOURS. Only 300 copies printed, of which 150 are taken up by Subscribers, and early application is recommended to secure one of the small number remaining. London: B. T. BATSFORD, 52, High Holborn.

Now Ready, 8vo., price reduced to 3s., post-free.

IMPROVED SYSTEM OF BOOK-KEEPING, specially adapted for BUILDERS and CONTRACTORS.

By the author of the Birkbeck Prize. This system secures accuracy by simplicity of arrangement, and contains within itself a perfect check against careless errors. London: H. C. BEVES, 97, Lambeth-road, London.

NOTES ON BANKRUPTCY LIQUIDATIONS, COMPOSITIONS, AND PRIVATE ARRANGEMENTS (eleventh edition), by JOHN BATH & SON.

Carried out with remarkable conciseness and ability.—The Accountant. Price One Shilling. ALFRED BOOT, 7, Mark-lane, London, and all Booksellers.

HEALTH & HEALTHY HOMES; or how to secure Healthy and Comfortable Homes.

A practical treatise on House Drainage, Water Supply and Domestic Filtration, Ventilation, Lighting and Heating, the Use and Abuse of Disinfectants, with other valuable information for the household. Price 6d., by post 7d. Published by the SANITARY ENGINEERING AND VENTILATION CO., 115, Victoria-street Westminster, S.W.; and through any respectable Bookseller.

THE BIRKBECK BUILDING SOCIETY'S ANNUAL RECEIPTS EXCEED FOUR MILLIONS.

HOW TO PURCHASE A HOUSE FOR TWO GUINEAS PER MONTH, With Immediate Possession and no Rent to pay.—Apply at the Office of the BIRKBECK BUILDING SOCIETY, 29 & 30, Southampton-buildings, Chancery-lane.

HOW TO PURCHASE A PLOT OF LAND FOR FIVE SHILLINGS PER MONTH, With Immediate Possession, either for Building or Gardening purposes.—Apply at the Office of the BIRKBECK FREEHOLD LAND SOCIETY, 29 and 30, Southampton-buildings, Chancery-lane.

HOW TO INVEST YOUR MONEY WITH SAFETY. Apply at the Office of the BIRKBECK BANK, 29 & 30, Southampton-buildings, Chancery-lane. All sums under £50 repayable upon demand.

Current Accounts opened, and Interest allowed on the minimum monthly balances. Cheque-books supplied. English and Foreign Stocks and Shares purchased and sold, and Advances made thereon. Office hours from 10 to 4; except on Saturdays, when the Bank closes at 2 o'clock. On Mondays the Bank is open until 9 o'clock in the Evening. A Pamphlet with full particulars may be had on application. FRANCIS RAVENSCROFT, Manager.

STAFFORDSHIRE BLUE TERRA-METALLIC PAVING & KERBING

SUITABLE FOR FOOTPATHS, &c., &c. Now largely used.

STABLE PAVING

Made in same Material to any Patterns or Designs.

The Cheapest and Most Durable Paving now in use.

JOSEPH HAMBLET WEST BROMWICH, STAFFORDSHIRE.

COPINGS FOR WALLS, STRING COURSES, BUILDING BRICKS,

FOR RESISTING DAMP, BEARING GREAT STRENGTH, &c., &c. Made from this Material.

PRICES AND BOOK OF ILLUSTRATIONS ON APPLICATION. Through the widespread reputation which these goods have gained, many makers have been induced to send into the London and other markets spurious imitations, which are only COLOURED by a chemical process, and will not bear any comparison for strength, durability, &c., with the genuine article. Gold and Silver Medals Awarded at Paris and Brussels Exhibitions.

THE BUILDING NEWS.

LONDON, FRIDAY, DEC. 21, 1877.

DR. SCHLIEMANN'S DISCOVERIES AT TROY.

OF the many archaeological exhibitions of the last few years that of Dr. Schliemann's, now on view at the South Kensington Museum, must be pronounced to be the most deeply interesting. A private view of the collection has enabled us to present to our readers some account of the valuable specimens of the earliest historic art discovered on the hill of Hissarlik—the site of Homer's Ilium, during the years 1871-1873. We have on a former occasion (see Vol. for 1875) given the outline of Dr. Schliemann's labours as recorded in Mr. Philip Smith's interesting narrative of them, to which we refer our readers for a connected view of the discoveries. We may, however, just recall to the reader's memory that four successive strata, representing so many Troys, were discovered at Hissarlik, the earliest remains found indicating those of the Aryan race, proved by the symbols, and especially the "Suastika," or symbol of sacred fire, which appear on many of the prehistoric whorls exhibited at the Museum. These strata of débris and remains are over 50ft. in thickness, and repose upon a solid rock; they represent four successive nations preceding the veritable Greek Ilium. In this accumulation, it may be as well to remind the reader, Dr. Schliemann discovered ruins of houses one upon another, and the remains he has now brought together were found at various depths, and therefore belong to different periods. Let us take the cases of remains as we find them classified. It is perhaps to be regretted that the objects were not arranged in the order or depth of the successive strata, even at the risk of mixing up pottery and examples of different kinds. Though this would not necessarily have been chronological, it would have been approximately so. The first case we come to is filled with a curious kind of symbolic art entitled "pre-historic whorls," of terra-cotta, varying in size from half-an-inch to two or more inches in diameter, adorned with various symbols (supposed to be Aryan), which, Dr. Schliemann says, were confined to the pre-Hellenic people. These whorls are of circular top-like form, perforated in centre, and many of them are illustrated in Mr. Smith's work. On some of them we see geometrical flower-like incisions. Some are marked with altars, others with signs and symbols of the sacred fire; some are like balls, others discs or flattened of spheroidal shape, with stars engraved upon them. The devices are most varied, all incised, and it is thought these curious products were used in sacrificial rites or worn as amulets. Generally they represent the sun in the centre, with stars or rays round. These whorls were found at various depths, from 6ft. to 60ft. On some of them we find animal representation, hare hunts, &c. Passing to a second case we find a remarkably interesting collection of bone and flint implements, including needles for net-making, knives, saw knives of silex, sling shots, tube-shaped bones (flutes), lids of vases, incense stands, axes, hammers, discs. These were found at varying depths from 13ft. to 45ft. The vertebrae of sharks show the existence of the animal. Thousands of implements have been found, and a few of copper, crystal, and alabaster, &c., are exhibited. One of the most instructive cases contains a variety of terra-cotta moulds assigned to the third or fourth century B.C. These moulds are of baked clay, though some are cut out of calcareous

stone, mica-schist, &c., and it is clearly obvious for what purpose they were used. Many were moulds for casting battle-axes, arrow heads, and we saw one small cut stone intended as a mould for jewellery. Crucibles and funnels of baked clay of various sizes (some very small) are seen, very curious, and corresponding with many of the types of copper implements and ornaments. Thus we are brought from the stone age to that of copper. Many of these indicate weapons and implements of an advanced civilisation, and the axes, lance heads, nails, &c., to be seen are extremely interesting. We may say also that the stone implements show different degrees of workmanship. Some are of a very rough make, but those dug out in greater depths show considerable improvement in manufacture. It is somewhat remarkable that Dr. Schliemann found the signs of a higher civilisation at the lowest depth.

The remains from the first Troy are, perhaps, save the treasure, that of deepest interest. Here we have pottery, in the shape of dishes, bowls, urns, vases, &c., with tubular holes in the sides, but we especially note the tubular perforations, or means of suspending. One vase is especially noteworthy. It is a small red terra-cotta, partially glazed, of a cup shape, with one handle, found at the depth of 48ft., or within a few feet of the native rock. A similar kind was, we understand, found at Mycenæ. Two hand-made tripods, about a foot high, with handles to them, are noticeable. In one was found a skeleton of a human embryo, about 6in. in height, which is also to be seen in the same case. Other specimens of Trojan vases and cups are shown, with necks having the mouth shaped like a bird's bill. These vary greatly in size, and are generally of red or grey terra-cotta, with no painting. We must not forget to mention too, the owl-faced pottery found in various strata. These sacred Minerva vases, as they are called, have owl heads in the necks, with two small handles. The Minerva idols are very curious remnants of early superstition. A small suspended ball, about 1½in. diameter, shows incised representations of an owl with two hands rising to heaven. On the right is a wheel symbolic of the sun, on the left is a smaller one representing the full moon, and below a rising star, while on the reverse side a few rough strokes indicate the hair of the Ilian goddess. One splendid brown-coloured vase, about 2-ft. high, has also the features or owl-face of the goddess in the neck marked with breasts in the wide part of the body, with a necklet and an engraved band or girdle round. This fine specimen of pottery was found in the King's or Priam's Palace at a depth of 26ft. It was broken, like many other of the vases, the result of exhuming it, but the fragments have been carefully put together. Another variety of pottery exhibits animal-shaped vessels, some in the form of pigs or hedgehogs; some of these are incised with signs and symbols of the sun-god; but the most unique is the Homeric "Amphikypella" classical-shaped vessels of trumpet shape, with long handles, which are incapable of standing, and therefore could not be put down when filled. The forms of terra-cotta goblets are also chaste, and put us in mind of Etruscan forms. A case of perforated and incised ware, ornamented with rough dots geometrically disposed, call for attention. The hunting bottles (terra-cotta), similar to those discovered in Egypt, are curious.

The bronze weapons, &c., found at different depths, are exceedingly instructive examples. The needles from lin. to 5in. long, are singular, and, though much discoloured, are clearly defined in form. Some painted objects found on the site of Heracon, near Mycenæ—namely, a Juno idol of agate, a lentoid gem of porphyry representing

Phœnician gods holding lightnings, and another of serpentine—are to be seen in the same case. Copper hair-pins, ornamented with gold, and other implements may be noted. We must not overlook, also, a small collection of horned serpents of terra-cotta—a curious instance of superstition—and there is still an idea that these horned serpents, if brought into contact with persons, will cure diseases, and especially epilepsy, and Dr. Schliemann—to whose kindness and explanations we are indebted—told us of a case in which a workman had stolen one or two under that idea.

But the central attraction of the exhibition is the treasure found 23ft. deep in Priam's Palace. The case before us contains the copper cauldrons, a bottle of gold of globular form with short neck, a gold cup weighing 600 grammes, bearing marks of fire, with two handles at the sides: the latter about 7in. long and the same broad, and in the shape of a double-mouthed pap-boat, one mouth being small. It is by Dr. Schliemann thought to be the Homeric "depas amphikypella," and is of cast gold, the handles being fused on.

In the same case we note also some silver vases, showing marks of fire, two head-dresses of gold, with idol-shaped pendants, found in one of the silver vases, and another with 61 chains, formed of fine hammered gold leaves, strung to chains of the finest workmanship.

We have no space to describe more fully the articles which crowd upon the visitor's attention, but simply call the architect's notice to a huge jar used as a substitute for a cellar, found at a depth of 6-12ft.; a "stele," or memorial pillar, found on the site of the Temple of the Ilian Minerva, dated about the third century B.C., with Greek inscriptions, and a beautifully-carved metope of white marble from the Doric temple of Phœbus Apollo at Ilium, representing the god and his horses. Mr. Newton, we believe, thinks this metope, found near the surface, to date from end of the fifth century. It is about 7ft. long and 3ft. high.

THE BARROW-IN-FURNESS TOWN-HALL COMPETITION.

IN response to the advertisement of the Barrow-in-Furness Town Council in July last for designs for a new Town Hall, there were about 140 applications for instructions, and in October last 20 sets of plans were received. Of these seven are Gothic, viz., "Rath-haus," "Esse Quam Videri," "Lismore," "Black Star," "Ima," and "Jamais Arrière." Two are Venetian Gothic, viz., "Venetia" and "Time is on the Wing." Four are Renaissance—viz., "Fortis," "Red Star," "Cavendo," and "Theta." Seven are variations of Classic—viz., "Experientia," "Excelsior," "Omega," "Fair Trial," "Aries," "Furnesii," "L.A.G.B." and "Certo." Aries also sent in a Gothic alternative design. We will take the Gothic designs first. "Ima" (author unknown, but who we suspect will be found on the other side of the Irish Sea) excels all competitors in arrangement and fitness for the wants required. Taking the old Town Hall as one side of a square the competitors would naturally put their new buildings on the other three—nearly all have used the hollow of square for various offices or yards; but "Ima" has cleverly formed a pleasant quadrangle in the centre of the block. The junction of the Cornwallis-street wing with the existing Town Hall is happily conceived. The elevations are very slightly drawn, and the perspective is the barest pencil outline, but there is enough in it to show good composition and well-controlled picturesqueness. The general description of this design would be incomplete if reference were not made to the poor

character of some of the detail—viz., the pumpy dormers, the want of reveal in the windows, &c. No matter how much we may admire the outlines or the plan of arrangement, the details fail to please the eye our feelings of regard for any building lose depth and interest. "Black Star" (Mr. E. W. Godwin, London), gives the idea of having been designed and drawn in a hurry. The perspective is in brown tint, and owing to its being simply washed in, has a quite ghostly look. The upper part of the design is the best. The archway of the principal entrance is very poor, and unnecessarily low. "Jamais Arrière" (Mr. Brade Kendal), is Gothic. Another design with central tower. Its effect is much marred by a want of repose. The perspective is well etched. "Rath-haus" (Messrs. H. Perkins and G. B. Bulmer, Leeds), consists of nine drawings. The etched perspective exhibits a well-balanced design of the ordinary arrangement of a tower in the centre of the façade; the lower story has an air of strength. There are two Venetian Gothic designs. The first by "Venetia" (Mr. Curzon, London), has novelty, both in plan and elevation, to arrest the attention. The Cornwallis-street elevation, shown in the etched perspective, is very successful as a study for an original treatment of a subject with stereotyped forms. "Time is on the Wing," claims to be Venetian, but the resemblance which the central tower bears to a water-works tower destroys all effect of style. Coming to the Renaissance designs "Fortis" (T. E. Colcutt, London) is quite the leading design of the Renaissance group. It is well illustrated; there are five perspectives, including two etchings; and three pencil drawings, all excellent and full of good work. The principal front to Duke-street is the weakest though most ambitious portion of this design. The principal entrance just escapes the look of a secondary door. Recessing the central part of front by an arcaded gallery is a mistake, with a north aspect and no sunshade; the idea reminds one of the Chateau de Madrid. The dormers over this arcade stand so closely together as to suggest making them at once into one simple wall-face. We turn with real pleasure to the Cornwallis-street or side elevation. One of the pencil sketches does full justice to this view, and gives full effect to the dignity of the great tower. The plan arrangement is good, but we suspect that the placing of the Boro'-court in the centre of the quadrangle, far away from the side streets, has been fatal to the chance of first place. "Red Star" is, we believe, by Messrs. Bell and Roper, and has a central tower very much after the same model as the great tower in "Fortis's" design, but not treated with so much power or grace. The general character of the architecture is Renaissance. This design is unaccompanied by a perspective view, and consequently is to some disadvantage, as all the principal ones are illustrated by at least one exterior view. "Theta," Jacobean Renaissance. A good etching shows this design; but it would be seen to better advantage in a wooded park than in Barrow. "Cavendo" is another Renaissance design, but with much of the best Jacobean feeling. It is illustrated by excellent etchings of interior and exterior views. The principal entrance is good, and, although there are weak points—for instance, the market façade—taken all round this is one of the front-rank designs. Arriving at the Classical designs, "Aries" (Mr. Macintosh, Barrow), comprises twelve drawings, including tinted perspective view. The design is Classic, and the elevations display power and merit in draughtsmanship, the etching being exceptionally good, and evidently done by a thorough artist. We should think a French hand was in this work. The elevation taken towards Duke-

street is good in treatment, but the tower above is strikingly weak. An interior geometric drawing of the council chamber shows powerful artistic work. This design, so well drawn in elevation, gains nothing by the heavily-tinted view which gives it perspective. "Aries" sends in also an alternative design in Gothic, for which the New Law Courts have been laid under contribution. The Classic is the better design by far. "Experientia"—Classical and practical-looking neat drawings explain this design. The side elevation is the best, and comes out well in the exterior view. The manner in which a pediment hood is put over two coupled windows is painful. A well-etched perspective enhances the design.

THE READING TOWN-HALL COMPETITION.

ANYTHING new is worth notice, even in connection with competitions, and the conduct of the Reading Town Council with respect to the competitors for the erection of the new Town Hall, Library, and Museum building has a novelty about it that by its absurdity and injustice at once arrests attention. The Building Committee appointed by the Town Council have expressed their opinion that none of the designs submitted are entitled to the premiums in consequence of non-compliance with the conditions laid down, but that, "nevertheless," they have selected three, and having added the premiums together have divided the total amount in equal shares among these three competitors, awarding them the sum of £108 6s. 8d. each, on condition that their plans become the absolute property of the Committee. We gave last week currency, with an expression of our doubt on the matter, to a rumour that the plans had been submitted to an architect at Brighton to report on. If this extraordinary award is the result of his advice, we should say his services will be greatly in request by committees who wish to act unfairly and in the most ridiculous fashion. Nothing seems clearer than the fact that, if no competitors observed the conditions, none of them deserved the premiums, and to select three of their number for better treatment is a piece of favouritism of which the less fortunate competitors may reasonably complain. We strongly suspect, however, that a job has once more been perpetrated. We are assured, indeed, that more than one local architect abstained from competing, in the conviction that one of the three fortunate competitors, who has been mixed up with the museum in an official capacity, would ultimately erect the new buildings, and that, in fact, he was mainly the author of the instructions to the competing architects. We trust that this assertion is not correct, and that the Town Council will yet see their way to a more honest and sensible decision. We have only been able this week to inspect the three premiated designs. Next week we shall notice the others. The requirements of the published conditions were rather vague. We find a hall, including orchestra for 260 to 300, was asked for, capable of accommodating 1,500 persons seated, or 2,000 partially seated; that the principal entrance to present Town Hall was to form one means of access; and that the new hall and offices were to be arranged so that both halls might be used *en suite*, though so separated as to be capable of being utilised for different purposes. Competitors might also—so it was stated—show alternative positions. We accordingly find the authors show alternative positions—some placing the axis of their halls north and south, and others east and west. The first design we come to is "Plan," by Messrs. Alexander and Henman, of Stockton-on-

Tees. We find the hall placed east and west—its end or entrance abutting on Blagrove-street, and its location adjoining the old hall being at right angles thereto, but separated by a small area from end of it. The hall has a central entrance and a side corridor entrance for the use of the artistes and others, and a spacious groined vestibule, and the dimensions shown are 81ft. 6in. by 52ft. on the ground floor; but including the gallery, which extends over half the vestibule, the length is 119ft. The orchestra is at the east end. The dimensions are, perhaps, rather small for the accommodation required. The library and museum occupy a block between the hall and the angle already built upon. It has a front entrance, rather narrow (6ft.), leading to an inner hall, from which the reading-room (34ft. by 21ft.), the library (24ft. by 30ft.), and the reference library (27ft. by 22ft.), are reached. Behind the hall is a ladies' reading-room. A small court separates this from the schools behind, which have a frontage towards the new street, with a distinct entrance. The ground-floor is devoted to a lecture-room, lighted from court and three class-rooms facing the street. Over school we have a laboratory the painting and class-rooms, while the museum is over the reading and reference libraries in front. We notice that the hall is partly isolated by the side corridor, which is desirable, and there is much to be said in favour of the compactness of the arrangement. In elevation the authors have assimilated their design with the existing structure, designed by Mr. Waterhouse. The hall gable is, by the arrangement, recessed a little, so as not to overpower the present building, and the carrying on of the lines of Mr. Waterhouse's work makes a happy blending of the two. The gable of hall is seen above the roof of entrance, however, with campanile-treated shafts. The Gothic interior of hall, shown in perspective, with the flimsy iron arcade, and spandrels, detracts much from the merit of this design. "Be Strong" is another design, submitted, we believe, by Messrs. Brown and Albury, of Reading. The authors place their hall north and south. It is 110 × 63ft., its main end entrance being towards the newly-formed street. Intervening between its south end and the old hall is a crush-room, an octagon of 32ft. diameter, by which the halls may be used together if necessary, with a distinct entrance from Blagrove-street. The entrances and exits are cleverly-managed. A front entrance in Blagrove-street leads into a spacious vestibule, 25ft. × 13ft., opening on the left being the reading-room and the right the museum. The former is 45ft. by 30ft., and is at the corner, while the latter is 55ft. by 27ft. 6in., and is lighted also from the front. The school of art is on the first-floor, the advanced painting-room being over the reading-room, and the elementary room over the museum. A second floor gives laboratory and class-room. The plan is compact, and the hall is spacious, and occupies a position that does not interfere or crush by its proportions the old hall. Externally the style selected is Gothic, freely rendered, but expensive in treatment, and open to the objection, perhaps, that it does not harmonise in style with the existing work, if this is thought necessary. The façade in the new street lacks connection with the hall behind, the roof of which will be seen. "Grosvenor" (Mr. Sams, of Conduit-street, the architect of the Grosvenor Gallery) places his hall, which is 127ft. 6in. by 54ft. 6in., in centre, its axis being north and south, with entrances from the new street and Blagrove-street, low corridors being obtained on both sides, thus isolating the hall from the other departments. The hall is stated to be capable of holding 1,700 seated persons. The school

and class-rooms occupy a block in the rear, the elementary and advanced departments being over the school. The block facing Blagrove-street comprises the reading-rooms for males and females on each side of entrance, and above is the museum, lighted by a clerestory and glazed ceiling. The style selected is Queen Anne, rather heavily handled; the side gables seem to crush the composition. An arched open porch, with side flights of steps, forms the central feature.

The other designs we shall refer to in our next. We note here "Brick and Terra Cotta," "Apt," "Triangle," "As You Like It," "Utility," "Plan and Purpose," "Lux," "Progress," "Economy," "Boz," and some others. In the meantime, we once more hope the Corporation will pause before they fully determine to commit an act of injustice to the competitors, who have devoted so much labour and thought in the preparation of designs upon the faith of the advertised conditions. We understand that the name of the "Brighton Referee" is Mr. Lainson. We have not seen his report, but we should like very much to do so.

LATE GOTHIC—SHALL IT BE REVIVED?

THOSE who anticipated a sensational paper from Mr. Stevenson last Friday week, at the Architectural Association, must have been disappointed. There was a generally preconceived idea that Mr. Stevenson was going to enter the arena of controversial æsthetics, or to favour his hearers with some reasons for dissent from the architecture of the nineteenth century. Instead of this, however, the lecturer contented himself with giving his audience a brief elementary discourse on the development of Gothic architecture—a *réchauffé* of an old article, admirable in its way, but scarcely complimentary to some of his hearers, who were supposed to have already made themselves proficient in this part of their training. From our report of the paper last week it will be seen that Mr. Stevenson took a general view of Gothic architecture, tracing its origin to France, and forcibly drawing attention to the necessities of vaulting as the primal motive of the pointed arch. The chief aim of the author apparently was to show that Gothic was not a style indigenous to the middle ages only, but that its development lasted down to the latest style—that it was as much a domestic as an ecclesiastical style, and that the style we call the "Perpendicular" was the outcome and final result of the system, and not, as we have been in the habit of regarding it, a symptom of degradation or decline. In short, Mr. Stevenson endeavoured to lead up to the latest and flat-arched Gothic to show that it was as much a development as the thirteenth-century style, to which architects have been looking for inspiration, and which they have placed before them as the acme of perfection. Now, no one will be so rash as to dispute many of the inferences the author drew—some of them, in fact, are familiar enough. Viollet-le-Duc, Fergusson, and many other writers have, before Mr. Stevenson, shown the genesis and development of Gothic architecture—that the twelfth, thirteenth, fourteenth, and fifteenth centuries each produced a style as appropriate and as suitable to its age as it could be, and that with the decline of the ecclesiastical and the rise of the secular power the Domestic Gothic was evolved—a style in many respects as truthful, honest, and as characteristic of its age as any that had preceded it. But no logical mind could ever have come to the conclusion that if we want a bank, a town hall, or a habitation, we must go to the Gothic of the

thirteenth century. It is true many architects have acted on the principle that Gothic must be early or nothing at all, and probably Mr. Stevenson was referring to them, but he fell into the error of assuming all acted upon this principle. It is very clear that the author wishes to redeem the latest of the Gothic styles from the reproachful epithets of "debased" and "degraded;" he desires that it shall share the same regard and reverence as its predecessors, and that future restorers shall bestow upon it the same honour as the earlier styles have received. But to establish for it this regard it must be shown that the style has the intrinsic merit of its predecessors. Although the thirteenth-century style is little adapted to our modern wants, it represents the Gothic system in its perfection, and we must acknowledge that if Sir Gilbert Scott or Mr. Street builds a new church, or restores one of mixed style, he is justified (*cæteris paribus*) in adopting the phase that presents the most undoubted advantages of the Gothic style. Albeit for our secular or domestic wants we have protested as much as Mr. Stevenson against the employment of Gothic of an early type, and the absurdity of introducing sharply-pointed arches in domestic buildings for every small window and doorway. At the same time we are not prepared to accept the Perpendicular as our starting point. It is perfectly true that the style "arose with the growth of modern thought," but it was the last effort of a system to adapt itself to domestic and secular uses, it was far from being the ideal of the system. And we must not forget that the growth of modern thought rekindled the art of Greece and Rome.

There was an ulterior aim in the author's paper. Just as we anticipated, it was necessary for Mr. Stevenson to prove that the so-called debased Gothic of the sixteenth century was a pure style, as he and the party of anti-restorationists he represents were bound to show that the work of the Tudor and Stuarts had as much claim to preservation and protection as the earlier work executed when England was under foreign influence. Less easy, however, was it to account for the prevalence of the Perpendicular, or, as the author called it, "Horizontal style," on the supposition that the pointed arch became obsolete with the disuse of the vault and with the introduction into the style of the timber roof. This was certainly not the case, as that style was brought about by the evolution of the vaulting system, the necessity of increasing the intercolumnar spaces for light at the same time as the entailment in the height of the structure. As Mr. Spiers said, too, the author had overlooked the fan-vaulting and its exigencies. We know, and Prof. Willis remarks, there are no Continental examples of fan-vaulting; it is a specially English development to which the Tudor or flat Gothic was mainly due. This style was undoubtedly the result of the endeavour to economise material and to reduce the points of support. And we are not slow to give to that style its due for the marvellous effects the ingenuity of its architects produced; above all we admire, as much as Mr. Stevenson, its fine flattened vaults and spacious interiors. But with this avowal it was yet a style in decline; the principle of the system was in reality being lost or contravened; the greater effects and apparent economy attained was at the expense of prodigious propping, the thrusts were infinitely greater—in fact, the equilibrated construction found where the vaults and arches were of higher pitch was being gradually lost sight of. It was to the architecture of Normandy, from which our greatest mediæval works are to be traced, that we owe all that is best in Gothic. Severe, methodical, and scientific, as Viollet-

le-Duc observes, "it bears the stamp of the practical mind of the architect, a strong regard for principle unrestrained by traditions; while in the Ile-de-France this architecture becomes refined and pliant, characterised by the reserve of a cultivated taste."

We are now in a position to consider the suitability of the depressed or Tudor Gothic to modern buildings, which was the burden of Mr. Stevenson's discourse; or, in other words, how far we may consider it to be the most perfect form of the Gothic development. We have shown that the Gothic of the Tudors or Stuarts is not the representative or most pronounced form of the system, but rather the endeavour to adapt its forms to social and domestic requirements. He might have traversed the question with more effect without going over the ground he did, or referring to the earlier history of the style, by bringing a few practical examples and details to show the undoubted advantages of square-shaped openings and flat-topped windows. We consider the revival of Classic helped considerably towards the result, and in England, the later Stuart was an amalgamation of the two styles—Jacobean certainly was. The Tudor was a costly mode of construction—it necessitated the use of mullions and tracery, panelling and carving. No one will deny that a mullioned window is a great deal more costly than a plain square opening, and that the simpler forms and construction of Renaissance give us all the facilities of the horizontal system of building. It gives larger openings for light, horizontal floors and lintels upon the only logical principles, and the mullion and visible arch, which in the Late Gothic became secondary and ornamental, were now abandoned to the lintel and breastsummer. Another costly feature of Late Gothic was the panelling; the interest in the style still centred in the vertical line, not in the wall surface, and in spirit the style was essentially a vertical one, though it assumed the horizontal character. In short, the depressed Gothic, or Perpendicular, whatever merits it had, was not a constructive style in the sense that the thirteenth century Pointed or the Classic was; its wide openings and horizontal divisions were not the result of any principle, but the effort to stretch the Gothic beyond its limits. We perfectly agree with the dictum that if we worked on the same principles, as the old Gothic builders, we should have something very different from pointed Gothic; and, we may add, also something very different from flat Gothic. Mr. Stevenson said we should have no "pointed windows, quatrefoils, and buttresses, which receive no thrust, nor chamfer stops simulating wooden framed work, ugly and unmeaning notchings." Certainly not; yet, strange to say, the Late Gothic is full of these conceits. Let any one enter any late sixteenth-century church; let him examine a shrine, or a chantry—he will see the false buttresses, quatrefoils, unmeaning chamfers and notches by the hundred. The lecturer, in his concluding sentences, condemned the very style he was advocating. What is the vernacular style of which we hear so much? Is it not precisely that which the builder and workman find it easiest and best to work in? What is the architect's duty? Is it not that of giving to these vernacular ideas an expression in accordance with them, without reference to any previous style or preconceived archaeological sentiment? Is it not, in truth, the grammatical construction, so to speak, of the forms and materials that we are most accustomed to—the rendering in architectural language of those everyday wants and constructive expedients by which it has been our fortune to be surrounded? A hint was given that the educated minds of the last thirty years have

been hopelessly attempting to supplant the vernacular. Has the attempt not proved futile for the same reason that the Gothic revival has failed—the attempt to copy features and styles rather than to originate them to circumstances? But the last course—that recommended by Viollet-le-Duc and the greatest minds in the profession—has now been declared modern, and therefore not architectural. Is not the vernacular style as much Classic as Late Gothic? What, in short, does this argument point to? Is it not an attempt to revive Late Gothic, as we have nearly had a satiety of Queen Anne? It must be remembered, however, the Perpendicular has been tried, and it soon gave way. It was tried for one great public building. Our churches, schools, and public institutions once revelled in quatrefoils, false buttresses, parapets, and pinnacles, but it was soon found costly and ill adapted to the climate. Since then we have tried French and the earlier developments of the style, which for civic and domestic structures have been pronounced equally ill suited. The seventeenth century Classic has again risen in popular estimation; buildings are now rising in it, and we have to await the verdict of the public. We have seen two Classic revivals; shall we see another Gothic revival?

MECHANICS OF ROOFING.—II.

THE hammer-beam roof, which we find in common use in buildings of the fifteenth century, affords a familiar illustration of the mechanical principles which we discussed in our previous article.*

The figure given is intended to represent the general outline of a hammer-beam roof, having a pitch or angle of inclination to the horizontal of 45° , which angle was called θ . The hammer-beam $A I$ carries at its outer end a vertical strut $I B$, which acts as a support to the rafter at the point B , taken in the present instance at one-third of the length of the rafter $A V$, so that $B V$ is twice the length of $A B$, and the load L at M is twice the load W at C . Drawing the lines to represent the several forces as in the former paper, and taking $K N$ to represent the load L , we have $B K$ representing the horizontal thrust T at B , acting outwards; then $D C$ is the load W at C , producing the thrust $E F$ or H at B and A , and the vertical pressures $F C$ or Q at B , and $F D$ or P at A .

The total vertical pressure on the strut $B I$ is $L + Q$, represented by $K N + F C$. Draw a vertical line at A , and measure $A Y$ thereon equal to $K N + F C$; then since $A I$ equals $B K$, which was shown before to represent the horizontal thrust at A , the line $I Y$ will represent in magnitude and direction the resultant of all the forces acting upon the hammer-beam $A I$. If a raking strut is fixed in the direction of this resultant, the whole of the forces will be conveyed to the point Y , and the length $I Y$ will represent on scale the compression down the strut, which will then act as if it were a vertical pillar. By this means the horizontal thrust is thrown much lower down on the wall, and consequently its tendency to push the wall over about its base is proportionately diminished.

If the strut abuts against the wall at some point J between A and Y , then by drawing $Y O$ perpendicular to $I J$ we shall have the compression down $I J$ represented by the line $I O$, and there will also be a transverse strain on the strut, the amount of which is measured by the length of the line $O Y$. This latter force also acts at I perpendicularly to $I O$, and tends to cause the outer end of the hammer-beam to drop by producing a leverage about the point J , a circumstance which is often observed in

old roofs of this kind where the strut has been fixed at too high an angle with the wall. Moreover, by placing the strut at J instead of at Y we have the horizontal thrust T acting at a greater distance above the base of the wall, and therefore producing a more powerful influence in tending to overturn it.

If a horizontal tie or collar is placed across the rafters at M , which is half-way between V and B , it will reduce the horizontal thrust at B by one-half, and in a greater or less proportion according as it is nearer to or further from B . With the collar at M the horizontal thrust at B will be

$$\frac{1}{2}(T - H),$$

and that at A will be

$$H + \frac{1}{2}(T - H), \text{ or } \frac{1}{2}(T + H).$$

Representing this thrust by the length $A G$ we have the line $G Y$ as the measure of the resultant of the forces acting on the outer end of the hammer-beam.

When the collar is placed at any other point (say M') where the ratio of $B M' : B V$ is that of $1 : n$, the horizontal thrust at B is

$$\frac{1}{n}(T - H),$$

so that when the point M' is at B we have $\frac{1}{n} = 0$, or there is no horizontal thrust at that point. The only horizontal thrust at A is H in this last case.

CORRECTIONS.—In the former article on this subject the fourth number from the top of the third column in Table I. should be “41,” and not “45,” as printed. The heading of the second column of the same table is “ $\tan \theta$,” the “ θ ” having dropt in printing. In the twenty-third line from the bottom of the first column on page 558, the letter “t” between “A” and “teuding” should be omitted, and a comma substituted.

ARCHITECTURAL STUDIES IN FRANCE.*

THE completion and publication in one handsome volume of Mr. W. Galsworthy Davie's Sketches will be welcomed by many in the profession as a sort of supplement to the more comprehensive works of Messrs. Johnson, Nesfield, Shaw, and others. While going over different ground, Mr. Galsworthy Davie has collected a few of those typical examples and details of Transitional and Early French architecture, which his predecessors gave in more

* Architectural Studies in France. By W. GALS-WORTHY DAVIE, Architect, Gold Medalist, R.A., and Soane Medalist, R.I.B.A. London: B. T. Batsford, 52, High Holborn.

general form, and has produced them to a large and workable scale. The sketches, some of which have been noticed by us already, were all made by the author during the years 1874, 1875, and 1876, and were nearly all plotted on the spot—a recommendation that will enhance greatly the practical value and reliability of Mr. Davie's labours. Another important consideration is, that the mouldings, which to our minds form by far the most valuable portion of the work, have been given to a much larger scale than we ordinarily find in architectural books—the main portion of them being full-size, half full-size, and a quarter and one-eighth, while the author informs us that the smaller scale mouldings have been reduced from full size drawings. With this assurance we can open the pages of Mr. Davie's work with confidence; and the student will feel that he has all the advantages to be derived, or as much as he could obtain, from a study of the actual mouldings themselves.

Opening the volume before us we find some well-executed coloured plates, representing enamelled work and stained glass in Auxerre Cathedral and Museum, painting at Bayeux Cathedral, and stained glass, tapestry, and encaustic tiles from Bourges, Laon, Noyon, and Sens. We may mention the enamelled pyx and chasses from Auxerre Museum, interesting examples of Early design and colour, drawn full size; also some quaint encaustic tiles with chocolate ground of geometrical and conventionalised patterns; some stained glass in rich colours, from choir of Auxerre Cathedral, a collection of grotesque tiles from Laon Museum, and a specimen of tapestry from Sens. But it is upon the lithographic outlines we set most value. We have, in one or two previous notices of the work, referred to some of these, and shall only here note a few of the striking plates. Mr. Davie has picked up a few of the details from great French examples that other explorers have overlooked. Thus we have some interesting detail from Amiens; we note especially some pure work in an Early style from the south-west entrance of the cathedral, and a very fine jamb and arch moulding given half full-size. From Le-Grand Andeley an exceedingly nice jamb of the west doorway is given, in which are eight detached shafts in two ranks, the outer rank supporting the arch moulding, and the inner an arcade below the stiff-leaved capitals of the first row. We do not admire the doorway at the west end of aisle in the choir of Auxerre, though it is a singular instance of a combination of segmental arch and straight luted openings. The full-size details of caps shown exhibit some good carved foliage of the thirteenth century to be found in the choir, whilst the almost incomparable Lady Chapel and chevet of Auxerre are represented by a detail of one of the windows. The detail from Bayeux is interesting, if not beautiful, while the circular transept windows of Beauvais are peculiar. A number of plates is devoted to the illustrations of St. Georges-de-Boscherville, an unique Transitional example, the groined chapter house in three bays, fully detailed in Mr. Davie's book, being the most interesting instance. The west arcade or front is thoroughly Romanesque in spirit, and the details are instructive as exhibiting the development of the style. Another strong feature of the work is the crypt of Bourges Cathedral, to the illustration of which several plates are given. It may be remembered that the plan of Bourges is unbroken by transepts, which gives to it a length and grandeur of effect not known in the northern cathedrals. Its semi-circular apse and double aisles of different heights perhaps make Bourges a model of symmetry. Mr. Galsworthy Davie has contented himself in giving us figured drawings of the plan of crypt, showing the double groined aisles

* See BUILDING NEWS, Dec. 7, page 557.

under the circular apse, and a section taken through the outer aisle, shown expanded or stretched out with the capitals and groin ribs. The carved bosses, caps, and piers are extremely good examples of early work. Passing some details from Chartres and Coutances, we come to some choir seating from Gassicourt Church, near Mantes, with some quaint carvings from the elbows of seats. We have also the Church of St. Martin, Laon, illustrated in some interesting iron hinges, of peculiar workmanship; details of Mont St. Michel, showing the Salle-des-Chevaliers (illustrated by us); some choice ironwork from Noyon Cathedral and Sens, and various scraps from Rouen, Chartres, Rheims, and Angers. Some of the capital foliage and ironwork are excellent, and we consider the author has exhibited some discrimination in selecting details of a useful and adaptable type. It would have added to the interest of the book if the reputed dates were given with some of the detail, and descriptive notes had accompanied it: however, for all practical purposes the notes affixed furnish needful information. The mouldings are drawn in bold outline. On the whole, we can cordially recommend Mr. Galsworthy Davie's "Studies in France" as a valuable repertoire of Early French detail, in which the student may find much suggestion. The drawings have been carefully printed by the lithographers, Messrs. Newbery and Wilday, Holborn, and the "get up" of the volume reflects credit on the publishers. We observe that the work is dedicated to Mr. W. Butterfield, the well-known Gothic architect.

NOTES FROM EDINBURGH.

THERE is no slackness in any department of the building trade here, and a great amount of work in additions and alterations is still proceeding, without showing any symptoms of having reached the beginning of the end. The results are chiefly apparent in the number of streets and tenements erected for the working classes. But there have been considerable additions also to the villa residences and houses of the better class. Drunshuegh-gardens contain only first-class houses, the largest in the city, and when finished will be architecturally by far the best addition in the fashionable west. On the other hand, in the same quarter, one of the noblest sites that Classical architecture could desire, unfettered by few charters, or the fear of being built out of view, has been hopelessly sacrificed by the greed or senselessness—or both combined—of the speculative builder. This site crowns the banks and overlooks the nobly-wooded valley of the water of Leith, and commands a splendid prospect of the valley of the Forth and the hilly country far beyond it. The street built here, and approaching completion, is a long continuation of Magdala-crescent, some houses in which have been sold for fabulous prices. With such good prospects of a ready sale, the builder might have invested a small percentage in providing a design of some architectural beauty for such a site. On the contrary, the whole of Magdala-crescent and this Douglas-crescent have been built from one, or at most two, designs; both of them bad for anything but semi-detached villas. A monster doorway and a huge bow window are repeated *ad nauseam*, exhibiting in an extreme degree the bow window nuisance, and the ugliness of plate glass, unrelieved by good proportions or astragal divisions. Had the builder left his roof alone, or built his masonry a story higher, in the plainest style, the attic rooms would have been better, and the design more pleasing. But his bow window reappears with stunted side lights in the roof, and the effect of these arrangements, as tested by their architectural aspect from the other side of the valley, is irredeemably bad. Commendation must be given to the praiseworthy desire of the speculative builder to make the working class tenements ornamental to the city. The great bulk of these additions are built in four-story tenements, and have generally ashlar fronts, with

more or less of architectural detail. Leith-walk, the widest thoroughfare in the city, is fast being built up with shops and houses of good accommodation. The same external appearance may be found, however, in houses where the rental varies from £15 to £30, all depending on the manner in which the floor space is divided—into four houses with two rooms each, three houses with four rooms, or otherwise. No new ideas, economical or sanitary, have been produced in any of these designs. In all, with the exception of a few built expressly for the Improvement Trustees, the w.c. arrangements are as they have ever been, in the heart of the structure. The cost of placing them in immediate contact with the air outside is too great, and the only connection with the outer air provided is, in most cases, little better than an evasion of the law. A shaft with 2ft. or 3ft. of sectional area, is provided for some tenements, but the greater number trust to a 3in. pipe carried to the roof. Nothing has been done to get at the root of the evil by ventilation of the public sewers, and it was only the other day that a lecturer was enlarging on the efficacy of traps of his own devising. This method of fighting the common enemy in detail seems to be the only one practicable when people are afraid of making all the sewers practically open by apertures all along their line. In this kind of protection for sewer gases, Mr. Beattie, of this city, has designed a very simple and effective apparatus, the cost of which is not above £15 for a large tenement. The principle is the same as that of Mr. Buchan, lately illustrated in the BUILDING NEWS; but it is not, apparently, so complete in its arrangements. By means of a 3in. iron pipe, and Haworth's or other ventilator, a current of air is kept perpetually passing upwards, and any pressure of sewer gas finds immediate relief, and so readily that no discharge from the upper floors disturbs the water in the cesspools of w.c. below. By an ingenious arrangement of glazed apertures in the pipes, as fitted up on his own premises, any one interested can satisfy himself as to the working of the apparatus.

Notwithstanding all the sewer gas, and unusually sunless weather of the past summer and autumn, Edinburgh has been exceptionally healthy, and the average mortality has been probably about 15 per 1,000. This looks encouraging for the Improvement Scheme, which is probably a factor of some moment, having let fresh air and light into many parts of the city where they were unknown before. Architecturally their operations are making but tardy progress. The Jeffrey-street thoroughfare, below the North Bridge, is nearly completed. A large tenement is building in this new street, which will effectually hide the ugly side of the New Trinity College Church. This edifice which, like most street churches, has the back part shabby, but a good Gothic front, is not what it ought to have been, as party spite prevented the sum realised by sale of the old church being spent upon the new one. But it has been opened at last, and the church in which the congregation had worshipped for many years is left in the hands of the Town Council, the parish having been suppressed. This church is one of the three into which St. Giles's is divided, and consists of the south transept and its aisles. It is interesting as having been witness to many stirring incidents of the national history; and it is proposed to restore it as much as possible to its original appearance as part of the Collegiate Church. It was here that Jenny Geddes discomfited the Dean of Edinburgh with her "cutty stool." Dr. Begg and others affirm that it is a "fell creepie" still; but to all appearance its occupation here is gone, whatever need there may be for such missiles across the border at Hatham. We are putting in stained windows, as richly dight as those which our ancestors knocked out when they drowned St. Giles himself in the Nor' Loch. The choir of the church has been fitted up at great expense with carved stalls, a Royal pew, and benches of oak. We have erected a reredos and pulpit of Caen stone, not perhaps in the best of taste with its surroundings, but still a reredos. This reredos contains niches for statuettes (sadly wanted architecturally), and which some wealthy citizen will soon provide. The choral service

is led by instrumental music, and one of the best choirs in the city; the incumbent intones the prayers with good effect, and is at liberty to use as much of the once hated Mass-book as he pleases; and in every way possible there is a desire to atone for indiscretion in the past, and make confession that Edinburgh went a little too far in her hostility to art and ancient liturgies. It is generally felt that this spirit of hostility has been too long permitted to stand as a plea for disguising the revolting contrast between splendour in the dwelling and scrimping in the church. It is poverty and not the will that now consents to rear a shabby church. The contrast between Prelatic and Presbyterian Gothic in Edinburgh has for long been very sharply drawn, but it is not so very obvious as once it was. Architects, to be sure, are still expected to design something very fine for £5 a sitting, and thus it is that there is hardly any Presbyterian Gothic here which does not in some way or other murder the proportions or details of the edifice. The only city churches on which money has been, if not very wisely yet lavishly, spent, are Classical in the design. St. Stephen's is externally the finest; and nothing can excel the skill with which the contour and proportions of its mouldings have been studied by Playfair. In this respect it is a great contrast to St. George's, which, however, has its dome; and St. Andrew's has one of the finest spires which Classical architecture has produced.

The cathedral church of St. Mary is now making good progress towards completion of the nave, which has been roofed in, or nearly so. The central tower is not yet up to level of the apex of roof, and the choir is farther behind. This edifice will undoubtedly fulfil all that is expected from it as ornamental to the city, and will open the eyes of the public as to the quality of Gothic architecture, which is too frequently a muddle of incongruous detail and infamous proportion. There are some very good specimens of carving on the south transept doorway, quite equal in stone to what Sir Noel Paton, the prince of fairy painters, has produced on canvas.

HARMONIC PROPORTIONS OF MUSIC HALLS.

MANY speculations have been broached upon the correct proportions of concert-rooms, but without any agreed result. The following dimensions are those of a few of the most celebrated music-halls in this country, and may be suggestive of desirable proportions. The Birmingham Town Hall has been justly celebrated for its acoustical properties, and musicians all bear witness to its excellence. The music-hall is stated to be 111ft. 6in. in length, 76ft. in width, and 70ft. in height. Including the two galleries it accommodates 1,840 persons. The Leeds Town Hall is 162ft. long, 72ft. wide, and 75ft. high, with circular roof. The Liverpool Philharmonic Hall accommodates 2,300 persons, is 106ft. long by 68 wide, and 68ft. high. The St. George's Concert Hall, Liverpool, by C. R. Cockerell, holding 1,100 persons, is 77ft. long, 72 wide, and 37 high-oval. Exeter Hall (3,000 persons), 138ft. long, 76ft. wide, and 54ft. high. St. James's Hall, 139ft. long, 59ft. wide, and 59ft. 6in. high. The Albert Hall (8,000 persons), 320ft. long, 305ft. wide, oval on plan. Referring to the *Dictionary of Architecture*, Part 10, from which we have quoted these dimensions, little information is afforded us, though the harmonic proportions of 2, 3, and 4 for the height, width, and length, are quoted—that is to say, in a moderate size room, the dimensions would, according to this proportion, be 16ft. in height, 24ft. in width, and 32ft. in length. The writer observes, "Theorists suppose that by this means a harmonious concordance of sounds is secured; a mere approximation to such proportions, however, is said to be worse than a total disregard of them; and the room must on no account be comparatively lofty, as this allows the sound to be lost in the waste space above." Curved end walls are said to prevent reverberation, and a ceiling slightly arched, or flat and coved, is, from experience, found to be desirable. Plain walls are found to produce a disturbing echo,

and boarded surfaces are better than plaster walls as productive of resonance. A long room—say a double square—is generally bad acoustically, though a lofty room is much worse. The angles of all rooms are best cut off, and any unpleasant echo can be obviated by boarded screens placed across the corners, or, if the apartment is high, by a boarded ceiling placed below the roof. Sometimes we have observed that drapery screens or curtains placed along the sides of a room destroy any disagreeable reverberation that may arise in a room barely stocked with people, but a felt carpet on the floor frequently produces the desired correction. A great deal depends on the furniture of an apartment, and especially in the amount of deadening material like carpets, cushioned seats, curtains, &c. Unpleasant resonance or reverberation can generally be cured by a well-stocked audience, but as this is a very fluctuating element, other methods must be resorted to. Covings and cantings of the angles of walls and ceilings often produce the desired acoustical effect, the principle being to confine the sound undulation, and not to impede its free transmission through the auditorium. By excessive height of apartment the sound is lost in the space above. To correct this, the shape of the auditorium, if possible, should be diminished in sectional area as it recedes from the source of sound. This is sometimes done by raising the seats at the extreme end, and the isochronic curve has been suggested. By confining cross the section of room the sound is intensified, and the effect generally improved. There can be no doubt that the high-pitched timbered roof is inimical to sound transmission, and as a rule we have observed lofty Gothic naves very trying to the voice. The subject is one that has not engaged the attention of architects as it deserves, but if the observations of experienced musicians, speakers, and vocalists were collected, and data of the best acoustic buildings obtained, the profession would be enabled to lay down for their guidance some more approximate rules than they have now, while the public and the musical profession would be gainers.

GRAPHICAL STATICS.

THE use of the equilibrium polygon to determine the reactions at the supports of roof trusses has generally been confined to those cases where the loads are supposed to be symmetrical and vertical. Now, it so happens that this is seldom the case in practice, roofs and trusses being exposed to a variety of loads and strains in all directions, as when subject to wind pressure, &c. Mr. James R. Willett, architect, lately read a valuable paper before the Civil Engineers' Club of the North-west, Chicago, in which he explains how, by means of the polygon, the reactions may be obtained graphically when the loads act in any direction. The author refers to Bow's "Economics of Construction," Von Ott's, Greene's, and Du Bois' works on graphical statics as explaining the general theory, and adopts Bow's notation. Now, it may be observed that the force polygon of vertical loads is a straight line—that is to say, the loads are laid off on the same line, since all are vertical, and the closing line overlies all the loads. This line gives the sum of both reactions, and the question arises, How much is borne by each support? In Bow's and other works on graphical statics this is shown. Let us try to explain the method. By assuming a point or pole, and drawing lines from it to ends of the several loads, A, B, C, &c., we get a series of converging lines; then, parallel to these are drawn in another diagram, under the beam, lines forming an equilibrium polygon, each line being terminated by prolongations of the vertical loads on beam. When these are drawn—an arch-like diagram being the result—a straight line joins the extremities; this is the closing line, and forms with the others a closed polygon. Then, by drawing a straight line from the pole to the vertical load line parallel to this last closing line, a point is obtained which is the dividing point of the vertical line scale, A, B, C, &c. If our readers have been able to follow us so far without the aid of a diagram they will understand the principle upon which Mr. Willett

proceeds to determine the cases of unequal loads acting in various directions. It is obvious that the load polygon, instead of being a line, will be a real closed polygon when the forces act in different directions on the beam, and that the closing line of the figure will give the sum of the reactions at both supports. Assuming, again, a pole, converging lines are drawn to it from the different points, and next the equilibrium polygon is drawn as before. There is only one little inconvenience that may arise—sometimes and that is, the different directions of the loads on the beam, if prolonged too far, cross each other, and some little care is required in recognising the lines. But it is only necessary, as the author says, to "draw the lines of the polygon from the direction of one load or force to the direction of the load or force which is next adjacent at the beam, although in so doing you may cross the directions of other forces." In all cases the closing line will be found to be in the same direction, and it is the direction of this line, or one parallel to it through the pole, which will give the division of the reactions, as we have said. If the letters are placed in alphabetic order between the forces at the beam, the lines of the equilibrium polygon may be drawn in the same order.

Another case is illustrated—that of a common roof truss subjected to forces acting more obliquely on one side than the other, a very ordinary condition under the action of wind pressure. In this instance we have, as before, the polygon of forces to be treated as in the former case, after which the equilibrium polygon is drawn precisely as before, and the closing line gives the dividing point of the reactions at the supports. It is impossible, without diagrams, to make clear to those who have not studied graphical statics, the means adopted, but we refer them to any of the works we have mentioned above. Mr. Willett has at least proved the capabilities of the very useful and elegant properties of the equilibrium polygon, and its application to the most diverse and opposite forces. He has especially shown what no other writer on this subject has done—the means of obtaining, by a simple geometrical process, the effects of wind and other sources of irregular pressure, which, as a rule, have been generally disregarded, though they have equal claims on the architect's consideration. In adopting graphical analysis the only difficulty arises in the confusion of the lines in complex constructions; but this can be diminished by resort to a simple notation, such as that indicated by Mr. Willett, to whom much is due for explaining the system.

THE ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS AT DARTFORD.

THIS association held a meeting at Dartford on Saturday last, for the twofold purpose of discussing the model bye-laws recently issued by the Local Government Board, and of inspecting the works near their outfall of the West Kent Main Drainage scheme, now approaching completion.

The discussion took place at Messrs. Hayward's offices in the morning, under the chairmanship of Mr. F. Ashmead, borough surveyor of Bristol, president. It was opened by Mr. LEWIS ANGELL (West Ham), who said the bye-laws are practically silent on the matter in which the members of that association were most interested—the manner in which those who carry them out are to be recompensed. Their very numerous clauses will necessitate a great deal of supervision of building operations and the laying out of streets, which will press very heavily on the officials of the smaller towns. He therefore moved "that the Local Government Board be memorialised to obtain Parliamentary powers which will enable local boards to charge, as in the metropolis, such reasonable fees as will provide the necessary supervision for the enforcement of the model bye-laws." This was seconded by Mr. JOSEPH HOPE (Colchester), and unanimously agreed to. A general discussion took place on the question as to whom these proposed fees should be paid—whether the metropolitan plan of payment to the district surveyors

should be followed, or whether the money should go to the exchequers of the local authorities. It was agreed without dissent that the latter was the only course by which the surveyor could preserve his independence. Broad hints were thrown out that urban authorities, if they find their revenues largely increased by fees, will be induced to deal liberally with the officers who bring them in, and it was also suggested to the Local Government Board, who largely increase the duties of borough and local board surveyors, ought to be asked to subsidise them from the national exchequer, as they now do medical officers of health and inspectors of nuisances. This, it was remarked, would induce urban authorities, as in those cases, to largely augment the salaries paid, and thus a better class of men would be attracted to perform the duties.

The members then proceeded to discuss the model bye-laws themselves, or rather those in Vol. IV., relating to new streets and buildings. These were complained of as generally too stringent, although in some points it was considered they do not go far enough. The provisions as to the width of new streets and the open spaces required to be left clear of obstruction at the rear of houses were denounced by Mr. ELLICE CLARK (Hove) and others as certain to immensely depreciate the value of building land by imposing needless restrictions on its laying out. The concrete or asphalt foundation was, it was pointed out, quite necessary in some towns, but not in those on rock or chalk strata, and the glaring inconsistency between the requirements for a damp-proof course 6in. above the ground, and for the lowest timber being kept 3in. above this and the layer of concrete (as stipulated by clauses 56 and 17) was exposed. The regulation that no wood shall be inserted into a party wall was referred to as needlessly severe, as a 4½in. thickness of brick ought to be, as it is considered in the metropolis, ample protection against fire. Mr. CHAS. JONES (Ealing) and Mr. ELLICE CLARK pointed out that a Gothic architect will not be able to add barge boards to his house unless it is 50ft. from any other, but must put up a 3ft. high parapet of brick or stone—the very thing of all others he dislikes. Nor can he erect a turret or dormer on his roof, except it is of incombustible materials. Mr. ANGELL and others urged that bye-laws are useless unless consolidated into an enactment; but others considered that they have their advantages in the elasticity with which they can be varied to suit special requirements of exceptional districts. On the motion of Mr. ELLICE CLARK, seconded by Mr. ANGELL, it was unanimously resolved "That the council be requested to report to the Association as to the practicability of carrying out the model bye laws recently issued by the Local Government Board, and that a copy of such report be forwarded to the members to lay before their respective boards."

After an adjournment for luncheon at the Bull Hotel the members visited the West Kent Main Sewerage Works, under the guidance of Mr. Alfred Williams, C.E., the section inspected being that between Joyce's-green and the outfall. The present scheme, which was devised in 1874 by Sir Joseph Bazalgette, C.E., consulting engineer, provides for the construction of a main intercepting sewer from Beckenham, forming an outfall for the sewage of Bromley, Chislehurst, Bexley, and Crayford, a sewer in the Cray Valley, from Orpington to Crayford, forming a branch to this main outfall, and both uniting at Bourne Bridge, Bexley, into one sewer discharging into a reservoir situated on the Dartford Marshes at Long Reach—a point about seven miles below the outfalls of the Metropolitan main sewers. The contract drawings were prepared by Mr. Alfred Williams, the engineer, under the supervision of Sir J. Bazalgette, and the contract was let to Messrs. John Neave and Son, the well-known sewer contractors. The works were begun towards the end of 1876, in the neighbourhood of Halfway-street, near Sidcup station, on the North Kent Railway. There have been 18 shafts sunk down to the level of the sewer of from 40 to 65ft. below the surface, and four others are also being sunk, which will soon be down to that level. The sewer excavated in tunnel is about 5,600ft. in length, and a further length of about 10,000ft.

has been constructed eastward of Penhill Bridge, in open cutting, at depths varying from 9 to 25ft. below the surface. The main sewer is for the first section of about 6 miles, egg-shaped in section, and 6ft. by 4ft. internal diameter. It then changes to a circular barrel, of 5ft. diameter, which is enlarged to 5ft. 6in. on the marshes, and continues of this dimension to the outfall. A length of about 1,800ft. of the Cray Valley branch sewer has been constructed between Bourne-bridge and Bexley. At the outlet works a length of about 2,500ft. of sewer is made, the floor of the reservoir and filters is in a forward state, and the works in river below low water are in progress. An important feature is that the sewer is being constructed of Portland cement concrete, (except in the egg-shaped portion, where some brickwork is introduced), and thus considerable saving is effected on the ordinary cost. The concrete is in the proportion of 6 of ballast or washed gravel to 1 of cement. The works on the marshes, visited on Saturday, are about 10ft. below the surface, and are constructed in bratticed cutting, and then covered in. There is a layer of excellent gravel pierced in the work, which is turned to account in the forming of concrete. We were unable to ascertain the average cost per yard. The members descended into the sewer, which is here 5ft. 6in. in internal diameter, and explored its course for a considerable distance. The walls are of 9in. concrete, not rendered on the inside after the centres are struck, but the thickness is gradually increased to the outlet, to which there is a fall here of 3ft. to the mile, but an average one of about 15ft. per mile. Here the sewer was nearly dry, but considerable difficulty has been met with from the influx of water into the tunnel works. Beneath the Dartford Creek the sewer has been carried on the siphon principle in two 4ft. iron pipes, laid side by side, and having a slope of about 45° in the fall, and a vertical rise to the old level beyond the Creek so as to facilitate cleansing operations. The manholes will be left gridded, and open for ventilation wherever practicable. The reservoir, now being constructed, will be 500ft. in length and 10ft. 6in. deep, divided into three longitudinal chambers and several transverse ones. Here the sewage will be screened, and so far purified as to meet the requirements of the Thames Conservators, and then discharged into the Thames at low tide from below the level. The total length of sewer now completed is about 3½ miles, and the contract is being actively carried forward. After the inspection of the works—the intended visit to the reservoir had to be abandoned on account of the lateness of the hour—Mr. Williams again exhibited and further explained the maps, plans, and sections, showing the projected extension westwards towards Croydon, and perhaps ultimately to the Thames Valley, near Kingston, and added that it is probable that Dartford and other places will negotiate to be connected with the system. Some discussion took place as to the means of flushing, cleansing, and of protecting the works from influxes of water, on the best qualities of connecting stoneware pipes, &c., and at the close of the visit Mr. Williams was cordially thanked for the facilities he had offered for inspection.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

LEEDS ARCHITECTURAL ASSOCIATION.—On Thursday week a paper was read by Mr. H. P. Holt, C.E., giving a description of a combined iron and timber roof construction, which he has used largely in the neighbourhood of Leeds and other parts. Mr. Holt stated that the object he had in view when designing this type of construction was to use the least possible amount of the cheapest, and at the same time the most suitable, materials to resist the various kinds of strains, and to give the requisite strength in such a form as to entail only a small amount of machine work and low-priced labour in manufacturing the several parts of the construction, and also that only unskilled labour should be required in its erection. For moderate spans, say from 25ft. to 50ft.—exceeding which this type of roof is not specially intended—the parts in compression are formed of timber, usually Memel fir, except when

wrought, in which case pitch pine is used. The parts in tension are made of wrought iron or steel, and those in which a cross strain occurs, as at the junction of a compressional and tensional member, in cast iron or steel.

LIVERPOOL ARCHITECTURAL SOCIETY.—The fourth meeting of the present session was held on the evening of December 12th, the President, Mr. J. M. Hay, in the chair. A discussion took place with regard to the council having issued their report on the model bye-laws of the Local Government Board to the public before it was adopted by the society at a general meeting, thus compelling the society to pass a resolution adopting the report, in order to support the dignity of the council, whose action in the matter was by many considered premature; and finally Mr. Nugent gave notice that he would propose at the next meeting, to be held January 9th, 1878:—"That the resolution adopting the report of the council on the model bye-laws issued by the Local Government Board be rescinded, and the whole matter more thoroughly discussed." The designs submitted by the student members for a country church, to seat 400, period fourteenth century, being the first subject on the syllabus for this session, were exhibited. Mr. T. Mellard Reade, C.E., architect to the Liverpool School Board, then read a paper on the "Liverpool School Board Truant School, Hightown." Mr. Reade explained that the Liverpool School Board, like other boards, was met by the difficulty of dealing with truant children, but in Liverpool it was probably worse than in other places, owing to its seafaring character and the extent of its docks, which gave great scope to the truant propensities of the children. After long and anxious deliberation the board effected a compromise between opposing views, and it was decided to divide the schools into two sections—one for Protestants, the other for Roman Catholics—and also to erect them at Hightown on about two acres of ground. Being an entire novelty no precedent in planning could be referred to, and the plans which were displayed as illustrations had to be thought out from first principles, strict attention being paid to economy. The building will accommodate 136 children, 68 in each section. It consists of a main block, 165ft. by 38ft., principally in two stories, the central portion being carried up one story higher. On the ground floor in each section are the office, taskmaster's room, with an inspection bay commanding the corridor, ten separate dormitories, kitchen, and other offices, and superintendent's parlour. A staircase affords communication between the three floors in the central block. The dining-room and school, with lavatories, are in wings, forming one-story annexes. The laundry, wash-house, and drying-rooms form a central story annex, and can be used alternately by each section. At the south end of the plot are good workrooms, made out of the movable wooden schools from Walton-lane. A plunge-bath and small bath, heated by the kitchen boiler, are in the main block in each section. On the first floors in each section are two parallel dormitories for 29 boys each, both commanded from the superintendent's bedroom by an inspection bay; rooms for linen and Sunday clothing are provided, together with the necessary bedrooms for officers and servants. On the second story are situated the sick wards, with nurses' rooms and bath-rooms, &c., isolated from the rooms below. The site provides also for playgrounds and kitchen garden space. The whole building is thoroughly warmed upon Harlow's system, and ventilated by Messrs. Potts and Co., the contractors being Messrs. Boardman Bros., of Leigh, and the work is rapidly approaching completion. In conclusion Mr. Reade expressed a fervent hope that the scheme would prove a success, as it was undoubtedly conceived in a spirit of Christian charity for the reclamation of those unfortunates who, without discipline and control, otherwise from vice to vice go backwards to perdition.

LIVERPOOL ENGINEERING SOCIETY.—On Wednesday evening, the 19th inst., this society held its last meeting of the year, and, after the election of the officers, the retiring president, Mr. Graham Smith, A.I.C.E., delivered an address on the "Status and Prospects of Engineers." He commenced by quoting from the

daily press, with a view of conveying some idea of the public opinion concerning the profession, and after considering at some length Lake Mœris, which, he said, according to Dr. Lepains, was a vast reservoir for irrigating purposes, and the Pyramids of Gizeh, constructed 5,000 years back, he said the profession is undoubtedly of ancient lineage. Tubal Cain was a worker in metals, and, according to George Smith, the great discoverer of the Ancient East, the title of "master of works" existed in Assyria 700 B.C. He said the remains of works were to be found all over the world, clearly denoting that the ancients possessed men answering to the description and filling the position which the engineer of the present day occupies. He then proceeded to say that the heads of the profession are totally unrecognised by the British Government, and that titles are sparsely distributed to engineers, but he thought they could dispense with them, as an engineer by his own work may gain more distinction and honour among the inhabitants of the civilised world than it is in the power of all the crowned heads of Europe to bestow. He defined the profession as the art of controlling the force of the winds and falling waters so that they may be made to grind corn and weave cloth to feed and clothe man, the making and perfecting of machinery for the purposes of cultivation, and the construction of roads, railways, canals, and bridges for the collection and distribution of the products of the earth; the construction of docks and harbours for the convenience and safety of ships bringing raw materials from foreign lands to provide employment for millions, and carrying back the products of vast industries; the ventilation, warming, and draining of the habitations of these people, and the bringing of the pure water of the mountain rill to their very feet; the inventing and perfecting of machinery with which to mine into the bowels of the earth for hidden treasures, and render them convenient to the uses and wants of mankind; and the performing of a multitude of other useful offices. He said the remuneration on entering the profession is small, but that, after a young engineer has thoroughly mastered the details of his profession, he may depend upon obtaining work of one kind or other at all times. He pointed out the difficulties facing a young engineer about to start in private practice, and said he could fully appreciate them himself as he was just about to face them. In conclusion he pointed out various works as instances of the scientific progress of the profession, and said they would long remain to immortalise such names as Lesseps, Sommeiller, Grattoni, Eads, and Fowler.

NORTHAMPTONSHIRE ARCHITECTURAL SOCIETY.—The thirty-second annual meeting of this society was held last week. Mr. Parker was unanimously elected honorary member. The treasurer's report showed the receipts to be as follow:—Cash in hand September 30, 1876, £110 12s. 8d.; subscriptions and arrears, £70 10s.; interest on deposit account, £7 10s.; repayment by the Leicester Society, £35s. 10d.; total, £191 18s. 6d. The payments—postage, printing, expenses of St. Alban's and Oxford meetings, rent of rooms, books bought, &c.—amounted to £86, leaving a balance of £105 18s. 6d. The deposit account amounted to £250. The officers, on the motion of the Rev. T. C. Alderson, seconded by the Rev. T. Richards, were unanimously re-elected, and a sub-committee was appointed, with power to add to the committee. The Rev. T. C. Beasley then read a paper on "Town Churches."

A new drill-hall for the use of the 9th Surrey Rifles was recently opened at Richmond. It is of well-seasoned deal, and is 120ft. by 50ft., and 30ft. high. The floor is to be asphalted. Mr. Brewer, of Richmond, was the architect, and Messrs. McTear and Co., of Belfast and Manchester, the contractors. The cost has been £500.

By the will of the late J. Durham, A.R.A., F.S.A., Mr. Raemaekers, of Pimlico, London, has been left to complete his unfinished works.

The foundations of a Board school have been laid this week at Penelawdd, for the Llanhydian Higher School Board, from plans prepared by Mr. J. B. Morgan, New-road, Llanelly.

A new iron and wood church, at Stechford, was dedicated on Tuesday. Mr. W. Tadman Foulkes, of Birmingham, is the architect.

MARY'S CHURCH, SOUTHAMPTON—ROYAL ARCHITECTURAL MUSEUM SKETCHING CLUB EXAMPLES—ART FURNITURE—LANCING COLLEGE CHAPEL.

OUR LITHOGRAPHIC ILLUSTRATIONS.

CHURCH OF ST. MARY, SOUTHAMPTON.

This large church, from designs by Mr. George Edmund Street, R.A., is unusually interesting from the fact of its erection being intended as a memorial to the late Bishop Wilberforce, of Winchester. The plan shows a rather novel arrangement of vestries, which are approached by steps leading down on either side of the sacristy, and divided from it by a screen. This feature is illustrated in the plan we give. The view is taken from Mr. Street's autograph drawing, exhibited in the Royal Academy this year.

OLD OAK SCREEN, MIDDLE TEMPLE HALL.

This beautiful example of decorative carved woodwork is in a good state of preservation in the Middle Temple Hall. The screen supports the music gallery, at the east end of the hall, and forms a passage from the porch to the Temple offices. Two orders of Roman architecture are introduced into the design, as well as caryatides and fauns, and the screen is otherwise elaborately ornamented with panels and carving. The drawing which we publish was made under the direction of Mr. J. P. St. Aubyn, architect to the benchers of the Middle Temple, by Mr. Charles Grieve, it being intended as a record of the screen should it be destroyed by fire or otherwise. It would be well if other bodies and their architects would follow the benchers' example by having similar drawings and records made of such remains under their care.

BEDFORD PARK ESTATE.

We have already published, during the past few weeks, the working drawings of these semi-detached and detached villas, now building at Turnham-green. To-day we give a general perspective prospect of one of the roads. The houses are from the designs of Mr. R. Norman Shaw, R.A., architect; and the decorations of the interiors are being executed under the supervision of Mr. J. Aldam Heaton, of Bloomsbury-square.

ART FURNITURE.

The drawings which we publish to-day among our lithographic plates are selected from those which we reviewed at the time of their publication*, leaving little to remark now. The designs are by Mr. E. W. Godwin, F.S.A., prepared by him for execution by Mr. William Watt, of Grafton-street. The author has taken Japanese forms as the basis of his productions, which have been prepared with a care for English wants. The designs will explain themselves, and will be found suggestive.

INTERIOR OF NEW CATHOLIC CATHEDRAL, QUEENSTOWN; HOLLOWAY COLLEGE, EGHAM; AND THE BEAUCHAMP CHAPEL, ST. MARY'S CHURCH, WARWICK.

DESCRIPTIONS of these illustrations have not yet come to hand. We hope to publish them next week.

LANCING COLLEGE CHAPEL, SUSSEX.

This chapel is being built both for the use of the college of St. Mary and St. Nicholas, Lancing, and its upper class school, and also for the use of the several middle and lower middle-class schools connected with the college, to be assembled together at certain great annual gatherings. The first stone was laid in 1868, and since then there has been steady but slow progress, for it was discovered that, although the college buildings stand on solid chalk just under the surface, there was no solid foundation on the site of the chapel nearer than at about 50ft. below the slope of the hill. It became, therefore, necessary to sink to this depth, and to carry up great piers of concrete for the internal pillars and for the buttresses, between which the external walls are carried on arches. There being a difference of about 25ft. from west to east, owing to the fall of the hill to the east, this was utilised by the formation of a crypt or lower chapel, which includes the space occupied by the apse above and four bays westward, including in its width both aisles. This lower chapel was completed in 1875, and is used for service. The central space is divided into two naves, and has an apse forming a complete octagon common to both, the result of which rises as a dome to a height of 24ft. from the floor; the two naves are vaulted, and rise 18ft., as do the aisles. At the east end of the south aisle is "The Founder's Chapel," screened off from the sanctuary and body of the chapel. The great piers for the columns of the upper chapel are carried up in brick in cement, faced with chalk in the lower chapel; the arches and groining ribs are all of yellow sandstone, and the walls are lined with white chalk; the filling in of the groining is of white and grey chalk. The walls are faced externally with sandstone from the neighbourhood of Hayward's Heath, filled in with flint and ballast concrete. The upper chapel, shown in the view, has now been raised at the eastern end—and for five bays westward, including the two eastern towers—to an average height of 30ft. from the floor; this is the level of the springing of the three-light windows of the aisles. The outer wall is being built first, and is faced with stone ashlar, and filled in as the walls below. It is intended to carry up the chapel very gradually, keeping the east end works always the highest portions, so as to groin and roof in the apse and sanctuary, while the western end is in progress. The inside walls of the upper chapel are of sandstone. The height from the floor to the under side of the vault will be upwards of 90ft.; the total inside length is 217ft., the total inside width 63ft. There will be a direct communication from the ante-chapel above to the north aisle of the lower chapel. The works are being carried out by the college workmen, without any contractor, from the designs of Mr. R. Herbert Carpenter, and Mr. B. Ingelow, the architects to the college.

ROYAL ARCHITECTURAL MUSEUM SKETCHING CLUB.

SHORTLY before this club was started we published* some particulars with reference to it. To-day, in obedience to a promise then made, we give the first of the series of plates, which we propose publishing, selected from the drawings prepared by members of the club, which is now in active working at Westminster. Country members may contribute sketches of examples from their local buildings, but the drawings for the most part will be from casts and specimens in the museum. Of these, Mr. T. Frederick Pennington contributes to-day from sketches of carvings from Southwell Minster, of 14th century date, which are characteristic of the more naturalistic treatment of foliage peculiar to the style, and suggestive to those who wish to employ a similar feature. The two earlier caps from Jedburgh are drawn by Mr. Jesse F. Scott, who has sent us the following few particulars:—The chancel of Jedburgh Abbey is of rather earlier date than the nave, being pure Norman, and it probably formed the original church. It is conjectured that when the present nave was built the old nave arcade (which runs rather lofty) was partly filled up to form a triforium, and to secure an

abutment for the new arches; some curious corbelling was inserted in the old piers, an example of which is shown. That this alteration occurred at the time of the enlargement is evident from the fact of the abacus of both caps shown being of the same moulding, though to a different scale. The unusual bar of stone left in caps to nave pier, illustrated, is peculiar, and without apparent purpose, though probably there was some reason for it. The nave of this abbey is of the Transitional Period; it is one of the most graceful remains of this style, and very well worth a visit.

MUIR COLLEGE, ALLAHABAD.

THE illustration shows one corner of the quadrangle of Muir College, now being erected from the designs of Mr. William Emerson, of Westminster-chambers, by the Royal Engineers, under the direction of Col. Fraser, C.B., the Superintendent Engineer of these provinces. This college for the education of the Mohammedans is intended to form part of the University of Allahabad, and is the result of the energetic measures taken by Sir William Muir, K.C.S.I., when Lieut.-Governor of the North-West Provinces, for the higher instruction of the native classes. The building is designed in an admixture of Caireen and Indian Mohammedan styles. At present only two sides of the quadrangle are being built. The large domed building on the left is the convocation hall, named after H.H. the Maharajah of Vizianagram, who contributed £10,000 towards the work. The open stair seen in the view leads to the public gallery. The tower will be 183ft. high, and contain a peal of bells. The low buildings on the right are the lecture-rooms, with open verandahs on either side, which the intense heat necessitates for shade. The stone used in the construction is from Sheorajpore, whitish and nearly as fine grained as marble.

SCHOOLS OF ART.

SOUTHAMPTON.—The annual distribution of Science and Art prizes at the Hartley Institution took place on Friday week. The attendance at the School of Art during the session has been 122. In April, 345 drawings and studies, the work of 69 students, were sent to South Kensington for examination; one third-grade prize in the advanced section was awarded, and one drawing retained for national competition. In May, 57 students tried the second grade examinations in freehand, model, geometry, and perspective; 29 papers were satisfactorily worked out, and nine students were awarded prizes for excellence. The committee also superintended the examination, in the second grade, of 22 outside candidates not connected with the school; of these only four passed satisfactorily.

On Thursday week, the following gentlemen were elected Royal Academicians:—Mr. W. Q. Orchardson, painter; Mr. R. Norman Shaw, architect.

A new skating rink is now being erected at the Humberstone-gate end of Rutland-street, Leicester, from the designs of Mr. T. H. Baker, architect, at a cost of £7,000.

Messrs. W. B. Wilkinson and Co., cement manufacturers, of Newcastle-upon-Tyne, have brought a new method of constructing incombustible partitions as a substitute for lath and plaster. In the new method no wood or iron is employed, and no plastering is required; the partition has special recommendations of strength and cleanliness; and the expense does not exceed that of ordinary lath and plaster constructions. This form of partition can be made to hang from wall to wall, independently of any floor; and ceilings can also be formed independent of any roof.

Last week, on p. 603, under the heading "Richmond, Surrey," we mentioned Mr. Daniel Bell as the executant of the mosaics in the recesses at the new mortuary chapel, but assigned to other artists the stained-glass window above. Mr. Bell requests us to state that he designed and executed both glass and mosaics under the direction of Mr. Blomfield.

Mr. E. G. Mawbey, of Derby, has been appointed clerk of the works to the Stephenson Memorial Hall at Chesterfield.

The designs for the Elm-road schools, Wisbech, were not prepared, as stated last week, by Messrs. Adkins and Son, but by Messrs. Adams and Son, of Wisbech and King's Lynn.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fortnightly meeting of the Institute was held on Monday evening at half-past seven o'clock. The President, Mr. Charles Barry, F.S.A., occupied the chair. The following gentlemen were balloted for and elected as fellows: John T. Bressey, of 70, Bishopsgate-street Within; J. H. Jones, of Denilsguis, New South Wales; and David Thompson, of Glasgow; as an associate: W. B. Tomlinson, of Coventry; as hon. associates: W. H. Barry, 23, Westbourne-terrace, W.; Philip H. Calderon, R.A., Weston Lodge, 16, Grove End-road; J. Gascoigne Lynde, The Orchard, Gore-street, Manchester; Charles Manby, C.E., 24, Great George-street, Westminster; Alfred Morrison, F.R.G.S., 16, Carlton House-terrace, S.W.; and Charles Neate, C.E., 4, Victoria-street, Westminster, S.W. Thirteen nominations for membership were read, two each as fellows and associates, and nine as hon. associates. The thanks of the members were accorded to several donors of books to the Institute library.

The PRESIDENT then invited Mr. James Neale, F.S.A., Associate, to read his paper, entitled

ARCHITECTURAL NOTES ON ST. ALBAN'S ABBEY.

The walls of the Institute room were decorated with an elaborate display of drawings illustrative of the abbey, including a ground plan, elevations, sections, and details. As Mr. Neale explained in his opening remarks, each of these detailed drawings was executed to scale on the spot from measurements, every joint shown and every moulding taken the real size. We hope to give some of these drawings next week, and also the second portion of Mr. Neale's paper, which we are obliged to hold over. There were also a number of coloured illustrations of the decorations recently discovered on the bosses and the panels of the ceilings.

Mr. NEALE remarked that it is now seven years since he measured a bay of the thirteenth-century work on the north side of the nave of the abbey, with the hope of passing the examination as a student of the Royal Academy, and, being successful, he continued the study, and in 1875 he gained the Pugin travelling studentship, and afterwards the silver medal of the Institute. During his studentship he accumulated so many drawings that some antiquarian friends suggested their publication, which led to a continuance of the work for three more years, and he now looked forward to the issue of his volume from the press in the course of a few weeks. After an allusion to the traditional founding of the abbey circa 303, Mr. Neale came to the founding of the present building by Abbot Paul, of Caen. Abbot Paul was a relative of Lanfranc, Archbishop of Canterbury. Lanfranc, who was Abbot at St. Stephen's of Caen at the time of its erection in 1064, rebuilt Canterbury almost upon the model of St. Stephen's. Paul, more ambitious, rebuilt St. Alban's on a similar plan, but on a scale vastly exceeding either Canterbury or St. Stephen's, as the following comparison of the three edifices—in which Caen is first, Canterbury second, and St. Alban's third in order of mention—will show:—Number of bays in the naves, 9; 9; 13. Number of bays in the choirs, 2 besides the apse; 2 besides the apse; 5 besides the apse. Number of bays in each transept, 2 and 1 apsidal chapel; 2 and 1 apsidal chapel; 3 and 2 apsidal chapels. Total length from east to west, about, 290ft.; 290ft.; 460ft. Total length across the transepts from north to south, about 145ft.; 145ft.; 189ft. Length of naves taken from west front to west face of transept, about, 193ft.; 193ft.; 234ft. Length of western facades, about, 90ft.; 90ft.; possibly about 150ft. Abbot Paul's church consisted of a nave, with its side aisles; transepts, without aisles; choir, with side aisles; sanctuary, with side aisles and apsidal termination. He adapted the levels of the floor to the levels of the site. The floor at the east end seems to have been about 6in. above the ground line adjoining, and the floor at the west end about the same amount. The slope of the hill downwards from the east allowed a difference of 4ft. in the floor

levels. But, not contented with this, the slope from the north southward was also echoed—the floor is thus 2ft. 6in. lower at the south than at the north wall of the transepts. These floor levels have been frequently modified, but their influence has been considerable on the fate of the building. The high altar was ultimately elevated 3ft. 6in. above its original level; but the Norman levels in the sanctuary aisles have probably always been maintained, and they dictated the floor levels of that great extension of the eastern arm, which occupied the century in which mediæval art was attaining, and attained its greatest excellence. A sufficient elevation was obtained for the high altar without the necessity of a crypt. The Norman church was built of tiles collected from the ruins of Verulam. Some measure 21in. by 12in., by 2½in., but the average size is 17in. by 12in., by 1½in.; they are of a deep red colour. The mortar joints are, as a general rule, a little thinner than the tiles themselves. The possession of so immense a bulk of ready-made material excluded stone from any considerable portion of the building; a few shafts and capitals, and the impost mouldings of the ground-story and triforium arches were for constructive reasons made of Barnack stone, but practically the whole of the building was constructed with Roman tiles. Probably the massiveness of walls and piers was to some extent due to the unlimited supply of tiles. Cushion capitals occur in the transepts and tower—very possibly the earliest capitals of this form remaining in England. As to the plan, or state of preservation of the early church in 1077, we have no proof, but it is certain it was no mean structure; and the Normans, although erecting an entirely new building, retained parts of the destroyed one. The Saxon relics seem to have been arranged with considerable care in the bays of the triforium arching of the sanctuary and transepts. Those in the sanctuary would be removed when it was partly pulled down and wholly remodelled in the thirteenth century, but those in the transepts still remain. These balusters are complete in themselves, each having a shaft, capital, and base; but, in order to lengthen them, the Normans added capitals and bases. These additions contrast with the original columns in workmanship, material, and design. The new capitals and bases were worked with the axe (as was all the other stone throughout the Norman church). The whole of the plain and moulded surfaces of the original balusters are worked smooth—evidently turned in a lathe. Some of the marks of the turning tools are very fresh. It would thus appear that it could never have been used externally in the Saxon church. The rest of the circular shafts—used alternately with the Saxon ones—are of the Norman period; they are not turned, but axed vertically. During the late restoration of the Saxon church on the Castle Cliff at Dover, and also that at Jarrow-on-Tyne, a number of these curious balusters—which had also been re-used by the later builders—were exposed to view. Some of the moulded bands of the Dover balusters exactly correspond with the St. Alban's mouldings. Those at Jarrow have a multiplicity of mouldings, consisting mainly of flattened beads without the variety of detail found at St. Alban's and Dover. Fragments of similar balusters were recently discovered at Ely Cathedral with mouldings of the same character as those at St. Alban's, and the marks of the turning-tools very clearly visible. The Norman church retained its original character till Abbot John de Cella (1195-1214) pulled down the west front. In commencing reconstruction he made his floor line in the porches about 3ft. 6in. lower than the original floor of the nave of the Norman church. This new level also appears in the north and south aisles. In the north aisle the bed for the tile floor remains against the stone bases of the piers between St. Andrew's Chapel and that aisle. In the south aisle a similar bed exists in the arch leading to the south-west tower, and at least for a few feet further eastward. It is possible that De Cella may have vaguely contemplated carrying this lower level along the nave some considerable distance further eastward. It is equally possible that he did not intend to carry it further eastward than the

eastern portion of the western bay of the nave, rising to the general floor level by means of a flight of steps. This last has, for some thirty years last past, been believed—without very much foundation—to have been De Cella's intention; a belief that is likely to embody itself in a solid form ere long, with a flight of steps from the north of the north aisle to the south of the south. The floor levels north and south previously mentioned give, however, incontestable evidence that the north aisle retained, till the destruction of St. Andrew's Chapel, the floor line that De Cella had marked out when he started on the western front. For about 70ft. from the western wall the north aisle must have been reached by a flight of steps on the aisle side of the ground-story piers; whether this lower floor extended further eastward of this new excavations will determine. The western porches contain interesting evidence as to the manner in which succeeding builders completed a design, which had been carried too far for material alterations, except in the details. De Cella put in apparently all the foundations, but thereafter threw all his energy on the northern side. In his time the northern porch was entirely completed. This porch has mouldings of extreme delicacy, some enriched with the dog tooth. In the central porch he did not, however, succeed in carrying out his design higher than the tops of the main columns. In the southern porch there are scarcely any architectural features due to De Cella. A beautiful holy-water stoop was inserted in the north porch in the early part of the fourteenth century. This porch would naturally be used by the laity coming from the town on the north of the church. Abbot William de Trumpyngtone took the central and southern porches in hand and speedily carried them to completion. All the new mouldings above the capitals of the central porch, and nearly the whole of the mouldings of the southern porch have the same character; there are fewer members in the groups, and the mouldings are coarser in themselves than those in the northern porch. There is no dog-tooth in either of these porches. The carving in the north porch and the earlier carving in the central porch has peculiar overlapping curling leaves and strongly defined stems, and is singularly like that in the choir of Lincoln Cathedral. The later carving in this porch and the whole of the carving in the southern porch is the normal Early English foliage. From this it will be seen that the northern and central porches differ largely from the southern porch. The omission of central bosses from these vaults both differ from the northern porch. There are in the central porch evidences of individual preferences, over and above the evidence of the change in style. As far as was compatible with maintaining the work already erected and carrying it to a logical completion, Trumpyngtone made modifications in the framework of the design that are hardly credible. For instance, De Cella contemplated reproducing the jambs of the central porch on the nave side, with their clustered marble shafts—thus giving it a greater depth and importance than the lateral porches. But Trumpyngtone built in the two doorways between the clustered jambs. The jointing of these doorways does not range with the jointing of the original jambs. In mediæval work it was not unfrequently for stones already prepared to be used at a later date. This occurs in the central porch at St. Alban's, but with this difference from other instances—a difference making the case unique. Trumpyngtone used stonework prepared by De Cella, but cut away the minor mouldings. De Cella had not worked the whole of the vaulting ribs; Trumpyngtone was unwilling to supply what was wanting with copies of De Cella's stonework. He was equally unwilling to throw aside the stonework already prepared—this strange piece of self-assertion is the result. Judging from the carving and the forms of the mouldings the earlier parts of the porches of St. Alban's appear to be a few years later than the choir of Lincoln, and therefore 1200-1205. Cutting down his predecessor's work was a custom with Trumpyngtone. The porches might have been sufficient for many men, but in the work of the intended western

towers he did something equally vigorous. The archway on the north side was destroyed at the time of the fall of St. Andrew's Chapel, with the exception of a portion of the west jamb. On the south side the arches and jambs are more perfect, and the original design of De Cella (1195-1214) is there exhibited. The alteration of the character of the design by his successor, Trumpyngtone (1214-1235), on continuing the work is also shown. In the jamb prepared by De Cella eight clustered marble shafts were arranged for, and six smaller stone shafts, slightly recessed, in the intervals between these marble shafts. De Cella's design is also traceable up to the level of the marble annulet moulding. At this level he discontinued the work. Trumpyngtone carried up the smaller stone shafts to the capitals, but entirely omitted the marble ones. The dimensions of the western towers can be ascertained from the foundations, and their height when further progress was arrested may be supposed to be shown by the height of the existing work. There is weight in the suggestion of the Rev. H. Fowler, that the western towers would almost certainly have been named in the records if they had ever been complete enough to form part of the floor of the building. In truth the existence of Norman towers—now a mere conversational commonplace—should rest on a more solid foundation than the tile and flint work found under the ground level, which might be of any century. The total destruction of St. Andrew's Chapel might fairly justify an argument for a north-western tower as advanced as that on the south. But to suggest more than this; to describe, for instance, both the towers as "crowned with roofs of steep pyramidal shape, the most ancient form of covering applied to features of this kind," &c. (Buckler, p. 99) would require a temerity to which I cannot lay claim. In August, 1877, after the removal of the modern brick cottage (which abutted against the western end of the south aisle wall) the ground was excavated for the foundations of the new buttresses of the south side. A part of the foundation of the eastern wall of the south-western tower was exposed, 10ft. thick, composed of flints and Roman tiles. Messrs. Buckler, in their admirable book, "The Architecture of the Abbey Church of St. Alban, 1848," make a special point of the method of the change from the Norman to the Early English work. They say "the Norman walls were not wholly demolished, but the massive tile work was reduced in sufficient proportion to allow it to be cased with ashlar." It is also added that the transformation commenced at the top continuing downwards. A comparison of the Norman and Early English bays will show what miracles of cutting away in the triforium and clerestory passages would have been necessary; and as further consideration the ground-story piers, 19ft. 4in. high, would have been reduced from about 16ft. square to octagons of 2ft. 9in. across. The supposition that such transformation began at the top and continued downwards might derive support from the eastern bay of the clerestory, and from the strange form of the east pier of the ground story, but the mouldings are actually later in date, stage by stage, from the ground story upwards. In Mr. Neale's opinion the whole casing theory is a work of high imagination without any, even the slightest, support from actual facts. It has the credit of having beguiled well-meaning people against their better judgment for a goodly term of years. Trumpyngtone was an *enfant terrible* in architecture, and exposed with frankness what is usually concealed with care. When he commenced the rebuilding of these bays on the north side of the nave, he prepared the base mouldings of the main piers to receive filleted shafts, but the shafts were carried up as plain rounds, without the fillets. One of these bases was used and still remains *in situ* to the westernmost pier of the easternmost bay on the north side of the nave. When it was decided not to remove the half of the Norman pier on the eastern side of this bay, the three upper courses only were built upon the Norman work. The base not being required was cast on one side. After the idea of the filleted shaft had been given up Trumpyngtone still tried to en-

rich the plain shafts by dyeing them on to an octagon, at the base. When erecting the two easternmost of the Early English bays on the south side, the piers were worked without either octagon or fillet, but a base previously prepared, but not required on the north side, was now used on the south. Trumpyngtone intended to vault the nave, and we still see marble vaulting shafts in the spandrels of the ground-story arches, and the abacus at the triforium level cut away to allow the shafts to pass. The clerestory piers on the north side of the nave have sinkings designed to give shadow behind the intended shafts. When the rebuilding had proceeded on the north side as high as the springing line of the triforium arches, Trumpyngtone determined to forego the vaulting and substituted a wooden roof. The two easternmost of the five Early English bays, on the south side of the nave, were erected some little time after the three adjoining bays and the four bays opposite on the north side. This is evident from the marked change in the mouldings. There is also no preparation on these two bays for vaulting the nave. The piers of the clerestory are not hollowed on the face, as is the case in the piers on the north side. The clerestory arches to the easternmost bay are enriched with the dog-tooth. This ornament does not occur in the rest of the clerestory—an additional instance of minor retrenchment. Trumpyngtone on continuing the work of De Cella at the west end retained the Norman floor line in the nave. He also adopted the top of the surbase of the new porches as his porch floor line. Thus he only required two steps up to the nave. It has been stated by Messrs. Buckler and others that the original Norman work remains in the massive pier on the south side of the nave, and that in the thirteenth century the western half of this Norman pier was cased with stone; a similar course being again adopted with the eastern half when the fourteenth century bays were erected. The tiles and flints which appear in the triforium passage have no doubt given rise to this theory, and it has been adopted by one writer after another without special consideration. It is true there is Roman tile in the centre of this pier, but the component parts of the mortar prove the core is not practicable, and in keeping with the new architecture. The interior of the Lady Chapel walls are mostly of Roman tiles and flint structure. The different mortars used at the various dates are all easily discernible. The mortar of the Decorated work is very hard and contains more lime than the Norman mortar. After the fall in 1323 of the Norman bays on the south of the nave, Abbot Eversdone immediately commenced the rebuilding, and it is to him that we are indebted for the design of the five Decorated bays eastward of Trumpyngtone's work. These Decorated bays on the south side of the nave, and the Lady Chapel, are clearly proved to be works of the same period; for in the small niches in the jambs of the Lady Chapel windows are exactly the same mouldings to the bases and to the capitals, as to the Decorated bays in the nave. These moulded bases to the niches in the Lady Chapel are only 1in. high, although those in the nave are about 1ft. 5in. Again, some of the carving is precisely similar in design. Also the same peculiar ball-flower occurs in both the nave and the Lady Chapel. The carving in the nave is indeed much bolder, and worked with a firmer and more decided hand than that in the Lady Chapel. This fact, and many other features, would lead to the conclusion that the five Decorated bays in the nave are rather later than the Lady Chapel, although designed by the same architect. At Eversdone's death, which occurred at the end of 1326, the rebuilding had probably reached as high as the floor of the clerestory passage, and all above this level was continued by the succeeding Abbot, as indicated by a change in the character of the mouldings, which are more shallow and flattened in their outline. The general design is, however, almost upon the model of the thirteenth-century bays, and the arches are more acutely pointed. This seems to have led one writer after another into the error of attributing these bays to 1275. The date is only discoverable with certainty by means of the details. It seems clear that Eversdone intended the triforium piers to consist of three principal

and two smaller intermediate shafts. The mouldings of both the capitals and the bases were worked, prepared for such smaller shafts. This, doubtless, would have a pleasing though severe appearance. However, to enrich the effect, these intermediate shafts were afterwards carved with bold four-leaved flowers, arranged alternately, some circular, projecting to the line of the original shafts, while the others were worked receding and flat. By this ingenious arrangement, which also occurs in the carving of the triforium string, much variety and depth of shadow are obtained. Parts of the original intermediate shafts still exist, adjoining the capitals and the bases. Even these parts, in two or three instances, were carved, but as the result was not very happy, the rest were left in their original condition. It was also intended that the label mouldings should simply die into each other (as in the Early English bays). Carved heads, as terminations to the labels, were afterwards added so skillfully that a very careful examination can alone discover them to be an afterthought. Much of the carving is now almost as perfect as the day it left the artist's hands, and evinces the greatest depth of feeling in the carver. An assertion was made some years ago, "the walls at the backs of the Early English and Decorated arcading were introduced when the steep roofs of the aisles were removed." This assertion has been frequently copied; but the triforium arcades were never, as generally stated, entirely open, for (1) the stones of the arches over the triforium bond with the walling at the back of the passage; 2, the masonry joints of the asserted filling in are continuous with the piers; 3, the mortars used in the external walling and in the arcade, have the same component parts; 4, there never was any relieving arch or double arcade to support the clerestory wall above (as at Westminster Abbey) which would have been essential had the walls been pierced; 5, the corbels on the south side of the nave, which carried the timbers of the roof over the aisle, are arranged irrespectively of the piers, and some occur in the walling, said to be the filling-in of the arches; 6, it is evident the small doorways (still existing) which led from the passages into the roofs over the aisles, and also the corbels; are of the same date as the rest of the arcading. [We shall give the second half of the paper next week.]

A discussion followed, in which Sir Edmund Beckett, Sir Gilbert Scott, Messrs. Street, Clarkson, and Ridgway-Lloyd, and the Rev. W. J. Lawrence took part, and at its close a vote of thanks was heartily accorded to Mr. Neale.

Mr. Locock Webb, Q.C., read a paper on the "Law of Easements," dealing chiefly with that branch which deals with their essential qualities, and the acquisition of easements of light, air, and water. An abstract of the first portion of the paper appears opposite, and it will be concluded in our next issue. The thanks of the members were accorded the lecturer on the motion of Messrs. Whichcord and Currey.

BOOKS RECEIVED.

The British Almanac and Companion, 1878 (London: Stationers Co.), reminds us of the approach of the new year. The information is of the usual type. The writer of the architectural summary for the past year is cut shorter than usual, but still manages to express his disapproval of architects generally, though encouragement is held out that in civic architecture lies the best hope of work for the architect in the coming years, and the faintest chance of the new "nineteenth-century style," whose advent some still profess to believe in. *The City Diary for 1878* (London: W. H. and L. Collingridge) is as useful, handy, and unpretentious as ever. We have used it for fifteen years, and always look for its arrival. *The Boy Engineers*, by the Rev. J. Lukin (London: Trübner and Co.), is another welcome contribution from that veteran adviser of juvenile mechanics, Mr. Lukin. He has somewhat enlarged his field in this volume, not altogether with advantage, but still he seldom travels beyond his own experience, which has been a wide one. Any one blest with a restless specimen of advanced boyhood, who looks scorn-

fully on the usual pabulum provided for respectable children at this season, and who wishes to hit on something more agreeable to the taste of the recipient, had better buy this book. *Calvert's Mechanics' Almanac and Workshop Companion*, 1878 (Manchester: J. Calvert), in addition to the usual matter contained in an almanac, is replete with useful information of value to architects, engineers, and workmen. *The Whitworth Papers* (Manchester: J. Calvert), are a reprint, by permission of the author, of some valuable papers read at different times by Sir Joseph Whitworth, to which is added information concerning the Whitworth Scholarships. *The Professional Pocket Book* (London: Rudall, Carte, and Co.), is specially adapted to the hourly requirements of professional and business men, and will be found useful by all in need of reminders of their multitudinous engagements. *Notes on Bankruptcy, Liquidations, Compositions, and Private Arrangements*, by John Bath and Son (London: Alfred Boot), is a clear and explicit statement of the law affecting bankrupts and compounding debtors, and will be found useful by every trader and professional man. We find as a rule that people who compound with their creditors need remarkably little assistance in these times, so that it is possible those who may find this treatise of most service will be creditors anxious to know what chance exists of their ever obtaining any part of what is due to them from unscrupulous and ingenious customers.

THE LAW OF EASEMENTS.

M. R. LOCOCK WEBB, Q.C., Hon. Associate, read a paper on this subject before the Institute (*vide ante*) on Monday evening, of which we give a *résumé* of the first part, and propose to conclude it in our next issue.

The accepted definition of an easement he quoted from Gale as "a privilege without profit, which the owner of one neighbouring tenement has of another existing in respect of their several tenements, by which the servient owner is obliged to suffer or not to do something on his own land for the advantage of the dominant owner." There must, as an essential quality of an easement, be two distinct tenements, the dominant, to which the right belongs, and the servient upon which the obligation is imposed. The right conferred by an easement attaches upon the soil of the servient tenement. If any disturbance of an easement has taken place previous to the transfer of the servient heritage, although such tortuous act would give a right of action against the former owner, his successor is also liable if he allows it to continue. The servitude, once acquired, passes with the heritage to each successive owner. Although the right to an easement is a "privilege without profit," it has been held that an easement is an interest in land for the invasion of which compensation may be claimed under "The Lands' Clauses Consolidation Act, 1845," 28 and 29 Vict., c. 18. Easements are either affirmative or negative. Affirmative easements authorise the commission of acts which, in their very inception, are positively injurious to another—such, for an example, as a right of way over, and a right to discharge water by a spout or projecting eaves, upon another man's land; the right to support from a neighbouring wall; the right to use or to affect water of a natural stream in any manner not justified by natural right. Negative easements are injurious consequentially, only restricting the owner of the soil in the exercise of his natural rights of property—as where he is prevented building on his own land to the obstruction of lights. The right of support of neighbouring soil for land not incumbered by buildings, and the right of a riparian owner to the flow of a stream in its natural course, are ordinary incidents of property, and not easements. The origin of every easement may be referred to an agreement, either express or implied, of an owner of the property to be subjected to it. In case of express agreement, it will be obvious that the precise words of the instrument itself must determine the extent of the right created. The implication of the grant of an easement may arise in two ways—firstly, upon the severance of an heritage by its

owner into two or more parts; and, secondly, by prescription. Upon the severance of a heritage, a grant will be implied of all those continuous and apparent easements which have been used by the owner, and which are necessary for the use of the tenement conveyed, though they had no legal existence as easements, and of all those easements without which the enjoyment of the severed portions could not be had at all. Grants will be construed most strongly against the grantor, "for no principle can be more sacred than that a man shall be compelled to perform his contract." And another kindred principle is, that "no man shall derogate from his own grant." Both these principles are well-established rules of law. Upon the severance of an estate, such rights of easements, usually called "easements of necessity," will be acquired by implied grant as may be necessary to give effect to the intention of the parties to the severance. The grant of a thing passes everything included therein, without which the thing granted could not be had. But a grant arising out of the implication of necessity cannot be carried further than the necessity of the case requires, and there must be a reasonable user of the easement. Easements are also acquired by prescription, or in other words by possession had during the time and in manner fixed by law, for after the lapse of the requisite period, the law adds the right of property to that which before was possessory only. To constitute a legal possession, there must be not only a corporeal detention, or that quasi-detention, which, according to the nature of the right, is equivalent to it, but there must be also the intention to act as owner. An enjoyment in order to confer a title must have been interrupted, both as to the manner and during the time required by law; but in those easements which require the repeated acts of man for their enjoyment, as rights of way, it would appear to be sufficient if the user is of such a nature, and takes place at such intervals as to afford an indication to the owner of the servient tenement that a right is claimed against him—an indication that would not be afforded by a mere accidental or occasional exercise of it. By the 2nd and 3rd William IV., c. 71, known as "The Prescription Act," the title by prescription is governed by statutory provisions, making length of possession, prescribed by the statute, a bar or title of itself, which was so before only by the intervention of a jury. The Act provides that (Sec. 1) claims to right of common and other rights with profit shall not be defeated after thirty years' uninterrupted enjoyment, unless held by consent or agreement; (Sec. 2), claims of rights of way or other easements the prescription should be twenty years; (Sec. 3), when the access and use of lights to and for any dwelling-house, workshop, or other building, shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding, unless it shall appear that the same was enjoyed by some consent or agreement, expressly made or given for that purpose by deed or writing; and (Sec. 4), each of the before-mentioned periods should be deemed to be those next before some suit or action, wherein a claim to which such periods relate shall be brought into question. These are the general principles relating to the law of easements. It is now proposed to allude to some particular easements and natural rights of a similar character, such as those relating to running water, eaves, subterranean channels, nuisances, and light and air. Running water is the subject of easements of several kinds. The right to receive a flow of water in a natural stream and transmit it into its accustomed course is an ordinary right of property—a natural right. The right to interfere with the accustomed course, either by penning it back upon the land above or transmitting it, altered in quality or quantity to an extent not justified by natural right, is an easement. Without any convention, the occupier of a lower field holds it under servitude of recovering the natural drainage from an adjoining field on a natural level. This servitude is imposed by usage, depending upon natural situation, and extends

to usual floods. But, if a storm floods the adjoining lands in an unusual manner, the landowner may, it seems, fence against it, within the period of prescription. He may raise the banks to keep the stream within its ancient bed, if he can do so without injury to others, and so, perhaps, if the stream changes its course. *Prima facie* the proprietor of each bank of a stream is the proprietor of half the land covered by the stream, but there is no property in the water. Every proprietor has an equal right to use the water which flows in the stream, and consequently no proprietor can have the right to use the water to the prejudice of any other proprietor. Easements of an affirmative nature, the object of which is to interfere with the natural course of the stream, may be acquired by user over a stream flowing through a man's own land. With regard to eaves, although every one in building is bound to construct his house so as not to overhang his neighbour's property, and to construct his roof in such a manner as not to throw the rain water upon the neighbouring land, yet a man may acquire a right by user to project his wall or eaves over the boundary line of his property, or discharge the rain running from the roof of his house upon the adjoining land. As to subterranean channels, the rule of law which governs the enjoyment of a stream in its natural course is not applicable to underground springs or subterranean channels. Any person may dig wells, or cut drains in his own lands with impunity, although he thereby drains his neighbour's land, by interrupting the flow of water percolating through the pores of the soil, and which, but for such cutting or draining, would have reached his neighbour's land, or by causing the water already collected on his neighbour's soil to percolate away from and out of it. The easements acquired and servitudes imposed by an artificial watercourse depend on the purpose for which it has been made and used. In a certain sense all sewers passing through the lands of private owners are easements; but sewers constructed under legislative authority, or which, although originally private property, have become vested in public bodies, such as the Commissioners of Sewers, are regulated by statutory authority. By the "Land Drainage Act, 1861," the powers of Commissioners of Sewers extend (1) to cleansing, repairing, or otherwise maintaining in a due state of efficiency, any existing watercourse or outfall of water, or any existing wall or other defence against water, and to such other matters as are mentioned in the 16th section of the Act. By the interpretation clause "water-course" includes all rivers, streams, drains, sewers, and passages through which water flows; (2) to deepening, widening, straightening or otherwise. The law relating to sewerage is regulated by the Public Health Acts of the 31 and 32 Vict., c. 115 (the Sanitary Act, 1866), and the 38 and 39 Vict., c. 55 (the Public Health Act, 1875), which repealed the 31 and 32 Vict., c. 115, except so far as relates to the metropolis. Under the provisions of those statutes, all existing and future sewers, within the district of the local authority, except sewers made by any person for his own profit, or by any company for the profit of the shareholders, and sewers made and used for the purpose of draining, preserving, or improving land under any local or private Act of Parliament, or for the purpose of irrigating land and sewers under the authority of any Commissioners of Sewers, are vested in and placed under the control of the local authority, which is restricted from making or using any sewer, drain, or outfall for the purpose of conveying sewage or filthy water into any natural stream or watercourse, or into any canal, pond, or lake, until such sewage or filthy water is freed from all excrementitious or other foul or noxious matter, such as would affect or deteriorate the purity and quality of the water. The term "nuisance" is applied in the law indiscriminately, both to a disturbance of an easement already acquired, and infringements upon the natural rights of property, for which an action can be sustained. Strictly speaking, however, the term "nuisance" should be confined to the latter class of injuries only; those acts which though originally tortuous as infringing the common law

rights of property, may nevertheless, in process of time, confer a prescriptive title by enjoyment. Many acts done upon a man's property which are in their nature injurious to the adjoining lands, and consequently actionable as nuisances, may be legalised by prescription. There can, however, be no prescription to make a common nuisance, which is a prejudice to all people, because it cannot have a lawful beginning by licence, or otherwise being against the common law. But when manufactories may have been borne with in a neighbourhood for many years it will operate as a consent of the inhabitants to their being carried on, though the law might have considered them as nuisances had they objected to them in time. A manufacturer may consequently acquire a right to pour his polluted water into a stream as against all new comers, so that those below him, coming after he has acquired the right, may not have the right to complain of what he does to the stream. An injunction has been refused against a private gas company, to prevent hindrance to traffic arising from taking up parts of streets, on the ground that the injury done was accidental and occasional only. The strict right of property entitles the owner to so much light and air only as fall perpendicularly on his land. He may build to the very extremity of his own land, and no action can be maintained against him for disturbing his neighbour's privacy by opening windows which overlook the adjoining property, but it is competent for such neighbour to obstruct the windows so opened by building against them on his own land at any time during twenty years after their construction, and thus prevent the acquisition of the easement. The right to the reception of light and air in a lateral direction without obstruction is an easement. The right to the enjoyment of air is, generally speaking, governed by the same principles as those which regulate the passage of light; and although it is rarely now that a case is established for the interference of the Court upon the ground of stoppage of air irrespective of obstruction to light, such exceptional cases have arisen very recently. With regard to the law relating to the obstruction of ancient lights, the old doctrine which was established by Lord Eldon in what has been termed the parent case of the Attorney-General v. Nichol, seems in substance never to have been departed from. "There are," said his lordship, "many obvious cases of new buildings darkening those opposite to them, but not in such a degree that an injunction could be maintained, or an action upon the case, which, however, might be maintained in many cases, would not support an injunction." It was held also in *Back v. Stacey*, that in order to give a right of action and sustain the issue, there must be a substantial privation of light sufficient to render the occupation of the house uncomfortable, "and" to prevent the plaintiff from carrying on his accustomed business on the premises as he had formerly done. With the single exception of reading "or" for "and," the above ruling correctly lays down the doctrine in the manner in which it would now be supported in action in the Supreme Court of Judicature. There is no difference between the right of a person residing in a town and the right of a person residing in the country to be protected in respect of obstruction of ancient lights, and it is held that the owner of ancient lights is entitled, not only to sufficient light for the purpose of his present business, but to all the light which he may have enjoyed previously to the interruption sought to be restrained.

The memorial stones of a new Primitive Methodist chapel were laid at Melton, next Gravesend, on the 4th inst. The cost will be about £800. Mr. J. Kerridge, of Wisted, is the architect, and Mr. H. Rands the contractor.

Mr. James Ballantine, a Scotch poet, dramatist, and novelist, died on Tuesday, in Edinburgh, at the age of 69 years. He was the head of the firm of glass-stainers which bears his name.

The Lords Justices on Tuesday confirmed the decision of the Queen's Bench that lands acquired by a railway company for the permanent purposes of the undertaking are not superfluous lands which revert to the adjoining landowners, although such lands may not have been required for permanent purposes within ten years of the expiration of the time limited for the completion of the works.

COMPETITIONS.

BARROW-IN-FURNESS.—At a meeting of the new Town Hall committee, held in the municipal offices, Barrow, on the 15th December, Mr. A. Waterhouse's report on the designs submitted, was read, in which he stated that he had come to the conclusion that the first place in the competition should be awarded to "Ima," second place to "Fortis," third place to "Rath-haus." It was moved and seconded, and resolved, that the report of Mr. Waterhouse be received and adopted. The committee thereupon proceeded to open the various letters containing the names and addresses of the authors of the designs, when it appeared that the architect for the designs "Ima," had omitted to enclose his card. "Fortis" was Mr. T. E. Colcutt, 26, Bloomsbury-square, W.C.; "Rath-haus," H. Perkins, and G. B. Bulmer, Park-row, Leeds. The premiums are £150, £100, and £50 respectively. The designs are reviewed on p. 607.

DUBLIN.—A rather important competition is about to take place at Dublin. The time for sending in the designs has been extended from the 10th to the last day of the present month. The directors of the Midland Great Western Railway of Ireland are about to erect 80 to 100 cottages for workmen, and they offer three premiums—viz., £100, £50, and £25 for what they consider the best plans.

ILFRACOMBE.—At a meeting of the Ilfracombe Local Board of Health on Wednesday, last, the designs of Mr. W. Morgan Robbins, submitted in open competition for the laying out public pleasure grounds, were accepted, and a premium of £10 awarded, together with instructions to proceed with the work forthwith.

KILMARNOCK.—After a public exhibition of the competing models for the proposed Burns statue, and giving due weight to the opinion of subscribers as elicited by voting-cards, the committee have decided that the artist of model No. 1 (Mr. W. G. Stevenson, Edinburgh) be commissioned to execute the statue; that the artist of model No. 10 (Mr. D. W. Stevenson, A.R.S.A., Edinburgh) be awarded the premium of £50; and that the artist of model No. 6 (Mr. Charles M. Bride, Edinburgh) be awarded the second premium of £25. These awards are subject to the condition that the three artists agree to execute details as may be arranged by the sub-committee, who retain possession of the models.

LANCASTER.—Designs for a new Congregational chapel to be built at Lancaster, are to be sent in to-morrow, the 22nd inst. The building is to accommodate 800 persons, at a cost of not more than £3,500. The structure will be known as the "Centenary Congregational Church."

OSWESTRY.—A new Board School is to be built at Oswestry for 600 children, and a competition has been instituted. Designs will be received to-morrow (Saturday), the 22nd inst.

READING.—At a meeting of the Reading Town Council, on Tuesday, the following resolution was adopted:—"That, inasmuch as the committee are of opinion that none of the plans are entitled to be awarded the premiums mentioned in their statement, in consequence of non-compliance in some one or more important particulars required as conditions, nevertheless the committee have selected three plans—namely, the plans with the mottoes 'Grosvenor,' 'Plan,' and 'Be Strong'—to which they have determined to award an honorarium of £108 6s. 8d. each, making in the gross the total amount of the premiums offered, but on the special understanding that these plans and drawings are to become the absolute property of the building committee." The names of the successful competitors are as follows:—"Grosvenor," W. T. Sams, of 17, Conduit-street, London, the architect of the Grosvenor Gallery; "Plan," Alexander and Henman, Stockton-on-Tees; "Be Strong," Brown and Albury, Reading. A review of these designs appears on page 608.

New gasworks at Hengold were opened on Thursday sen night. The masonry has been executed by Mr. Gould, of Newport, Monmouthshire, the gas apparatus was put up by Messrs. Willey and Co., of the engineering works, Exeter. The works are capable of producing 4,000ft. of gas per hour.

Building Intelligence.

BALLYMACARRETT.—On Monday the ceremony of laying the foundation stone of a new Presbyterian church was performed. The building will be a parallelogram on plan, with a circular tower attached to one extremity of the vestibule. Sittings will be provided for 430 persons on the ground floor, and the galleries will accommodate 270 persons. All the external walls will be built of the local silurian slate in random coursed work, with dressings of Scabo sandstone. The ceilings will be plastered between the tie beams, which will be stained dark and varnished. The builder is Mr. John Russell, Donegal Pass, and the works are being carried out from the plans of the architects, Messrs. Young and Mackenzie, Donegal-square, Belfast. The cost of the building will amount to nearly £3,000.

DUDLESTON, NEAR ELLESMERE.—The new chancel to Dudleston Chapel was opened on the 12th inst. It has been built of local stone, with Shelvoke stone dressings; the roof is covered with tiles. The chancel is lit by a three-light east window and two two-light side windows; it is separated from the nave by a low stone screen, and fitted with oak stalls. A stone sedilia and piscina are built in the south wall of the sanctuary. The reredos, representing the Crucifixion, is by Earp. Maw's tiles are used. The builder is Mr. W. Bowdler, of Shrewsbury. The architect is Mr. E. Haycock.

EDINBURGH.—A new library has been added to the Royal College of Physicians, Edinburgh. The room is 55ft. long and 32ft. wide. The ceiling is circular, about 27ft. 6in. high at the centre, and is divided into panels, ten of which are filled in with stained glass. The design for the library was one of the last works on which the late Mr. David Bryce was engaged a few months before his death. The whole of the new work has been designed in the Italian style, and in keeping with that of the main hall adjoining—the architects being Messrs. David and John Bryce.

HEREFORD.—A new middle-class college is about to be erected at Hereford, from designs by Mr. F. R. Kempson. The style adopted is Early Gothic. The building will be of brick, relieved with terra-cotta and stone dressings, and the roofs will be covered with Broseley tiles of a dark colour. The erection of the college and its accessories is estimated to cost £13,000. The contract for the building has been taken by Mr. James Bowers, of Hereford.

INCORPORATED CHURCH BUILDING SOCIETY.—The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, held its usual monthly meeting on Monday. Grants of money were made in aid of the following objects, viz.:—Building new churches at Mount Hawke, near Scorrier, Cornwall; Sharlston, near Wakefield; and the Lodge, near Ruabon. Rebuilding the at Pebrockstowe, near Beaford, Devon; enlarging or otherwise improving the accommodation in the churches at Bledington, near Chipping Norton; Chaldon Herring, near Dorchester; Croxdale, near Durham; Hargrave, near Chester; Patney, near Devizes; Pembroke, St. Mary; St. Giles-in-the-Heath, near Launceston; Southburgh, near Thetford; South Shields, Holy Trinity; Sutton-Bonington, near Loughborough; and Wellington Heath, near Ledbury. Under urgent circumstances the grant formerly made towards reseating and restoring the church at Sutton-on-the-Forest, near Easingwold, was increased. Grants were also made from the Special School Church and Mission House Fund towards building mission churches at Chester, St. Barnabas; Fisher-street, in the parish of Barking; and Haggerston, St. Paul, Middlesex.

KEIGHLEY.—New schools in connection with the Congregational chapel at Keighley have been opened. Messrs. Hargreaves and Bailey, of Bradford, were the architects. The building is in the Italian style. The assembly-room is approached by a short flight of steps, 10ft. wide. This room is 9ft. long, 3½ft. wide, and 28ft. high, exclusive of the orchestra, which is 21ft. by 11ft. There are also six class-rooms

communicating with this room, and six classrooms on the upper floor. Accommodation is provided in the class-rooms for about 600 scholars, including 140 infants, and nearly 800 can be seated in the assembly-room. The lecture-room will also seat about 100. The total cost will be about £4,350.

LISCARD.—St. Mary's Church, Liscard, intended for the inhabitants of a large district carved out of the parish of Wallasey, was consecrated last week. The church is designed in one span, with the addition of transepts, but without side aisles or pillars, so that the view of the east end is entirely unobstructed. The style chosen is Early Perpendicular. The walls are built of local grey stone, relieved with Run-corn stone dressings; in the interior the open seats are of polished pitch pine, and the floor of the nave is laid throughout with patent wood block pavement. The decorative art has been almost exclusively confined to the chancel, and consists of sgraffito work on the walls. The floor of the chancel is laid with marble mosaic, and this and the sgraffito work has been executed by Messrs. G. Trollope and Sons, of London. The span of the roof is 38ft. 6in. The heating is effected by Messrs. G. Haden and Sons' warm-air apparatus, and the lighting by handsome pendants from the ends of hammer beams of roof, supplied by Messrs. Freeman and Collier, of Manchester. The church, which contains about 620 sittings, has been built under the immediate superintendence of Mr. E. W. Nobbs, Mr. Grayson being the consulting architect. The contractor was Mr. Ridehalgh, of Liscard.

LONDON SCHOOL BOARD.—At the meeting of this Board, held on Wednesday, the tender of Messrs. William Downs and Co., of Union-street, Southwark, amounting to £6,594, was accepted for the erection of a school for 436 children in Graystone-place, Fetter-lane, E.C., and that of Mr. B. Nightingale, of Albert Works, S.E., amounting to £7,332, was likewise accepted for the erection of a school for 587 children on a site in Buckingham-terrace, Kensington. A resolution of the Board of the 1st August last, accepting the tender of Messrs. Wall Bros. for the erection of the Tanner's-hill, Deptford, school, was rescinded in consequence of certain restrictions imposed by trustees, and the offer of the contractors to erect the new school for 572 children in accordance with the altered plans, on the contract schedule of prices, was accepted. Various alterations and additions were sanctioned to be made to school buildings, the most important being to those in Tottenham-road, Kingsland (to cost £950); Peter-street, Farringdon-road (£890); Mansfield-place, Kentish-town (£185); and Wornington-road, North Kensington (£143 8s.). Tenders were accepted for shelter porches at the schools in Canonbury-road, Islington; Drury-lane; and Mantua-road, Battersea. For furniture and fittings to new schools the following expenditures were authorised:—Curtain-road, Shoreditch (891 school places), £594 5s.; Holland-street, Southwark (815), £643 8s. 6d.; Chicksand-street, Whitechapel (952), £468 7s. 4d.; and Northey-street, Limehouse (enlarged by 281 school places), £229 8s. 2d.

METROPOLITAN BOARD OF WORKS.—At the meeting of this Board on Friday it was agreed to contribute one-half of the net cost (estimated at £2,500) of a proposed improvement by the Vestry of Bermondsey in Riley-street, Bermondsey, by which it will be widened to 30ft., and also to make a similar contribution of one moiety of the cost (estimated at £79,284) of the widening of Golden-lane by the Vestry of St. Luke. This thoroughfare is to be widened from an average of 22ft. to a uniform width of 50ft. throughout its length. The Corporation of the City will carry out that portion between Red Cross-street and Brackley-street, and the vote now made refers to the remaining portion (900ft. long) of the lane from Brackley-street to Old-street. The works committee signified their approval of the plan and elevation of the statue of John Stuart Mill (of which Mr. Woolner is sculptor), to be erected opposite the School Board offices on the Victoria Embankment, and it was remitted to the parks committee to give directions for laying out the surrounding grounds. The works committee brought up

a report on the conclusions arrived at by the select committee of the House of Commons on the Fire Brigade. The report mainly dealt with the recommendation of the committee that the control of the brigade should be transferred from the Board of Works to the Police Commissioners, and adduced many arguments against the proposal. The report was adopted. The works committee also reported that they had considered the 94 applications for the appointment of assistant in the drawing office of the superintending architect, and regarded 16 as the most eligible, from whom again they had selected six names for the final choice of the Board—Messrs. Ebbetts, Gough, Millwood, Perry, Taylor, and Wingate. The Board proceeded to the election on the exhaustive process, the candidate securing the least number of votes being successively struck off, until the list was reduced to two, thus:—First voting—Millwood, 28; Gough, 18; Wingate, 6; Ebbetts, 5; Perry, 3; and Taylor, 2. Second voting—Millwood, 25; Gough, 16; Wingate, 4; Ebbetts, 3; and Perry, 1. Third voting—Millwood, 25; Gough, 15; Wingate, 4; and Ebbetts, 3. Fourth voting—Millwood, 26; Gough, 9; and Wingate, 2. Fifth voting—Millwood, 26; Gough, 7. Mr. Millwood was accordingly elected. In reference to a recent memorial from Penge, as to more efficient protection from fire, it was stated that a hose reel had been recently supplied to the hamlet, and the clerk was directed to inform the Penge Vestry that the Board is not at present prepared to place a fire-brigade station in the district, but that telegraphic communication will be established between the Penge police station and the fire-brigade station at Sydenham. An amended design for a medal proposed to be given to fire-brigade men who distinguish themselves by extraordinary bravery at fires, was approved; it was decided that the medal be of silver, and the fire-brigade committee was authorised to have a die made and medals struck. An application of Mr. J. H. Huxtable, on behalf of Mr. C. Linton, for approval by the Board of a plan for the construction of a building at No. 18, St. Mary-axe, divided by patent wrought-iron curvilinear bank shutters instead of iron doors, as prescribed by the Building Act, was not granted. An information was received from the managers of the Brentwood District Industrial Schools of their intention to apply for a loan of £15,000 for the erection of a new infirmary, probationary wards, at their district schools.

MONTGOMERY.—The nave and north transept of this interesting cruciform church have been opened after restoration. They are fitted with oak open seats. Painted arches have been substituted for square openings between nave and north transept, in character with those on the south side. There are new wood floors, and pavements of Maw's tiles in nave, transepts, and chancel. The thirteenth-century windows have not been touched. The chancel contains the old returned stalls, and there is an extremely fine double-rood screen with loft over, which, tradition says, was removed from a religious house—probably Cherbury. The walls have been repaired where necessary, and underpinned. In the south transept, or Ly-more Chapel, is the singular canopied tomb of Richard Herbert, Esq., and Magdalen, his wife, who are represented with their eight children. One of the sons was the well-known Lord Herbert of Cherbury, and another (as he says) his "holy and exemplary" brother George, the poet whose name is so intimately associated with the place of his birth, Montgomery. The date is 1600. The lectern and other fittings are of oak. The oak memorial pulpit, with niches containing figures of the twelve apostles, &c., is being executed by Earp. The church is warmed by hot water. Messrs. Powell and Co., of Prees, are the contractors. The architect is Mr. E. Haycock, of Shrewsbury.

PATSHULL.—The tower of the Church of St. Mary, Patshull, near Wolverhampton, has been much altered and improved in the formation of a belfry to receive a fine peal of six bells, made and hung by Messrs. Mears and Stainbank, of London, who have also applied their chiming apparatus for occasional use. The ringers have now a commodious chamber

(formerly the bell-chamber), approached by an external staircase, instead of having to ring from the inside of the church, as heretofore, in the position where the bells were formerly hung. From the main cornice, which is almost on a level with the old ceiling or vaulting of this chamber upwards, the octagonal portion of tower and dome was wholly removed, and the floor of the new bell-chamber is now at this level, the upper portion of the tower, which forms the new bell-chamber, being reconstructed from this point. The character of the work is in keeping with the body of the church, consisting of a circular-headed belfry window on each of the four sides, embraced in the Tuscan order, with square quarter pilasters and rusticated angles. From the blocking over the entablature of the order rises the dome upon an appropriate base; this is covered with lead, and crowned with a perforated cupola terminal and gilded ball and vane surmounting the whole. The flag of the vane is the same that stood at the apex of the former dome. The circular windows on three sides of the ringers' chamber are glazed, in place of the old louvres, and an iron grille has been fixed in each. It is proposed to open a window into the church at the west side of the tower, where the niche with a statue of King Charles II. now stands. The entire height of the tower to the top of the vane is 86ft.; the old tower to the same point was 71ft. The builder's work has been executed by Mr. Benjamin Graham, of Huddersfield, who has obtained the stone required for the work from the quarry in Patshull High Park. The whole of the works have been carried out from the designs and under the supervision of Mr. Wm. C. Banks, architect, of Gracechurch-street, London.

WETHERBY.—On Friday week the new chancel which has been added to the church of St. James, Wetherby, was opened. A new east window, filled with stained glass, has been erected at a cost of £200. A new altar of oak, by Mr. G. B. Thain, has been provided. It is in the Early English style. Over the altar and touching the window-sill is a redos in plaster, designed by Mr. Henry Walker, the contractor. The floor within the altar rails and in the centre of the chancel has been laid with tiles supplied by Mr. R. Minton Taylor, of Stoke.

WEYMOUTH.—The extension of the break-water at Weymouth, for the protection of the harbour during easterly gales, is erected on the rubble ground first deposited in 1827, under the direction of the late Sir J. Cubitt. It is 250ft. in length from the end of the old break-water, or outer pier; the width on the top is 18ft., the sides battering 3in. to the foot. It is constructed of concrete built in situ. The upper edge of the work is protected by a heavy coping of Portland roach stone, joggled and cramped. The engineer of the works is the borough surveyor, Mr. W. Barlow Morgan, under whose personal supervision it has been constructed. The contractor is Mr. John Jackson, of Glasgow, the foreman of the works being Mr. Challoner.

The annual dinner of the Society of Engineers was held, on Tuesday evening, at the Guildhall Tavern, under the presidency of Mr. Thos. Cargill, C.E., who, in proposing the toast of the evening, claimed that the measure of the civilisation of a country is the number of railways it contains.

The Town Council of Exeter have decided by a large majority, to purchase water works in the city, on the basis of payment of 8 per cent. on the capital of the company. In addition to an expenditure of £94,000 on the purchase of the old company, the council propose to either go to Dartmoor or bore into the old red sandstone for a fresh supply for drinking purposes, at an outlay estimated at from £50,000 to £100,000.

The Wantago Town Commissioners have commended, in accordance with their surveyor's report, to lay Val de Travers asphalt on two sides of the Market-square, and in other thoroughfares, at a cost of £900, and to completely reform and raise the Market-square at a further cost of £320. The money has been borrowed on mortgage of the rates for a term of 16 years.

The Town Council of Blackpool have applied to the Local Government Board for sanction to borrow £26,000, for purposes of sewerage, &c., in the town, and £5,785 for sett-paving the carriage-drive on the south-shore promenade, from the Manchester Hotel southwards.

PUBLIC HEALTH,

The Leading Journal of Sanitary Science and Progress. The number published December 21 contains articles on Urban Surveyors and Model Bye-laws, The Fire Brigade and the Board of Works, Municipal Precept and Example, The Tottenham Sanitary Association, Treating Diphtheria with Alcohol and Quinia, Lectures by Ladies on Health, The Adulteration of Food, Treatment of Relapse in Leads, Curiosities of Suicide, The Air of Glasgow, Gymnastics and Hygiene, Open-Air Treatment of Phtisis, The Preservation of Food, Public Health Reports, Legal Intelligence, Correspondence, Editor's Table, Cleanings, &c. Price 2d.—31, Tavistock-street, Covent-garden, W.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE ENWARNS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australasian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Back numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

RECEIVED.—D. R.—J. D. S.—G. W. H.—W. B. and Co.—E. O.—S. G. C.—H. G.—J. H. T.—J. B.—W. H. P.—R. Lloyd W.—J. N.—J. F. B. (with photos)—B. and R.—M. H. (Your suggestion shall receive consideration.)—J. S. and Sons.—D. P. F.—H. G.—H. P. and J. B. B.—C., Sons, and B.—G. A. W.

SOUTHPORT NEW MARKETS COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—When the subject was under discussion at a previous meeting of the Town Council, the designs marked "Regardez Moi," "Sanitas," and "Experientia Docet," were recommended by the markets committee for the first, second, and third prizes.

The report of the council meeting adjudicated the premiums as follows:—1st, "Iron;" 2nd, "Southport;" 3rd, "Regardez Moi." Evidently the council themselves (as inferred from the reported speeches) generally did not agree with the selection made by Mr. Waterhouse. Mr. Councillor Hacking—a prominent exception—stated that he thoroughly agreed with Mr. Waterhouse in awarding the first prize to "Iron." This seems a strange inconsistency; for at the previous council meeting he stated there was, in fact, only one set of plans—those of "Sanitas"—which agreed with the instructions.

So far as regards a covered market, the sanitary and general arrangements are far more important than architectural design.

In reference to the selection of referee Mr. Waterhouse stands in the foremost rank of living architects.

Mr. Waterhouse, in his report to the committee, has laid down certain principles, or essential points, to be observed.

1. The cost of each design.
2. The value as a source of revenue considered from two points—(a) the extent of accommodation provided, and (b) the quality of that accommodation—such as the means taken to direct the stream of public traffic to all the stalls equally.
3. The isolation of the fish market, and its contiguity to the yard.
4. The treatment of the basement—especially as to its lighting and mode of access—so as to make it worth the cost of its construction.
5. The appliances for lighting and ventilating the markets themselves.
6. The suitability of the designs to the general architectural character of the town.

The report implies that the selection was made of plans that generally embodied the above features. Let us look at the plans. Not one of the premiated carries out the third essential point. The fish market has not the slightest contiguity to the open yard, but, on the contrary, this market is placed as far as possible away from the yard.

Again, the treatment of the basement. A very casual examination of the drawings shows that not one of the three plans could be built as drawn—the level of the main sewer is so shallow that the cellars would be constantly flooded. "Iron," the first prize, would never have a less depth of water standing therein than from 1ft. to 2ft., and both the other designs would also suffer. "Regardez Moi" plainly shows the relation of the bottom of sewer to the cellar. No professional eye is required to see that these plans, so far as regards the basement, are such as could not be tolerated, for they would be, in truth, nothing but cisterns for deposit of sewage water.

It seems very singular that a plan with the above serious disadvantages, and also with the objections stated by Mr. Alderman Sutton in his speech—a fish market provided for only eight stalls (though on looking at the plans I fail to see more than five stalls), w.c.'s adjoining the main and principal entrance, and architecturally considered, occupying the most prominent corner of the building, deficient entrances, and, I may also add, no provision for weighing on any large scale—should obtain the first prize, and that, too, evidently weighing against the opinion of the markets committee, who, so far as arrangements and convenience of plan of market are concerned, ought to be well able to judge.

Regarding the cost of the erection of "Regardez Moi," the architect's own report states distinctly that the plans could not be carried out for anything like the sum fixed by the "instructions."

As one of the twenty-five competitors ("Sanitas"), I submit that the selection is unfair. The selected plans do not comply with the printed instructions to architects, nor are they arranged with any regard to the levels shown on the plan attached to the instructions.—I am, &c.,

JOSEPH HARDING.

49, Lime-street, Preston, December, 1877.

DISHONEST ARCHITECTS.

SIR,—There has been much discussion lately on architects taking illicit commissions, and it is to be sincerely hoped that the exposure will lead to the discontinuance of such dishonest practices.

Believing as I do that publicity will do much to check the evil, I am desirous of bringing to your notice the following case:—My employer is an architect of some standing, and is one who would scorn to touch a farthing offered to him by way of a bribe or commission, and, in fact, would look upon such an offer as a great insult to his dignity. This high-minded gentleman having some works in hand, important enough for the services of clerks of works, has

induced his clients to employ his assistant (myself) to act in the capacity of travelling clerk of the works—part of the time being employed on the works, and the remainder at the office. By way of remuneration each client was informed that so much per week (naming a sum) with travelling expenses, in addition, would be required. To this the clients consented, believing, without doubt, that the architect would receive payment merely for my time and costs on the works. When forwarding a certificate for payment to the builder an account is made out in my name for salary as clerk of works, on receipt of which the client sends my employer a cheque for same. I am, however, paid my usual salary as if this arrangement did not exist, and consequently the architect pockets the client's cheque, and also makes a profit of some 60 per cent. on the transaction, as the rate charged for my services is considerably more than the cost to my employer. Thus by overvaluing my time to the client the architect contrives to make this large bonus without the slightest scruple.

This wrong could easily be prevented if the client made the cheque payable to my order, and also insisted on my receipt for same—for in either case I should decline to attach my signature, on the ground of being a party to the fraud. I will leave your readers to judge of the fairness and honesty of these proceedings, merely remarking that I greatly regret my inability to interfere under the circumstances.—I am, &c.,

FIAT JUSTITIA.

RESTORATION OF ANCIENT BUILDINGS.

SIR,—I am glad to find from Mr. Gough's letter in your last issue that the Society for the Protection of Ancient Buildings is coming to the front. However, in the particular case of North Frodingham Church, it is impossible to know who is in the right without seeing the drawings of the building as it is, side by side with the plans for restoration. When an architect of the present day adds new work of his own to an old building, his great object appears to be to copy ancient examples so carefully as to prevent future critics from detecting the fact that restoration has taken place at all.

Now, this is essentially bad and false art. When new work is put in, it should be executed in such a manner as to leave no doubt which portion belonged to the ancient fabric, and which portion is the new link in the historical chain of features added in the nineteenth century. Up to a few years ago there was no difficulty in assigning a date to any altered part of a building, because a later style was always a development of a previous one. This kind of comparative criticism is now impossible, for the manner in which an edifice is designed by the modern architect is as follows—viz., the elevation is obtained by consulting several volumes of plates from the BUILDING NEWS, and taking a window here, a door there, and a chimney-stack from another page; then the plan is made to suit the elevation; finally, a few carved capitals, &c., are added out of Viollet-le-Duc, or perhaps a picturesque dormer window from a sketch made while on a summer tour in Normandy. The drawings are then fit to put into the hands of a contractor, who does the rest.

There are two remedies for this state of things, 1. Architects may design more nobly, and develop a style which has sufficient individuality to be unmistakable; or (2), if they will persist in servilely reproducing the work of past ages, then, whenever a church is restored, the Society for the Protection of Ancient Buildings should insist on careful plans and sketches being made, showing accurately the state before and after restoration. Copies of these drawings should be hung up in the vestry for the benefit of visitors, who would then know whether to bless or curse the memory of the restorer.

I know of no case in which this latter alternative has been adopted, and perhaps Sir Gilbert Scott or Mr. Street, who have restored so many churches, may be able to tell us the reason for not having adopted so apparently obvious a course.—I am, &c.,

J. ROMILLY ALLEN.

31, James-street, S.W., Dec. 10.

Intercommunication.

QUESTIONS.

[5222].—**Damp in Walls.**—Can any reader give a remedy for damp in an internal brick wall? The bricks were shipped to the building and thrown into the sea by the contractor, and must have retained a certain amount of salt, which is thrown out, and discolours the paper. The proprietor does not wish to strap, lath, and plaster the walls anew (they are now plastered on the brick), as this alters the cornices, skirting, and architraves, which are not easily matched. Has any one tried felt, tinfoil, or other substances, under the paper, and with what effect?—**DAMP.**

[5223].—**External Plaster Work.**—Will any of your readers state what material they use, or is generally used, for plastering externally the framing of half timber work? Builders inform me that Portland cement is the only material that will resist the weather; but surely a material (perhaps putty and silver sand) can be used of a more artistic colour. I am aware that rough cast is used, but I am speaking with reference to a finished face?—**DISCIPULUS.**

[5224].—**Floor.**—Will any of your subscribers kindly give a diagram of a floor betwixt a wooden two-story bay-window without the beam showing below the ceiling of the bottom room?—**BEVERLAC.**

[5225].—**Plaster Roof.**—Will any reader inform me the best way to run an elliptic Gothic rib in a plaster ceiling of a schoolroom, 22ft. wide? The roof is lath and plaster against the rafters. The principals and the purlins will be moulded in plaster in the shape of a common ogee, stuck on the edge 3in. below face of ceiling. What I want to know is how to work out the elliptic Gothic (lath, P, 3in. wood) rib, which projects from face of L, P, 3in. Is it best to make a trammel or how?—**A YOUNG PLASTERER.**

[5226].—**Brick Ornament.**—Can any reader inform me whether there are any books published containing ornamental brick spouts and cornices of various sizes, and if so, by whom they are published?—**YOUNG BUILDER.**

LEGAL INTELLIGENCE.

NEGLIGENT WORKMEN.—A case of some importance to both employers and workmen was decided in the Salford County Court on Monday. A mechanical fitter, named Garside, formerly employed by Messrs. R. Neill and Sons, builders, sued that firm for wages amounting to 34s. alleged to be due to him. The defendants admitted the claim, but pleaded that the plaintiff owed them a much larger amount. Garside, it appears, had been employed in taking down a mortar mill at the new Central Station, and it was alleged that in consequence of his neglect the pan of the mill had been broken, and Messrs. Neill had been obliged to make good the damage thus done. This was the basis of the counter-claim, and Messrs. Neill presented their demand under section 3 of the Act of 1875, which gives power to every county court in disputes between masters and workmen to "adjust and set-off, the one against the other, all such claims on the part either of the employer or the workman arising out of or incidental to the relation between them, as the court may find to be subsisting, whether such claims are liquidated or unliquidated, and are for wages, damages, or otherwise." On a review of these facts, the judge came to the conclusion that the allegation of negligence had been established, and his decision was that Garside should pay Messrs. Neill the sum of £10 11s. 3d., being the amount of damage done to the mortar mill, minus the 34s. due as wages and the price the broken pan realised as old metal.

MR. HANKEY AND THE BUILDING ACT.—On Tuesday, at Westminster, Mr. Henry Alers Hankey, of Queen Anne's-mansions, St. James's-park, was summoned by Mr. E. Dru-Drury, the district surveyor, for various infringements of the Building Acts. There were six summonses relating to the construction of the mansions at Queen Anne's-gate, and the summonses alleged that the defendant had constructed a building of greater area than 3,600 square feet, that he had omitted to close the openings of the party walls by unwrought iron doors of the thickness prescribed by the Act, &c.; that he had constructed the building of greater height than the plans specified, that the floors were constructed of other than fireproof and incombustible materials, and that openings had been made in the walls separating the west wing from the south wing, which made them one building, in contravention of the Building Act of 1855. In opening the case a solicitor, who represented the Board of Works, said the summonses might be summed up under three heads—viz., height of building, floors, and passages, and party walls. The Act provided that no dwelling-house should be erected of a greater height than 100ft., but should it be proposed to construct one of greater height it would be necessary to ask the permission of the Board, and Mr. Hankey sought that exemption in November, 1875. With regard to the north wing, Mr. Hankey had permission to build to the height of 130ft.; he had, however, built to the height of 141ft. With regard to the south wing, permission had been given to go as high

as 141ft., whereas it would be proved that the height was 147ft. 10in., and the other section applied to a portion of the building for which no permission had been granted at all. Since these buildings had gone on Mr. Hankey had three times, but unsuccessfully, endeavoured to obtain the permission of the board to carry up the building beyond the height in the license. With regard to the west wing, which had been constructed to a height of 111ft., or 11ft. in excess of the ordinary height of building, no permission had been given at all to exceed 100ft. Counsel then proceeded at some length to argue the law on the second point—viz., the forming of the floors and corridors, to be constructed of incombustible material; in buildings intended for dwellings of more than 12,500 cubic feet the floors of corridors should be constructed of stone or other fireproof material, and in this instance concrete had been used. Of course this was somewhat uncomfortable, and the floors had been covered with wood, which, he contended, was combustible material, and thus an infringement of the Act. Mr. Poland contended that they had as much right to put down wood as carpet or kamptulicon. The object was to prevent the spread of fire from floor to floor, and in this case the precaution had been taken by the use of concrete. Mr. Bazalgette contended, however, that the boarding was part of the floor as construed by the Act, and, if part of the floor, then not incombustible. He then went to the third section of the alleged infringements, and pointed out that, instead of having double iron doors between two separate buildings, Mr. Hankey had inserted single concrete doors. That might or might not be better than the iron doors, but the terms of the Act had not been complied with, and that was all with which he had to do. The case was then adjourned for a fortnight.

A "BUILDER-SURVEYOR'S" CHARGE FOR PLANS.—*Shaplin v. Woollard.*—Lambeth County Court.—In this case the plaintiff, a builder and surveyor, sued the defendant, a grocer, for £2 2s. for preparing sundry drawings and estimates in respect of certain property possessed by the defendant in Lordship-lane, Camberwell. It appeared that in April last the defendant called at plaintiff's offices on Peckham-rye, and requested him to make some drawings and specifications for the purpose of converting some house property into shops. On the part of the plaintiff, it was contended that the order had been virtually given, the work properly done, and adopted by the defendant in his conversion of the premises in question. For the defence it was stated that plaintiff was never employed, but was only a volunteer competitor, and that the property in question had not been built or altered according to his plans. After a deal of evidence, his Honour said the ordinary course was that, unless there was a special bargain, no charge was to be made if the work was not accepted. Judgment would be for the defendant, with costs.

ACTION FOR CARPENTER'S WORK.—*Delay in Completion.*—*Webster v. Blanche.*—Bow County Court.—This was an action brought to recover the sum of £23 for money paid. According to the plaintiff's statement, borne out by his witnesses, it appears that in March last he had some houses that wanted finishing, and the defendant agreed to do the required work to two of them for £120. Plaintiff being satisfied with the work, gave him two more to do, the price to be the same as the first. He went on with the work for some time, and £102 had been paid on account of the second contract. On the 28th of July, plaintiff finding defendant was not going on with the work, complained to him about it, but he took no notice, whereupon plaintiff wrote, telling him that unless he immediately continued the work he should have to get somebody else to finish it, and should hold him responsible for the amount that should be charged. Upon this the defendant refused to do anything more to the houses, and plaintiff called in another builder, who finished the work and charged £41, which he (plaintiff) paid. Defendant said he would have finished the work, but could not do so when plaintiff wanted him, as he had a very important job to do. With regard to the amount charged by the other builder, he considered it excessive—in fact, he, as a practical man, could have done all the work that wanted doing to complete the houses in a week. His Honour, after hearing the witnesses on both sides, gave judgment for the plaintiff for £22 10s., and costs.

CHARGE OF CONSPIRACY TO DEFRAUD AGAINST BUILDERS.—At the Guildhall Police-court, on the 18th inst., William Smale, builder, of 57, South Lambeth-road; Samuel Greenslade, builder, of 5, Jelf-road, Brixton; and Charles Francis Knox, of 11, Newgate-street, appeared before Sir Andrew Lusk to answer a summons charging them with conspiring to cheat and defraud the creditors of Smale. Mr. Besley and Mr. Straight appeared for Messrs. Eastwood and Co. (Limited), brick merchants, Belvedere-road, Lambeth, who prosecuted, and Mr. Poland appeared for the defendants.—Mr. Besley said the defendants' design evidently was so to arrange matters that Smale's creditors should not receive one farthing of his money. Smale was a builder in a very good way of business, and having very good credit. There was no doubt that at some time he was solvent, or very nearly solvent, and that he then obtained credit to the extent of £4,000 or £5,000. Smale then gave a bill of sale to Mr. Knox (his solicitor) for £1,314, upon all his moveable plant

and business effects. Then he had some houses building at Brixton, to which Messrs. Eastwood and Co., had supplied goods on his order, and those he transferred to Greenslade, a man in his employ as a foreman at foreman's wages, and he also gave him a bill of sale on his furniture. The only thing left was the benefit he had in a contract, and that he assigned to his father for an alleged advance of £600, so that there was not one farthing for the creditors. Smale next sent a circular round to his creditors to try and liquidate, but this fell through. Messrs. Farniloe and Sons then instituted proceedings in bankruptcy, and in proving his bill of sale for £1,314, Mr. Knox produced cheques for various sums advanced to the defendant, Smale, at different dates, making up the amount. The counterfoils agreed with the cheques, but when Mr. Knox's banking account was examined, it was found that whenever a cheque had been given to Smale as an advance, a similar sum had been paid into the bank on Mr. Knox's account only a day or so before, and in many instances that money was Mr. Smale's money. Mr. Knox's balance had frequently been as low as 6s. 8d., and several of his cheques for £3 10s. and £4 had been dishonoured. At the examination, before Mr. Registrar Brougham, he called on Mr. Knox to show how he made out his ability to prove his claim under the circumstances, and he replied that he had friends who had advanced money to him for the purpose, and he had money in his pocket which he never passed through his bank. Mr. Registrar Brougham called upon him to furnish an account, which he did, and the account showed that from Jan. 10 to June 2 he had advanced Smale £3,850. Mr. Registrar Brougham said he did not believe him, and refused to allow his claim. Messrs. Farniloe had some claim on buildings which Smale was erecting at Brixton, but on applying for the money they were told that the buildings were Greenslade's. With regard to the benefit in the contract, which the defendant, Smale, had made over to his father, under a bill of sale, the other parties to the contract refused to acknowledge the bill of sale, and had since paid the amount into the hands of the trustee.—Mr. William Stopher, solicitor, of Coleman-street, then gave formal evidence, and the case was adjourned, Sir Andrew Lusk admitting Knox to bail in his own recognisances in £500, and the other defendants—Smale and Greenslade—each in two sureties of £100 each, and themselves in £200 each.

ARCHITECTS' FEES.—*Laurie v. Davis.*—This was an action in the Lord Mayor's Court to recover £120 for professional services in preparing plans of a projected skating rink, which the defendant was about establishing at Lewisham, at an estimated outlay of £3,000.—The defendant pleaded never indebted, and had paid a sum of £10 into court. Beyond that he averred that he was not liable. The plaintiff and the defendant had been acquainted for some time, and the result of a correspondence and conversation between them was, that the plaintiff was engaged to prepare the plans for the rink, but the scheme was never carried out.—The jury found a verdict for the plaintiff.

STAINED GLASS.

BIGGLESWADE.—A stained glass window has been placed in the large east window of the parish church in memory of the late Mr. Barnett, of Stratton-park. In the centre is a representation of the Transfiguration, and on either side are grouped scenes in our Lord's life, numbering in all eight. The tracery openings are filled with figures of the apostles and evangelists.

HARROGATE.—A memorial window has been placed in the baptistery in the west end of Christ Church, High Harrogate. The subject is the baptism of Christ by St. John. In the upper portion of the window is the sacred monogram, beneath which is a canopy. Under the canopy, and occupying fully one-half of the window, is the principal subject. Christ is represented standing in the water, and St. John upon the bank in the act of performing the rite, while over the head of the Saviour the dove is hovering. In his hand St. John holds a cross, to which is attached a banner bearing the inscription "Ecce Agnus Dei." On the bank are the symbolical flowers, iris, water-lily, &c. The window was designed and executed by Messrs. Shrigley and Hunt, Lancaster.

A meeting of the delegates from the different master builders' associations was held on Tuesday, at Birmingham, for the purpose of forming a national association. It is proposed that Birmingham should, on account of its central position, be its headquarters.

NOTICE OF REMOVAL.

CHUBB AND SON,
LOCK, SAFE, AND IRON DOOR MAKERS,

Have REMOVED their SAFE and LOCK BUSINESS to new and extensive Premises,

123, QUEEN VICTORIA STREET, ST. PAUL'S, E.C.

Makers to the QUEEN, H.R.H. THE PRINCE OF WALES, and the Bank of England.

Our Office Table.

THE Home Secretary distributed the prizes gained by the students attending the metropolitan drawing classes in connection with South Kensington Museum at the Cannon-street Hotel last week. He said that, although we had done much lately for education, he thought we had little to boast of, as we did not move in the matter until we saw it could not, with safety to the nation, be longer delayed. Until a very recent date he considered that taste in art was very low in this country, and in proof of this he pointed to what he called the vulgar exhibitions to be seen in the interiors of the houses of the great. Mr. Cross then contended that, even for the benefit of our artificers, the public taste should be so educated that nothing, except founded on the principles of art, should be demanded from them.

A DISPUTE between the Metropolitan Board of Works and the New River Company was settled on Monday, for the second time, against the former. They have paid at the rate of one shilling per thousand gallons for the water supplied for watering the Embankment and the public gardens thereon. The Board claimed that a section in an Act of 1852 entitled them to the use of this water for sixpence per thousand gallons; to which the company replied that that reduced rate could not be applied to so intermittent a supply as one for the summer only. The Lords Justices, on Monday, confirmed the decision of the Queen's Bench in favour of the New River Company.

THE programme for the 20th session of the Society for the Fine Arts has just been issued, and shows that there are arranged for the ensuing year five conversazioni the first being fixed for the 17th January, and held at the rooms of the Society of British Artists, Suffolk-street, W.; a Shakespearian recital by Miss Herand; and six lectures, including "The Decoration of Town Houses," to be treated of by Mr. R. W. Edis, F.S.A. (March 17th); "The Historic Relation of Secular and Sacred Art," by Mr. J. Forbes Robertson (April 4th); and "Pen and Pencil Sketches in Brittany," by Dr. Phené, F.S.A. (May 16th).

THE annual general meeting of the Institution of Civil Engineers, "to receive and deliberate upon the report of the council on the state of the Institute, and to elect the officers for the ensuing year," was held on Tuesday. A motion for the adoption of the report led to a long discussion, but was ultimately carried in conjunction with another resolution, directing the incoming council to prepare, for the consideration of a special general meeting of members and associates, such alterations in the bye-laws, as the suggestion contained in the report with reference to classification may require. The premiums and prizes awarded at the close of last session were then presented by the president. The report of the scrutineers declared that the following gentlemen had been duly elected to fill the several offices in the council for the ensuing year:—Mr. John Frederic Bateman, F.R.S., president; Mr. J. Abernethy, Sir W. G. Armstrong, C.B., F.R.S., Mr. W. H. Barlow, F.R.S., and Mr. J. Brunlees, vice-presidents; Mr. W. Baker, Sir J. W. Bazalgette, C.B., Mr. F. J. Bramwell, F.R.S., Mr. G. B. Bruce, Sir John Coode, Mr. W. Froude, M.A., F.R.S. Mr. G. F. Lyster, Mr. W. Pole, F.R.S., Mr. C. W. Siemens, F.R.S., Mr. D. Stevenson, F.R.S.E., Sir Jos. Whitworth, Bart., F.R.S., and Mr. E. Woods, members; and Col. H. Hyde, R.E., Mr. J. P. Knight, and Major-General Scott, C.B., R.E., F.R.S., associates.

On the 13th inst., died, at his residence in Limerick, one of the oldest, if not the oldest architect in the United Kingdom—Mr. James Pain—at the age of 97. The deceased was born in London, of a well-known family, distinguished in architectural and building affairs. He served in the office of the celebrated John Nash, by whom he was sent to Ireland to superintend some important works, and eventually with his brother, Mr. George Richard Pain, settled in Cork and Limerick, in which counties, as well as in the south and west of Ireland generally, the firm of James and G. R. Pain enjoyed for many years an extensive practice. Among

their works may be noted Mitchelstown Castle, erected for the Earl of Kingston, a noble pile in the late Tudor style; Dromoland Castle, for the Earl of Inchiquin; Loughcooter, for Lord Gort; Elm Park for Lord Clarina, and many others. Adare Manor, the residence of the Earl of Dunraven, was begun by them, and afterwards passed into the hands of the second Pugin, and finally into those of Mr. P. C. Hardwick. They also designed the Cork Court-house, possessing a splendid Corinthian portico, referred to by Lord Macaulay in his history; the Cork and Limerick prisons, Thomond and Athlunkard bridges over the Shannon, and several large churches, both Protestant and Roman Catholic, in the cities of Cork and Limerick. Mr. G. R. Pain died at a comparatively early age, but Mr. James Pain continued to reside in Limerick, and to practise his profession till within the last few years. He enjoyed a deservedly high reputation for his upright and honourable course of conduct, both amongst his employers and professional brethren. His remains were interred in the venerable Cathedral of Limerick, on the 17th inst.

THE intended restoration is announced of a hitherto neglected relic at Dunfermline, dating from the time when King Malcolm held court at the Tower-hill. This relic is Queen Margaret's Cave, which consists of an apartment in the solid rock, and is situated a few hundred yards from the Tower-hill. It is 6ft. 9in. in height, 8ft. 6in. in width, and 11ft. 9in. in length. At the bottom of the cave is a small spring well, the water of which rises at times and covers the whole of the lower space. Queen Margaret was accustomed, historians tell us, to repair constantly to the cave for the purpose of private devotion, and the King discovering the real cause of her long absences, hearing, while he listened, prayers uttered by her on his behalf, caused the rude excavation in the rock, always damp and dingy, to be fitted up as an oratory. After the Queen's death the place was permitted to fall into decay.

THE trustees of the National Gallery and the nation have sustained a serious loss by the death of Mr. Ralph N. Wornum, the Keeper and Secretary of the National Gallery, who died of nervous disease of the brain on Saturday last. Born in 1812, and originally educated for the bar, Mr. Wornum, in 1834, devoted himself to the history and practice of painting, first by six years' diligent study in Munich, Dresden, Rome, and Paris. He established himself as a portrait-painter in London in 1840, and was one of the competitors selected for praise, though not for a prize, in the first cartoon competition in Westminster Hall. A correspondence with Sir C. Eastlake in 1845 on the insufficiency of the National Gallery catalogue led to his selection, at the suggestion of Sir Robert Peel, for the compilation of an improved catalogue. His "Epochs of Painting" has been adopted as the text-book for examination in the art schools of Oxford, on the recommendation of Messrs. Ruskin, Dyce, and Richardson. In 1864 he published his "Life of Holbein," the best English work on the subject, and has thus made the English student—on one leading painter's history at least—independent of foreign labours. Besides all this work, his daily labours as keeper and secretary of the National Gallery were devoted and unceasing, and continued to the time of death.

THE *Dunedin Trades Journal* says if one were to judge by the number of substantial-looking buildings which are being erected in all quarters of the city of Dunedin, a very flattering opinion as to the prosperity of the building trade must necessarily be formed. On all sides the landmarks of the past are being swept away, and brick and stone are taking the place of wood. A former resident, who had been absent but a couple of years, on his return would be amazed at the almost Aladdin-like change which has taken place in that brief period. The Princes-street of old is no more, and instead of the rickety, tumble-down row of shanties which overhung the precipice, a row of stately buildings have been reared, whose ample proportions and architectural beauty would be an ornament to any city. Go where you will improvement seems to be the order of the day,

but although many of the commercial and business establishments have been making extensive improvements, additions, and renovations, in no class of the community has the building trade secured so many patrons as amongst the publicans.

THE "Working Women's Hotel," at New York, founded by the late Alexander T. Stewart, will soon be opened. It has cost about 2,000,000dols., and that amount is given absolutely to the enterprise; but thus started, it is to be self-supporting. There are upwards of 500 private rooms in the hotel, some double rooms of 30ft. by 16ft., which two women may take, and other single rooms of half the size. A number of reception-rooms are provided, in which the residents may entertain their friends. The main dining-room will seat 600 persons at a time. The house is intended to give to women who earn their own livelihood the best rooms, best furniture, best attendance, and best living at a charge for the whole not exceeding 5 dols. per week. Mr. Stewart estimated that the hotel ought to make 1,000 working women independent, and 3,000 or 4,000 more nearly so. The great kitchen has a capacity for cooking food for 5,000 people.

AT the meeting of the Society of Antiquaries of Scotland at Edinburgh, held on Monday week, a very interesting paper was read on "Roslin Castle, its Buildings, Past and Present," by Mr. Andrew Kerr, architect, formerly of her Majesty's Office of Works. It seems probable, from various notices and traditions, that there may have been a stronghold of some kind at Roslin so early as the eleventh century, but no remains of any such early work can now be traced. The oldest part of the present castle appears to be of the early part of the fourteenth century, and was erected by Sir William St. Clair, who set out with the Bruce's heart to Palestine, and fell fighting against the Moors in Spain in 1330. The castle was added to by his great grandson, Henry, the second of the St. Clair line of the Earls of Orkney. He built the great keep or south-west tower. Sir William St. Clair, third Earl of Orkney, the founder of the Collegiate Church of Rosslyn, also made large additions to the castle. These exhibit many French features, and Mr. Kerr accounted for this by the fact that Sir William and his wife resided for some time in France. In 1544 the castle was burned by the English forces of Henry VIII. It was partially restored by Sir William St. Clair after 1530. The building was continued by Sir William of Pentland, his son, whose initials, with the date 1682, are cut on the lintel of the door leading to the great staircase. The ceiling of the dining-room, which is richly decorated, bears in the centre panel the Rosslyn arms and the date 1622. It is immediately after this that the castle seems to have been in its most complete condition. The north-west side was battered down and the castle plundered by General Monk. It was partially restored after this, but again attacked and plundered by a mob in 1638.

WATER SUPPLY AND SANITARY MATTERS.

ROTHERHAM.—A Local Government Board inquiry was held at Rotherham Court-house, recently, before Lieutenant-Colonel Cox, with reference to an application which had been made by the Corporation for sanction to borrow £4,000 for the purchase of land at Northfield for the deposit of dust, ashes, and rubbish, collected by them, and £10,000 for works of street improvement. It was stated that the latter sum was required for flagging, paving, channelling, and kerbing Masborough-road, Sheffield road, Frederick-street, and other thoroughfares. These streets were formerly macadamised, but it was found that the cost of repairing the macadam on Sheffield-road was about 20 per cent. of the original outlay. It was now proposed to put down granite setts, which, it was hoped, would last 20 years.

TYLDESLEY.—The local board of health have instructed Mr. R. Vawser, C.E., of Warrington, to prepare a scheme for the interception and purification of the sewage from their district. This step had been rendered imperative on the board in consequence of legal proceedings under the Rivers Pollution Act having been threatened against the board by Lord Lilford, and others, who allege that the streams in the district are being polluted by sewage.

THE BUILDING NEWS.

LONDON, FRIDAY, DEC. 28, 1877.

SCULPTURE BEFORE MICHAEL ANGELO.

IF painting before Raffaele some years ago created a school in Europe—and more especially in England—sculpture before Michael Angelo is creating a similar school among the Italians of the nineteenth century. There is organised at present in Florence an association representing that which by many has always been considered the higher, the purer, and the less meretricious art—dedicated to the vindication of, as it were, pre-Michael-Angelo sculpture. That artist, they say, in the appeal now circulating to the mediæval spirit, bequeathed to his posterity from fifteen to twenty masterpieces; and are these to intercept our view of the mighty background behind? The ancient Greeks had a proverb, "There were strong men before Agammemnon;" and so, the modern Florentines declare, there were Italian sculptors before Michael Angelo. In this conviction they are about to assemble a gallery of examples—whether originals, copies, or casts—in the Tuscan capital. Others have gone upon another path, and claimed for Canova that which they denied to the sculptor of "Moses;" but their opinions are quietly put in the background. Given, the genius of Angelo, acknowledged in its highest degree; and had it any relation with, any growth in, the genius of preceding ages? Frankly answered, from an artistic point of view, we can imagine few questions of more interest to the living generation of Italy. But the art-archæologists of Florence, like some of our own countrymen, students like themselves, have been compelled to search almost exclusively in a particular century—and that the thirteenth—for illustrations of their favourite theory, which is, that Angelo, like Raffaele, was rather the offspring than the father of a school, the birth and development of which is traced through the two following epochs. Apart from this, which is hypothetical, it is impossible not to admire the veneration, late though it be, after long periods of neglect, bestowed upon those austere *bas-reliefs* executed by Nicholas of Pisa—the suggestions, no doubt, of much that Donatello accomplished, but which were comparatively lost amid the shadows of churches and monasteries, the universal and invariable principle scorning all classic or pagan taste which pervaded them; and yet the gradually growing grace which the masters of Tuscan art, even in its younger modern period, could not fail to impress upon their works, archaic and ascetic though they were intended to be. The pre-Michael-Angelists said, like the pre-Raffaellites, "Let us restore nature;" but they could not help adding to it the ideal, and this even the Florentines of the nineteenth century admit while drawing their comparisons. But, throughout, they confess that it is less with statuary than with architectural sculpture that they have to deal. To the former class belong, moreover, groups of heroic effigies rather than reminiscences of the Greek or Latin thought; huge mailed warriors, like Bartolomeo Coleoni, Charles of Anjou, in the Hall of the Capitol at Rome; and even Roman emperors in panoply. The mediæval sculptor addicted himself very much to symbolism; he gave himself up to mysteries and passions, too, and rarely aimed at beauty or even sublimity. Even the Apulian marble-worker prefers to deal with animals and leaves than with the human form. To say truth, indeed, there survives no single work of those times to be compared, in

point of pure art, with the works of the times which came after them. They are wonderful, full of teaching, lessons in earnestness and rough knowledge, but a single stamp is upon them all, and the Florentine artists desire to discover whether, amid all the relics of those generations, there be any exceptions to the rule. The representation of St. Eustace, at Ravello, is certainly not one, with its Arab-like drapery and barbarous attributes. In fact, the art of statuary, if not of sculptor, appears for awhile to have deserted the Italian genius, so that the term "Renaissance" was applicable in its fullest sense. There are tombs, fountains, portals, mortuary monuments, pulpits, gates, and mythological compositions in abundance; but the sculptors were, all the while, executing their tasks clumsily and without inspiration—as, for example, Morio, with his colossal effigies of SS. Peter and Paul, at Naples—two enormous figures, with no more character than a couple of dolls. It is true that Italy, and Rome in particular, was in need of models during that twilight time. Thousands of statues—even those which Theodoric had spared—lay in mutilation about the streets; hundreds of others were built into walls, like worthless stones; but nearly the whole of the epoch is barren: and even in the fifteenth century we know of but two Roman sculptors—Paolo Romano and Gian Cristoforo—the first a goldsmith as well, and the second a carver in wood. The Lombards were more ambitious, but even Milan produced little more than ecclesiastical monuments, with images of Popes and virgins in draperies copied from paper, linen, and glue; though there an early revival began to be felt, which stimulated, no doubt, in later years the emulation of Florence. Still, the architectural predominates over the simply sculptural, as our Florentine pre-Michael-Angelo-ites deplore. Caradossa is famous only for a mortuary, Bambaja for a tomb of Gaston de Foix, Bernardino for a frieze, and Marco Ferrari for a representation of St. Bartholomew being flayed alive—a composition which might never have been noticed had not the artist innocently added an inscription warning the critic not to mistake it for a work of Praxiteles. A very different order of art is arrived at, we are reminded, when Leoné Leoni, goldsmith, medallist, and sculptor, Antonio Fontana, and Modèo—the one great sculptor of Pavia—and the Venetian artists appear in the foreground, waiting, as it were, for Michael Angelo to initiate a new generation. It was over the studios of Florence, however, that his spirit cast a spell, though, as already noticed, the modern Florentines declare him to have inherited, rather than created, a style from amid the ruins of Byzantine barbarism and magnificence. In proof they point to the Descent of Christ from the Cross in the church of St. Martin, at Lucca; the Baptistery at Pisa, which is little more than a plagiarism from the famous sarcophagus in the Campo Santo; the throne at Sienna, the choir at Bologna; but none of this is sculpture as Michael Angelo understood the art—by no means confounding it, however, with a mythological multitude of fauns and nymphs, Graces and Satyrs, Apollos or Mercuries. The true point is now approached by our Italian archæologists, for they ask, Did a decadence in sculpture take place when Mount Olympus ceased to supply its models? Must every artist's idealisation be that of a form which has been fed upon ambrosia? Why, no more than Michael Angelo himself would have repelled so academical a doctrine, though he certainly did burst away from the narrowness and acerbity of the earlier Christian centuries. So, at least, according to the new *cognoscenti* of the Tuscan studios, who would prefer recognising in him rather

a development than a type. They are inclined to lean somewhat heavily upon Nicholas of Pisa and his pupils, who, indeed, represented almost a generation of Italian sculptor life, with John of Pisa as his ally, to whom are due four figures, whence Angelo himself might, indeed, have translated an idea—of Prudence, Moderation, Courage, and Justice—works in which, as it were, a lineage and transmission of genius is distinctly visible. In them, nevertheless, there is not an attempt at poetical beauty. All is simple, strong, and real, without the slightest embroidery of imagination—too much muscle and vigour, in fact, and too little of re-moulding nature, according, at least, to the nineteenth-century Florentine standard. The son, in these respects, was even less of a "frame-maker" than the father. But it must always be remembered what was the work which these sculptors had to do, and to which they were, in a manner, chained down. Arnolfo of Lapos' *chef d'œuvres* were the tomb of Cardinal de Braye in the church of St. Dominic, at Orvieto, and at Rome the Tabernacle of St. Paul's—without—the-Walls—two as arid subjects as could easily be conceived. The Cathedral of Orvieto belongs to a different category, but the sculptures in that edifice belong also to a different time. They are principally *bas-reliefs*, however, and, of course, essentially Scriptural. Up to this time, indeed, or since the Pagan downfall, sculpture was the mere handmaid of architecture, and it may be feared that the pre-Angelo enthusiasts will find a difficulty in demonstrating anything else. Then, however, sculpture began once more, so to speak, to step down from the wall, to detach itself from the solidity of central structures, to appear in the full shapes of St. Cecilia, Judith and Holofernes, John the Baptist, and the Magdalen—Classic subjects being still rejected. There was an equestrian statue of Gattamelata, at Padua, round which the people thronged as round a novelty; another of Francesco Sforza, at Milan: a third of Colleoni, at Venice, and the Italian taste for sculpture spread. Nothing, however, or at any rate very little, of Michael Angelo in all this, notwithstanding the confidence of the Florentine art-antiquarians—nothing in the monuments even of Marsuppi and Bruni, in Santa-Croce itself, superb though they are. His own early effort, "Head of a Fawn," executed at fourteen, was a declaration of war against the exclusively ecclesiastical style; and then it came to be seen that, throughout the Renaissance period, the Tuscans were, of all artists in Europe, the most sympathetic and intelligent students of the antique, and that, when called up, they had treasures of acquisition ready at hand with which to meet the new appeal. But they never learned to become copyists, and this was a debt due from them to the predecessors whose works are now somewhat indiscriminately decried; if, indeed, they deserve disparagement at all. They had ceased, it is true, to treat sculpture as an art exiled from Greece and Rome, and to be regarded as a foreign refinement, with all its foreign elements preserved: it had gone through a long process of change, resembling, at times, decay, or even dissolution; but the "age of tombs" passed, it may be said, with the Medici, and the plastic spirit, in its highest expression, revived. The pupil of Ghirlandajo studied from the antique in the gardens of Lorenzo—sufficient evidence, perhaps, even for the new Society of Mediævalists, that the middle ages had not, in their most fructifying period, given a school of oral art to the ages which were to come after them. Whence, amid their annals could he have caught the inspiration of his "Sleeping Love," or "Bacchus," or "Adonis," or even the "Pietà," ordered

from him by the Abbot of St. Denis? There is nothing like this "Pieta" in the whole pre-Angelo series. It will not be pretended, of course, that there is anything like the "David" or the "Moses," while the celebrated "Tomb" is so utterly in contrast with the old sacerdotal sarcophagi in the Gothic churches of Europe as to suggest a different order of structures altogether. Explanations have been given, say the somewhat eclectic critics of the new Florentine Academy, to the purport that, up to the Reformation, or nearly so, Art was the pensioner and ally of religion in a particular form. It disidealised itself; it went into the chapels of the monasteries, and the cells of monachism; in a word, it cut off the connection which we are asked to perceive between the art of caskets and chests and quaintnesses, and the revived, if not greater art, typified by Michael Angelo. Certain it is, however, that no contrasts could be deeper than those between the resemblances which the Florentine art-archæologists seek, and those which they will not discover. It might be better, however, did they not make it so entirely an affair of schools. They are seeking links at Florence—and among the most competent in that city, too—between the several generations of Italian art-work, peculiarly as applied to sculpture, and peculiarly also as applied to the growth developed between the ages which preceded that of Michael Angelo and the ages and types which grew from the genius, cultivated as it must have been, of himself, his contemporaries, and his successors. Any endeavour to conduct the history of Italian, and, therefore, of European modern art in a broad, free, and connected stream from the darker through the brighter days, must be of infinite merit in itself, and would be of incalculable value if successful. The Florentines, therefore, may feel assured of encouragement in any case, and of honorary crowns uncounted, after the Italian fashion, should they succeed.

THE READING TOWN HALL COMPETITION.

WE return to the other designs in this competition, which we had no time nor opportunity of criticising last week. Several points occur to us upon a further consideration of the designs, and these we shall now notice. The competitors had first to decide upon the position of the hall, its size and connection with the present town hall. Upon this a great deal depended; in fact, we may class the designs under two great groups—the parallel hall plans, or those which place the hall parallel to the present one, *i.e.*, in the direction of north and south, and the right-angle arrangement, in which the axis is placed east and west. As regards the library, museum, and school department, various arrangements have been adopted. Other points to be attended to were the necessity of a wide entrance from the main street to the hall, with good egress, easy access to the library and reading-rooms, and well-lighted drawing and painting rooms. A further study has convinced us that several of the unpromised plans comply with the conditions, and we fail to see in what respect the conditions have been disregarded. It was only fair to the authors that the award of the committee or their referee should have stated in what points the authors had neglected their instructions, and the competitors will not be satisfied till this is done.

"Boz" is a design marked by considerable refinement in a French or Flemish type of Gothic. The elevation is tastefully drawn, the roof, broken by dormers, being tinted to show red tile; but the plan does not equal the elevation. The hall is 100ft. × 52ft., placed east and west, with a centre entrance from Blagrove-street. There is an

ante-room and corridor communication with the old hall, and a circular apse for organ. Below the hall is the lecture-room for cookery and the kitchen offices—a location that has been assigned for these departments by other competitors as well, and, though making the most of the area, is open to objection, unless the most perfect ventilation be adopted. On the north side of the hall are the reading-rooms and library—the former in two parallel rooms kept low and lighted from the roof, the lending library being in front, with an entrance from Blagrove-street. The school of art is on the east or back portion of the site entered from the new street. In front is the museum, on the upper floor, partly over the lending library, but poorly distributed. "Brick and Terra Cotta" is the motto of a cleverly distributed plan, with well-disposed areas, showing hall in an east and west position, 111ft. × 50ft., joined to the present hall by a lobby, and also by the existing corridor. By this arrangement the halls may be connected for exhibitions, conversaciones, and concerts on special occasions, or may be disconnected if desired. The main entrance is made a loggia or arcade in front, with side flights of steps to the large hall. The library in front at the north side has a corridor entrance, and the lowness of this part of the building disconnects the hall in effect from the library building, perhaps rather too much for the sake of unity. The museum is behind, separated by an area. The elevation pronounces the hall, the entrance end of which is brought out to Blagrove-street. There is too ecclesiastical a character in the treatment of the large pointed window over the entrance, the side-stair turrets, and the crowning of niches at the summit of the gable which surrounds the base of central fleche, or appears to do so. The pencil sketch is spirited and clever. "Lux" sends two clever plans. The first shows an east and west position of the hall, which is 88ft. by 51ft. 9in., with orchestra at the west end, a loggia entrance with two side flights of stairs to hall, and a gallery all round, a total of 1,619 persons being provided for. The hall is lighted on north side. The entrance to the library, which extends along the new street, is in front, though we scarcely like the flight of steps to it and the turn into it. The museum is below and the school above. We find the author has well satisfied the demands for light and air, as there is a good intervening area on the north of hall. We like the alternative plan better in some respects; the hall is placed north and south, and the connection between the two is by a curved corridor and an ante-room rather ill-studied as regards the pier spacing. The museum library and school are in front block quite isolated from the hall, which is behind, and placed parallel. We notice a main loggia entrance in the new street to the hall, which thus does not compete injuriously with the present entrances. The cooking school is below the hall; the analyst and medical officer have also rooms provided here, with access from an open archway. This is undesirable. The elevation of the alternative plan shows much feeling in a foreign Gothic style, and the treatment would have been simple and dignified if the entrances and bay windows had less broken the harmony of the front than they appear to do; there is, however, much merit in the design, though the coloured perspective does not do it justice. "Plan and Purpose" has the hall east and west, with a vestibule communication with the old hall, a front lobby entrance, and is lighted on both sides. The hall is 135ft. 6in. by 92ft., besides the gallery extension over entrance. The author separates his hall and library by a large area, the latter building being placed along the new street frontage. A

long corridor, entered in front, gives access to the library and reading-rooms, above which is the school department, traversed by a similarly long corridor, which is not desirable. There is a mechanical look about the Gothic, which, though not glaringly faulty, scarcely harmonises with the old structure. The high-shouldered roof and parapets of the hall front have a disjointed effect. We find the author follows the rather objectionable plan of placing his kitchen offices below hall, and the museum below library. "Triangle," with dot (Mr. Webb) has a striking coloured perspective in a rather glaring yellow colour, exhibiting a bold freely-treated Gothic front, with a well-designed entrance tower, which would disagree with that of the present building, if not overpower it. The hall is placed east and west, and the library and reading-room below the hall, while the school department faces in the new street. We may point to the questionable position of the reading-room under the hall, and the very narrow staircase, which seems too small for the vestibule. The entrances are certainly not well considered. Of the school of art we may say it is unpleasantly suggestive of a photographer's studio perched on the top of a house. Another Gothic artistically-conceived design shown in a cleverly-drawn brown-line perspective, but far too domestic in character, is "Utility." The treatment is half timbered, and well grouped; but there would be an almost ridiculous mixture in such an addition to the present brick and monumental Gothic of Mr. Waterhouse—it would almost savour of the sublime and the ridiculous. We find the hall placed behind, north and south, with a vestibule communication with the old apartment, the school placed below the hall on the ground floor—a fatal objection—and the library and museum as a front building, the reading-rooms being on the first floor—in contradiction to the instructions—and the museum and cookery apartments in front. There is a confused disposition of the front block. "As You Like It" has a very wide hall, north and south, placed at the back, and divided into nave and aisles, lighted from clerestory and one aisle; but the entrances are too small and few. It is cut off by a corridor from a front library. The museum is in the basement, and the author has not studied with enough care the requirements. The elevation is far better than the plan—it shows some spirited Gothic detail and refinement in parts—but the buildings are too dislocated. "Progress" has some good features, shown in a carefully-prepared set of drawings. The new hall is 108ft. × 53ft., and is calculated to give accommodation for 1,500 persons seated in the area and balcony, with an orchestra for 300 performers. Access is provided by one entrance 12ft. wide from Blagrove-street, the old one being used for the balcony; but egress is deficient. Provision has been made for the service of dinners to the halls, and the retiring-rooms are tolerably compact and well planned. The library and reading-rooms are placed in front, approached from the main entrance, and also from a separate entrance; and the librarian's room is well placed for circum-spection, and near the lending library. Above the library is the museum, with top light. The schools are on the north side, and are ample; the cookery school is well placed under the hall. Architecturally the author has endeavoured, and with some success, to harmonise his buildings with the present one, and the grouping and subordination have not been lost sight of. The library entrance forms an octagon turret, and the hall is emphasised in front. The author estimates the different portions at 5d., 6½d., and 8½d. per foot cube, or a total cost of £24,794.

Another design with the same motto we note with some good points, but with only one exit and one entrance from an old corridor. "Hope" is the motto of a plan showing the hall, the entire depth of the site, with its end towards Blagrove-street, dimensions 98ft. by 50ft., with a side corridor entrance and hall connection with the present building. We object to the arrangement of making the library entrance opposite to that of the hall in the same corridor. The science department is placed behind and the art school in front; this, too, is objectionable. The elevation is tawdry. "The Kennet" is the motto of a Gothic design displaying taste in the elevation, and a departure from the usual position of the orchestra. Here the hall is central (105ft. by 50ft.), its axis being north and south, and the orchestra, a large semi-circular recess, occupies the side of hall, though the motive for this is not apparent. There is an intervening vestibule between the old and new halls, and the entrance is a flight of steps leading from the front street. The library is cut up in front, and the museum at the back poor, the school being placed on the north side. "Fleur-de-lis" has the east and west arrangement of hall, an end narrow stair entrance to gallery, but inadequate access to ground floor, except the old corridor connection. The library and school on the north side are reached from the same end vestibule and corridor—a very insufficient means of communication. Looking at the elevation we find much to commend. The elevation harmonises with the existing building, but is very heavily coloured, and we do not like the mansard and turret over the loggia, which rise over the openings of a balcony and appear to crush it. The hall interior has nothing to recommend it. "Apt" is another east and west arrangement of hall, which is large, and surrounded by corridors and gallery. The main entrance is in Blagrove-street, in front of the hall, leading on the left to the library by a passage or vestibule. Crossing this vestibule there is a descent of several steps to the hall, which is objectionable, the floor being lower than the street level. Considerable study is shown in the plans, and some good points occur in the Gothic elevation, which is of a later and more florid type than the old town hall, and too domestic to please us. There are some others we note, though of less merit. "Cardomine" is a showy heavily-tinted perspective in a late Gothic dress, with a north and south hall enclosed by a wall in front and in a line with the present hall; the school of art and museum are behind, and the library and reading-rooms below the hall. The interior of the latter is station-like, and the Gothic is very debased and quite out of keeping with the present building. "Utility" is the motto of an elaborate set of drawings (Gothic) bound in a large folio. There is nothing in the design to attract attention except that there is only one entrance vestibule, which serves as a common entrance to the new hall and a connection with the old one, that the frontage is made to curve with the street, and that a great angle tower of preposterous dimensions rises over the entrance. "Acoustics" has a very red-looking perspective (Gothic). All we notice in it is that the buttresses and pinnales overhang the front in a rather questionable manner. "Fors" exhibits thought and clever handling, but the hall, 55ft. by 52ft. is small, and the common entrance of hall and library objectionable. There are two corridors on the north and west sides of hall; the drawing room and reference library are mixed up together in front undesirably, and there is a general want of separation in the departments. We may just mention "Utility," a very extravagant Gothic design, with a hall 112ft. by 65ft. placed E. and W.,

that overpowers everything else; inadequate in its entrances in its narrow passage to reading rooms and cramped stairs from the new street to the Art Department. It is a pity to see such a fruitless amount of labour expended in the drawings, which are clever but excessively confusing in minutiae, and what we may term "fizzy." "Data" is confused; "Civis Muro" lacks study of conditions; "Toujours Fidèle" is extravagant in its Gothic; "Y. Z." is disjointed in plan; "Talfourd" is a fiery red-looking elevation in which all is sacrificed to the hall, badly provided with entrances; "Economy" has a large hall in alignment with the present hall and the library and museum below, while "Experience" exhibited in a tawdry-tinted elevation, has a hall with a colonnade entrance to the new street, and a corridor entrance in front intersecting with the old corridor prolonged.

Last week our remarks were chiefly descriptive of the three premiated designs. We here make a few critical observations upon them. Taking "Plan" first, in our opinion the best of the three in many points, and certainly the most economical, we find the hall placed endwise at right angles to the present hall. This position is best in some respects—it allows a good entrance to be made in the principal facade; it does not, as the author points out, cut off means of access from Blagrove-street to back portion; and it forms a more pleasing combination with the present hall. On the other hand, there may be the objection that the end being so near the street should be pronounced instead of masked by the entrance. The hall is, as we said, only 81ft. x 52ft., about the length of the old. This is small, considering that the main purpose of the council was to erect a hall of much greater dimensions than the old one. This is no doubt the weak point in "Plan," though it is one that might be rectified by bringing out the front or by widening. Ingress and egress from the town hall has been managed by making the end of the new hall range with the flank of the old one. Among the defects we notice that the side corridor entrance is narrow, being only 6ft., and the main central entrance would have been better a little wider; the library and museum entrance also looks contracted, and the staircase to the museum is commonplace. The narrow aisles and iron arcades in the hall are certainly below par, and useless as far as we can judge. A good area for light and air is provided over the roof of the library, which is kept low, giving side lights to the rooms above; and an open area is left between the library and the school at the back. The borrowing library and reading-room are well placed, and the painting-room is at the top, well lighted on the New-street side. We find the orchestra is well planned for sound, being apsidal, and a passage under the orchestra communicates with both sides. The merits of "Be Strong" seem to centre in its larger hall, 110ft. x 63ft., placed at the back in a north and south direction, its architectural treatment and flat-curved ceiling, with coves, and its octagon vestibule connection with the present hall. Two galleries are provided, a balcony surrounding the hall on three sides, and following the semicircular end of hall, and a gallery above this end. The retiring and refreshment rooms, stairs, and orchestra arrangements are well studied. Again, the reading-room and borrowing-counter are conveniently placed in front, with separate ingress and a good vestibule—the counter is in front of entrance, and the hall and library and museum departments are kept distinct. On the other hand, we do not like the steps down from present to new hall, which is 7ft. 6in. lower than the former, and we consider that at any sacri-

fice the halls should be on the same level, especially if they are to be used *en suite*. A Blagrove-street entrance is provided, but we first have to ascend seven steps to the octagon vestibule, and then go down six steps to get into the hall. This is very objectionable. On the whole, however, the plan is clever, and reflects credit on its authors. The chief elevation, however, does not harmonise in spirit with Mr. Waterhouse's Gothic, and we certainly think the hall front in the new street inexpressive, and poor in treatment. The best feature is the octagon stair turret to the science school. "Grosvenor" adopts the same direction of hall, but places it centrally with a vestibule between it and the present. Instead of being level with the latter, it is six steps higher, and there are about twenty steps to mount before we reach it from Blagrove-street—an objection it shares equally with the last-named plan. The corridors, roofed low, on each side of the hall, practically isolate it from the other buildings; there are two entrances, one a main one from Blagrove-street, and the other a corridor entrance from the new street, which, however, is the chief access to the schools, which extend along the east side. The gallery runs round three sides, and the orchestra is at north end, with artistes' rooms compactly arranged. As we have said, the reading-rooms, &c., are on both sides of front vestibule entrance, the portion near the hall is kept low, and roofed with top light—the space being divided by piers into bays. The museum is well lighted over the front part, an area for light being got between it and the hall, the latter is thus lighted by eight side windows on each side with fan-lights over. The hall is Classically treated with a flat-panelled ceiling to harmonise with the old. We question the value of the area on the east side. There are desirable points in each of these designs, and the crucial question is the hall and its position. It is obvious the three departments should be practically kept distinct, though the library and museum admit of being placed together in the same block. There can be no doubt the library should be located in front, and that the main entrance to hall should, if practicable, be in Blagrove-street, the schools being well kept by themselves, either on the east or the new-street side. Economy, however, may point to a combination of the library, museum, and school departments. The object to be realised is a combination, however, that shall not affect the distinct performance of the work of either, separate entrances, convenience of access to the reading-rooms and library, and ample ingress and egress to the hall.

We wish, in conclusion, to recall the attention of the Reading Corporation, if their minds are not wholly made up, to the points that appear to us to demand consideration. From a further examination of the three plans which have been premiated in the very unreasonable and indiscriminate manner we pointed out last week, under the gratuitous assumption that none have complied with the conditions—although, from what we have since heard, eight designs were at first selected by the committee for the referee's opinion—we think the only just course to the other competitors would be to make a further selection from the other designs before a final plan is decided upon, placing them in the hands of a competent judge who has had experience in municipal structures—say, Mr. Waterhouse—for that purpose. The council have asserted that none comply. They are therefore bound to let the competitors, or a selection of them, have a further trial before the building is carried out. Only this course, we believe, will satisfy the competitors, who have been told that not one design has complied with the condi-

tions, although three have been awarded an honorarium.

THE DOORWAY AND ITS TREATMENT IN ANCIENT AND MODERN DWELLINGS.

THE revivalists of the domestic architecture of the Stuarts among a number of questionable features are introducing one that is pre-eminently social and English—namely, the wide-hooded doorway. Whatever our habits as dwellers in cities may become, it is quite certain the old English doorway—that external symbol of hospitality—will long remain a feature of interest. A strong case was, however, made out the other day for its almost entire abolition from crowded cities and central sites. An expounder of the Parisian system of dwellings in flats showed that the reduction of private entrances, in the main frontages at least, would be a great saving, and that a much larger frontage for shops would be secured. The British tradesman will welcome any plan that will add to his often narrow frontage and give him a greater display of plate glass. If eight or more private entrances could be reduced to one common doorway in a central passage or court, giving access to the residences above the shops, considerable extension of shop frontage would be the result. The idea, if not artistic or English in sentiment, has at any rate a commercial advantage, and we may regard it as one step towards utilising ground. We can group our chimney stacks together; why cannot we group our doorways and staircases? But there is another set of architectural antiquarians who are in face of this movement to economise space, proposing the old doorway, with its wide panelled door architraves and massive hood supported on carved trusses. They have a great national sentiment in their favour, and it is difficult at present to see which set of revivalists will gain public approval. The two classes are certainly irreconcilably opposed. One is for the French block, with all its commercial and communal advantages, while the other desires to reinstate the English plan of isolation in all its antiquated completeness. At any rate, in the mean time, there is room for the admirers of both modes of living to express their views. One thing is pretty certain, and it is this—that the Parisian plan, though admirable for crowded localities where blocks of three or four story buildings may be bought cheaply and pulled down, to be reinstated by the *maison-à-loyer* of from five to seven or eight floors, will not be remunerative in residential neighbourhoods, or not at least till English prejudices are vastly more shaken than they are at present. Another thing is equally evident—it is, that the Queen Anne style can never realise the expectations its votaries have set out with, if the French system takes root. The Stuart revivalists will, therefore, act wisely by expunging from their favourite style those features that cannot stand the crucial test of utility; they must set their houses in order—in our cities, at least—for practical people will naturally inquire what advantages each system offers. We have for too long a time been playing with Italian palaces and Gothic castles and cloisters, and we must, sooner or later, be called upon to draw decided conclusions between this or that style of habitation, and to cast up the features that command the approval of common sense and economical consideration. Facility of communication between apartments, economy of service, lighting, and heating, will have to be included in this reckoning, and the sooner the architect sets about the solution of this problem the better it will be for him. Somehow or other it is generally left to an ingenious amateur, or to some

speculative builder to invent a new system of building, and the architect, after decrying the plan, has at last to adopt it. Concrete, for example, was pooh-poohed by nearly every architect some years ago; now there are several that are using it, and who have produced pleasing buildings with it. We might even name one follower of Queen Anne who has largely adopted concrete.

But there is much to be said by both sides on the subject of the entrance. If the Parisian idea prevails, the doorway, as a special and significant feature, will be lost; while, on the contrary, should the isolation plan of the seventeenth century come into favour, the doorway will resume its prominence as an essential part of the system. Every Englishman likes his own doorway or undivided portal. To enter a wide common passage or lobby before you reach your door is not John Bull's notion of privacy, though it is true the tenants of our rows have often a very flimsy wall between them when they reach their doorsteps. In the days of the Stuarts and early Georges, a spacious portal or lobby entrance was the fashion; it certainly added dignity to the front, and it stamped the house with an appearance of unselfish hospitality. There is, undoubtedly, something remarkably repellent in a doorless house-front, it has a prison-like exclusiveness; it lacks politeness to the passer by. We look at such entrances as those we see in drawings of old Cleveland, Burlington, and Clarendon Houses with their flat or heavily-carved broken pediments resting on rich consoles, with extreme interest; the whole art of the architect, carver, or plasterer seems to centre in these features; in truth, they fairly express the wealth and hospitality of the owner, and the skill of the artists engaged, who apparently lavished their best art upon them. In many of the old houses about town, in country towns, and cathedral cities, we see charming models of the flat or semi-circular hood or pediment, the tympanum often hollowed out in a niche or shell-like form. The carved ornament, moulding, and plaster enrichments of these hoods are frequently choice bits, worthy to be reproduced in the Queen Anne sketch-book. The consoles are sometimes profusely enriched, and the cove adorned with some allegorical or classical subjects, in which we trace the genius of a Mantegna. The door itself is massive, and through a century of paint we discern the genuine mouldings and carved work. The jambs are pilastered, have well designed caps and bases, and are often panelled on the face, and enriched with carving. Choked by paint they are still works of Old English art, and recall the festivities of the period when sideboards and tables were all designed in Tudor or Jacobean taste, and were laden with ponderous barons of beef. The hall, too, was a fitting sequel to the wide doorway. Panelled in oak, frequently to the ceiling, round which a massive block or enriched cornice was run, it was spacious, well-lit, and comfortable-looking, with its settles and its sideboard; while its richly carved and hooded fireplace and dog-grate invited the wayfarer, and has become by consent the picture of English cheer, and the background of all that is homely and hospitable.

The question that arises, then, is whether the English entrance, as a prominent architectural feature, will revive the endeavour to bring in a new system, or whether it will sink in importance. It is now known that in nature a disused organ dwindles in size till it becomes merely an adjunctive feature. Will the English doorway and hall suffer in like manner—still more than they have done—from the spacious proportions they assumed in the Tudor days when the hall was the main feature? To this question we may reply that the demands of space in our great towns, and the

introduction of more economical arrangements, will quickly determine whether we are to retain our separate entrances, or whether they will be combined—and this question of entrance appears to determine the principle of building: it seems to be the crucial point between English and French systems of planning, and the architectural conception of our national style largely depends upon the issue.

THE BRITISH MUSEUM LIBRARY, AND THE LATE CONFERENCE OF LIBRARIANS.

NOT quite so much attention was given as we cannot but think there ought to have been to the important conference of librarians so recently held on the subject of the British Museum and other libraries. To us the Museum library is, of course, the most important; and it would, indeed, be a puzzle to know what we should do without it. It would be quite impossible to exaggerate its importance, for in the labours of "research" it would be impossible to find anywhere a substitute for it. It is a world of thoughts in itself. Books in these days do a work unknown in past times, and it would be difficult to imagine what the change would or could be if we were without them, or could not readily get at them. There is no end of them hardly, and it may surprise some readers to be told that there are in the Museum library no less a number than three millions of books, and two thousand volumes of catalogues of them. Miles of shelves and whole warehouses are required for so vast a mass of human thought, and it is no wonder that those who have care of it, however able they may be, are at times puzzled to know what best to do. One is simply appalled at it; but yet, great as the task is, it has somehow or other to be done, and the conference did a somewhat to help.

No one, we are sure, has read the "address" of the principal librarian—Mr. Winter Jones—who has not felt intense interest in it, and wonder, too, at the immense number of items compressed in so short a space into it. Indeed, a mere catalogue of the leading headings of the contents of so vast a place would in itself afford matter for a lecture or address. But, with all this, we felt just a little disappointment at the way in which the principal librarian treated his matter—or rather at the want of utilitarian detail, and suggestions of what he would do if opportunity and means offered themselves. Consider for a moment what it is, and needs must be, to have no less a number than three millions of books to arrange and put into some order, and thus to be able to find volume by volume, and to point to, as divided into sections of knowledge, all that is known at present to humanity anywhere and everywhere. A wonderful comprehensiveness of mind and grasp of human thought must be needed, and must be ever present here. There is science, and art, and general literature—as the wide term is, including the most rare as well as the commonest things of human existence—to be dealt with, and to be coguisant of. And these have all to be thought of, and had constantly in mind. Yet no man can possibly know all things—he can but glance at them.

Now, the first thing that struck us in the able and industrious address of the principal librarian was a wish that he had been a reader in his library as well as its keeper. If he had been one he never would have declared, as he did, to the surprise of not a few, that it was impossible to print the catalogue of the vast library under his charge. We hardly can tell what he could possibly mean by such a statement. In the first place if any one will consult the

old catalogue, as it is termed, he will see that at least a beginning has, as it is, been made, and that there is a printed catalogue—*i.e.*, a catalogue in type. It is interesting, in passing, to note here the existence still of a yet older compilation, on dust-coloured paper, of an all but primeval catalogue of the museum library; and it certainly does require a very powerful imaginative faculty to call up those who, indeed, and in very fact, did compile and consult these venerable volumes. We sometimes more than half believe that these forms do, indeed, contain matter which the newer and fuller volumes do not contain and cannot. There may possibly be others who think so too. We certainly never actually counted the volumes, taken all together, of the British Museum catalogue; but there are, as we have said, not less than two thousand volumes (folio) of them, so that some idea may be formed of the task before the guardian of such a list as is indicated by the mere numbers.

We do not dare to dwell too long on the books and book catalogues, even of the British Museum; but would suggest to the authorities, if nothing better can be done, to in future print in type the slips now written and lithographed, and then pasted on the blank leaves of the catalogue volumes. This alone would be an immense improvement, and for clearness and towards readiness of reference would be a boon. As some readers will remember, a "class" catalogue has been more than once talked of, but very few can hope for it, or we should have been inclined to ask, by way of trial and specimen, for a catalogue of some one section of the library of the Museum—Science or Art, or whatever else. Such might, indeed, guide to a more general catalogue, and might make the work of it the easier. A map and a music catalogue there now is, quite separate from the general catalogue, and there is a catalogue of the Royal Library, the foundation of which is printed with MS. additions and corrections. Truly it is a gigantic work before all who shall ever engage in it, and the principal librarian may well be excused when he declares it to be impossible, and shrinks from the mere contemplation of so huge a task. But is not all difficult and exceptional work like this and such as this? We fancy we know those who would begin even this.

There are many other things which press themselves on our notice here, and we pass them by with no small reluctance; but there is one which we cannot but think all who use this vast collection would consider a boon if it were thought over and eventually carried out. It is this. The what may be termed conveniently the "Reference" library, on the ground floor of the reading-room, contains, as it should do, a huge store of general encyclopædias and encyclopædic knowledge and general books and dictionaries, and it is certain that nothing can be more handy and useful than such; but there is a something more we would have, and it is a select and well-considered selection of those primitive authorities from which encyclopædias themselves are compiled. These should be quite as ready of access as the dictionaries are. A cyclopædia is good enough in its way, and most useful and handy at times, but to our minds there is nothing like the original source from which all these useful books are compiled. We would specially, without going into details, cite by way of example all the original travels and voyages giving descriptions of newly-discovered lands and peoples: indeed, generally, what may be termed without exaggeration the foundations and beginnings of human knowledge. Some of these are here, it is true, but not all, and they are without due arrangement. We would include all first-histories. Would it

not be a good plan—we merely suggest it—to appropriate the first gallery of the reading-room to this special purpose, with a way to it thus to be accessible to the general readers? We would but touch on the subject of the library itself as a room and as a piece of architecture, and on the arrangement of its desks and seats, and the placing of the books, or rather book-shelves, and the position in the room of the catalogue. Many pages might be needed to go into all these and other "details," but that there is a wide opening for improvement even here no one who really makes use of the library can or will deny. This reading-room, as most readers of this journal know, is circular on plan and dome-covered, and the general idea of it was taken from the world-famous Roman Pantheon. We have an old "section" of this now before us, and, looking at the "ornamentation" of its vaulted roof and at the mode of lighting, one cannot but wonder at what is sometimes meant by "improvement" and "progress." More than 2,000 years have passed since this Roman building was designed and put together, and the "details" of it thought out, and no one who has studied it will doubt of the artistic skill of the workman and artist who designed it. Why should this vaulted room in the British Museum, in the centre of the mightiest city in the world—and the wealthiest—come short of the Roman vaulted room? The panelled vault of the Roman building is of stone, while that of our own is of "iron ribs" only and "plating." It may seem a small matter this to the industrious book-worms here, but it must have its mental influence even if it be unnoticed. We name it here with the books because books, after all, are not the sole teachers.

There is, again, among so much else, one item in this reading-room as contrasted with its Roman prototype, that involves considerations of no small importance, and, in the present day of much that is missed and lost sight of, but which in ancient days were never neglected. We refer to the method of lighting it. The Roman building, as is so well known, is lighted simply enough—*viz.*, by a large circular hole in its domed roof. This circular opening, without glass covering or skylight of any kind, is about, in diameter, one-fifth of that of the diameter of the floor of the building. Nothing can possibly surpass the simple and magnificent effect of so simple a mode of lighting, the blue sky of Italy always visible through it. Now it is quite true that this sublime simplicity has its inconveniences, for the rain and the sunlight came through this opening inconveniently enough some times, so that it would not do in the British Museum Library. But may not the advantage of the occasional sight of the blue sky and sunlight be got without their inconveniences? We think so? The museum skylight, as it now is, is of dull ground glass, and over this a tarpaulin of still duller canvas has been spread, so that this room is more than usually gloomy and depressing. Might not, then, the experiment be tried of quite clear plate glass, in one sheet it might be, and then over this a light canvas tent some feet above it, to keep out the direct sunlight? Thus would the blue of the sky and its changes be visible between the edge of the ring and the canvas roof and the pure light of day let in. Anything but the dull gloom as it now is. There is work for another conference yet. C. B. A.

On Wednesday week a new public hall and assembly-room was formally opened at Whitby. The hall has been built by Mr. James Gladstone, from the plans of Mr. Falkingbridge, architect.

A statue of the late Dr. Graves, which has been erected in the Hall of the King and Queen's College of Physicians, Dublin, was unveiled last week. Mr. Albert Bruce Joy was the sculptor.

BUILDING NEWS DESIGNING CLUB

REVIEW OF DESIGNS.—NO. XXI.

A Cemetery Chapel.

WE have a large number of designs for this subject, and a few have grasped the idea with success. "Début" we place first. The plan is cruciform, about 40ft. long, with circular apse at end. We do not like the awkward way in which the seats terminate at the chord of apse. No altar or desk is shown. One transept contains an organ recess and vestry; the opposite one the porch, and a small waiting room which is too small. In external design "Début's" idea conveys admirably the expression of a mortuary; there is an almost death-like severity of line and feature in the Classic style he has chosen, and the calm horizontal repose of the lines and roof are thoroughly characteristic, though to some minds the treatment is not sufficiently suggestive of a Christian's burial. One end is treated with a series of five lights, relieved by Ionic pilasters between them. The side and apsidal end have circular windows between plain broad-faced pilasters, which spring from a set-off about 6ft. high, below which the walls are perfectly plain. There is a simple bell gable over the porch, the transepts being hiped. The roof is a plain barrel vault. "B" in circle comes next in the conception of a cemetery chapel. It is an octagon in plan, 25ft. diameter, with two opposite groups of 18 sittings. There is a porch at one end, open, with side arcades, and a chancel at the opposite end, with altar raised on two steps, and railed off, and a vestry at side. No waiting-room. Externally the author has selected a pleasing model. A plain bell niche or gable rises between the porch and octagon; the roof is pyramidal and high pitched, and surmounted by a plain metal cross at apex. We do not like the porch, which is too small to be of service, and the detail is roughly drawn. "Loisir" is a plain chapel, with waiting-room in the form of an apse at one end, an open carriage porch, and a passage entrance, with a vestry at the other end. There can be little doubt in our minds of the source of the author's inspiration. We published a cemetery chapel a few weeks ago that was almost an exact counterpart—open porch, bell gable, and all—though the copy cannot be regarded as an improvement upon the model. "Tom Pinch" is a small rectangular chapel, 50ft. by 18ft., with an altar raised at one end, and an ante-chapel at the other—a vestry, dead-house, lavatory, &c., being placed on one side, forming an aisle-like projection. The seats are not well planned. An open porch is placed at the ante-chapel end. There is a well-designed bell gable for two bells, but the design is redundant in detail, and scarcely pronounced enough. Estimate at 53d. amounts to £1,581 5s., the materials provided being concrete for walls, and Ketton stone dressings, with brown tile roof. "Prêt" has a plan about 50ft. x 20ft., with a porch for hearses and foot passengers (open) at one end, and waiting-room and vestry projecting from the side at the angles. In design the side elevation is passable, but the German traceried intersecting cross-bar window in the gable front is out of character and wanting in the quality of repose. A small desk is provided at one end on a raised platform, the coffin being placed at the other end under the window; seats for thirty-six mourners are provided on each side. "Discere Volo" exhibits a chapel with side seats and centre bier 38ft. 6in. x 20ft., a raised altar at east end, and an organ recess at the west, with side stairs to it, and a side open arcaded cloister on one side, straight with and beyond which is a vestry and stove. The plan is compact in its arrangements, and the external design is suitable, a double bell gable flanking the west end, and an arched porch being shown in front of cloister entrance. "Sirius" has a plain chapel, the seats being at one end, and the bier placed in the centre with a reading desk. A waiting-room, porch, and vestry form a side lean-to. The design has too near a likeness to a small chapel of the usual type. The side elevation is better. Estimate at 9d. per foot cube = £1,224. "Excelsior" shows a mortuary chamber at the side of chapel, which has a porch and a vestry

at the other side. No bier is indicated, and the design bears too strong a resemblance to a church in the Classical style. The style adopted, Greek, is suitable but severe, and the tower and cupola are unnecessary. "Student" is a neat drawing of a chapel with a small apse of oven-like proportions, which might have been omitted, a vestry, centre mortuary, transept, and porch being on one side, with a second porch on the other side of chapel. A screen separates the mortuary from the chapel, which latter is arranged solely for seats in two groups facing the apse and reading desk. The style is too chapel-like, and the turret and detail mimic rather a Nonconformist than a cemetery chapel and mortuary. "Cave Canem" has a small chapel, 32ft. x 22ft., with side seats and a centre bier, a small recess, with altar and a vestry, an open porch being at the west end. The details were plain, but they are hardly characteristic of a mortuary chapel, and the provisions for one are not perfect. In a second order of merit we place a very long plan with hearse porch, ante-room, chapel, vestry, inquest-room, and dead-house, all in a row, priced out at 7d. = £1,366. "Nil Desperandum" (unfinished), "Trefoil" in circle (exceedingly like a church), "Ambition," "A. L. B.," "Medicus" (a good plan, simple and expressive, but detail poorly drawn, which would otherwise have claimed a higher place), "Cleo" (a right-angle arrangement, one arm being the Church, and the other the Dissenting chapel, with attendants' and ministers' rooms in angle), "Jack," "More Firmior," "R. J." (a church in miniature), "Naivété" (try again).

Dining-room Decoration.

We have received two or three creditable designs for this. "Début" sends the most artistic sketch; the wall is panelled, and the doorway is framed with panels round it as architraves. The door is in nine panels, with the head and real enrichment in the mouldings, and the lock rail is sunk with a carved honeysuckle pattern, which is also carried round the wall paneling. The buffet is simple but effective, has a sideboard top, a locker above, and angle shelves for bric-à-brac, and the top has also shelves for ornaments. Below the sideboard is another locker, and the whole is raised from the floor by truss-like legs. A Classical feeling prevails. "Fleur-de-lis" shows a pleasing design in Jacobean taste. The wall has a dado of stamped leather, of a rich lake colour, the wall surface is distempered of a light cinnamon, with lines of darker tint dividing it into squares, the frieze is panelled with foliage of a sage green ground with leaves of subdued colours. The woodwork is proposed to be in oil of dark tones, the upper panels of door having three figure subjects and twofoliac panels above in rich colours. The buffet is simple, and framed with a sideboard, drawers, and cupboards beneath a centre mirror, and side lockers and under recesses for china. Brass sconces flank the buffet, and blue Nankin vases and brass dishes make up a pleasing grouping. "Tom Pinch" is a clever study. There is a high dado with panels of Japanese design, a wall surface of rouge royal, and a panel frieze also Japanese in conception. The door is in two large and two small frieze panels, the latter decorated with flowers. In the design of buffet there is good taste exhibited in the general outline and forms. It is canted at the angles with angle shelves and centre locker, over which is the top, above which are shelves for glass and china. The detail is in good keeping, and the drawing well executed. "J'Espère" we place next. The author shows a panelled wooden dado, a recess with buffet, and traceried light above, and a six-panelled door. The wall is treated with natural foliage in panels, and its surface is divided into three horizontal divisions by bands. A kind of Flemish Gothic, for which the author has a penchant, is adopted, and the drawing is well executed. "Bee," in circle, is a clever Japanese treatment; the woodwork of door and buffet is very plain, and consists chiefly of small and sunk mouldings. There are two cupboards, a foot space, three drawers above, and a top shelf for bric-à-brac. It is intended to be of polished oak, and the door and skirting of room of dark bronze. The wall consists of stems in parallel lines and leafage disposed as branches, breaking irregularly as

panels with medallions having birds on the wing in them. "Boz" shows a too fanciful door with ornamental lower panels, and a plain upper one, and a buffet in questionable style. The wall is supposed to be sage green, and the frieze to be panelled in blue on a buff ground. There is a want of rhythm and harmony in the composition. "Johnny Morgan" is another design wanting in character, and the lower door panels are too small and out of proportion.

Foliated Hinges.

"Début's" sketch for wrought-iron door-hinges is by far the best. The idea of ironwork has been kept in view, and the style partakes of a free Gothic character. "Silkworm's" design we place next. It lacks freedom; the crossed branches look stiff, and the foliations are too crowded and meaningless at the thick part of hinge. "Naivété" has taken a great deal of pains. His hinge is 3ft. 6in. in length. The foliations are a little too flat in the curves one way, and the diminution of the foliated parts as they extend has not been kept in view. The details are shown.

THE CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THE first meeting of the session took place on Thursday week, at 7, Westminster-chambers. A vote of thanks having been accorded to the retiring President, Mr. R. M. Bancroft, the President, Mr. H. Valpy, read the opening address. He expressed the hope that Mr. Dixon, who read a paper last session, before this society, on the "Transport of Cleopatra's Needle," might soon see his labours crowned with success. Allusion was made to the ventilation of sewers, and a plan was advocated for exhausting the sewer gases, and for burning them at a station, out of London, instead of allowing them to force their way into the streets and houses. The designs for a new bridge in continuation of Northumberland-avenue were spoken of, and the advantages to traffic in the saving of half a mile of distance, and in the unusually easy inclines to the approaches, were set forth. A short examination of the value of electric lighting was entered into; and whilst its use was highly recommended as a concentrated light for light-houses, for the heads of coal and other mines, for the loading and unloading of steam vessels at night, and in large factories where motive power was at hand, it was shown that now, as a quarter of a century back, when the light was used at the works of Westminster bridge, its subdivision and distribution, as in the case of gas, was utterly impracticable. Wherever it was used there must be motive power, which was a matter of considerable outlay and annual cost; so much so, that for places using an electric light of about 1,000 candles, the cost would be from three to five times that of gas, and smaller lights would cost still more in proportion.

AMENDMENTS OF THE BUILDING ACTS.—III.

(Continued from p. 585.)

SECTION 8 of the Metropolis Management Amendment Bill is an interpretation clause, and provides that "the term 'site of a house, building, or other erection' shall mean the whole space to be occupied by such house, building, or other erection between the level of the bottom of the foundations and the level of the base of the walls." This part of the bill is intended to give the Board of Works power to make and enforce bye-laws to secure good foundations, so as to remedy the evils of building on damp sites and on "made ground." And it is important that the definitions in the bill, which will largely govern the operation of the bye-laws, should be thoroughly comprehensive, at the same time precise. In this respect the above definition is unsatisfactory, and if not amended will undoubtedly fail to answer its purpose. Indeed, it is hardly too much to say that the clause is not intelligible. Everything depends upon the meaning of "foundations," and there is no looser term in the whole building vocabulary. If "foundations" were defined first, the meaning of "site"

could be made clear. Definition is difficult, almost to a proverb, but as criticism should sometimes be constructive as well as destructive, we venture to suggest a definition of "foundations" for the purposes of this bill, which can doubtless be improved, but will serve to indicate what is desirable:—"The term 'foundations' shall mean the artificial formation, bed, or substructure upon which the footings of the walls shall rest or be supported." It is provided by this section that in this part of the bill terms to which meanings are assigned by the Metropolitan Building Act, 1855, shall have the same meanings respectively. And the Building Act defines "the base of the wall" to mean the course immediately above the footings. The meanings of these terms "foundations" and "base of the wall" having been determined, a definition of "site" could be framed somewhat as follows:—"The term 'site' shall mean the cubical space included by the horizontal superficies which the building shall occupy or cover, and by the vertical superficies extending from the level of the bottom of the foundations to the level of the base of the walls."

Section 9 is not cast in the most elegant mould, and in some parts is not English. It gives the Board of Works power to make bye-laws with respect to the following matters:—

(1) The foundations of houses, buildings, and other erections, and the sites of houses, buildings, and other erections to be constructed [erected] after the passing of this Act, and the mode in [which], and the materials with which such foundations and sites shall be made, formed, excavated, filled up, prepared, and completed for securing [insuring] stability, the prevention of fires, and for purposes [the preservation] of health.

(2) The description [nature] and quality of the substances [materials] of which walls are authorised to be constructed by section 12 of the Metropolitan Building Act, 1855.

(3) The powers and duties of district surveyors in relation to such foundations and sites and substances [materials], and for the guidance and control of [modes in which, and the means by which] such district surveyors in the [shall] exercise and discharge of such powers, duties respectively, and the fees to be paid to such district surveyors in respect of any duties imposed upon them by any such bye-laws or by this Act.

Section 10 provides that if the site or foundations of any building erected after the passing of the Act shall not be in accordance with the bye-laws made under the Act, the owner, occupier, or builder shall be liable to a penalty of from ten to forty shillings a day until the building is taken down; and the board may demolish the building and sell the materials.

Section 11 gives power to appeal within 7 days against any notice of a district surveyor.

All such appeals shall stand referred to the Building Act committee appointed by the board for hearing appeals, who may [shall] hear and determine the same, and may order the district surveyor, or any other surveyor, to inspect any such foundations, site, house [or], building, or other erection, and may on such evidence as they shall think satisfactory either confirm the notice served by the district surveyor, or may confirm the same with such modifications as they shall think proper, or refuse to confirm the same, and the decision of the committee with respect to the requirements contained in any such notice, and the justice of the same shall be final and conclusive, and binding upon all parties.

The working of this regulation will be sufficiently humiliating to the district surveyor without that curious clause empowering the committee to pronounce on the justice of the surveyor's notice. There seems also to be a want of some safeguard against the abuse of the power to appeal. It might be expedient to provide that, in cases where the surveyor's notice is confirmed, the appellants should pay at least the costs of the surveyor, and of any witnesses whom he might call.

The remaining clauses are not of any general interest.

On the whole the bill must be welcomed as likely to be a valuable addition to the Metropolitan building regulations. The fault in-

herent in it is that it will be another instance of piecemeal legislation. Nothing of the kind can be quite satisfactory until a Metropolitan Building Act is passed which will gather up into itself all existing building enactments, with all needful additions and improvements, and serve as a basis on which to frame a General Building Act for the whole country. Such a work will require some time, and much wisdom. And it may, perhaps, be questioned whether the system of close hatching adopted by the Institute and the Local Government Board in the preparation of the new scheme is the method most likely to produce the desired result. The new model bye-laws recently issued by the Local Government Board furnish an example of a courageous but rather unsuccessful attempt to settle a multitude of difficult questions without the aid of the proverbial multitude of counsellors, and the severe handling which the bye-laws have received from the Liverpool architects can scarcely be said to be unmerited. The framers of the bye-laws certainly consulted the Institute, but a circular addressed to the district surveyors, with a draft of the proposed regulations, would probably have called forth such suggestions, dictated by experience, as would have effected a material improvement in the rules. It is, of course, too much to hope that such measures may be discussed in detail in the professional journals before reaching the stage of legislation. Nevertheless it must be said that such a mode of treatment is "devoutly to be wished."

W. G.

THE LAW OF EASEMENTS.*

THE easement of the owner of a dominant tenement to have his light and air unobstructed by newly-erected buildings is not lost or diminished by the circumstance that, by means of clearances effected in the neighbourhood by other parties shortly before the alterations, he has acquired more lights than the buildings could obstruct. The Prescription Act has not altered the law as to the nature and extent of light to which the owner of an ancient light is entitled. The case of *Leech v. Schweder* is one of considerable importance. The facts in this case were these: L. was the assignee of the lease of a tenement in the City of London, used as a manufactory and warehouse, "with all lights, easements, advantages, and appurtenances whatsoever thereto belonging or in anywise appertaining." The lease contained a covenant for quiet possession. S., claiming under the same leases, proceeded to erect a new building, and in doing so raised the party wall. When the bill was filed the wall had been raised about 15ft. above the original height of the party wall, and according to the plans was to be raised to the height of about 15ft. more. Lord Selborne, upon an interlocutory application, restrained S. from proceeding with the building till the hearing of the cause. At the hearing Sir George Jessel granted a perpetual injunction, following the words of the covenant; and, in delivering judgment, made the following observations:—"It is clearly established by authority that there is sufficient to justify the Court interfering if there has been a breach of the covenant. It is not for the Court, but the plaintiffs, to estimate the amount of damage that arises from the injury inflicted upon them." Upon appeal the Lords Justices held that there is no difference in the right of an owner of land to the ordinary easement of light, whether it is acquired by twenty years' user or by grant from the owner of the servient tenement, and if the grant is accompanied by a covenant for quiet enjoyment of the premises, such covenant does not enlarge the right of the covenantee so as to entitle him to an injunction to restrain an obstruction where the damage is not sufficient to enable him to maintain an action at law. But it is otherwise where the right to light claimed is not the ordinary easement, but a special right created by the covenant, in which case a court of equity will grant an injunction without regard to the amount of damage. The sole difference between the court below and the Court of Appeal—most important, no doubt, as it is—was simply this: the Master of the Rolls held that

upon the contract "he must decide whether there was any molestation or disturbance at all," and the Lords Justices held that a covenant for quiet enjoyment accompanying a grant of lights conveys no greater or other right in equity than the covenantee would have at law, and consequently unless you can show that the right you claim falls within the terms of the demise you cannot succeed on the covenant. The laws relating to ancient lights were again reviewed by the Master of the Rolls in *Aynsley v. Glover*, in which his lordship decides that, whenever an action can be maintained at law, and considerable damages can be recovered at law, then the injunction ought generally to follow in equity. His lordship added, "If I had found by the evidence that there was in this case a clear instance of very slight damage to the plaintiff—that is, some £20 or £30, or £40, but still very slight, and a very large material substantial damage to the defendant, I should be disposed to hold that that was a case in which this Court would decline to interfere by injunction, having regard to the new power conferred upon me by Lord Cairns' Act to substitute damage for it." And in the still more recent case of *Kino v. Rudkin*, the further very important rule was laid down by Mr. Justice Fry:—"That an inquiry as to damages for an alleged obstruction to light will not be directed where the plaintiff has opened a case of substantial damages and has failed to prove it. It is impossible to lay down any rule as to what would constitute sufficient damage upon which to ground an application. But the result of the authorities may be shortly stated thus:—It is not every impediment to the access of light or air which will warrant the interference of the Court by way of injunction, or even entitle the party alleging himself to be injured, to damages. In order to found a title to relief in respect of such an impediment some material or substantial injury must be established, and the onus of proving the injury rests upon the plaintiff. Some few observations as to the doctrine touching the statutory rule touching the angle of 45° may be useful. The Metropolitan Board of Works, under statutory authority, by a bye-law passed in 1856, prescribed in effect that every new street within the limits of the Metropolis must be of the width of 40ft. at the least, but if the building fronting any street be more than 40ft. high from the level of the street, then such street must be of a width equal at least to the height of every building above such level. And by the Metropolitan Local Management Act, 1862, it was provided that: "No building except a church or chapel shall be erected on the side on any new street of a less width than 50ft. which shall exceed in height the distance from the external wall or front of such building to the opposite side of such street, without the consent in writing of the Metropolitan Board of Works; nor shall the height of any building so erected be at any time subsequently increased so as to exceed such distance without such consent, and in determining the height of such building the measurement shall be taken from the level of the centre of the street immediately opposite the building up to the parapet or eaves of such building." Lord Selborne in the *City of London Brewery Company v. Tennant*, said "the fact that 45° of sky are left unobstructed after the erection of new buildings, may, under ordinary circumstances, be considered *prima facie* evidence that there is not likely to be material injury." The question again came under consideration by the present Master of the Rolls in *Hackett v. Baiss*, who said "that on being satisfied that 45° are unobstructed, he ought *prima facie* to come to that conclusion, unless there was something special in the case. Now, what is special in this case was in favour of the plaintiff. In the first place Jewry-street was rather narrower than it ought to be [only 38ft. in width]. In the next place there was some positive evidence that the present height of 46ft., a little over 45°, had interfered with the access of light not to an inconsiderable extent, and had actually caused personal inconvenience to one of the occupiers of the houses." And an injunction was granted to restrain the defendants from erecting the new building at a greater height than 46ft. from the pavement or base line. This was not, however, to prevent the defendant from

making a sloping roof of a greater height, so long as the angle of incidence of light over the roof to the centre of the ground floor windows of the plaintiff's house did not exceed 45°. The subsequent case of *Theed v. Debenham* is another illustration of what the Court will consider a special case, to which the rule as to the 45° does not apply. In this case the ancient lights of a sculptor had a north aspect in a street in the metropolis, 31ft. wide. In the course of his profession he required, not only a direct light, but what is technically termed an under or low light, and which he had hitherto enjoyed. Some of the ancient windows had been enlarged within twenty years. The defendants' old buildings on the opposite side of the street were, as to part, exactly 31ft. high, and as to the other part, a little less than that height. They intended to raise their new building so that their new parapet would be 38ft. from the pavement, and their ridge of roof about 7ft. above the new parapet, and they claimed to have a statutory right to raise their building to a height subtending an angle of 45°, measured from a base line, level with the centre of the plaintiff's light. It was proved that if the defendants raised the new building to the height proposed the plaintiff would sustain a serious diminution of light, and it was held by Vice-Chancellor Bacon that the statutory regulation as to the height of buildings in streets is not to be taken as limiting the right of prescription to ancient lights, but that such right depends upon the degree and amount of obstruction in each particular case. On the other hand, where there are no special circumstances, the statutory rule has been held to apply. There is yet another subject relating to the alteration of ancient lights which ought to be discussed at length, but it is impossible that I can do justice to the subject here, and I think, therefore, that I ought merely to refer you to the decision of the House of Lords in *Tapling v. Jones* which (overruling *Renshaw v. Bean* and *Hutchinson v. Copstake*) decided that the opening of a new window, being in itself an innocent act, could not therefore destroy existing rights in one party, or give new or revive old rights in another, and that, consequently, when there was an ancient light, and then others were added, and an obstruction was raised against the added lights, which, from their position, could not be obstructed without obstructing the ancient light, such obstruction was illegal. And to refer you also to the recent most important case of *The National Provincial Plate Glass Insurance Company v. Prudential Assurance Company*, in which, not only the question as to the alteration of ancient lights, but the considerations on which the question of injunction or damages depends were fully discussed. In that case a building containing ancient light was pulled down and replaced by another, in which the front was set back and a dormer window converted into a skylight, and it was held that the right to accept of light was not lost. That any substantial alteration in the plan of the windows destroys the right, and that the right remains where any portion of the light which would have passed over the servient tenement through the old windows passes also through the new windows.

At the last meeting of the Bethnal-green Board of Guardians eight tenders in number were received for the execution of certain structural alterations necessary to provide for the accommodation of two resident medical officers of the workhouse, the highest being by Mr. Enfield £138, and the lowest that of Mr. Beale £55 10s. One of the guardians gave notice of his intention, at an early date, to move for the appointment of a surveyor to the board, the absurdity of the tenders just submitted being, in his opinion, a strong proof of the necessity of the guardians taking such a step.

Arrangements are being made for bringing *Cleopatra's Needle* from Ferrol. Mr. Dixon has given bail in the Admiralty Court to the owners of the *Fitzmaurice*, which picked up the *Cleopatra*, to meet such salvage as shall be awarded. Captain Carter, the master of the floating needle-case, has been sent to Ferrol with a picked English crew to resume possession of his ship. He has inspected the *Cleopatra*, and found her in better trim than might have been looked for. The necessary repairs can be completed, he says, very soon, and a tug is to be sent to tow the *Cleopatra* across the Bay of Biscay.

* Conclusion of abstract of a paper read by LOCOCK WEBB, Q.C., Honorary Associate, at the Royal Institute of British Architects, December 17th, 1877. See p. 654 ante.

CHAPEL—NEW REREDOS IN ST. PAUL'S CHURCH,
NOTTINGHAM.

OUR LITHOGRAPHIC ILLUSTRATIONS.

STONYHURST CHAPEL.

The chapel, like those at Eton, King's College, Cambridge, &c., is a simple parallelogram, 90ft. x 35ft. inside measurement, designed in the Early Perpendicular style, with moulded and carved hammer-beam roof and panelled ceiling of that date. One side of the chapel has a row of confessionals, treated externally like a corridor, with flat roof and ornamental parapet, and above are six large windows filled with rich and delicate tracery. On the other side of chapel are tribunes, to which access is gained from the west wing, the building containing the professors' rooms. The east end being a blank wall, is almost entirely filled by an elaborate reredos reaching to the roof, filled with niche work and sculptured panels, representing various scenes from the passion of Our Lord, the figures of the rood crowning all, and rising into the central arch of the roof. Externally the elaborate tracery windows are well set back under deeply-moulded arches, and between each are buttresses of 12ft. projection. On the lower story the space between the buttresses is thrown in the lavatory, then the confessionals occupy this position on the level of the chapel floor, and above the chapel wall appears some ten feet further back, with its windows and buttresses, and finished at the top by a panelled and embattled parapet, broken by pinnacles that crown each of the buttresses. We give a view of the chapel which forms one side of the Priests' Quadrangle.

ST. PAUL'S CHURCH, NOTTINGHAM—NEW REREDOS.

The reredos occupies a semi-circular recess, which is part of the original structure of the church, which was built by Wilkins, the architect, in 1822, in the Grecian Doric style. The reredos is constructed of Caen stone, with pilasters of blue Greenmore stone, and the patera in the centre of the cross is veined Nottinghamshire alabaster or gypsum. The ledge above the inscription, "Do this in remembrance of me," forms a super-altar. Gold has been sparingly used to bring out the effect of the incised work, and to form a background to the central cross. The central carved panel has the grapes and corn, symbols of the bread and wine of the Communion Service; the side panels have the lily as an emblem of the purity of the faith of Christ, and the passion flower as representing the sacrifice of His death. The execution of the workmanship is first class, and is from the workshops of Mr. Charles Lowe, of Nottingham, and Mr. Birchenough, carver and sculptor, from designs prepared by Mr. S. Dutton Walker, F.S.A., of Nottingham, architect.

"BUILDING NEWS" DESIGNING CLUB.

We illustrate this week the best designs for a hall fireplace. For critical review see p. 584, published a fortnight since.

HOUSE, ELSWORTHY-ROAD, PRIMROSE HILL.

The illustration shows a detached house, lately erected by the owner, from the designs of Messrs. Batterbury and Huxley, architects, 25, Great James-street, Bedford-row, W.C. The walls are faced with plum-coloured Luton bricks, the dressings being of red bricks. The roofs are covered with brown Broseley tiles. The owner was responsible for the plan adopted, and for the omission of the plaster cove, and the substitution of flat overhanging eaves.

CARVINGS FROM ST. ALBAN'S ABBEY.

OUR double page plate to-day illustrates Mr. Neale's paper on St. Alban's Abbey, read at the last meeting of the R.I.B.A., and reported in our last and present issues. The selection of drawings we publish to-day was made from those which Mr. Neale exhibited on the occasion of his lecture, and they illustrate in a very interesting manner the four several periods of carving adopted in the ornamentation of the four great architectural styles of England, and are drawn from examples existing in the abbey of St. Alban. For further particulars we refer our readers to Mr. Neale's paper.

NORFOLK ISLAND AND CHILI PINE.

THE Norfolk Island pine, which forms a distinct species, grows to a height of 160 and even 180ft., and Governor King informs us that he measured some in Norfolk Island which were 228ft. high, and 11ft. in diameter. It was first discovered by Captain Cook on his second voyage, on that extremity of New Caledonia called Queen Charlotte's Foreland, and on a neighbouring island named by Cook Botany Island, also on another island, which received the name of the Isle of Pines, from its being almost covered with the above-mentioned tree. Captain Cook writes of it "If I except New Zealand, I at this time knew of no other island in the South Pacific, where a ship could supply herself with a mast or a yard, were she ever so much distressed for want of one. My carpenter was of opinion that these trees would make exceedingly good masts. The wood is light, close-grained, tough and light. Turpentine had exuded out of most of the trees, and the sun had inspissated it into a resin, which was found sticking to the trunks and lying about the roots. These trees shoot out their branches like all other pines—with this difference, that the branches of these are much smaller and shorter, so that the knots become nothing when the tree is wrought for use." Forster, speaking of them in his account of the above voyage, says: "Peculiar to Norfolk Island, and to the east end of New Caledonia, we found a species of coniferous tree, from the cones seeming probably to be a cypress. It grows here to a great size, and makes useful timber." Captain Hunter, in his journal of the transactions at Port Jackson and Norfolk Island, says: "The pines, which have been particularly spoken of by Captain Cook and by others, are the most conspicuous of any trees here; they grow to a prodigious size and are tall in proportion, being from 150 to 200ft. in height, and from 12 to 14ft. in circumference, some being as large as 28 and 30ft. These trees, from their immense height, have a very noble appearance, being in general, very straight, and free from branches to 40 and sometimes 60ft. above the ground; they have been thought by some fit for masts for ships of any size, and in length and diameter they certainly are." Captain Hunter does not, however, consider the quality good enough for masts, owing to many being unsound, and he states that in providing a topmast and a top-sail yard for a seventy-four gun ship, twenty-seven trees out of thirty-four were found to be defective. His experience, however, appears to have been more unfortunate than that of others, and we must also remember that a defect, which would be fatal in a mast, would by no means of necessity prevent the wood being used for building purposes. Indeed he says, "I think it fit for house-building, for which we know it to be very useful." When fresh cut down, five out of six trees will sink in water, and for naval purposes the difficulty of getting whole trees from the interior of the island to the sea, if designed for masts, would operate

against its use, were our navy great consumers of wooden masts, but if used for building purposes, it could be cut up where felled; and the transport would be comparatively easy. Lieut. (afterwards Governor) King says of it: "These trees are in general sound, but the upper part is too knotty and hard to be useful. The pine is very useful in buildings, and being dispersed in various parts of the island, is well calculated for such buildings as may hereafter be necessary. From what I have observed it is very durable, as that which we had used in erecting houses stood the weather very well."

The wood of the Chili pine is of a yellowish white, fibrous and full of very beautiful veins, capable of being polished and worked with facility. The resin abounding in all parts of the tree is white, and its smell like that of frankincense. There are large forests of this tree, which rises to the height of 150ft.; its trunk is quite straight and without knots, ending in a pyramid formed of horizontal branches, which decrease in length gradually towards the top, and is covered with a double bark; the inner is 5in. or 6in. thick, from which, as from almost all other parts, resin flows in abundance. The outer is of nearly equal thickness, resembling cork cleft in various directions, and equally resinous with the other. It is probably the best adapted for shipbuilding, as has been shown by the experiments made in 1780, in consequence of which orders were given to supply the squadron commanded by Don Antonio Bacaro, then at anchor in the port of Talcaquano. The resin is put to a variety of uses; it is applied in plaster, as a powerful remedy for contusions and ulcers; it cicatrises recent wounds, it strengthens fractures, and mitigates headaches. The Indians make use of the fruit of this tree as a very nourishing food; they eat it raw, as well as boiled or roasted, and with it they form pastry and distil from it a spirituous liquor.

Although in a state of nature these pines possess many excellent qualities. It is quite possible that the quality of the timber they furnish might be greatly improved by a little cultivation, but the Swiss saying, "trees and weeds grow everywhere," illustrates the indifference with which trees are generally looked upon. "To hate a tree like a Spaniard" is also another illustration of the same negligence. So far as our own possessions are concerned it is to be hoped that the authorities are looking better after the forests than our European neighbours have done, for on turning over the leaves of our consular reports we come across such expressions as these:—

Austro-Hungary: "In the alpine regions the decrease in the yield of timber is attributed to the wanton and irrational destruction of the trees by the peasants, far more than to the unfavourable influence of the climate. In other places the inhabitants have been industriously destroying the forests for the last two centuries or more. In Bohemia and Hungary, whole forests have been uprooted." Sweden: "The productive power of the forests is rapidly getting smaller, owing to forest fires and the indiscriminate felling of immature trees." Norway: "The same causes which have led in Sweden to the diminution of the productive capacity of forest lands, have led to a similar result here." Switzerland: "The annual production of the Swiss forests, is considerably less than the amount they are called upon to supply." United States: "No steps appear to have as yet (1875) been taken to prevent waste or to renew the supply of timber." Cuba: "No systematic official precautions have ever been taken to prevent injuries to the forests. And thus has valuable timber been diminished."

These few extracts will serve to show that we cannot know too much concerning building timber in various other parts of the world, which have not yet appeared in our market, but with which we may some day be glad to make better acquaintance.

Mr. Longden, of Malton, has been elected borough surveyor of Warrington.

At an early hour on Christmas morning the premises of Mr. James Stirling, builder and decorator, of North-road, Uxbridge, were broken into by thieves, and property to the value of about £2,000, consisting of tools, and a large amount of brass work and gas fittings, were carried away.

ARCHITECTURAL NOTES ON
ST. ALBAN'S ABBEY.

WE give this week in continuation from p. 652 a condensed report of the second portion of Mr. James Neale's paper, and a résumé of the discussion which followed its reading before the Royal Institute of British Architects, on the 17th inst. In our photolithographic pages will be found selections from the lecturer's drawings, which, as will be seen, illustrate the four great periods of carving, from typical examples in the Abbey.

The roof (said Mr. Neale) between the roof screen and the tower has twelve principals, with tie-beams and centre posts. The scantlings of the tie-beams average 15in. by 12in., with a clear bearing of 40ft. The beams, which project 3in. below the ceiling boards, are chamfered on the lower edge, and by means of these and of painted decoration, the whole surface is divided into panels. The whole of the nave ceiling was treated in the same manner, but at some comparatively recent date it was repaired. To save morticing and tenoning the new ceiling joist boards were simply nailed to the under side of the original beams. A flat unbroken surface was thus given instead of a surface broken by projecting beams, as in the choir. This flat surface, 211ft. long by over 30ft. broad, was divided into panels, in imitation of the more ancient design, by daubing in strong colours. The greater part of the original beams still remain within the roof, above the ceiling boards; they are morticed for ceiling joists, and chamfered exactly the same as the choir beams, and fragments of the original painting are discoverable. Only a few new beams were inserted. The choir ceiling boarding is of chesnut. Part of the old boarding was re-used in the nave, but the greater portion is in thin deal. In the centre and the western parts of the nave ceiling the joists are rudely sawn out of moulded and decorated beams; and braces to wall pieces, painted with stripes and stars (as in the choir) are re-used as common timber. Towards the eastern end of the nave there are indications under the present distemper painting on some of the re-used boards of an earlier design—possibly fifteenth century work. There is much difficulty in deciding whether the roof timbers are of oak or chesnut. Some are clearly of oak, but the greater part appears to be chesnut. This ceiling—which is 40ft. wide—is not flat, but rises about 1ft. towards the centre; obviously for the reason of hindering the beams from appearing to sag when viewed from the ground. During the summer of 1875 the choir ceiling was repaired, and the distemper painting touched up. Whilst replacing one of the panels, a workman accidentally rubbed off some of the new paint, and beneath it indications of an earlier design were brought to light. One by one the panels—66 in number, arranged in 11 rows of six panels each—were cleansed by peeling off the outer coat of distemper, and a painted design of much beauty was exposed to view. The two central panels of the middle row contain representations of our Lord and the Virgin, in each of the other rows three of the panels are charged with shields supported by angels; the three alternating panels bearing monograms, *I.H.S.*, surrounded by wreaths and vine leaves. The date of the painting has been put at between 1368 and 1376, but the lecturer thought it much later, probably about 1440. The apsidal sanctuary of the Norman church, with the exceptions of a few alterations by Trumpyngtone (1214-1235), seems to have remained entire until 1257, when the whole of the eastern part of the church was pulled down. At the rebuilding, which was immediately commenced, about 50ft. of the north and south walls were left standing in order to form buttresses to the great tower. All the work eastward has been removed. The square east end of the new design was built upon the connecting wall which crossed the Norman church at the springing of the apse. The two first bays occupied the space between the tower and the second Norman buttress to the eastward. Sufficient space was not left between this point and the east end for four bays of the same width; three bays somewhat wider than those to the west were therefore erected, making five in all.

These bays of the sanctuary were erected just at the change of the style from the Early English to the Decorated. The latter style was not sufficiently far advanced to bring about an alteration in the outline of the clerestory windows. During the excavations in 1872, a cylindrical hole, sunk in a block of stone, was discovered in the south aisle of the ante-chapel; in this hole was found the lid of a small wooden box of oriental workmanship, which probably contained the heart of the builder or special benefactor of this chapel. The manuscript in the British Museum states that, although the body of Roger de Nortone reposed elsewhere, yet his heart was buried before the altar of St. Mary of the four tapers, in the south aisle of the ante-chapel. This documentary evidence confirms what the architectural details and mouldings would have led us to conclude—namely, that the southern portion of the ante-chapel was erected during the abbacy of Roger de Nortone (1260—1290). Some portions of the ante-chapel appear a few years later, and most likely were a continuation by the succeeding abbot, John de Berkhamstede (1291—1301). The sanctuary and the ante-chapel made rapid progress towards completion, but at the accession of Hugh de Eversdone, in 1308—fifty years after the insertion of the foundations—the Lady Chapel walls had only reached the level of the under side of the window sills, 10 feet above the ground. During this period architecture had greatly developed, and the change in the mouldings and other details clearly prove the work could not have been continuous. The vaulting of the ante-chapel was never carried above the stone springers. Hugh de Eversdone, abandoning the beautiful features of the central nave and aisles with their vaulting, removed four of the piers, cut down the stone springers, and covered in the space with a panelled ceiling, and thus entirely altered the design of his predecessor. Hugh had much difficulty in obtaining money, was anxious to complete the ante-chapel, and thought it would be wiser to do so quickly, even at the sacrifice of a portion of the original design. For the Lady Chapel he received a bequest of 200 marks, with which he erected a vaulted roof and put in glass windows. Some few years since, when the Lady Chapel was used as a grammar school, the vaulted roof being somewhat shabby, laths, plaster, and white-wash were applied on the boarding. The lath and plaster is now being removed, and some painted decoration is exposed to view. The group of chapels offers examples as exquisite as it is possible to find of two of the most interesting phases of English mediæval architecture. The earlier portion is hardly equalled in beauty of design by any contemporary work; the traceried windows, wall arcading, and clustered piers must be ranked amongst the most perfect specimens of the period anywhere remaining. The modifications are by no means improvements. Some of the mutilations betray a hardihood that might have made Trumpyngtone blush for his own meekness. Some 300 years ago the beautiful shrine of the Protomartyr was shattered by sacrilegious hands into thousands of pieces, which were used with the common rubble masonry for walling up the arches at the eastern end of the Saints' Chapel, when the public passage through the church was formed. When these arches were opened out in the spring of 1872, about 2,000 fragments of Purbeck marble were discovered. Under the guidance of Sir G. G. Scott, these fragments have been ingeniously put together by means of shellac, and the structure was found to exactly fit the marks in the pavements in the centre of the Saints' Chapel, traditionally regarded as the site of the shrine of St. Alban. The pedestal is of Purbeck marble, with the exception of the vaulting to the niches, which is of clunch stone and painted. The general dimensions are about 8ft. 6in. long by 3ft. 2in. wide, and 8ft. 4in. high from the top of the steps to the cresting. Mr. Ridgway Lloyd, in his pamphlet, attributes it to the time of Abbot John de Marynes, chiefly on the authority of a reading in the "Gesta Abbatum." De Marynes died in February, 1308. If by the end of 1307 the whole was completed, we may safely infer the pedestal must have been completed long before this time. The mouldings and carvings do

not, however, contain a single detail that would identify this work with so early a date, for (1) the carving is later and more natural-looking than that in the Lady Chapel (circa 1320); (2) Some tracery on the sides of the niches has the same peculiarity as the tracery of two windows in the north wall of the Lady Chapel, but of a still later form; (3) The earliest specimen of good flowing tracery is in the restored portion of the choir of Ely Cathedral, by Alan de Walsingham, commenced in 1322, but this is not reticulated work; whereas that in the shrine is thoroughly so; (4) There are not elsewhere rosettes so early as 1307 identical with those on the shrine; and (5) the finials have the same descriptions of crumpled foliage as those of the east window in the Lady Chapel, but of a later character. Is St. Alban's the longest cathedral in the kingdom? For many years past it has been stated, and with local pride, that St. Alban's is the longest church (now cathedral) in the kingdom, and each history of the building has gladly availed itself of this tradition. Good amount of length and other dimensions go to the making of grand architecture, and are, therefore, not to be lightly spoken of. Still this controversy is a little trivial. Unless the length involves superiority in other ways as well, and the whole are discussed together, a little matter for whimsical drivelling is provided, and nothing more. However we will give the result of no little painstaking of our own and Mr. Colson's, a fellow of the Institute, the surveyor to the Dean and Chapter of Winchester, who took dimensions specially for these comparisons. It is somewhat difficult to measure the total length of St. Alban's, and the dimensions taken by the north and south walls vary. The whole of the long dimensions have been taken on the axis of the building with an accurate steel tape in 100 feet lengths.

Winchester: From plinth of buttress of east wall of Lady Chapel to plinth of west porch	ft. in.
St. Alban's: From plinth of buttress of each wall of Lady Chapel to face of buttress of west porch	557 9
The extreme length of Winchester Cathedral exceeds that of St. Alban's by	7 7½
Although the extreme length of Winchester Cathedral exceeds that of St. Alban's (with its unfinished porches) by 7ft. 7½in., yet the nave of St. Alban's is 8ft. 10½in. longer than that of Winchester.	
St. Alban's: From western face of main west wall to western face of tower	284 5½
Winchester: From western face of main west wall to western face of tower	275 7
The extreme length of St. Alban's nave (as seen on the outside) exceeds that of Winchester Cathedral by	8 10½

The nave of St. Alban's is not only the longest in the kingdom but the longest in the world. This 8ft. 10½in. does not fully represent the apparent excess of length of St. Alban's—as seen on the outside—beyond Winchester. The aisles of the Winchester transepts take off 25 feet from the length of the nave aisles. There are no aisles to the transepts of St. Alban's. The repetition of the strong unbroken lines of precisely similar length at different levels in the nave and aisles at St. Alban's, drives home to the imagination in a way quite unique the impression of length. Mr. Neale added some general notes on the Abbey, remarking that, contrary to general custom, at St. Alban's the architecture on the north side is richer than that on the south, a peculiarity which arose, in Trumpyngtone's case at least, from want of money. The average size of the stones in the tracery, it may be mentioned, is 2ft. 6in. by 2ft. Many examples were exposed during the restoration of lead dowels in the joints of detached shafts, so skilfully inserted that the neck mouldings remain perfect to the present day. Sinkings were cut in the upper and lower surfaces of the joints. Holes about one-eighth inch diameter were drilled through the upper stones in each case, and melted lead poured in, which, when set, formed the dowel. The shafts were often

sunk into both capitals and bases; in some instances, however, the shafts were not let into the capitals, but the same system of dowelling was employed. In the construction of the fourteenth century bays on the south side of the nave oyster shells are used with the mortar. In many cases there is a complete bed of shells at the springing of the main arches. The mortar is very hard, and contains much lime. In the ante-chapel wall arcading the new shafts put in during the restoration are of clunch stone, and not let into either capitals or bases, but dowelled with slate into both. When fixed, the joints were so tight that the thin blade of a knife could not be inserted, yet within a few months the stone had shrunk $\frac{1}{2}$ in. in circular shafts 3ft. 3in. long and $3\frac{1}{2}$ in. diameter. In the old work the shafts of like dimensions are mostly in Barnack stone. Nearly every joint in the arches of the new work (executed in clunch) has shrunk since the time it was fixed. Some laid at 1-16in. thick are now 3-16th. These points, however, do not affect the solidity of the construction. The clunch used in the interior is in wonderfully good preservation, but wherever exposed to the weather it has decayed. The abaci to the capitals of the ground-story piers of the Early English work are in a stone much harder than the clunch, and apparently from Barnack. The architects evidently distrusted the bearing power of the clunch, as in the abaci of the main arches, annulets, strings, &c., at different dates the hard stone was used. As to the tooling, the Norman stonework is axed; the Transition, chiselled; the Early English, bolster-tooled; the Decorated (including the bays on south of nave and the Lady Chapel) ashlar is claw-tooled, the mouldings scraped; and the Perpendicular is finely scraped. The building may be considered as a huge architectural museum, containing work of almost all dates from the beginning of permanent building in England to the suppression of the monastery in the sixteenth century,—Roman in part of its materials; Saxon in the turned stone balusters; Norman in the eastern part of the nave, the transepts, and the central tower; Transitional in the slype; Early Early English in the western porches; Middle Early English in the western part of the nave, the choir windows, &c.; Late Early English in the sanctuary; Early Decorated in the upper parts of the sanctuary, and the sanctuary aisle windows; Middle Decorated in the ante-chapel; Late Decorated in the Lady Chapel, the bays on the south side of the nave, and the shrine; Perpendicular in the screens, north and south windows of transepts, great west window, watching loft, &c.; and Tudor and subsequent styles in the tombs, brasses, stalls, pulpit, &c.: altogether a series extending over a period of about 1,000 years. Mr. Neale closed his lecture as follows:—Probably there is no building in the country which has such peculiar interest for the architect as St. Alban's Abbey. Its antiquity, its vast size, its majestic form, the exquisite proportions of many parts, the wealth of original detail, attracted me first to its study, and my reverence and interest have grown deeper continually as I have laboriously sought after the principles of its designers. An architectural student may well be thankful that good fortune has given him a training by which he may be able to follow through the work of his life in the footsteps of the men of old time. An expression of hearty gratitude to many such old masters in our art is also due from me; especially now to those who at St. Alban's have left for our learning such monuments of their skill and their devotion.

Mr. R. RIDGEWAY LLOYD thought that ancient records should not have been thrown aside by Mr. Neale except on very strong architectural grounds. That the Decorated bays at the west end of nave, south side, were the work of Eversdone there were two documentary evidences in early chronicles, showing that it was executed between 1323-33, and two mediæval writers also testified that the lower part of St. Alban's shrine was removed in 1308 by Abbot John de Marynes. In a recent instance he had found a confirmation of one of these ancient chronicles. The stone of the great west window was said to have been brought from the North country (*in partibus boreæ*), and attention having been called to

this, Sir Gilbert Scott and Sir Edmund Beckett had the material examined, and pronounced it to be millstone grit from Yorkshire.

Sir EDMUND BECKETT, Q.C., said much of what they had been told that evening had been published before. Mr. Neale had, however, taken much pains with the dimensions, a point of interest about which every one had different figures, and had shown that the St. Alban's nave was slightly longer than Winchester after allowing, as he (Sir Edmund) suggested to him, 25ft. for half the width of the transepts at Winchester. The screen in St. Alban's, although very fine, was a nuisance, as it shortened the choir and obstructed a view from end to end. The central tower was perhaps the finest and largest Norman one in the kingdom, and owed some of its effect to the present low roofs. If their pitch were raised, as sometimes proposed, it would be well to add a slight spire turret to the tower. In the west front the staircases for the turrets remained, not at the angles, but some 7ft. or 8ft. from them. He should like to see them finished or rebuilt, as they were the only examples placed in such a position. He also wished to see the south wall at the west of nave pierced with windows instead of being left in its present bare unsightly state. It might be said that this was an evidence of the Abbot's house, which formerly stood against the nave at this point, but the wall was not an old one, but a rebuilt one, and there should be no hesitation in opening windows between the buttresses Sir Gilbert Scott is adding. Sir Edmund concluded by appealing for funds to carry on the work of restoration, in which plea he was followed by the Rev. W. J. LAWRENCE.

Mr. S. F. CLARKSON said the paper had dealt with much discussible matter. The existence of an apse in the Norman church was probable, but the only evidence for it was the word "Concomeracionem" in the "Gesta Abbatium"—a word that might stand equally well for a barrel vault. He doubted whether the Norman church extended so far westward as the present west end, for the existing foundations of flint, with courses of tiles worked in them, did not appear below or beyond the science of the 13th century builders. Much might be added to all that had been said as to the dominant influence of the Norman structure on the works which in each succeeding age modified its original form, but it was difficult to go with Mr. Neale so far as to attribute the floor levels in ante and Lady chapels to the carrying forward of the Norman levels in the sanctuary aisles; nor could he admit Mr. Neale's claim that the so-called Saxon balusters came from the sanctuary triforium. There are six in the south transept and only two in the north one. As to the change of floor level in nave, introduced by John de Cella, his own belief was, that the Abbot had no very definite purpose before him. It might have arisen from a desire to decrease the external acclivity westwards of the doors, or to reach a more solid substratum for his foundations. One portion of Trumpington's work in the south transept evidenced an itching to meddle more and more with the eastern parts of the church, and would form an admirable text case in the contention on principles of restoration. To get more light Trumpington opened two large windows in the west wall of this south transept, but they were probably blocked up when the passage over the cloister roof was formed, before the immense south window was inserted. They have been now re-opened, when the clear glass of all the windows admits an excess of raw light into the transepts.

Sir GILBERT SCOTT, R.A., proposed a vote of thanks to Mr. Neale. He could not agree with him as to the different dates of the northern and middle west portals. He believed they were both by De Cella. He had compared the mouldings in each by means of templates; they differed from each other certainly, but were of the same age and character, and both ranged in courses with the undoubted work of De Cella closely.

Mr. STREET, R.A., seconded the vote, speaking in high terms of the skill in draughtsmanship and industry in research displayed by Mr. Neale.

Mr. NEALE, in responding to the vote of thanks (which had been carried by acclamation), replied to Sir Edmund Beckett that he

claimed originality for his paper, adding that his object had been to make it entirely fresh. As to the portals, it was by a comparison of the mouldings with templates that he was led to believe them to be of different dates.

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of this association was held on Friday evening, the President, Mr. B. A. Paice, in the chair. The following were elected as members:—Messrs. J. Shillcock, Angelo W. R. Simpson, J. Martin Brooks, R. Sparrow, jun., and Lewis H. Duval.

THE REVIVAL OF THE LATER STYLES OF ENGLISH GOTHIC.

Mr. J. D. SEDDING read a paper upon this subject, illustrated by examples of mouldings from abbeys and churches of the fifteenth century.

The LECTURER said he should endeavour in his essay to prove—1. That the Later English Gothic is essentially noble; 2. That it is relatively superior to the Earlier Gothic; 3. That a hearty revival of the later styles is needful to the well-being of the existing Gothic school, and to architectural design at large. In this he was conscious that he was at issue with generally-received opinion, and ran the risk of wide dissent. For a long series of years the later Gothic has been treated of with unsympathetic sternness, and spoken of with disapprobation and contempt. It has been neglected as a subject of appreciative study, or as a source of inspiration for modern effort, and in the case of modern restorations has not unfrequently been destroyed to make room for insertions of an earlier style. But not only have its good points been overlooked, but every blemish has been exaggerated, and its imperfections have been dwelt upon with delight, while the relics of the earlier middle ages, upon which the modern Gothic school is founded, have been eulogised as "the best, the most pure, the most vigorous, and the most perfect types of Gothic art." The disparagement of the "detestable Perpendicular" has been enforced by appeals to reason, taste, and conscience, so that it is not easy to disturb a faith supported by such a body of authoritative opinion. Yet there was much that was accidental and transient in the causes for the flowing of the stream of romance and antiquarianism—of which the Gothic revival is the concrete symbol—in the one direction, and not in the other; and now that profligacy has succeeded puritanism, the younger generation has risen in revolt, and it is seen that the "Perpendicular" cannot be demolished without shaking the very foundations of English Gothic, along with its chances of acceptance and extension in the nineteenth century. At the outset of an examination of modern criticism on the two main clauses of mediæval art, we are confronted with the fact that new architectural laws have been invented, new tests applied, and theories advanced for the purpose of passing judgment. Formerly the three indispensable questions in a building were stability, utility, and beauty; and it was sufficient if the edifice combined in itself the elements of proportion, harmony, and symmetry. But the nineteenth century critic represses his own impulses and tastes, and with purity and perfection for watchwords, he feels equal to any valuation of the productions of his sires. Although creative art is just now rather at a low ebb, research was never so active. The result of this inquisitorial attitude has been that the great whole of English art was split up into opposed sections; the Elizabethan and Queen Anne were accounted doubly dead, and were buried by the Goths without ceremony, and the English itself was divided into Early and good, and Late and bad, by a rigid arbitrary line of demarcation—the difference between noble and ignoble architecture being deemed simply a question of chronology. The fact has been ignored that in all living art the workman's capital is not merely in rules and principles, but in himself, and it is overlooked that every phase of national art alike represents development and growth, illustrates the spirit of a period, and the change of popular mood. The facts on which it is intended to rely to prove the nobility of Late Gothic are the vigour and

variety of its types, the dignity of its effects, the greatness of its aim, its power of developing fresh ideas, new capacities of imagination, new skill in work, and new scope of structural device and decoration. It is not within our scope to travel into sixteenth-century work, otherwise it is capable of proof that finality was never recognised, even to the last stroke of English Gothic. That contrast which is ever the best way of illustrating character will be of service in concluding between the relative claims of Early and Late Gothic art—Early English or thirteenth-century being taken to represent one class, and the Perpendicular, or work ranging from 1350 to 1520, as typical of the other. Fourteenth-century art being an intermediate art will be little dwelt on, as it more or less harmonises with the salient features of the two main groups. In this comparison Salisbury Cathedral and Rievaulx Abbey may be taken as typical of the early, and Winchester Cathedral and Sherborne Abbey of the later styles. Salisbury, by common consent, has a pre-eminent place among buildings of its class, and it was erected continuously without alteration of original conception. We will consider the three points of composition, of sculpture, and of imaginative effects, and inquire what was the state of these three heads. The west front is a not unfair example of the imaginative capacities of the architect and the possibilities of his art. Here we have the gable of nave roof surmounting all, the gable being flanked by a high wall on each side that runs horizontally from the parapet of the nave roof and terminates at each extremity with a square tower. The whole of the wall surface is covered with sunk panellings of various devices, but the design of the nave front has not much visible relation to the front of the aisles, nor do the surface works of the towers and aisles fit comfortably together. There is nothing of the quiet mastery of true composition anywhere. It is pieced work, fidgety and broken up; there seems an absence of regulative power in the design, even of any instinct of law, and a want of conscious governance of effects, for the various features are neither appositely chosen nor pleasantly combined. True, in all northern work there is something of caprice and incongruity, but here things everywhere stand on end, and we wonder whether it was innocence, accident, or perversity that dictated this *malapropos* joining of parts that could never meet with propriety, or whether high "purity" and "perfection" and "vigour" demanded the attempt. Large arches standing in high relief from the wall run round the towers to intersect—arches, labels, and all—in the most awkward manner at the angles, with no pretence at any continuing lines. In the three lower stages the tower arcades abut upon other arcades and windows that have no relation to them as to line, size, or form; while the lower main arcading of the nave surface is abruptly broken by a buttress. Of carving (speaking generally of the whole building) there is some dog-tooth ornament in the arches, a zig-zag of leaves to string-courses and to the capitals, a few figures in niches, and four small gurgoyles to each of the three western entrances; some delicate tracery of leafage fills a hollow mould of the central door, and the spire and spire windows are studded with bell-flowers. The capitals' carving is of the universal Early English type of foliage—curled leaves rising on stiff stalks from the neck of the capital, turning over under the abacus with graceful curves. The capitals to the corbel tabling consist of an infinite number of groups of four little balls; round balls also occur at the intersecting line of the projected moulding in the labels of the nave arches—and no more infelicitous objects could be conceived. In the imaginative elements of the structure as a whole we have much to admire. The two most beautiful points in this cathedral of Salisbury are its monotony and its grace—both quiescent, not active qualities. Much of the pleasure derived from the building is obtained by the simple variations of one thought—in the changing number of combined lights. In the sides of the nave we have two lights next the ground, with three in the corresponding space in the clerestory above; in the transepts the numbers run 2, 4, and 3; in the west towers

they run 3, 4, 2, 3; in the transept fronts, 3, 6, 4, and so on. There is a limited number of changes in the chiming—the melody is played on an instrument in which harmony is out of the question. The main interest of the structure lies not in the masonry of walls, but in the arrangement of the lines that divide the walls. The delicately traced lines of slender shafts, or lancets "long drawn out," or sharp arched panellings, or close-set tiny mouldings of arcades, are everywhere insisted on as the great source of effect, with the persistency and self-satisfaction of a child that has discovered new combinations of its toys. We get nothing deep or awe-inspiring or majestic; there are no heavy lines to thicken the gloom, no richness nor mystery no interest in the details. Simplicity, grace, and repetition of thought are its characteristic qualities, yet even here the work is far from flawless—its virtues are not perfected, and although it never appeals in vain to our sense of beauty, its charm is only a limited one. It is no dispraise of buildings of this class to say that in their absence of ornament, their austere line, and timid venture, they have a true parallel in the spring growth of nature. The slim pillars are the lithe trunks of the young sapling; the plain unadorned ribs of quadripartite vaulting that stand out in strong relief are as the stiffened boughs ere the summer has worked its magic upon them. Whereas the later fabrics have all the signs of a more bounteous time, they combine grace and grandeur, majesty and beauty; they have fuller sunshine and thicker gloom, higher lights and denser shadows. The slender-pillared and scantily-clothed ribs of the spring-time of art have developed into a forest of welded trunks, which mount from floor to roof with grand trenchant lines, and then break suddenly into a crown of innumerable branches, that creep and spread upwards and outwards, gaining richness by the intricacy of line, mystery by their fantastic indistinct shadows, variety by embossed carving of foliage and flower, and harmony of softened line by the tender gloom of rich-toned colour. Rievaulx is as simple as Salisbury Cathedral, but more vigorous; as graceful as Salisbury, but more manly. It works on the same lines, but, though somewhat earlier in date, it goes deeper than the other. We must, however, content ourselves with illustrating the condition of early art by a look at its mouldings and sculpture. The mouldings are bold and effective, and manifest the ready discursive method of a great architect. Instead of the ordinary plain cylinders of the Salisbury piers, we have a graceful composition of filleted rounds, the fillets being carried into the capitals and bases, and there is a profuseness and hilarity of genius in the fanciful corbelling which abounds all over the building, and which makes one of its most interesting features. The changes of treatment in those corbels of hard Yorkshire stone are marvellous. For instance, one corbel changes from segments of circles to irregular octagons, from octagons to circles again, from seven facets to five, from five to three, from three to the final one—eight changes of shape in less than 6ft. of masonry. We will compare some of the mouldings of Rievaulx (c. 1200) with those of Winchester (c. 1350), supplementing them with other examples. In the jambs of one of the lancets at the eastward of Rievaulx the mouldings outside follow a wide splay arranged in square with three simple hollows of uniform size, ranging with the splay, the square nooks being filled with circular shafts. The inside is rather more varied. The arches are moulded, and rest on moulded capitals. Ruskin's definition of composition in design is that there must be the laws of principality (or the subordination of inferior portions to one chief feature), of repetition, and of continuity. Let us bear these in mind as we examine the classes of moulding at Rievaulx and Winchester, remembering that "the decision of inferiority in these rests only on questions of degree." In the Rievaulx mouldings there is no conformity to the law of principality, for each of the three orders is similar to the rest; those of repetition and continuity are complied with, but only in their simplest and least interesting phase. But Winchester complies with all three laws in a high degree. In each class of work there is a

pleasing array of lines; but how much more is the imagination exercised by the later work—how much loftier the range of mind and gift of composition in the later workmen! Easby Abbey is another famous example of thirteenth-century work, of later date than Rievaulx. Compare the window moulding of the muniment-room of Easby with the cloister window of Cleeve Abbey, Somersetshire, of two centuries later. At Easby we have a wide splay with three curved flutings of equal size, then a break of 2½ in., and a further flute similar to the rest; and inside a repetition of this flute, and then a long splay. This is also inferior composition. At Cleeve the mouldings are contained within an imaginary line, which the members touch here and there; but there is increased ingenuity and complexity in the design. Further than this, the earlier mouldings are almost wholly mechanical, whilst the later ones have hardly any compass work—their subtlety of motive could alone be executed by the cunning of a man's right hand. Instead of the old grouped cylinders, plain chamfers and recurrent flutes, we have in the later work counter-set waves, opposed concave and convex lines, hollow beads and fillets, arranged with the nicest sense of proportion and most delicate harmony of line. In comparing the imaginative sculpture of English thirteenth-century work with that of the fifteenth-century we touch a really crucial point. Architecture should have something more than mere proportional lines and massed effects to be Art of the highest class, and we draw particular attention to the paucity of imaginative sculpture in the Early English work—first, to endeavour to give the work its true place in relation to other periods; and secondly, to show the delusion which the popular mind labours under in this respect. No one can say that in the examples of thirteenth-century work before us the workman is not doing his level best everywhere. We have given a category of sculptural ornamentation at Salisbury; at Rievaulx we have even less—only dog-tooth and beak-head ornaments sparingly applied, and some carving in one of the corbels. The thirteenth-century worker was only displaying beauty of line in mouldings and proportional construction; he knew of the capabilities of sculpture, as shown in the wondrous carvings, so brimful of human interest, of the still earlier buildings. The germ of art was inherited, but he had not the power of developing more than one line at once. A glance at the walls of Winchester will show that the Perpendicular workman developed every side of his art, and that English sculpture has recovered itself. Taking technical points first, there may be much "detestable" in Winchester to those who can only admire the Early Gothic; yet William of Wykeham looked with pride on his four-centred nave arches, the depressed arches of his aisles and clerestories, the grating tracery, the lierne vaulting, the scheme of wall panelling, the elaborate and well-considered mouldings which have in modern times been so eloquently condemned. In a comparison of buildings it may be taken for granted that the more comprehensive the edifice, the more varied its adjuncts, the more intense its spirit, the more complex its composition (within the laws of harmony), so much higher its rank in the order of human creation. To the majority of spectators Winchester is not so pleasing as Salisbury, probably because one is simple and easily comprehended, while the other is complex, and has a more intense personality, more elaborate construction, more imaginative vigour, and it is not possible to gauge the powers of its architect as you can at Salisbury. In the one you have simple grace—in the other living force. Winchester, with its heavy masses, trenchant lines, artful contrasts of light and shade, and bold carving, gives the sense of redundant, unresting, unsatisfied, hardly restrained vigour everywhere. And Wykeham is a far better interpreter of nature than Poore, and shows a great advance in sculptural device on the Early English workers. The structural lines of Winchester are simple to severity, and ornament is but sparingly used—only the large cornice under the triforium gallery, the bosses on the roof, and the capitals of the vaulting shafts are carved. The cornice sculpture is wrought in

large hold blocks, and include angels in different attitudes, masses of rich foliage, and heads of ecclesiastics and laymen—a whole portrait gallery of Winchester notables of the time. Of later date is the magnificent reredos of beautiful canopy work, with a crowd of saints in the niches surrounding the cross, on which is the figure of the Redeemer. In the Lady Chapel are the noble oak stalls, with fine tracery, and mouldings and varied carvings; the screens of the two chapels are second to none in the kingdom for exquisite beauty. Throughout the building we see that the aim of English mediævalism was to give pleasure by familiar portraiture and by simple facts and adhesion to local things. But there is something still higher in Winchester for which Salisbury has no parallel—the dominant quality of Wykeham's work is force learned at the feet of Nature, and the charm of Winchester is that some of the sublimest aspects of Nature are reflected in the heavy hulk of the masonry, the magnitude of the details, the depth of the shadows, the solemnity of the colossal arches and great piers that loomed from floor to roof with unbroken lines (for this work is not as Mr. Stevenson says it is, "Horizontal.") The same character is seen in the close-ranged piers and the traceried wall space, like rock surfaces. Sherborne has much the same qualities as Winchester, but in a different dress. There is masculine vigour and breadth of treatment, richness, variety, and scientific skill, and there is also a bluff English massiveness; but all this is relieved and brought into complete harmony by the rich tones of stained glass and coloured masonry. The presence of two centred arches throughout this noble example of Late Perpendicular affords opportunity of contradicting the idea that depressed and four-centred arches are universally employed in Perpendicular; on the contrary, the prevailing form of arches of arcades, doors, and windows in the five renowned Perpendicular counties—Somersetshire, Suffolk, Norfolk, Devon, and Cornwall—is two-centred, often well pointed, besides typical examples external to those counties. As to the title of the style the old name is true to a shade, while the newly-suggested one (Horizontal) has no authority. In the interior of the best buildings of this style every line leads up to the roof, the vertical lines are emphasised throughout. The same applies to the towers, as, for instance, in their buttresses, and in the wall panelling the leading lines are vertical. In conjunction with this assertion from Mr. Stevenson came another equally fallacious, that "the Pointed style arose from vaulting necessities, and, indeed, to the use of wooden roofs in England may be traced the abandonment of the pointed arch." We have already seen that the pointed arch never was abandoned in windows, doors, and nave arches anywhere in England till the last stroke of Gothic, and, moreover, in the whole of the Devonshire and Cornwall, and a large proportion of the Somersetshire churches every rafter has its arched rib from end to end. A little further actual experience would have prevented this assertion, and a glance through Brandon's "Examples of Open Timber Roofs" should dispel it once for all. The Pointed style prevailed in Italy (which was not mentioned by Mr. Stevenson but always in conjunction with flat roofs). As to the use of wooden roofs in England having anything to do with the fall of Pointed architecture, the "Horizontal" character of English Gothic should, according to this theory, be apparent from its first stroke, because wooden roofs always prevailed in England, and you may count on your hands the examples of vaulted parish churches of all styles, not including the Norman. We come now to our third proposition, that a hearty revival of the Late Gothic is called for in the interests of the Gothic school and of architectural design at large. The lecturer had been surprised to hear Mr. Stevenson at their last meeting treat "Old Gothic" architecture as a beautiful but obsolete science, not to be altogether lost sight of, but to be kept handy as an illustration of negative excellence whenever the supremacy of the nineteenth century is in debate. We heard that the whole of the past labours of the Gothic school were to be wiped out as a blot on the

page of nineteenth-century progress, hut, alas! nothing was settled for the future. One fact alone loomed out of the darkness and confusion—there was to be henceforth but one style practised, and that was not to be based on anything that went before; we were to have no more insipid reproductions of bygone times. The speaker would not attempt to rebut Mr. Stevenson's charge of copyism against the Gothic school, although he denied it totally, but he would inquire whether this brand-new school is free from such a censure? Has it no relations with the old Classic, the old Gothic, or the Mediæval Renaissance? No one believes the curly dormers, the tapering pilasters, the attenuated sash-windows, the moulded cornices, and frisky foliage of the so-called "Free Classic" school are new-horn features, evolved out of the inner consciousness of nineteenth-century designers. Any one who has travelled at all in England and on the Continent can give chapter and verse for every fragment of design embodied in works of this class. Nay, still more than this, every one knows that this so-called "Free Classic" is neither more nor less than Gothic thinly veiled. Still, although this is so, the new school is worthy of our heartiest commendation and encouragement—life and freshness must be welcomed from whatever quarter they come. We do not say that the Perpendicular or any style whatever is the one only answer to all the wants of the age. To take merely the question of ecclesiastical architecture, we would say let the Early styles be confined to the country, where cheapness and simplicity are a necessity, and small churches are needed. Use the Perpendicular for country towns and the Renaissance for cities, for a Renaissance building has an especially modern aspect, suited to the modern surroundings of a city, while a country town will probably have, besides plenty of modern structures in its streets, some historical remains or traditions or picturesque qualities of site to recommend the adoption of an historical and picturesque type of English architecture like the Perpendicular. Further, a church in a country town is one of two or three conspicuous objects; in a city it is inconspicuous among factories and warehouses, houses, and crowded squares and streets, so that you do not so much regret that the least worthy side—the outside—of a Renaissance structure is little observed or observable in the closely-populated spot in which it is planted. There is a still further reason for the employment of the Renaissance for cities. It is a noble style, marvellously well suited to 19th century ideas and wants, and should therefore have its chance equally with other styles. It were mere folly to ignore the tastes and wants of the age whose ministers we serve; we should serve to imhine its spirit, to test our work by this, and be ever ready to accept the conditions it imposes upon us. Now, if there be one thing which appeals more than another to the modern mind it is vastness, size, and space. The Perpendicular of all the English styles comes nearest both in tone and spirit to this age, and can respond to its wants by honest developments of its original character, and therefore is most suited of all the Gothic styles to this time. But the Italian Renaissance runs close by the side of English Perpendicular, and can therefore be used for the same ends, and can respond to the same requirements. Taking our model from the best Renaissance of Italy we have a style that will adapt itself freely to all our wants, in the employment of which the best side of modern art can pour out its products at the feet of God, where our Burne Jones, Morris, Poynter, Rosetti, Watts, Minton, and Salviati, and Royal Academicians and sculptors employ their genius without any sense of inconsistency, without any fear of transgressing precedent, or denying the primary intention of the art dealt with. You may cover the walls and arches of a modern Renaissance church with lovely carved subjects, terra cotta, and inlaid marbles as at St. Francesco, at Rimini; you may have a church painted all over, every feature and every particle of wall space having its one place in one vast scheme of coloration as at St. Andrea, at Mantua; or you may aim at stern effects as at St. Spirito, Florence. We Gothic revivalists may grant all this sphere of usefulness to the

Renaissance, and yet have our hands full. Art is a city, and the immortal citizens of Art speak but one universal tongue. Giotto of Florence and Poore of Salisbury, Brunelleschi of Florence and William of Wykeham, are brothers in a commonwealth, where glory of rank is measured not by what individual style was employed, but by the genius of the artist, and the everlasting worth of his work. Yet there is something after all in National Art, and it seemed to the lecturer that a style which is native to England—a style which was the most active in the whole range of English Art—which has illimitable resources—is not to be shelved by an essentially reproductive age like the present, without detriment to the hopes of modern architecture. A style native to England in her palmy days must naturally have within it those conditions which best enable the Englishman to express himself for all time. Like the art of Phidias, the Perpendicular style sums up the best of the complex gifts of a race once for all. It is the index of the English mind at the time when the English genius is roused to the full height of its varied powers. All that the Englishman has instinctively of sense of grace, of majesty, of judgment in proportion, of mystery, of grotesqueness, of refinement of humour—all the lights and shades of his character have a home there. The truly great spirit of English Art, as seen in Perpendicular, is the self-same in the deep solemnity of Winchester, the massiveness of Sherborne, the elegance of Gloucester, the spaciousness and large quietude of Salle and Lavenham, the richness of Cawston and Southwold, the majesty of Wrington and Leigh-on-Mendip, the sober picturesqueness of Haddon, Coventry, and Hever. It is not that one county is ahead of another, but that our forefathers were at the full height of their artistic stature everywhere alike. We hold to the fellowship of the English genius through all times; we draw no hard and fast line between the works of one period and another; to us they are not conflicting, but harmonious and sympathetic. And while we would allow the "Free Classicists" perfect liberty to assimilate all manner of alien matter in the elaboration of their own system of composition, we claim like toleration in the free development of the Gothic architecture of England, in its entirety and fulness, without partiality or restraint.

The PRESIDENT said they had listened to an interesting and instructive paper, in which, perhaps, there was considerable matter for discussion. He himself was unable to appreciate the greater beauties of the Perpendicular mouldings over Early ones; but all must agree as to the grandness of the interiors of these Perpendicular churches—a notable instance, fresh in the memory of all who took part in the autumn excursion, was St. Michael's, Coventry.

Mr. ALEXANDER PAYNE was unable to follow all Mr. Sedding's poetical allusions, but he understood him to say in plain prose that there was a section of the Gothic school who were always "running down" Perpendicular work. The remark required some proof; if any Gothic men did so, they were very few in number. At the same time that Mr. Sedding was pleading for the more generous treatment of the Perpendicular, he used what appeared to be most ungenerous remarks about Salisbury Cathedral—admittedly one of the grandest buildings in Europe or in the world. Having quoted some of those strictures, Mr. Payne added that a generous critic would hardly have taken as examples of that edifice the treatment of its west front and towers. The lecturer did not seem to have quite made out his case, however, and there were many other buildings—as the abbey churches of Yorkshire—to which he might have gone for illustrations. As to the mouldings exhibited by way of contrast, for himself he considered them not more vigorous and, indeed, decidedly inferior to the Early English examples placed by their side. The lecturer had admitted that Early English was best suited for the country churches, and Renaissance for those of towns. He did not understand where, then, he wished his Perpendicular style to be adopted. He wished to propose a vote of thanks to Mr. Sedding for his lecture.

Mr. PORTER seconded the proposition, and in doing so urged the necessity for building in

lasting materials. The great fault of Perpendicular, in his opinion, was that it was unsuitable for granite or any durable and hard stone. Still it was a good style, and needed some encouragement; they remembered how a late President of the Association (Mr. White) had condemned it in unbridled terms as consisting of "hammer-beam failures and soft-stone dressings."

Mr. FLORENCE thought Mr. Sedding had dealt very fairly with the various views prevalent, and had given due credit to the merits of the earlier styles. He was afraid, however, he had been a little unfair in the selection of his mouldings. He had shown great courage and liberality in suggesting the adoption of Renaissance for town churches. It was a style that lent itself very well to the arts of sculpture and painting, and was in harmony with the modern style in those arts.

The motion of thanks having been heartily accorded,

Mr. SEDDING replied, vindicating his choice of examples of mouldings, by showing that they were taken from all parts of England, and from buildings considered typical examples of their respective styles. The first speaker had been answered by the second on the point of the treatment of Perpendicular by some of the leaders of the Gothic school. Mr. Payne had misunderstood him as to the places in which Perpendicular should be used—he had suggested that it be adopted in the smaller country-town churches.

SIR HENRY COLE ON ART SCHOOLS.

SIR HENRY COLE who distributed the prizes to the students of the Manchester School of Art on Friday last, delivered an address in which he said that it was 25 years since he was called upon by Government to see if he could do anything to promote science and art in this country. Twenty-five years ago a school of art might have been a school of physical art, a school of chemical art, and a school of mechanical art, but a school of art was now understood as a school of fine art, in which were practised the methods of painting, modelling, and carving. Schools of science of different kinds meant schools of knowledge. Then there were the technical schools. Whether or not they meant a kind of national workshop he would not say. We had a great of art which the great artists and doctors of fine art looked upon more or less with contempt, and yet the works of fine art—what he ventured to call fine art—could only originate with the artists, though they might hereafter be reproduced by mechanical agencies. A work of fine art was the work of a handicraftsman, but he maintained that when the work was repeated so well that the artist himself could not distinguish it from his own handicraft it was for all those purposes for which fine art ever existed in the world worthy of being called fine art. He had no doubt that we should get into a better mode of expressing our ideas upon this subject as schools of art went on; he meant that these schools would be able to see and appreciate and produce forms of beauty by means of drawing, painting, and modelling. But there were some half-dozen pedants who said that schools of art did not produce artists. They never were meant to produce artists. An elementary school did not produce a poet. A poet was something quite beyond the means of elementary schools, or colleges, or, he might even venture to say, of universities. Heaven had a hand in a genius. He might be educed out of a multitude of other people, but as to the creation of a genius nobody had ever discovered how to set it going. The genius of the artist was, like the genius of the orator and the poet, in the main the work of Heaven. It could not be created by any school. Genius might be helped and cultivated, but could not be created by schools of art. If Shakespeare had not learned to read and write the world would not have had his dramas perhaps, and yet the genius of Homer was manifested even without reading and writing as far as they knew. According to the old proverb a poet was born and not made, and so was the artist, the painter, or the sculptor. John Henry Newman had said that works of genius fell under no art and that heroic minds

came under no rule, but he insisted upon the importance of teaching. He said, "I am no great admirer of self-taught geniuses. To be self-taught is a misfortune, except in the case of those extraordinary minds to whom the title of genius justly belongs, for in most cases to be self-taught is to be badly grounded, slovenly finished, and to be preposterously conceited." Mr. Poynter, a man of talent—he was almost disposed to say genius,—the present art director of South Kensington, at the Social Science Congress last year uttered some enormous fallacies. He said that "to calculate on any general artistic sentiment becoming a part of our national life would seem more hopeless now than it ever had been." A most monstrous fallacy! He (Sir H. Cole) should say that if ever there was a chance of fishing up a genius and setting him to work for this country, it was by the creation and extension of schools of art. Mr. Poynter also said that the accession of the high standard of the glorious epoch of Greek art could never be repeated in the world's history. Did Mr. Poynter mean to say that the world was not now the same world that it was 2,000 years ago? He should say that England had just as great a chance as Greece—a better chance probably—of producing great works of art which would be standard works at some future time. Mr. Poynter might just as well say that there was no chance of a future Homer. In one sense that was true. England, however, had had one nearly as immortal. We had had Milton and Shakespeare, and Italy had had a Dante. It seemed to him to be utterly fallacious to be howling about and saying that what had been in the world would not be repeated. General propositions were extremely dangerous. Never indulge in a general proposition. They might be precise if they said that two and two made four, but never say if they added up figures that they were sure to come to a correct result. (Laughter.) Mr. Poynter further said it was better to have no decoration at all than such as was purely mechanical. If that was so, he hoped that Mr. Poynter lived in a white-washed room, and that he had no room papered with patterns by Morris or by Owen Jones. He hoped he had a dull neutral piece of druggit in his room instead of a Turkey carpet, and that his nerves were never distressed if he saw any lady that he admired in a Cashmere shawl. All these things were mechanical; they were not decorative; and when he said that he preferred to have no decoration rather than decoration produced by mechanism, he thought his hearers would agree with him when he said he had gone a little beyond the mark. Sir H. Cole went on to describe the improvements that had of late years taken place in architecture, terra cotta, stained glass, pottery, and tiles, and said that competent judges had declared emphatically that the finest things exhibited in the Paris Exhibition of 1867 were the result of British industry and fine art applied to industry. The problem we had before us was how to give the fine-art power a democratic influence—to unite the artist with the workman, not to gratify one person but millions; and that, he maintained, was being done, and successfully done. Aristotle said, "Of possessions, those rather are useful which bear fruit; those liberal which tend to enjoyment." By fruitful he means which will yield revenue; by enjoyable where nothing accrues of consequence beyond the using. The possession of fine-art power and able handicraft was both useful and liberal, and it bore the fruits of both money and enjoyment. Art-culture was taught by schools and museums. The system was shown by the fruits, and by local and annual exhibitions. To those who decried our system, and there were some perhaps who did, he would say that almost every European nation, including France, the United States, and the colonies, had more or less adopted the system which had been brought to completion here. It was partially extended and methodised by his (Sir Henry Cole's) colleague, Mr. Redgrave, who had not yet received the recognition to which he was entitled for the work he had done for his country. The practical effect of this system in Manchester was, that whilst in 1851 there was a School of Design attended by 250

students who paid £256, last year at that School of Art, which took the place of the School of Design, the number of students was 429, and the fees £961. But in addition to that there was in Manchester a second school of art at the Grammar School, which had 838 students, paying £549. Besides that there were 586 students in small art schools throughout the city—principally in night classes—and 7,129 children were learning drawing in the elementary schools. He had no doubt that with the activity of the committee of that institution, and the opinion which was evidently growing in Manchester, they would soon double those figures. It was true they were badly in want of proper premises for their School of Art, but he believed they would have premises soon if they would look upon the school as something like a factory or workshop. If they went on the right line they would make a fine thing of it. But they might desire to know what the system of which he had been speaking had done throughout the country. In 1851 there were 17 schools, and these had now increased to 141. He hoped the young men present would, at the end of the next 25 years, see these schools increased to 500. For himself, he thought the schools would so increase, particularly if the people got the right to spend their own money in support of the schools, which right at present they only had in a certain way. They had to dance their hornpipe in fetters, being trusted only to spend a penny in the pound for this object. The 141 schools which he had mentioned had 27,900 students; there were 883 night schools, teaching 31,000 students; and nearly 4,000 public elementary schools, teaching elementary drawing to 460,000 children. He had no doubt before long the whole of the two millions of children who ought to be in the elementary schools of the country would be able to draw a little, just as they were learning to write, to the great advantage of trade and to the nation at large.

COMPETITIONS.

BARROW-IN-FURNESS.—We find the hint we gave last week as to the authorship of the first premiated design for the erection of the new Town Hall and public offices at Barrow-in-Furness turns out to be correct. The architect who adopted the nom de guerre of "Ima" is Mr. W. H. Lynn, of Richardson Buildings, Belfast. The author estimates the cost of carrying out his design at £31,000, calculating it at 9d. per foot cube. We hope shortly to illustrate this and the other premiated designs.

MAIDENHEAD.—One or two complaints have reached us respecting the unfairness of the decision of the Maidenhead Corporation, in connection with the Hospital competition. Mr. Ernest Turner's letter to the Corporation was read the other day after a discussion, but the council have refused to entertain the idea of a reconsideration of their decision, and confirm their previous decision. We think that Mr. Turner, Mr. A. L. Cooper, and a few others who have produced good plans, should at least have been invited to send in guarantees of the cost of their designs before a final decision was arrived at. To say the least, they have much ground for complaints, and the anonymous letters the town clerk asserted he has received are the results of decisions conducted upon the defiant principle.

ARCHÆOLOGICAL.

ROMAN LONDON.—Through the kindness of Mr. W. H. Cross, of St. Bartholomew's, Mr. John E. Price, F.S.A., had, on Saturday last, an opportunity of inspecting some discoveries recently made while excavating within the precincts of the hospital. In clearing what was once the site of Pye-corner for the erection of a new library and museum two stone sarcophagi were exhumed. They were 11ft. from the surface, and situated 50ft. from the new buildings in Windmill-court, and at no great distance from the line of the City wall. They lay east and west, are about 7ft. long, of coarse oolitic stone, have massive lids or covers, and can at once be identified as Roman. In one two skeletons were found: one of a man with his head to the west, the other of a woman with hers lying towards the east. Both the skulls

and the teeth are in good preservation. In the other tomb a leaden coffin had been placed. It is much corroded, and has been considerably injured by the efforts of the finders to convey it away piecemeal for sale and the melting pot. It has fortunately been saved, and sufficient remains entire to identify the ornamentation upon it. It shows the rope or cable moulding disposed in a diamond pattern, and resembles similar coffins found years ago at Old Ford, Stratford, Bethnal-green, Stepney, to say nothing of those at Colchester and other places. The sarcophagi both resemble that found a year or two since near Seacoal-lane and on the bank of the old Fleet River. This is now preserved in the Museum of the Corporation of London at Guildhall. At the head of one of the tombs appeared a short stone pillar, a portion of a column with sufficient of the moulding remaining to indicate its origin. It is such as have been frequently seen among the débris of Roman buildings and probably served as a headstone or other memorial, the forerunner, doubtless, of the "Shattered Column" so familiar in our modern cemeteries. Smithfield has long been known as the site of one of the extensive cemeteries attached to Roman London. The remains, however, usually found are simply bones, charred or otherwise, cinerary urns, and broken pottery, and there is no published account of so important an interment as that now before us. It fortunately happens that the discoveries have found a chronicler on the spot. Dr. Norman Moore, M.D., who was the first to make them public, is still devoting attention to the subject, and as the works are still in progress further relics may be revealed.

TEMPLEBOROUGH.—The works at Templeborough were continued last week. The material drawn out seems to be now almost entirely composed of large stones, some dressed, some boulders. On Friday week a portion of a quern, or hand-mill, having had two orifices for putting in the grain, was found, and also a portion of a Samian vessel, without pattern. In cleaning the interior of the Prætorium, a tile with an almost perfect stamp of the fourth Cohort of the Gauls was discovered, and, oddly enough, not far from it, and at the depth of 4ft. 6in. from the surface, an English halfpenny of the reign of William and Mary. On Monday week, a coin which seems to be a second brass of Hadrian was turned up, and another coin which has almost entirely perished was found about 5ft. deep in the rampart, near to the paved surface in front of the southern colonnade, together with four fragments of Samian in good preservation, and the neck of another vessel with a beaded pattern. The coin of Hadrian was found in the Prætorium.

WESTMINSTER ABBEY.—The window erected by the Dean of Westminster in memory of Lady Augusta Stanley, over her grave in Henry VII.'s Chapel, has been unveiled. In the upper compartment the subjects are taken from events in the history of the Bruce family, and in the lower compartment the subjects represent Lady Augusta in the six acts of mercy. The window is executed by Messrs. Clayton and Bell, who have also just completed a window in St. Michael's Chapel, in memory of the sufferers in the Ashantee war, representing St. Michael in heaven, and St. George and St. Maurice on earth.

NOTICES OF NEW BUILDINGS.—Metropolis Local Management Acts.—Wandsworth Police-court.—Henry James Erastier was summoned by Mr. Corsellis for building in Park-hill, Clapham, without giving notice to the Wandsworth Board of Works. Mr. Corsellis said it was the practice of builders to commence their works without notice. The board had directed the proceedings to show builders it was necessary to give notice. The defendant endeavoured to show by his questions that he gave verbal notice to the board's surveyor. Mr. Corsellis said the Act required seven days' notice in writing. The defendant said not a builder in Clapham had been summoned. Mr. Southam, the surveyor, said this was an exceptional case. Mr. Paget said builders must take care to obey the regulations, as it was not a light matter. He fined the defendant 20s., and 2s. costs.—George Shaw, a contractor, of Page-street, Westminster, was next summoned for commencing to lay and dig out the foundations of a new building as an addition to Maurea House, a Roman Catholic college at Rotherhampton, without giving to the board seven days' previous notice thereof. The defendant said he gave notice to the district surveyor. Mr. Corsellis explained that the notice to the surveyor was for the purpose of superintending the building, but the notice to the board had reference to the drainage. Mr. Paget said it was a case of more importance, and fined the defendant 40s., and 2s. costs.

Building Intelligence.

BRADFORD.—The foundation stone of a new Primitive Methodist chapel at Bradford was laid on Monday. The design is in the Italian style, by Mr. T. Howdill, architect, Leeds, and shows a building 70ft. by 48ft., with a height of 31ft. in the interior, capable of seating 800 worshippers. The cost, apart from the land, is estimated at £4,000, and altogether the expenditure is estimated at about £5,000.

BRADFORD.—On Saturday week a new church at Bolton, in the barough of Bradford, was consecrated. The architectural treatment is an adaptation of Early English. The plan comprises nave, aisles, chancel, organ chamber, and vestry, arranged in cruciform plan, the transeptal wings occupied by the organ chamber and vestry respectively. Accommodation is provided for 400 worshippers. The east window has four lights filled with stained glass, the work of Messrs. Shrigley and Hunt, of Lancaster. The architects are Messrs. Andrews and Pepper, Bradford.

CHALGROVE.—New schools have just been opened at Chalgrove, in the county of Oxford, providing accommodation for 114 children, with a residence for the master. The contract was taken by Messrs. Howland and Wells, of Thame, for £1,208, including furniture, but there have been no extras and deducting provisions inserted in the specification, the actual cost has been £20 below the contract sum. The architects are Messrs. Morris and Stallwood, of Reading.

DEVONPORT.—The foundation stone of the buildings for the accommodation of the pupils connected with the Devonport High School for Girls, was laid on the 11th inst. At present only a portion of the complete design is to be erected. Eventually the entire building will accommodate 250 pupils, the number to be now provided for being 150. There will be three floors—the basement, containing a large play-room 50 × 17, and a day-room 25 × 19; classrooms and other provision for the Kinter-garten department; rooms for the care-taker—heating chamber, and all conveniences; the ground floor, comprising cloak-room, head-mistress's room, secretary's office, and three large class-rooms; the upper floor, containing a room for the assistant mistresses, and four large class-rooms. All the rooms are lofty, those in the basement being 11ft., and the others 13½ft. clear height. The general arrangement is a central corridor, east and west, flanked by rooms on north and south, and communicating with other rooms in a wing at each end. Externally, the structure will present a symmetrical front to Albert-road; the central range, with three dormer gabled windows, being flanked by projecting wings which are carried up as gables of Elizabethan or Tudor design. The south elevation will present a somewhat dwarfed appearance until the intended future additional story is erected, and will also suffer architecturally from the absence of the future block of building at either end. All the external facings will be of Portland cement, which has been adopted on account of the great difficulty experienced in otherwise erecting a building impervious to moisture. The architect is Mr. H. J. Paull, F.R.I.B.A., of London and Manchester. The contractor is Mr. Berry, of George-lane, Plymouth. The clerk of works is Mr. Siddall.

METROPOLITAN BOARD OF WORKS.—At Friday's meeting of this Board it was decided to advance to the City Commissioners of Sewers the sum of £30,000 towards local improvements in the following proportions:—114 to 117, Newgate-street, £8,000; 14, 15, and 16, Aldgate, and 1, 2, and 3, Jewry-street, £4,000; 17 and 18, Aldgate, £1,000; 93, Great Tower-street, and 10, Little Tower-street, £6,000; 28 to 31, Lime-street, £2,000; 34, 40, and 41, St. Mary-at-Hill, £1,000; 23 to 31, Poultry, £8,000. The solicitor was directed to take steps for opposing the proposed application to Parliament by the London School Board for compulsory powers to take property comprised in the Whitechapel and Limehouse and the Bedfordbury schemes under the Artisans' Dwellings Improvement Act, 1875.

£3,000 is to be advanced to St. Pancras Vestry towards the expense of building the new bridge at Gloucester-gate, Regent's-park. Sanction was given St. Luke's Vestry to borrow £79,000 for the Golden-lane improvements, repayable with 5 per cent. interest in 50 years. In the list of candidates for the post of assistant draughtsman in the architects' department the name of "Mr. Ebbetts" appeared last week; it should have been "Mr. T. C. Ebdy, of Hull."

MUCH DEWCHURCH.—The Church of St. David, Much Dewchurch, was re-opened on Sunday week, after restoration under the direction of Mr. Thomas Blashill, of London. Mr. W. Cullis was the contractor, and the total cost has been about £2,400. The walls of the church have been thoroughly repaired and consolidated. The building is well warmed by one of Musgrave's stoves. The soft, rich-coloured local stone harmonises well with the original walls, so that no glaring new effect is produced. Every feature of the old church has been preserved, and nothing new been introduced as mere ornament. The fabric consisted originally of a nave and chancel, the massive walls of which were built in the twelfth century, and contained the very small windows, placed high and deeply splayed within, which are often found in this country. The circular-headed chancel arch is very low and plain. The chancel was probably apsidal, but its eastern part was rebuilt in the fifteenth century, and contains a good three-light window. Windows were also inserted in the nave and chancel in the fourteen and fifteenth centuries. The nave walls were slightly raised and a new roof put on in the fifteenth century, the timber being very massive and in excellent condition. A low screen of veined alabaster, combined with iron work, has been placed in the chancel arch. The altar, of oak and walnut, has been carved by the vicar in his leisure moments. The floors of the chancel has been laid with Goodwin's tiles; the floor under all the seats in nave and chancel are of prepared wood blocks set on a bed of concrete.

TADCASTER NEW BOARD SCHOOLS.—These schools will be opened at Tadcaster at the beginning of the new year. The buildings, which are in the Gothic style, have been erected from the designs of Mr. E. Birchall, architect, Leeds. Cream-coloured bricks from Laisterdyke have been mainly used in the construction of the outer walls, whilst the stone was obtained from the Bramham Moor quarries. The buildings have a total length of 175ft., and have an elevation generally of 30ft., being of one story, with the exception of the master's house. Accommodation is provided for 250 children. The cost has been £3,800.

WHITSTABLE.—New Board schools have recently been opened at Whitstable, in the county of Kent, erected for the united district of Whitstable and Seasalter. Accommodation is afforded for 110 boys, 170 girls, and 200 infants. The boys have a school-room and one class-room; the girls, a school-room and two class-rooms; the infants, a large school-room, class-room for seniors, and babies' room. To each department is attached a spacious cloak lobby, with lavatories, and also extensive playgrounds, and the infants have a covered marching shed, with paved floor, 160ft. long. There are two good residences each, with parlour, living-room, scullery, pantry, fuel-shed, and usual offices, and three good bedrooms, open staircase, and landing. Very much care has been bestowed upon the ventilation of all the school and class-rooms, which is by means of upright shafts for admission of fresh air, and extracting shafts with small roof gables for taking off vitiated air. The heating is by means of Shillito and Shorland's Manchester grates, which form also a valuable addition to the means of ventilation. The schools and class-rooms are furnished with desks and seats on the dual system, while galleries are provided for the junior infants and babies. The work has been carried out by Mr. Foad, contractor, of Whitstable, at a cost of about £4,900, which includes the complete furnishing of the schools. Mr. Jarvis, of Huntingdon, acted as a most efficient clerk of works, and the architects were Messrs. Morris and Stallwood, of Reading.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. The Editor respectfully requests that all communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondence.]

All letters should be addressed to the EDITOR, 31, TAVISTOCK-STREET, COVENT-GARDEN, W.C.

To OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

ADVERTISEMENT CHARGES.

The charge for advertisements is 6d. per line of eight words (the first line counting as two). No advertisement inserted for less than half-a-crown. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 5 p.m. on Thursday.

TERMS OF SUBSCRIPTIONS.

(Payable in Advance.)

Including two half-yearly double numbers, One Pound per annum (post free) to any part of the United Kingdom; for the United States, £1 6s. 6d. (or 6dols. 40c. gold). To France or Belgium, £1 6s. 6d. (or 33f. 30c.). To India (via Southampton), £1 6s. 6d. To any of the Australian Colonies, New Zealand, the Cape, the West Indies, Canada, Nova Scotia, or Natal, £1 6s. 6d.

N.B.—American and Belgian subscribers are requested to remit their subscriptions by International P.O.O., and to advise the publisher of the date and amount of their remittance. If the last-mentioned precaution is omitted, some difficulty is very likely to arise in obtaining the amount. Book numbers can only be sent at the rate of 7d. each, the postage charged being 3d. per copy. All foreign subscriptions, unaccompanied by an additional remittance to cover the extra cost of forwarding back numbers, are commenced from the next number published after the receipt of the subscription.

Cases for binding the half-yearly volumes, 2s. each.

COMPETITIONS AND COMPETITORS.

To the Editor of the BUILDING NEWS.

SIR,—The pages of your last issue are, as usual, full of complaints about the results of competitions. I used to be as indignant as any one at the barbarous treatment which the profession continually experiences at the hands of public bodies—for they are the invariable offenders in the greater number of cases where competition is invited—but at last I have come to the conclusion that it is no use running one's head against a stone wall. We must take things as we find them. We have no remedy. Our profession has no legal standing, no powers of control over its members, no authority to lay down rules in such matters which shall have any binding power over employers or competitors. Employers will, therefore, do whatever, from their own point of view, may seem fit to them, without the smallest reference to the feelings or convenience of the profession. It should be understood that competition work is nothing more nor less than gambling—a staking of time and

money upon a remote and perfectly uncertain chance of succeeding in a lottery. That the best man in any given competition should be the winner is no more a consequence than that the best-dressed man in the "salons" of Monaco should break the bank. Of course, I know that competitions will go on just as at present, because there will always be numbers of young men with time to spare and ambition. But I cannot help thinking that it would be as well to cease these endless grumbings, which can do no one any good, and are in no way dignified or worthy of imitation. I have competed myself, but never complained; I thought that "le jeu ne valait pas la chandelle."—I am, &c., J. B. FOWLER.
Breon, Dec. 24, 1877.

CHURCH OF ST. MARY, SOUTHAMPTON.

SIR,—Referring to the view of this church in your last number, I beg to suggest that the angle piers of the upper stage of the tower are much too weak to carry the load and thrust of the heavy spire above, in consequence of the openings being placed so near the angles. In all old buildings we find this portion of the tower made especially strong, both inside and out.—I am, &c., E. W. T.

READING TOWN HALL COMPETITION.

SIR,—I hope your readers see that the award of the committee can have but one object—viz., that of placing the design of the local firm on an exactly similar footing with the other two premiated designs. Now they cannot all three be of equal merit. Would you kindly inform your readers of the order in which the three should have been placed? Thanking you for your bold article of last week, I am, &c., A COMPETITOR.

[The order in which the designs are named in the award is the only clue the profession has to the ideas of the Building Committee as to the pre-eminence of the designs. Our opinion as to their respective merits may be gathered from our article on the competition elsewhere. "A Competitor" has indicated exactly the point which deserves the serious consideration of the rest of the competitors who took part in this most unsatisfactory and ill-managed competition.—Ed.]

PAVING APPORTIONMENT.—At the Wandsworth Police-court Thomas Grant was summoned by Mr. Corsellis, clerk of the Wandsworth Board of Works, for the sum of £9 18s. 6d., being the sum apportioned upon him for the repair of College-street, Putney, in respect of certain premises of which he was the occupier. Mr. Reeves defuded, and elicited that the order was made by the Board in July, 1870. He then submitted that the Statute of Limitations applied. Mr. Paget overruled the objection. Mr. Corsellis said that he could not take proceedings earlier, as the premises had been vacant. Mr. Reeves then submitted that it was a charge upon the owner, and referred to the 77th section of the Act of 1862, under which the summons was issued. Mr. Corsellis also referred to the 96th, which, he said, must be coupled with it, wherein it would be found that it was a charge upon the present or any future owner. Mr. Paget made an order for the amount claimed.

Intercommunication.

QUESTIONS.

[5227.]—Architectural Charges.—A contractor who was unfortunate became in time a quantity surveyor. A gentleman called on me a few days ago, and asked me to make him a few designs for an entrance lodge. I made him ten sets of ground floor and one elevation, which he returned to me, as he did not like any of them, but I have since got instructions to go on with another set of plans for him. What (if anything) can I charge him for the original ten sets of drawings, not being properly an architect? T. R.

[5228.]—Maidenhead Infectious Diseases Hospital.—I should be glad to know if the committee have determined to carry out the plan which, according to the criticism in the BUILDING NEWS, contains many faults of arrangement? Are the many excellent plans sent in by competitors to be returned to their authors? Architects have cause for complaint when they find a committee absolutely rejecting plans that exhibit considerable ingenuity in the requirements of hospital construction.—JUSTITIA, BUT NOT A COMPETITOR.

[5229.]—Concrete as a Building Material.—I shall be pleased with the results of any recent experiments that have been made relative to—(1) The alternate action of water and air on concrete; (2) the best mode of wall-building with this material; (3) the strength of floors, landings, and arches of the material, and the data of experiments; (4) any decorative means that has been used to relieve the surface of concrete; (5) the cost per yard of concrete walling of ordinary thicknesses.—H.

REPLIES.

[5179.]—Binding the "Building News."—I think it best for reference to bind the plates separately from the letter-press—the year's illustrations making one volume, and the letter-press another. An architect or student frequently wishes to turn for information, say, in relation to a certain kind of building, as a hospital or a school, or to some other scientific, technical, or legal intelligence; he wants to make himself clear upon certain facts, figures, or data, and a volume free from plates has the advantage. On the other hand, it may be that he wants to refer to some plans to refresh his memory, or to some particular buildings or details, and it is preferable to turn to the plates alone. Of course, the complete bound volume has its advantages, and for the general student it is the best; but there are some who like to have the illustrations at their fingers' ends. My plan has been to bind plates and letter-press in one volume.—A SUBSCRIBER FROM THE COMMENCEMENT.

[5191.]—Inaccessible Heights.—The formula of N. L. Derby, New York, published last week, though with a misprint or two, is a useful one, and may frequently be adopted by architects and others. Perhaps, however, a simpler mode that I have sometimes used is the following:—Select horizontal ground. Find a position at which an angle of 45° will cut top of object, then it is necessary to measure the horizontal distance to find the height. A common 2ft. rule may be set to a right angle, and the ends of limbs ranged by eye, if an angular instrument is not at hand. Knowing trigonometry, the problem is simply performed by multiplying tangent of angle subtended by horizontal distance.—G. H. G.

[5220.]—Roofs.—The best work on roofs is Tredgold's. There are several modern editions. Hurst's and a smaller edition published in Lockwood's series will afford all the information required. Nicholson's "Principles of Carpentry" also is an old but useful work containing the chief varieties of roofs, trusses, and scantlings.—G. H.

Our Office Table.

PHILIP VEIT, the great painter and restorer of the ancient Christian style of art in Germany, has just been buried at Mayence. Veit was born at Berlin in 1793, and was the son of the banker, Simon Veit, a member of one of the wealthiest Jewish families of the capital. His mother, Dorothea, a daughter of the philosopher, Moses Mendelssohn, eloping with the poet Friedrich Schlegel, subsequently married the latter, turned Roman Catholic, and caused her two sons to be received into the bosom of the Papal Church. Dorothea distinguished herself by translating nearly one-half of the pieces contained in the famous German version of Shakespeare known as Schlegel and Tieck's version. One of her sons became a priest; the other, Philip, obtained a great renown as a painter, and, with Cornelius and Overbeck, revived the grand mediæval style of Christian art. His picture of "Germany," represented as a young matron, and his portraits of some mediæval emperors established his reputation.

At the meeting of the Court of Common Council, on Thursday week, the City Lands Committee presented their report on the reference to consider whether any improvement be capable of being effected in the design or suggested site for a new council chamber, and recommending that in accordance with the opinion expressed by the committee in the report presented by them on the 17th December, 1874, a new council chamber should be at once erected, agreeable to the plan and model therein referred to, at the estimated expense of about £50,000, exclusive of fittings. A discussion ensued but no decision was arrived at. One of the members was very sensibly of opinion that before building a new council chamber they should know first where the money was to come from. If they had to borrow the money for the purpose he thought they should wait. At the same meeting the Coal and Corn Finance Committee submitted a report on the reference of the 22nd October, 1874, and on having entered into an agreement with the Dean and Chapter of St. Paul's for effecting certain improvements in the enclosed grounds around St. Paul's Cathedral, at an estimated expense of £5,000, and a sum not exceeding £400 per annum for maintenance. The report was adopted.

The vexed question of providing Liverpool with an additional water supply reached another stage on Monday, when a special sub-committee of the Water Committee brought forward a report of Mr. G. F. Deacon, the borough and water engineer, upon the subject. It has been proposed at various times to obtain water from three distinct sources—viz., Ullswater, Windermere, and Bleasdale, and Mr. Deacon now reported upon two other schemes. One of these was to take the supply from Haweswater, a lake near Ullswater, and the other was to go into Wales, and obtain it from the river Vyrnwy, a tributary of the Severn. Of the Haweswater project he reported that it possessed undoubtedly many advantages. The lake was 723ft. above the level of the sea, and the aqueduct to Liverpool would thus have a greater inclination than could possibly be obtained from any other northern source; the quality of the water was of the best, and its quantity would be sufficient to meet the increasing demands of Liverpool for a long time to come. All these advantages, however, and many other advantages which Haweswater did not possess, were offered by the Vyrnwy scheme, of which, therefore, the engineer proceeded to speak in detail. The river Vyrnwy, he said, hitherto little known, except to the angler, was a tributary of the Severn, taking its rise in the Berwyn range, within forty-five miles in a direct line from Liverpool. The consideration of the report was deferred.

A most melancholy accident happened at St. David's Station, Exeter, of the Great Western Railway, on Saturday afternoon, to an architect well-known in Exeter, and has, unhappily, resulted in his death. The deceased was Mr. Joseph Neale, aged 42, residing at Weston-super-Mare, and having offices in Exeter. Mr.

Neale had taken a ticket with the intention of going home to spend Christmas, and intended travelling by the 3.5 train from St. David's. He was told by the guard that he could not go on, but eagerly announced his determination to proceed, and the inspector on duty, who knew him, anxious to assist him, opened the door of a second-class carriage, although the train was in motion, as he ran on. Mr. Neale, who was following close after the inspector, ran round him, and attempted to get into the carriage, but was struck by the open door, or tripped, was dragged some distance along the platform, and then rolled on to the line in the space between two of the carriages. The carriages were uncoupled, the former part of the train moved forward, and the unfortunate gentleman extricated. It was found that his right leg had been horribly crushed from the thigh downwards, and his foot almost severed just above the ankle, the toes of the left foot being also crushed. He was at first unconscious, but soon afterwards spoke. A stretcher was procured, and Mr. Neale was conveyed to the Devon and Exeter Hospital. He was found by the surgeons in such a low state that amputation of the leg could not be undertaken. Every effort was made to rally his strength, but all was of no avail, and he died about 1 o'clock on Sunday morning. The deceased was an able member of his profession, and architect for the new chapels at the Wonford House Hospital for the Insane, and the Exminster Asylum. His design for the restoration of Heavitree Church tower recently obtained the first premium. He leaves a widow, who is in infirm health, and four children.

The memorial stone of a new Baptist chapel and Sunday school about to be erected in Warwick-street, Deritend, Birmingham, was laid on Wednesday, by Lieutenant-Colonel Ratcliff. The amount of the contract is about £600, exclusive of fittings, for which, with contingent expenses, an additional £200 will be required. The front is to be of Gothic design, and will be wholly in brickwork. Mr. Lee is the builder, and Mr. George Ingall the architect.

Epps's Cocoa.—Grateful and Comforting — "By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*First Service Gazette*.—Sold only in packets labelled "JAMES EPPS & Co. Homoeopathic Chemists, London."

VERITY BROTHERS'

PATENT VENTILATOR OR AIR

PROPELLER for the introduction of cold or warm air into dwellings, &c.

The machine may be seen in action at their Show-rooms, 127, Regent-street, London, W. The apparatus consists of a drum, with a double set of fans, which are worked by a fly-wheel placed in the centre, and on the same axle as fans. The motive for this fly-wheel is derived by a small jet of water being directed on to it, causing both the wheel and fans to revolve with great velocity; the air passing through the machine at a rate equal to 2,500ft. per minute, if desired, according to size of apparatus.

N.B.—The above machine may be used either as an exhaustor or injector as may be preferred, or both objects combined.
